**Dispersion in electrically excited gases.** Rudolf Ladenburg. *Rev. Modern Physics* 5, 243 56(1933).—The anomalous dispersion of red-yellow Ne lines was measured and the results were used to calc. transition probabilities and the populations of excited levels. The population curves indicate that statistical equil. between excited atoms and electrons is reached at high currents. At very high currents equil. between different excited levels is reached. A. B. F. Duncan

**The scattering of electrons by metal vapors. II. Zinc.** E. C. Childs and H. S. W. Massey. *Proc. Roy. Soc. (London)* A142, 509-18(1933); cf. C. A. 27, 5241.—Investigations of the scattering of electrons by metal vapors were extended with measurements of the angular distributions of electrons of energy range 4-143 v. scattered elastically in Zn vapor. The exptl. curves are in good agreement with theoretical curves of the angular distributions calcd. by the use of a modified Fermi-Thomas field for Zn and Faxén and Holtsmark's theory of scattering (C. A. 22, 1273). Allen S. Smith

**Magnetic deflection method for angular distribution of electrons scattered by gas molecules.** A. Phago Gage. *Phys. Rev.* 44, 808-14(1933).—The theory of the method is developed and the app. described. As an illustration of its value, several scattering curves in Hg are shown, revealing some new details. L. S. Kassel

**Electron-deflection experiments on the variation of semiconducting crystal surfaces by electron bombardment.** R. Suhrmann. *Physik. Z.* 34, 878(1933).—Electron-deflection expts. were made to investigate a suspected connection between the change in contact potential apparent

after bombardment of a semiconducting surface with slow electrons and the appearance of the blocking effect. Results with galena, stibnite and pyrites crystals showed that the deflection max., present initially, disappear after bombardment for 5 min. with  $10^{-8}$  amp. and 100 v. accelerating potential; they reappear 1-2 hrs. later. Conclusion: The change in contact potential and perhaps also the blocking effect may be traced to a disturbance in the crystal lattice. Allen S. Smith

**Electron interference from emery-smoothed and polished surfaces.** H. Raether. *Physik. Z.* 34, 839-40(1933).—The Debye-Scherrer rings are attributed to small crystal points through which the electrons travel. Lowering of these by use of finer emery or polishing increases the brightness of the rings. Polished or hammered surfaces show only a metallic luster. With non-metals, FeS<sub>2</sub> and C gave lattice, and NaCl, Fe<sub>2</sub>O<sub>3</sub>, Al<sub>2</sub>O<sub>3</sub> powder diagrams. Careful polishing of some NaCl and CaF<sub>2</sub> specimens gave filament-structure indications, while in other cases CaF<sub>2</sub> and CaCO<sub>3</sub> gave single-crystal structure with refractive effect. Gregg M. Evans

**Helium hydride ion.** George Glockler and D. L. Fuller. *J. Chem. Physics* 1, 886-7(1933).—Math. The HeH<sup>+</sup> ion is composed of a He ion and a H atom rather than an excited He atom and a proton. Gerald M. Petty

**Photoelectric sensitization of cesium.** W. Kluge. *Physik. Z.* 34, 844-6(1933).—At  $-39^\circ$  and 5400 A. U., the photoelec. work function is of the order of  $10^{-8}$  coulombs per cal. For a Cs—Cs<sub>2</sub>O—Ag sensitized layer the max. emission is, for mirror surfaces, at about 7500 A. U., and for rough surfaces, at about 8600 A. U. Gregg M. Evans

**The emission constants of metals in the near infra-red.** C. Hurst. *Proc. Roy. Soc. (London)* A142, 466-80(1933).—The emissivity for a given wave length was measured directly as the ratio between the energy received from a given area of the radiating metal and the energy received from an equal area of a black-body slot cut in the metal and radiating, therefore, at the same temp. as the metal. Data were obtained for Cu over a wave-length range 1.5-5  $\mu$  at 2 temps.,  $700^\circ$  and  $850^\circ$ , and for Ni over the range 1.25-6.5  $\mu$  at  $850^\circ$  and the range 1-6.5  $\mu$  at  $1000^\circ$ . The emissivity (in percentage) of Cu at  $850^\circ$  is 6.1 at 1.5  $\mu$  and 3.55 at 5  $\mu$ . For Ni at  $850^\circ$  it is 21.1 at 1.5  $\mu$  and 10.2 at 5  $\mu$ . The results are compared with the values predicted by the classical theory of Drude and by the quantum-mech. theory of Krönig; the former theory is shown to fit the facts better than the latter. W. F. Meggers

**Field electron emission from liquid mercury.** J. W. Beams. *Phys. Rev.* 44, 803-7(1933).—The field strength needed to pull electrons from a liquid Hg surface was detd. by an impulse method as  $1.8 \times 10^6$  v. per cm. for the cleanest surfaces, falling to  $0.35 \times 10^6$  for impure Hg. The current obtained is about  $10^{10}$  times that calcd. from the Fowler-Nordheim theory on the assumption that the surface is perfectly plain; the discrepancy is probably due to irregularities in the surface. L. S. Kassel

**Total secondary electron emission from metal faces.** S. Ramachandra Rao. *J. Annamalai Univ.* 2, 249 57(1933); cf. C. A. 27, 4478.—An explanation was attempted of the peculiar shape of the total-emission curves and the differences observed between polycryst. and single-crystal faces as due to the absorption of the secondary electrons in the medium of the photoelec. target. Exptl. results agree well with an equation derived for the ratio  $R$  of secondary to primary current. The equation holds for single-crystal faces and offers an explanation for the observed difference in  $R$  for the polycryst. and single-crystal surfaces. The influence of adsorbed gases on  $R$  is discussed. Allen S. Smith

The external photoelectric effect at low temperatures. R. Suhrmann. *Physik. Z.* 34, 877(1933).—The theory of the effect of temp. on the photoelec. sensitivity of a clean metal, given by Fowler (*C. A.* 25, 5082) on the basis of the Sommerfeld-Fermi electron theory, and confirmed at high temps., predicts a greater effect in reducing the temp. from 293° to 83° than from 83° to 20° abs. Expts. with 2 Be surfaces gave the same decrease in photoelec. sensitivity, within the limits of error, in cooling from 83° to 20°. The expected effect was obtained with at. K surfaces on Ag. The temp. influence of the spectral max. at 343 mμ is also much smaller in cooling from 83° to 20° than from 293°.

Allen S. Smith

Photoelectric secondary currents. W. Lehnfeldt. *Nachr. Ges. Wiss. Göttingen Math.-physik. Klasse* 1933, 263 70.—With ZnS crystals the magnitude of the photoelec. secondary current is limited by the no. of excited phosphorescent centers and shows the same temp. coeff. as the latter. Crystals of AgCl give at low temps. very pronounced photoelec. secondary currents. Two different kinds of centers having markedly different times of duration exist in the case of AgCl; furthermore, for these crystals the phosphorescence is normally weak but can be greatly enhanced by the application of higher potentials. Conclusion: The photoelec. secondary currents are electronic rather than ionic.

P. H. E.

Constitutive parts of atomic nuclei. D. Ivanenko. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 50-2.—The abs. value of the mass defect of the neutron (or proton) cannot exceed  $2mc^2$ , where  $m$  is the mass of the electron.

S. Bradford Stone

Pauli's principle in the nucleus. W. M. Elasser. *J. phys. radium* [7], 4, 549-56(1933).—Based on Bartlett's procedure, a system of envelopes of protons and neutrons is postulated for nuclei, and quantum nos. are assigned to these particles, at least for the lighter elements. Closed envelopes have particularly large binding energies. This scheme explains more nuclear properties than the hypothesis of nuclei composed of  $\alpha$ -particles. Before emission, the  $\alpha$ -particles must be formed by an internal rearrangement. The distribution of kinetic and potential energies in the nucleus indicates specially large potential energies.

L. E. Steiner

The production of high-velocity ions and electrons. J. W. Beams and L. B. Snoddy. *Phys. Rev.* 44, 784 5 (1933).—A method is described for producing high-velocity electrons and ions in which the electron or ion is accelerated by a field which is so adjusted as to move with the same velocity as the ion or electron. With this arrangement, electrons have been obtained with a max. velocity of 80 90 kv. representing a threefold multiplication. It is believed that this method should be capable of producing electrons having velocities corresponding to several million v.

Allen S. Smith

The use of the ionization chamber at high pressures for the study of  $\gamma$ -rays and neutrons. P. Savel. *J. phys. radium* [7], 4, 608-12(1933).—An ionization chamber filled successively with H, N and A gases under pressures up to 30 atm. showed the advantage of high pressures for measuring the ionization due to  $\gamma$ -rays from Ra, and to the complex radiation resulting from the irradiation of Be by  $\alpha$ -particles from Po. For  $\gamma$ -radiation from radioactive substances, and that emitted by light elements bombarded by  $\alpha$ -particles, A under pressure is best; for a study of neutrons H at 30 atm. is best.

L. E. Steiner

Reflection of  $\alpha$ -particles from atom nuclei. III. Ilse Merhaut and Helmut Wallner. *Sitzber. Akad. Wiss. Wien Math.-naturw. Klasse, Abt. IIa*, 142, 297-306(1933); cf. *C. A.* 19, 3213.—A very accurate measurement of the scattering of wide-angled ( $128^\circ$ ,  $142^\circ$  and  $158^\circ$ )  $\alpha$ -particles from Ra C by the elements Ag to Te (at. no. 47 to 52) showed certain anomalies especially between the odd and even at. numbered elements. The even at. numbered elements cause less scattering than the theoretical but the curve closely parallels the theoretical curve, whereas with odd at. numbered elements the scattering is subnormal, does not parallel the theoretical curve and shows several points of inflection.

Oden E. Sheppard

Distribution of cosmic-ray nuclear disintegration in time. C. G. Montgomery and D. D. Montgomery. *Phys. Rev.* 44, 779(1933).—Data from observations on the occurrence of nuclear disintegrations produced by cosmic rays are in good agreement with the hypothesis that the disintegrations are randomly distributed in time.

Allen S. Smith

The positive electron. Paul Kunze. *Physik. Z.* 34, 849-57(1933).—Different methods of producing and various interpretations of the positron are considered. It is represented in the usual manner as having the charge of the proton and the mass of the electron. Positron formation by  $\gamma$ -rays, the possibility that the positron is an unstable particle according to the theory of Dirac, and the conception of it as a stable particle are discussed in detail. All results concerning the origin of the positron from  $\gamma$ -rays appear to be adaptable to an electron-twinning process. The question of the stability of the positron remains unexplained.

Allen S. Smith

Study of the physical properties of the positron. Jean Thibaud. *Compt. rend.* 197, 915-17(1933).—The charge on the positron is not less than half or more than double the charge on the electron. Radon and radiothorium emit positrons spontaneously, probably through the action of  $\gamma$ -radiation, in analogy to the photoelec. effect. The coeff. of absorption of positrons is of the same order as that for electrons. All the results obtained so far are in accord with the theoretical predictions of Dirac.

A. B. F. Duncan

Neutrons from cosmic-ray "Stösse." Gordon I. Locher. *Phys. Rev.* 44, 779-81(1933).—Preliminary results of cloud photography of cosmic-ray "Stösse," or ionization bursts, in A are described. Numerous neutron-recoil atom tracks, 2 long nuclear tracks, and groups of simultaneous tracks that converged at different points were found.

Allen S. Smith

Neutrons from deuterons and the mass of the neutron. M. Stanley Livingston, Malcolm C. Henderson and Ernest O. Lawrence. *Phys. Rev.* 44, 781-2(1933); cf. *C. A.* 27, 4162. —Further observations on the instability of the deuteron confirm the view that it disintegrates with the release of about 4.8 million v. of energy. Neutrons produced in the process have, accordingly, a mass of about 1.0006 mass units. The expts. demonstrated the production of neutrons and afforded a quant. check. The energy of the bombarding deuterons was raised from 1.2 to 3.0 million v. with fair agreement in the observations.

Allen S. Smith

Neutrons from beryllium bombarded by deuterons. M. Stanley Livingston, Malcolm C. Henderson and Ernest O. Lawrence. *Phys. Rev.* 44, 782-3(1933).—In the bombardment of Be by deuterons, it appears that the neutrons result from the disintegration of Be<sup>9</sup> with capture of the deuteron to form Be<sup>10</sup> and a neutron. It is calcd. that these neutrons have about 14 million v. of kinetic energy, on the assumption that their mass is 1.0006 and that no  $\gamma$ -radiation is given off in the process. The yield of neutrons from Be increases linearly with the range of the deuteron for ranges from 1 to 9 cm.

Allen S. Smith

Atomic disintegration during neutron emission. Josef Schintlmeister. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse, Abt. IIa*, 142, 197-200(1933).—Neutron emission of Pb, Mg, Cu and Ni under irradiation of  $\alpha$ -rays from Po was investigated by means of the tube electrometer. The results fully confirm the work of Trattner (*C. A.* 27, 5001) using the Wilson chamber. Oden E. Sheppard

The excitation of neutron emission from beryllium and boron by  $\alpha$ -rays. Walter Slonek. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse, Abt. IIa*, 142, 185-96(1933); cf. Kirsch and Slonek, *C. A.* 27, 2091.—The neutron emission from Be and B under the influence of  $\alpha$ -rays from Po was measured by means of the Geiger chamber. A wide variety of exptl. conditions was used, including "forward" and "backward" measurements. The results indicate the existence of 8 excitation energies for Be in the range of Po  $\alpha$ -rays, depending, apparently, on the differences in hardness of the  $\alpha$ -ray groups. The measurements with B do not seem to be in complete

agreement with those of Curie and Joliot (*C. A.* 27, 2873).

The velocity of neutrons from beryllium. Gerhard Kirsch and Hertha Wambacher. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse, Abt. IIa*, 142, 241-9(1933); cf. *C. A.* 27, 3604 and preceding abstr.—By use of the photographic method of Blau (*C. A.* 20, 1943 and 22, 3841) the velocities of neutrons from Be were investigated. This method indicates the presence of about 15 velocity-homogeneous groups or about double the no. indicated by the work of Slonek (see preceding abstr.). The neutron velocity groups are apparently distributed uniformly from about 1 to  $5 \times 10^8$  cm./sec. Oden E. Sheppard

Heavy water. K. F. Bonhoeffer. *Angew. Chem.* 46, 776 9(1933).—A summary of the methods of sepg. the isotopes of H and of the properties of heavy water. Nineteen references. Karl Kammermeyer

Technic for the electrolytic production of  $\text{H}^2\text{H}^2\text{O}$ . Hugh S. Taylor, Henry Eyring and Arthur A. Frost. *J. Chem. Physics* 1, 823-4(1933); cf. *C. A.* 27, 5630.—The electrolyte from com. electrolytic cells is electrolyzed in 3 stages, yielding  $\text{H}_2\text{O}$  in which 2.5% of the H was  $\text{H}^2$ . This is electrolyzed in 4 stages, the  $\text{H}_2$  being burned in a quartz tube. Six hundred and ten gal. of com. electrolyte yielded 420 cc. of  $\text{H}_2\text{O}$  in which 93% of the H was  $\text{H}^2$  in the sixth stage, and 82 cc. of 99%  $\text{H}_2\text{O}$  in the seventh stage. App. and technic are described in detail. Gerald M. Petty

Electrolytic separation of hydrogen isotopes and the mechanism of the cathode process. B. Topley and H. Eyring. *J. Am. Chem. Soc.* 55, 5058 9(1933).—Electrolysis of  $\text{H}_2\text{O}$  contg. approx. 7%  $\text{H}^2$  at 26° with Pt anode and various metals as cathodes gave values for  $\alpha$  ( $\alpha = d$  in  $n_H/d$  in  $n_D$ , where  $n_H$  and  $n_D$  are the nos. of  $\text{H}^1$  and  $\text{H}^2$  atoms in the electrolyte) in KOH: Pb 7.4, 7.2; Fe 7.6, 6.9; Pt 7.6, 5.6; Cu 6.8; Ni 5.5; Ag 5.3, 5.0; in  $\text{H}_2\text{SO}_4$ , Pt 5.7; Cu 5.5, 5.8. The mechanism of the cathode process is discussed. C. J. West

The satellites of the  $K\beta$  line of potassium. Hideo Taraki. *J. Sci. Hiroshima Univ.* A3, 321-5(1933) (in English).—The wave lengths of the  $K\beta^1$ ,  $K\beta^2$  and  $K\beta^3$  lines of K are 3475.7, 3438.3 and 3429.1 Å., resp. G. M. P.

The L-absorption spectrum of tellurium in various chemical compounds. J. G. Tandberg. *Arkiv. Mat. Astron. Fysik*, 24A, No. 6, 4 pp.(1933).—The L-absorption edges observed for Te in various compds were found to be displaced toward shorter wave lengths as compared with their positions detd. with elementary Te. For certain compds. fine structure of the L III and L II edges was observed, but could not be detected with certainty for elementary Te or the halides. C. C. K.

The dynamic reflection of x-rays by ideal, especially absorbent crystals. Max Kohler. *Ann. Physik* 18, 265 87(1933).—Math. Gerald M. Petty

Diffuse scattering of x-rays from sodium fluoride. II. Scattering at the temperature of liquid air. G. E. M. Jauncey and P. S. Williams. *Phys. Rev.* 44, 794-7(1933); cf. *C. A.* 27, 5245.—The ratio of the diffuse scattering intensity for polychromatic x-rays from a single crystal of NaF at 86°K. to that at 295° is detd. for several angles between 10° and 42°; the results agree with values calcd. from  $f$  values which had been calcd. by Shonka (*C. A.* 27, 4165), assuming zero-point energy. L. S. Kassel

Changes in the x-ray diffraction pattern of nitrobenzene produced by an electric field, changes in temperature and circulation. F. C. Todd. *Phys. Rev.* 44, 787-93(1933).—No change in the intensity of the  $\text{PhNO}_2$  diffraction pattern due to an elec. field of 10 kv. per cm. could be detected; the contrary result obtained by McFarlan (*C. A.* 24, 5213) is shown to have been caused by increased temp. and circulation of the sample in his expts. when the field was applied. L. S. Kassel

A ring-target x-ray generator adapted to scattering, fluorescence and irradiation experiments. Paul Kirkpatrick and P. A. Ross. *Rev. Sci. Instruments* 4, 645-8 (1933). E. H.

Experimental proof of the quantum theory of the funda-

mental line width. Wilhelm Schütz. *Physik. Z.* 34, 831-3(1933).—A math. derivation from the quantum standpoint is given. The values calcd. from classical and quantum theory, compared with the exptl. values, confirm the latter theory. Gregg M. Evans

Limitations of the theory of complex spectra. H. H. Marvin. *Phys. Rev.* 44, 818-20(1933).—The theory of two-electron systems is extended to  $d^2p$  and  $d^2d$ , the results being compared with data for Ni I. The discrepancies are greater than for  $d^2s$  or  $p^2p$  but the multiplets are still placed in the right order. L. S. Kassel

Standard copper wave lengths in the region 100 to 450 Å. P. Gerald Kruger and F. S. Cooper. *Phys. Rev.* 44, 826-30(1933).—A table is given. L. S. Kassel

Nuclear moments of xenon. E. Gwynne Jones. *Nature* 132, 781(1933).—For the isotope  $\text{Xe}^{130}$ , the nuclear moment,  $I$ , is  $1/2$ , and for  $\text{Xe}^{131}$ ,  $I$  is greater than  $1/2$  (probably  $3/2$ ). Exptl. data are given for the hyperfine sepn. for  $\text{Xe}^{130}$ . L. E. Steiner

Hyperfine structure of the red cadmium line 6438, and of the krypton lines 5649 and 5562. Marie Romanova and Alice Ferkhmin. *Compt. rend. acad. sci. U. R. S. S.* 1933, 55-7. S. Bradford Stone

Ionization potential of Be III. Hengt Edlén. *Phys. Rev.* 44, 778(1933).—New wave-length measurements in series  $1s^2\ ^1S_0-1s\ np\ ^1P_1$  of Be III and a calcn. of the series limit confirm an earlier value (*C. A.* 25, 2640), and indicate that the series limit reported by Kruger and Cooper (*C. A.* 27, 5640) must be in error. Allen S. Smith

New terms in the spectra of N III, N IV, N V, O III, O IV and O V. Willoughby M. Cady. *Phys. Rev.* 44, 821-5(1933).—The terms are obtained from lines between 105 and 796 Å. produced in a new type of condensed discharge. L. S. Kassel

Spectra of potassium in successive stages of ionization. Mela Ram. *Indian J. Physics* 8, 151-61(1933).—The important lines of K III, K IV and K VI in the extreme Schumann region below 1100 Å. U. have been identified and formed into completed multiplets which are included with the terms. Of K V only the  $3s^23p\ ^4S-3s3p\ ^4P$  multiplet could be located. Calvin Brous

Spectrum of doubly ionized A, A III. T. L. de Bruin. *Proc. Acad. Sci. Amsterdam* 36, 724-9(1933); cf. *C. A.* 27, 661. A. B. F. Duncan

Spectra of trebly and quadruply ionized calcium. Mela Ram. *Indian J. Physics* 8, 163-70(1933).—R. has analyzed the existing data for the spark lines of Ca. Important combinations with the fundamental states of Ca IV and Ca V have been identified; 14 terms with 27 lines of Ca IV and 24 terms with 36 lines of Ca V are tabulated. Calvin Brous

Regularities in the spectrum of doubly ionized cerium. P. N. Kalia. *Indian J. Physics* 8, 137-45(1933); cf. *C. A.* 27, 4479.—The Ce III spectrum between 3544 and 2203 Å. is analyzed. A  $^3F$  term of  $5d^2$  configuration is the fundamental state. Other states originate from  $5d^2$ ,  $6s^2$ ,  $5d6s$  and  $4f6s$  configurations. Other terms are included whose nature could not be detd. without ambiguity. Strong similarity with the spectrum of La II is shown. Calvin Brous

Magnetic rotatory dispersion and absorption of the cerous ion on solution. R. W. Roberts, L. A. Wallace and I. T. Pierce. *Nature* 132, 782(1933); cf. *C. A.* 27, 902.—By use of Rovenfeld's quantum mech. theory of the Faraday effect, instead of Ladenburg's formula, the rotation of the  $\text{Ce}^{+++}$  ion in more concd. solns. throughout the range 5780-3341 Å. was found to be controlled by 2 absorption bands with  $\lambda_{2900}$  and  $\lambda_{2540}$  Å., resp. For the range,  $\lambda_{5780}-3341$  Å., the strengths ( $f$  values) for the transitions  $4^3F_4 \rightarrow 5^3D_3$  and  $4^3F_4 \rightarrow 5^3D_1$  are  $1.40 \times 10^{-3}$  and  $2.20 \times 10^{-3}$ , resp. L. E. Steiner

Structural analysis of the molybdenum spectrum. II. M. A. Catalan and Pilar de Madariaga. *Anales soc. españ. fis. quim.* 31, 707-34(1933).—Results of Kieck (*C. A.* 17, 3453) and Catalan (*C. A.* 18, 1427) are reviewed and extended from the viewpoint of the modern theory of multiplets. There are classified 644 lines as 120 levels of quintets and septets. High and low levels

are arranged in terms. Of the middle levels only the lowest are arranged in terms. Interval, intensities and Zeemann effect rules do not hold in this spectrum, indicating great departure from the Russell-Saunders coupling. The Mo I spectrum is closely analogous to that of Cr I, but line intensity is more uniform in Mo I, so that some weak intercombination lines not appearing in Cr I appear in Mo I, but the strong lines become weaker. Rydberg denominators obtained in Mo I with the Kiess fundamental limit 59500 do not agree in the case of 6s and 5d electrons with those of the elements of the same period as well as with those of Cr I. If the denominator of the 5d electron is assumed to have a value in good agreement with the rest of the elements, the fundamental limit of 57200 = 200 is obtained. With this value, denominators are recalcd., and values found are analogous to those of the other elements except those of the 7s, which, together with 6s and 5s, were used by Kiess to det. the base values. The supposed 7s term is rejected as a numerical coincidence. When applied to Mo I terms, whose Mo II limit is yet unknown, it is possible to fix approx. values of deep terms of Mo II. With the new value of the base term, the ionization potential is 7.06 v. (old value 7.35 v.).

E. M. Symmes

Analytical and quantitative lines of silver, arsenic, bismuth, cadmium, copper, mercury, lead, antimony and tin in the arc spectrum between  $\lambda = 2330$  A. and  $\lambda = 3400$  A. S. Piña de Rubies and M. Amat Bargues. *Z. anorg. allgem. Chem.* 215, 205-10(1933).—A table of wave lengths and their sensitivities for each of 3 sizes of spectrographs is given.

Howard A. Smith

Application of electron tubes and undamped high-frequency oscillations to quantitative spectrochemical analysis. G. Potapenko. *Z. anorg. allgem. Chem.* 215, 14-8(1933).—An app. is described for generating sparks by means of undamped high-frequency oscillations at voltages ranging from 80 to 100 kv. The discharge circuit is coupled inductively to an exciting oscillatory circuit controlled by a 500-w. electron tube. The advantages of this mode of excitation are: (1) constancy of the spark with resultant reproducibility of the spectrograms; (2) almost complete absence of air lines from the spectra.

C. C. Kiess

The spectrum of Nova Ophiuchi No. 3 (RS Ophiuchi). Christine Westgate. *Astrophys. J.* 78, 372-3(1933).—A list of the emission lines appearing in the spectrum of the nova of 3 different dates.

C. C. Kiess

Some intensity measurements on the band spectrum of helium ( $\text{He}_2$ ). R. C. Johnson and R. C. Turner. *Proc. Roy. Soc. (London)* A142, 574-87(1933).—Line intensity measurements on the first 5 members of the main line series of  $\text{He}_2$  bands are made by photographic photometry. These bands represent the transitions  $n^1\Pi \rightarrow 2s^1\Sigma$  and give lines near 4650, 3676, 3356, 3206 and 3120 A. The predicted distribution is of the correct type, but agreement with observation is not complete. Notably the P and R branches are much stronger, relatively to the Q branch, than the theory indicates. Effective temps. were computed: (1) from the position of the max. intensity in the branches and (2) from intensity factor considerations. The 2 methods show remarkable agreement, the max. variation being only 5%. The mean effective temp. obtained from the bands is 750°K., but this effective temp. obtained by assuming Maxwell-Boltzman distribution is much higher than the true temp. of the source. The fall of intensity down the series is examd. and it is found that the relative intensities of the bands are given by a formula which is similar in some respects to that found for the Balmer series of H.

W. F. M.

Zeeman effect and uncoupling phenomena in the CaH bands. W. P. Cunningham and Wm. Watson. *Phys. Rev.* 44, 815-17(1933).—The effect of the strong J-uncoupling in the  $^3\Pi$  state on the Zeeman patterns of the lines of the  $^3\Pi \rightarrow ^3\Sigma$  CaH band at 7000 A. is discussed.

L. S. Kassel

The titanium oxide and zirconium oxide bands in stellar spectra. R. S. Richardson. *Astrophys. J.* 78, 354-8(1933).—The degrees of disoccn. of the components of

ZrO and TiO are calcd. for different temps. and pressures from the data afforded by the analyses of their spectra and their heats of disoccn. The results of the calcs. furnish a basis for interpreting the behavior of ZrO and TiO bands in the spectra of stars of classes S and M.

C. C. Kiess

Investigations in the near infra-red. R. Freymann. *Ann. Phys.* 20, 243-343(1933).—A thalofide cell in conjunction with a vacuum-tube amplifier has proved to be a sufficiently sensitive detector to permit the use of a grating spectrograph of high dispersion to investigate the near infra-red absorption spectra of various org. liquids between 0.8  $\mu$  and 1.2  $\mu$ . With this app. the well-defined max. of absorption bands can be detd. to within 5 A. New bands have been detected in various compds. contg. the groups CH, OH, NH, etc., and new wave lengths for the bands have been measured. These permit a study of the following effects: (1) length of the C chain; (2) isomerism; (3) double bonds; (4) substitutions; (5) temp.; (6) dila.; and (7) the effect of the absorption bands on the rotatory power of active substances.

C. C. Kiess

An unusual nitrogen tube. Joseph Kaplan. *Phys. Rev.* 44, 783(1933); cf. *C. A.* 27, 898.—Twelve new members of the Lyman bands of N have been discovered in the improved tube. A characteristic of the tube is a strong N afterglow in which bands arising on the very high vibrational states of the  $b^3\Pi$  level have been visually observed. It also has characteristics of value in auroral studies.

Allen S. Smith

The continuous absorption spectrum of polyatomic molecules. III. Yosioyige Fukumoto. *Science Reports Tohoku Imp. Univ. First Ser.*, 22, 868-78(1933).—The procedure used in previous work (*C. A.* 27, 4170) has been followed in investigating the ultra-violet absorption of some halogen alkyls in the gaseous state, and of mols. of the type  $\text{XCl}_4$  in both gaseous and liquid states. These compds. exhibit a continuous absorption without a neighboring band spectrum and convergence limit. It was found that the absorption limit shifts redward when the compds. are liquefied or their vapor pressures are increased, although the absorption max. remains unaltered.

C. C. Kiess

Spectrum of the afterglow of carbon dioxide. A. Fowler and A. G. Gaydon. *Proc. Roy. Soc. (London)* A142, 362-9(1933).—A discharge tube contg.  $\text{CO}_2$  was operated with an induction coil and a Hg break with a shutter adapted so as to cut off the light from the spectrograph when the discharge was passing and to allow it to pass in the intervals between discharges when the afterglow was visible. The spectrum of the afterglow of  $\text{CO}_2$  is different from any known spectrum given by oxides of C in vacuum tubes but resembles that given by the flame of CO burning in air or O. The spectrum of the exciting discharge indicates that the afterglow is generated by the interaction of excited neutral mols. of CO with neutral mols. of  $\text{O}_2$ . Under the conditions which gave rise to the afterglow, there was no evidence of disoccn. of the  $\text{CO}_2$  other than into neutral mols. of CO and  $\text{O}_2$ . The probability that the characteristic bands of the afterglow represent  $\text{CO}_2$  mols. is also strongly suggested by the great complexity which is revealed by the use of spectrographs of adequate resolving power.

W. F. Meggers

Investigation in the infra-red absorption spectrum of the change of the solvent by the dissolved substance. II. Influence of the state of association of water by hydrogen and hydroxyl ions. R. Suhrmann and F. Breyer. *Z. physik. Chem.* B23, 193-212(1933); cf. *C. A.* 27, 1821. —Infra-red absorption was studied for 5.5 and 2.75 M HCl, 2.8 and 1.4 M  $\text{H}_2\text{SO}_4$  and 10.9, 5.47 and 2.74 M KOH. For the acid solns. the bands at 0.98 and 1.2  $\mu$  are less intense, the band at 1.96  $\mu$  is only slightly changed but the band at 1.45  $\mu$  is considerably less intense and the absorption on the low-frequency side of the band is strongly raised. These phenomena are ascribed to the formation of hydroxonium ions and the no. per H ion is estd. The hydroxonium absorption curves are continuous and it is concluded that the H ion forms no definite chem. compd.

with the  $H_2O$  mol. Similar results are obtained for the base solns. with  $2H_2O$  mols. per OH ion and continuous absorption on both sides of the bands due to the influence of the OH ions on the  $H_2O$  mol. G. M. Murphy

The change in the absorption spectrum of cobalt chloride in aqueous solution with increasing concentration of hydrochloric acid. Owen R. Howell and Albert Jackson. *Proc. Roy. Soc. (London)* A142, 587-97 (1933).—It has been suggested that both in the crystal and in the soln. the Co atom is in assocn. with 6 other atoms or groups when the color is red, and with 4 when the color is blue. The absorption spectra of a series of solns. contg. the same amt. of  $CoCl_2$  with increasing concn. of HCl have now been measured and it has thus been possible to follow quantitatively the conversion of the Co from red to blue grouping, and to det. its dependence on environment. The extinction coeffs. at the max. of the 4 principal bands, 695, 666, 626 and 610  $m\mu$  plotted against the concn. of acid, show that no blue constituent is formed until a crit. concn. of acid (5.0 N) is reached. The amt. of the blue constituent then increases rapidly with increasing concn. of acid, the relation soon becoming linear. The linear relation begins at 7.1 N acid and for the 695 and 666  $m\mu$  bands it is complete at 9.0 N acid. The ratio of the relative nos. of Cl atoms to  $H_2O$  mols. at these 3 crit. concns. of acid is 2:3:4, which also expresses the relative no. of Cl atoms in the cobaltous compds. at the 3 stages. The state of the Co atom is therefore detd. only by the environment and is independent of the relative concn. of the Co to the other constituents. This has been demonstrated by measuring the absorption spectra of solns. contg. varying amts. of Co in the same concn. of acid; the extinction coeff. for each band is directly proportional to the concn. of Co. For the bands 626 and 610  $m\mu$  the extinction coeff. continues to increase with increasing concn. of acid beyond 9.0 N. This is explained by the depression of ionization of the complex; the suggestion therefore follows that the 2 major bands, 695 and 666  $m\mu$ , relate to the principal valences and the 2 minor, 626 and 610  $m\mu$ , to the 2 auxiliary valences, which alone are affected by further increase in the concn. of acid. W. F. Meggers

The absorption spectra of uranium compounds. Fritz Ephraim and Martin Mezener. *Helv. Chim. Acta* 16, 1257-72 (1933).—In addn. to the rare earths U is the only element that in numerous compds. exhibits line absorption spectra. Wave lengths are presented of the absorption lines that appear in the reflection spectra of various compds. of trivalent, quadrivalent and hexavalent U at temps. of  $18^\circ$  and  $-190^\circ$ . Differences in the spectra attributable to temp., type of compd., effect of solvent, are pointed out. Attempts to prep. uranates of the heavy metals through digestion of uranyl salts with the hydroxides of the heavy metals are described. C. C. Kiess

The ultra-violet absorption of alkylcyclohexanones and allylcyclohexanones. Mme. Ramart-Lucas and Cornubert. *Bull. soc. chim.* 53, 744-53 (1933).—The ultra-violet absorption spectra of  $\alpha$ -propyl-,  $\alpha,\alpha'$ -dipropyl-,  $\alpha$ -allyl-,  $\alpha,\alpha'$ -diallyl-,  $\alpha,\alpha'$ -triallyl-,  $\alpha,\alpha,\alpha'$ -tetraallyl- and  $\alpha,\alpha,\alpha',\alpha'$ -tetramethylcyclohexanones are given. This investigation is concerned with the variations of color and chem. properties of ketones as a function of the no. and nature of the fixed radicals. As the no. of radicals increases, the max. of the absorption band approaches the visible. The satd. and unsatd. ketones measured have an absorption max. in approx. the same position, but there is a difference in intensity. The allylcyclohexanone possesses an absorption coeff. greater than that of the satd. ketone. James H. Hibben

The ultra-violet absorption of substances containing two benzene nuclei. M. Chaix. *Bull. soc. chim.* 53, 700-11 (1933).—The substances examd. were the mono- and disulfide derivs. of biphenyl and the corresponding Se derivs., as well as compds. with substituents in the Ph group. In general, chromophores may be arranged in descending order according to the following: —Se — Se —; —CO —; —S — S —; —Se —; —S —; —SO —; SeO;

$SO_2$ ;  $CH_3$ , where the above-named groups sep. the 2Ph or substituted Ph groups. James H. Hibben

Spectroscopical characterization of organic dyestuffs and other colored substances. Jaroslav Formánek. *Collection Czechoslov. Chem. Communications* 5, 411-14 (1933); cf. Chloupek, C. A. 27, 4172 and Formánek, C. A. 22, 1240.—Polemical. W. T. H.

The absorption spectra of the mixed fatty acids from cod-liver oil. Wm. J. Dann and Thomas Moore. *Biochem. J.* 27, 1166-9 (1933).—The duration of the sapon. (in the prepn. of the fatty acids) exerts a profound influence upon the absorption spectrum of the acids. If the time taken for the sapon. is prolonged, the absorption becomes more intense. Benjamin Harrow

Correlation of spectroscopy and photochemistry. W. Albert Noyes, Jr. *Rev. Modern Physics* 5, 280-7 (1933).—A survey, in which the O-O<sub>2</sub> reaction and acetone decompn. are discussed. A. B. F. Duncan

Fluorescence. C. C. Pines. *Am. J. Pharm.* 105, 663 (1933).—A no. of specimens of fluorite were exposed to the radiation of an A-filled ultra-violet glow lamp for some seconds in a dark room. Of the specimens exposed, 4 were found which produced, in each case, a bright blue color of great beauty. Calomel produced a beautiful light orange-red color; the sample contained a few crystals of  $Hg_2Cl_2$ , which remained colorless. For purposes of comparison with the Hg arc vapor lamp, calomel and a no. of other specimens were exposed to both lamps. Results of the exams. are tabulated. W. G. Gaeckler

Optical determination of the amounts of photochemical reaction products. E. Miescher. *Nachr. Ges. Wiss. Göttingen Math.-physik. Klasse* 1933, 329-34.—M. colored NaCl crystals by heating them in Na vapor to  $760^\circ$ . By an optical method he then compared the no. of color centers before and after heat-treating the crystals for a short time in an elec. oven at  $360^\circ$ . This heat treatment was sufficient to flocculate the color centers into small colloidal aggregates and to shift the absorption max. from 4600 A. to about 5600 A. The total no. of color centers, however, remained the same. Heating 1 hr. to  $450^\circ$  resulted in larger colloidal particles, a shift in the absorption max. to 6000-6500 A., and a decrease of about 50% in the no. of color centers. P. H. Emmett

The formation of formaldehyde by the action of ultra-violet light on carbon dioxide and water: an application of the Allison magneto-optic apparatus. John H. Yoe and R. E. Wingard. *J. Chem. Physics* 1, 886 (1933).— $H_2O$  satd. with  $CO_2$  yields  $HCHO$  in proportion to its irradiation with ultra-violet light.  $O_2$  is liberated in the reaction. Detns. were made with Allison's magneto-optic app. Gerald M. Pettv

Influence of  $p_H$  on amino dyes of triphenylmethane and the decomposition of these dyes by light. P. Cohen Henriquez. *Rec. trav. chim.* 52, 991-1000 (1933).—The intensity of color of certain triphenylmethane dyes was studied in solns. of definite  $p_H$ . The influence of ultra-violet light on the equil. resulting from light absorption by the colorless tautomer is considered. With crystal violet a photochem. reaction takes place, Me groups being replaced by H. A. B. F. Duncan

The photochemistry of solid lithium hydride. F. Barch and K. F. Bonhoeffer. *Z. physik. Chem.* B23, 256-64 (1933); cf. C. A. 27, 1573.—An app. is described for prepng. thin layers of LiH on  $CaI_2$  and obtaining their absorption spectra. A sharp band at  $2517 \pm 2$  A. falls off toward the ultra-violet. A broader region of absorption begins at 1900 A. but no structure is discernible. H $\nu$  irradiation with the Hg line at 2537 A. H is liberated and the quantum yield is 5%. It is concluded that most of this comes from H stuck in the crystal lattice. Large crystals of LiH are colored greenish blue by ultra-violet light. Visible light or heat decolorizes them again. G. M. M.

The reaction mechanism of the photochemical conversion of *o*-nitrobenzaldehyde to *o*-nitrobenzoic acid in ultra-violet light. Karl C. Zimmer. *Z. physik. Chem.* B23, 239-55 (1933).—Infra-red absorption measurements

show that  $o\text{-ONC}_6\text{H}_4\text{CHO}$  is not a mixt. of 2 tautomers. Expts. at 4360 and 4050 Å. show it to be dichroic. No appreciable fluorescence or photoelec. effect was observed. The primary process in the photochem. decompn. is disson. of the  $o\text{-ONC}_6\text{H}_4\text{CHO}$ . The products then either unite to form  $o\text{-ONC}_6\text{H}_4\text{CO}_2\text{H}$  or recombine to form  $o\text{-ONC}_6\text{H}_4\text{CHO}$ . This mechanism explains the low quantum yield. The temp. coeff. between 45° and 70° is smaller than unity. G. M. Murphy

The photochemistry of the silver chloride crystal. F. Löhle. *Nachr. Ges. Wiss. Göttingen Math.-physik. Klasse* 1933, 271-7.—The photochem. reaction products in crystals of AgCl show absorption bands that must be due to flocculated colloidal particles. The production of discoloration in the crystals at -186° and the taking of absorption measurements within 1½ min. after the conclusion of the color-producing exposure leads to the same results as when carried out at room temp. P. H. Emmett

The Weigert effect. Influence of dye concentration on the photodichroism. W. Kemula. *Z. physik. Chem.* B23, 305-14 (1933).—Gelatin colored with various dyes was irradiated with white and linearly polarized monochromatic light and the Weigert effect studied. The influence of type of gelatin, concn. of the dye and wave length of the light on the change of the photodichroism with wave length was detd. The effect of concn. of the dye was explained as due to 2 modifications of the dye and the filter effect of the gelatin plates. G. M. M.

A new light absorption in alkali halide crystals. R. Hilsch and R. W. Pohl. *Nachr. Ges. Wiss. Göttingen Math.-physik. Klasse* 1933, 322-8; cf. *C. A.* 27, 673.—A new alkali halide absorption band occurring between 2000 and 2400 Å. is described. Light absorption in this region is accompanied at room temp. by formation of color centers in the visible. At -183° the photochem. yield of color centers is very low. The relation between the 2 bands is considered important in connection with problems of phosphorescence, latent-image formation, and photoelec. cond. effects in crystals. P. H. Emmett

Fluorescence phenomena of cerium and other rare earths. Oberst M. Haitinger. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse, Abt. IIa*, 142, 339-42 (1933).—By means of a strongly lighted fluorescence microscope (*C. A.* 25, 4470) Ce, Eu, Sm, Gd, Tb, Dy, Im, and Ho preps. were examd. with the naked eye and by use of the camera and found to exhibit fluorescence. La, Pr, Nd, Er, Yb and cassiopeium did not show fluorescence. The smallest quantity and the smallest concn. of the oxides that can be distinguished by fluorescence phenomena were detd. Oden E. Sheppard

Thermoluminescence spectra of fluorites. I. Thermoluminescence spectra of fluorites from Obira. Eliichi

Iwase. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 22, No. 461, 233-41 (1933); cf. *C. A.* 27, 3143, 5249.—The thermoluminescence of several colored and colorless fluorites was photographed and the intensities of the bands were measured. The intensity of luminescence after exposure to a quartz Hg arc was detd. and found related to the no. of short-wave bands in the thermoluminescence spectra. These bands are also related to the rare-earth content of the fluorites. A. B. F. D.

The fluorescence of the fluorites. Herbert Haberlandt and Karl Przibram. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse, Abt. IIa*, 142, 235-9 (1933); cf. *C. A.* 27, 5005.—Spectrograms of several fluorites at -180° are shown to demonstrate the marked change in fluorescence color due to the temp. change. Red fluorescence frequently vanishes reversibly at 40-50°. Ordinary blue fluorescence of fluorites and radio photofluorescence are destroyed by heating and regenerated by Ra irradiation and hence closely related. Fluorescence ability under ultra-violet exposure can be weakened (over-irradiated) by too long Ra irradiation but restored by cautious heating. Over-irradiated samples are found in nature. Oden E. Sheppard

Aluminum oxides capable of luminescence and their crystal-chemical relation to the natural and synthetic precious stones of the corundum type and their colors. Erich Tiede and Heinz Lüders. *Ber.* 66B, 1681-9 (1933); cf. *C. A.* 26, 1517.—Luminescent  $\text{Al}_2\text{O}_3$  was prepd. by heating  $(\text{NH}_4)_2\text{SO}_4 \cdot \text{Al}_2(\text{SO}_4)_3$  to form  $\alpha\text{-Al}_2\text{O}_3$ , in the presence of different activating agents.  $\text{Ti}_2\text{O}_3$  caused no red fluorescence or luminescence. With  $\text{TiO}_2$  present blue cathode fluorescence and blue-green phosphorescence are obtained. With  $\text{TiO}_2$  as with Pt and Mn  $\alpha\text{-Al}_2\text{O}_3$  shows 2 emission bands. Luminescence was weak with Fe and Ga. The luminescence of the Cr blend was not as expected (cf. Deutchbein, *C. A.* 26, 5847). Only sesquioxides in the corundum lattice are luminescent. Rh and V show bright fluorescent bands. Ruby shows no luminescence, differing from artificial Cr products. The series in increasing degree of deformation of the long axis and in breadth of band are Al, Ga, Cr, Ti, Fe, Rh, V. Foster Dee Snell

State of H dissolved in Pd and its relation to hydrogenation catalysis (Frank) 2. Quant. x-ray analysis of the concn. of metal phases in an alloy or mixt. (Glocker) 9. [Absorption spectra of] cryst. chlorocruorin (Fox, Roche) 10. Electrolytic disson. in  $\text{H}_2\text{SO}_4$  from Raman effect (Rao) 2.

#### 4—ELECTROCHEMISTRY

COLIN G. PINK

Direct and indirect reduction of ferromanganese in the electric furnace. M. S. Maksimenko. *Metallurg* 8, No. 3, 4-10 (1933).—Under ordinary conditions only 14% of the reduction is accomplished by CO, but this can be increased to 33% by increasing the CO pressure. This results in a saving of C fuel and elec. energy, a decrease of MnO in the slag, a decrease in the temp. of the exit gases to 250-300°, longer electrode life, and less possibility of disson. of  $\text{Mn}_2\text{C}$ . The furnace should operate at full capacity, ore < 25 mm. diam., depth of charge 1.5 m., with low c. d. in electrodes at about 60 v. H. W. Rathmann

Obtaining iron from magnetic ore by electrolysis. J. J. Pittard. *Arch. sci. phys. nat.* 15, 418-35 (1933).—Previous methods for electrolytically purifying Fe, including the analysis of scrap Fe and the Fe obtained by electrolysis and the possible advantages of electrically treated Fe, are detailed. With concd. HCl as the electrolyte surrounding the Fe ore anode and a double sulfate

of Fe and Al surrounding the sheet Fe cathode, Cl is evolved. In expts. in which 50%  $\text{H}_2\text{SO}_4$  was substituted for the HCl and the temp. and current were varied,  $\text{FeSO}_4$  was deposited in the anode compartment. The cost of the current is too high in every case to make this method of electrolysis of the Fe ore a profitable one. Leona Marsh

The anodic behavior of the iron metals. Konrad Georgi. *Korrosion u. Metallschutz* 9, 302-7 (1933); cf. *C. A.* 27, 5650.—A theoretical discussion of the potential phenomena with Fe, Ni and Co anodes based on the assumption of adsorbed layers on the surface. Leopold Peschl

The electropotential of iron as a function of its mechanical or thermal pretreatment. Heinz Domschke. *Korrosion u. Metallschutz* 9, 261-8 (1933).—Potential measurements were made on electrodes of compressed pure Fe powder. Anode polarization and potential vary with the mech. pressure used on the powder. With specimens

which had been subjected to a thermal and to a combined thermal-mech. after-treatment, the potential and corrosion resistance were functions of the no. of active centers per unit surface. The same applied to electrolytic Fe electrodes. Accordingly, the final potentials showed differences of up to 50 mv., while the overvoltages showed differences of up to 185 mv. Leopold Pessel

Hydrolysis and oxidation-reduction potential in the ferrous-ferric system. P. A. Kriukov and G. P. Avseevich. *Z. Elektrochem.* 39, 884-91 (1933).—Solns. of  $\text{FeSO}_4$  and  $\text{Fe}_2(\text{SO}_4)_3$  were titrated by NaOH under an atm. of  $\text{N}_2$ , a glass electrode being used for  $p_{\text{H}}$  measurement and a polished Pt electrode for the oxidation-reduction potentials. For the  $p_{\text{H}}$  range 3.5-6.0,  $E_{\text{h}} = E_{\text{h}}^0 - 0.058 \log \text{Fe}^{++} - 0.174 p_{\text{H}} + E_{\text{h}}^0 = E_{\text{h}}^0 + 0.058 [\log K_{\text{Fe}(\text{OH})_3} - 3 \log K_{\text{Fe}}] = 1.011 \pm 0.006 \text{ v.}$ , from which the soly. product ( $K_{\text{Fe}(\text{OH})_3}$ ) is calcd to be  $0.32 \times 10^{-38}$ . In the more alk. range the anticipated relation  $E_{\text{h}} = 0.183 - 0.058 p_{\text{H}}$  is not in good agreement with the exptl. results. This is explained by the occurrence of certain complications, e. g., partial reduction of sulfate to sulfide, especially in mixts. of  $\text{Fe}(\text{OH})_2$  and  $\text{Fe}(\text{OH})_3$ , and formation of ferrous ferrite (ferrosoferric hydroxide). Approx. soly. products derived from the titration curves are  $10^{-14}$  for  $\text{Fe}(\text{OH})_2$  and  $10^{-17}$  for  $\text{Fe}(\text{OH})_3$ . Cf. Britton, C. A. 20, 26-7; Elder, C. A. 24, 2057.

Purification of mercury by an electrolytic method. Martin F. Hauke and Martha Johnson. *Science* 78, 414-15 (1933).—Hg is made the anode at 110 v. d. c. with Pt electrodes in a stoppered bottle, first in 10%  $\text{H}_2\text{SO}_4$  and then in 5% NaCl. Finally in 10%  $\text{H}_2\text{SO}_4$  the Hg is made the cathode. The Hg loss is from 2 to 4%. L. M.

Electrochemical properties of germanium. J. Ivan Hall and Alfred R. Koenig. *Trans. Electrochem. Soc.* 65, 4 pp. (preprint) (1934).—Ge can be deposited electrolytically from strong aq. KOH solns. of  $\text{GeO}_2$ . When coherent coatings of Ge are obtained, the under metal has no effect on the electrochem. behavior. Ge can be deposited from a molten electrolyte that dissolves  $\text{GeO}_2$ . The most consistent potential for the chain  $\text{Hg} | \text{Hg}_2\text{Cl}_2 | N \text{ ZnSO}_4 | \text{Ge}$  is 0.56 v., in which the N calomel cell is the more pos. when the Ge is electrolytic. The chain potential with massive Ge is lower, being about 0.28 v.  $\text{H}_2\text{SO}_4$  lowers the potential of Ge against  $N \text{ ZnSO}_4$  and also against a soln. of its ions. Wide variance in  $\text{H}_2\text{SO}_4$  concn. has very little effect on the single-electrode potential of Ge when Zn and Ge ions are absent. The voltage of the chain  $\text{Hg} | \text{HgO}, N \text{ KOH} | 3 N \text{ KOH} | \text{Cu}$  at which Ge commences to plate out on Cu from  $3 N \text{ KOH}$  soln. of  $\text{GeO}_2$  is less than the voltage necessary to liberate H on Cu under the same conditions, and greater than the voltage required to liberate H at an electrodeposited Ge surface from the same soln. These facts probably account, in part at least, for the scabbing of Zn cathodes. The H overvoltage of electrodeposited Ge is about 0.32 v., that of massive Ge about 0.25 v. From this it is evident that the H overvoltage of Ge is not affected as much by a change in the surface of the metal as is the single-electrode potential. Ge replaces Ag from  $\text{AgNO}_3$  soln. but does not replace Cu, Hg, Sn, As, Sb or Bi from their chlorides or Pb from the nitrate. C. G. F.

The electroreduction of acid perrhenate solutions. The complex chloride of quinquivalent rhenium. W. F. Jakob and B. Jczowska. *Z. anorg. allgem. Chem.* 214, 337-53 (1933).—See C. A. 27, 4740. Curtis L. Wilson

The deposition of chromium from solutions of chromic and chromous salts. Charles Kasper. *Bur. Standards J. Research* 11, 515-28 (1933) (Research Paper No. 604).—Bright deposits at high efficiencies are obtained by maintaining a low concn. of H ions and a high concn. of Cr ions in the cathode film. Violet solns. of trivalent Cr, in which the green undissoc. mol. ions are not formed, do not increase the efficiency. Expts. to show whether a trivalent bath is comparable to the chromic acid bath are as follows: Chromic fluoroborate, producing a violet bath, required a high c. d., produced uniform, bright deposits with difficulty and had a narrow plating range.

1 A soln. of  $\text{KCr}(\text{SO}_4)_2$ ,  $\text{Na}_2\text{SO}_4$  and  $\text{H}_2\text{SO}_4$  also required a high c. d., had a narrow plating range and produced bright but pitted deposits. Prep'd. pure  $\text{CrSO}_4$  with  $\text{Na}_2\text{SO}_4$  in the anode compartment gave no better results. Complex Cr compds., as  $\text{NH}_4$  chromoborate, gave still lower efficiencies. Conclusion: The chromic acid bath as used today is superior to a soln. of a lower-valence compd. Leona Marsh

Local reinforcing of electrodeposits with special reference to silverware. Richard Justh. *Metalware-Ind. u. Galvano-Tech.* 31, 403, 442-4, 461-4 (1933).—

3 Practical methods are described, with their patent nov. Curtis L. Wilson

The mechanism of electrodeposition. L. B. Hunt. *Trans. Electrochem. Soc.* 65, 11 pp. (preprint) (1934).—The mechanism of electrodeposition is discussed in detail from the point of view of the supply of metal ions and their distribution at the cathode-electrolyte interface, the supply of electrons from the cathode and the factors detg. the electron transitions and subsequent lattice development. The concept put forward by Volmer (C. A. 23, 3393) is criticized and an alternative hypothesis is advanced to account for lattice development and the observed polarization phenomena. An accumulation of metal ions by adsorption in the double layer until a continuous lattice layer can be formed therefrom over the face of any particular crystal is suggested. The movement of electrons through the cathode surface is dependent upon the presence of adsorbed ions in a condition permitting their acceptance of electrons. C. G. F.

Measurement of internal stresses in electroplates. R. J. Piersol. *Metal Cleaning and Finishing* 5, 456-9 (1933).—Equipment and methods for detns. of stresses in electroplated coatings are described. D. Thuesen

Measurement of adhesion of electroplates. R. J. Piersol. *Metal Cleaning and Finishing* 5, 503-6, 516 17 (1933).—The phys. nature of electroplate adhesion and the various methods for measuring it are discussed. D. Thuesen

Electrocleaning with sodium metasilicate. F. J. Henning and T. K. Cleveland. *Metal Cleaning and Finishing* 5, 497-502 (1933).—Detailed directions are given for the prepn. and operation of  $\text{Na}_2\text{SiO}_3$  baths for the cleaning of various types of metal products prior to plating. D. Thuesen

7 Current distribution at the anode in the electrolytic preparation of sodium persulfate. O. A. Esin and B. Alifimova. *Z. Elektrochem.* 39, 891-4 (1933).—With varying c. d., current concn., HIF addn. and cell construction, the current yields of active O resulting from the electrolysis of  $\text{H}_2\text{SO}_4 + \text{Na}_2\text{SO}_4$  solns. are in agreement with values calcd. from the previously derived equation (cf. C. A. 27, 2322). L. W. Elder

Protection of aluminum against corrosion. José M<sup>a</sup>. Fernández-Ladreda. *Anales soc. españ. fis. quim.* 31, 776-8 (1933).—The best protection in moist atm. is obtained by anodic treatment in an aq. bath contg. cryst.  $\text{Na}_2\text{CO}_3$  125,  $\text{Na}_2\text{CrO}_4$  8, concd.  $\text{NH}_4\text{OH}$  25 cc. per l. at 50-60° for 10 min. E. M. Symmes

Elec. purification of blast-furnace gases (Richarme) 9. Elec. furnace refractories in the brass foundry (St. John, et al.) 19. Treating Zn sulfide ores, concentrates, etc. (U. S. pat. 1,937,633) 9. Mistensing hot gases, esp. those to be electrically cleaned (Ger. pat. 580,979) 1. Cooling gases [for elec. cleaning] (Ger. pat. 581,865) 13. Electrodeposition of rubber (Budiloff) 30.

Dry battery. Siemens & Halske A.-G. (Kurt Schenkel, inventor). Ger. 583,832, Sept. 9, 1933. Details of construction.

**Dry cell.** Cyril E. Delbel and Walter G. Waitt. Ger. 584,981, Sept. 27, 1933. Details are given.

**Dry cell assemblies.** Walter B. Schulte and John S. Zook (to Burgess Battery Co.). U. S. 1,937,045 6, Nov. 28. Structural details.

**Liquid batteries.** Le Carbone. Fr. 753,905, Oct. 27, 1933. The pos. electrode is of porous C, the neg. of Zn and the electrolyte is a soln. of NaOH and NaCl. A salt capable of preventing carbonation of the electrolyte, e. g., lithine, may be added.

**Primary cells.** Elise Pollak née Hirschberg and Philipp Burger. Ger. 579,832, July 1, 1933. Addn. to 570,939 (C. A. 27, 4178). The depolarizers for primary cells with a neutral or alk. electrolyte described in 570,939 are improved by varying the addn. of rare earth compds. The 5% addn. of the latter consists of 0.9 of an O compd. of Th and 0.1 of an O compd. of Ce.

**Storage battery.** Lawrence J. Pearson (to Philadelphia Storage Battery Co.). U. S. 1,937,714, Dec. 5. Structural features.

**Storage batteries.** Werner Kuhn. Fr. 751,501, Sept. 5, 1933. Short-circuiting and corrosion of the terminals by splashed acid is prevented by a suspension in an insulating medium, such as linseed oil, of oxides, carbonates or other salts insol. in water, of Pb, Ba or Sr, which form insol. sulfates.

**Storage-battery separator.** John H. Reilly (to Richardson Co.). U. S. 1,937,205, Nov. 28. Jute fiber is treated with Na silicate and is subjected to beating; asphaltum and filler material such as gritty non-porous material is added to the beaten fiber to form a mixt. comprising approx. 50% of beaten fiber, 10% asphaltum and 40% filler; acid such as HCl is added and the mixt. is formed into a pulp in aq. suspension, felted upon a screen and dried to produce a porous acid-proof sheet.

**Storage batteries.** Compagnie générale d'électricité. Fr. 751,398, Sept. 2, 1933. Construction is given of a porous insulating envelope for the plates.

**Storage batteries.** Soc. anon. des accumulateurs monoplaque. Fr. 752,654, Sept. 28, 1933. Construction of Pb plates is given.

**Storage batteries.** Émilien Vié. Fr. 753,382, Oct. 14, 1933. Iodometallic storage batteries function by electrolysis of iodides of light metals such as Al, Mg, Li, Cd and Be, and reversal of the reaction to form the iodide of the metal used.

**Storage batteries.** Pierre A. Pissoot. Fr. 754,065, Oct. 31, 1933. Construction of porous pos. elements capable of being satd. with a reactive substance under pressure. The elements are surrounded by catalytic material such as oxides of Mo or Sb, or these may be incorporated in the porous mass. The catalysts may also be introduced in liquid form into the electrolyte, e. g.,  $\text{NH}_3$  or bromides or acetates of metals more metallic than the metal of the neg. electrode.

**Storage-battery electrodes.** I. G. Farhenind. A.-G. (Ernst Thorsausch and Leo Schlecht, inventors). Ger. 583,869, Sept. 11, 1933. A method for making electrodes by compressing metal powder obtained by the thermal decompn. of carbonyls is described.

**Soft rubber lids for storage batteries.** Accumulatoren-Fabrik A.-G. (to Britannia Batteries Ltd.). Brit. 397,750, Aug. 31, 1933.

**Electrical condenser.** Albert E. Maibauer (to Haloway Corp.). U. S. 1,937,490, Nov. 28. Electrode elements are used with dielectric comprising a halogenated phenyl ether, halogenated phenanthrene, liquid halogenated hydroxy derivs. of such compds. or liquid hydroxy derivs. of halogenated diphenyl.

**Electrolytic condenser.** Preston Robinson (to Sprague Specialties Co.). U. S. 1,938,464, Dec. 5. A coating of Cr, V or Mn is used on Al electrodes. Cf. C. A. 28, 7161.

**Electrolytic condenser.** Elektrizitäts A.-G. Hydrawerk. Fr. 752,832, Sept. 30, 1933. The dielectric is composed of a layer of oxide. All metal parts joined to the electrodes and not covered with a layer of oxide are coated with an insulating layer.

**Electrodeposition of iron.** Franz Pawlek (to Ernst Kelsen and Edgar Ausnit). U. S. 1,937,068, Nov. 28. For maintaining substantially const. the H absorption in successive increments of deposition of Fe in the electrolytic production of Fe, and for controlling the crystal structure of the deposited metal, there is initially passed through the electrolytic bath a current of approx. 2 amps. per sq. dm. of cathode area, and the c. d. is thereafter increased by successive stages to a max. of about 5 amps. per sq. dm. (the increase from min. to max. c. d. covering a time period of about 30-45 min.).

**Electrodeposition of alloys.** Gottfried Fuchs. Brit. 397,780, Aug. 31, 1933. A bush for a hung-hole or faucet-hole is electroplated with an alloy of W, Cr and Ni to prevent corrosion. A suitable alloy is W 1-40, Cr 1-40% and the remainder Ni.

**Chromium plating.** Oscar Bornhauser. Fr. 754,299, Nov. 3, 1933. Chromic acid baths contg. Na tetrachromate are used which permits the use of c. ds. above 200 amps. per sq. dm. The tetrachromate is formed by adding Na ions ( $\text{Na}_2\text{Cr}_2\text{O}_7$ , neutral chromate or  $\text{NaOH}$ ) to the bath. A temp. below  $40^\circ$  is used. The coated metal may be heated to below its m. p. but sufficiently high to cause the Cr to alloy therewith.

**Nickel plating.** Franz de Wurtemberg. Fr. 751,330, Aug. 31, 1933. See Brit. 395,979 (C. A. 28, 4197).

**Electroplating.** Oscar Bornhauser. Fr. 753,671, Oct. 21, 1933. The electrolysis chamber has flexible walls to envelop as closely as possible articles disposed in the chamber. Fr. 753,672. The layer of oxide or Al or its alloys is replaced by  $\text{AlH}_3$  so as to obtain a solid and lasting galvanic deposit thereon. The Al may be heated to above  $100^\circ$  and treated with HCl.

**Apparatus for electroplating.** Albert W. Ritter (to Sargent & Co.). U. S. 1,937,359, Nov. 28. Structural and mech. features.

**Portable electroplating outfit.** Grace E. Adey. Brit. 397,609, Aug. 31, 1933.

**Galvanic metal-plating apparatus.** Württembergische Metallwarenfabrik. Ger. 577,747, June 3, 1933.

**Printing rollers.** Langbein-Pfannhauser-Werke A.-G. Ger. 579,064, June 20, 1933. Addn. to 574,902 (C. A. 27, 4490). The method of 574,902 for making Cu-coated printing rollers is improved by prep. the roller surface for deposition of the Cu by coating it with a polished layer of Fe, Ni or Co.

**Electrolytic cell.** Albert E. Knowles. Ger. 580,850, July 17, 1931.

**Electrolytic cells for generating gases.** Siemens & Halske A.-G. Brit. 398,021, Sept. 7, 1933.

**Cell for carrying out electrolysis under pressure.** Jakob E. Nöggerath. Ger. 580,704, July 15, 1933.

**Cell for electrolytic production of persulfuric acid.** Gustav Baum (to E. I. duPont de Nemours & Co.). U. S. 1,937,621, Dec. 5. A centrally located anode assembly consists of an anode member in a narrow anode chamber which is formed by an impervious cylinder and a concentric porous diaphragm, around which is a concentric cathode chamber.

**Electrolytic apparatus for making thin metal sheets.** Anaconda Copper Mining Co. Fr. 753,805, Oct. 25, 1933.

**Apparatus for carrying out electrolytic decomposition.** Jakob E. Nöggerath. Ger. 579,648, June 29, 1933.

**Electrolytic production of beryllium.** Louis Burgess. U. S. 1,937,509, Dec. 5. A fluid alloy of Be and a metal or metals such as Cu relatively more dense than Be and less electropos. than Be in relation to F is at least in part covered by a floating layer of fluid electrolyte contg. fluorides of higher disocn. potential than Be fluoride together with Be fluoride or oxide, and the electrolyte is electrolyzed in series with the alloy as cathode and with a suitable anode, this liberating Be at the cathode and adding to the Be in the fluid alloy (various other details of operation and app. being described).

**Refining chromium.** Erik Liebreich. Ger. 584,580, Sept. 21, 1933. Cr and Cr-Fe is refined by electrolysis in a bath contg. succinic acid or succinates,  $\text{H}_2\text{CrO}_4$ .

being simultaneously formed. Other acids such as  $\text{HClO}_4$ ,  $\text{HClO}_3$ ,  $\text{H}_2\text{S}_2\text{O}_8$ , or Caro's acid may also be present. Examples are given.

**Apparatus for treating metals as in refining and carburizing iron and steel.** Wm. H. Moore (to Pittsburgh Research Corp.). U. S. 1,937,064, Nov. 28. An open-topped vertical shaft with a refractory lining contains a stationary filling of granular carbonaceous material such as coke or SiC which constitutes a resistor; elec. current is passed through this material to heat it and metal such as iron or steel is poured through the heated filling.

**Gold recovery.** Benjamin G. Nicholl. Australia 8475/32, Aug. 10, 1933. Au is recovered from colloidal slums, etc., by adding an aq. cyanide soln. thereto to form a slurry, electrically charging the suspended solid particles in the slurry so formed with ions of opposite polarity to the ions causing stabilization of said particles, this producing a high degree of flocculation, and regenerating the cyanide content of the slurry by adding an alkali.  $\text{Al}_2(\text{SO}_4)_3$  may be used to cause flocculation.

**Nickel.** Hirsch, Kupfer- und Messing-Werke A.-G. Ger. 583,545, Sept. 5, 1933. Electrolytic Ni is prep'd. from  $\text{Ni-H}_2\text{SO}_4$  residues obtained as a by-product in Cu electrolysis processes by neutralizing the excess of  $\text{H}_2\text{SO}_4$  by addn. of  $\text{Ca}(\text{OH})_2$  or other substances forming insol. sulfates, removing the pptd. sulfate, concg. the  $\text{NiSO}_4$  soln. and electrolyzing this.

**Alloys containing boron.** Soc. d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine and Jean L. Andrieux. Fr. 753,394, Oct. 14, 1933. Alloys contg. B are produced directly by electrolyzing, by means of cathodes formed of the metal to be allied to the B (Fe, Ni, Co, etc.), a bath composed of boric anhydride or borates in the molten state and contg. alkali or alk. earth halogen salts, e. g., fluorides. The temp. is preferably maintained a little above the f. p. of the eutectic which has a compn. near that of the alloy to be obtained.

**Electrolytic oxidation of aldoses.** Edward L. Helwig (to Rohm & Haas Co.). U. S. 1,937,273, Nov. 28. In oxidizing aldoses such as glucose for producing monocarboxylic acids such as gluconic acid, the aldose is electrolyzed in alk. soln. with an insol. anode in the presence of a salt (such as KI or  $\text{CaBr}_2$ ) contg. a halogen of higher at. wt. than Cl and which serves to facilitate obtainment of a pure product even on first crystn.

**Formaldehyde.** Gutehoffnungshütte Oberhausen A.-G. Ger. 580,580, July 15, 1933.  $\text{CH}_2\text{O}$  is prep'd. by passing a high-frequency high-tension elec. current through a mixt. of  $\text{CH}_4$  and  $\text{CO}_2$ , the  $\text{CO}_2$  concn. being equal to or greater than the  $\text{CH}_4$  concn. The reaction is carried out at reduced, raised or ordinary pressures, and indifferent gases may be added. App. is indicated.

**Purifying hydrocarbons.** Jean F. A. Bruzac. Fr. 752,690, Sept. 28, 1933. Hydrocarbons are submitted to the action of an elec. field so that the impurities are electrolyzed and collect at the electrodes.

**Sugar sirup.** Ulrich Heubaum. Fr. 752,717, Sept. 29, 1933. Sirup is made from plant juices contg. polysaccharides, by obtaining the acid necessary for hydrolysis completely or partly by electrolysis. Thus the acidification takes place either in the central compartment of a cell divided into 3 by appropriate diaphragms or in the anodic space of a cell divided into 2 compartments. The hydrolyzed juices are neutralized by hydrolysis.

**Sterilization.** Siemens & Halske A.-G. Fr. 751,578, Sept. 6, 1933. In sterilizing aq. liquids in movement by electrolytic introduction of a substance having an oligodynamic action, cathodic losses in the substance having an oligodynamic action is avoided by interposing a diaphragm between the electrodes.

**Electrically sterilizing flat sheets, etc.** Godfrey Steerup (to American Can Co.). U. S. 1,937,536, Dec. 5. A surface to be sterilized is placed in close proximity to spaced electrodes between which a leakage path of moisture vapor is provided, and a high-tension elec. current is passed between the electrodes and along the leakage path by which an arc having increased spacial limits is

formed and caused to impinge upon the surface. App. is described.

**Electric furnace for high temperatures.** Gotthardwerke A.-G. für elektrochemische Industrie und Arturo Paoloni. Fr. 751,092, Aug. 28, 1933.

**Electrically heated furnace (with a centrally located resistor) for annealing wire, etc.** Nelson Webb (to Eastwood-Nealley Corp.). U. S. 1,938,306, Dec. 5. Structural features.

**Electric induction furnace suitable for melting metals.** Wm. E. Moore (to Pittsburgh Research Corp.). U. S. 1,937,065, Nov. 28. A crucible for holding material which is to be melted is provided with a narrow pocket projecting downwardly from its bottom, and elec. connections are provided for causing an alternating magnetic flux to traverse the pocket from side to side in the direction of its smallest dimension. Various structural and elec. details are described.

**Induction furnace for smelting metals.** Berlin-Ilsenhurger Metallwerke A.-G. (Otto Hoffmann, inventor). Ger. 581,741, Aug. 2, 1933. The metal in the canal leading from the hearth of an induction furnace is artificially cooled.

**Induction furnace without an iron core.** Berlin-Ilsenhurger Metallwerke A.-G. Ger. 580,796, July 17, 1933.

**Regenerative furnace head.** Fritz Brand. Ger. 580,932, July 19, 1933.

**Regenerative furnace gas ports designed to obtain maximum heat release in minimum time.** David Russell. Brit. 396,826, Aug. 17, 1933.

**Apparatus for the continuous smelting of zinc ores in an electric furnace.** St. Joseph Lead Co. Ger. 579,519, June 28, 1933.

**Electric systems suitable for controlling the current supplied to electric-arc melting-furnace electrodes.** Edward A. Hanff (to Wm. Swindell & Bros.). U. S. 1,937,695 6, Dec. 5.

**Apparatus for carrying out electrical processes.** Anton Kratky. Ger. 580,849, July 17, 1933.

**Electric arc.** Presslicht-Patent-Verwertungsgesellschaft mbH. Ger. 579,682, June 29, 1933. App. for producing an elec. arc in which a gaseous hydrocarbon is led between two concentric C electrodes is described.

**Electric motor utilizing the kinetic energy of gaseous ions.** Henri Chaumat. Fr. 753,363, Oct. 14, 1933.

**Electrical device for measuring the heat conductivity of gases and vapors.** I. G. Farbenind. A.-G. (Arnold Nitsche, inventors). Ger. 581,800, Aug. 3, 1933.

**Purifying gases from roasting processes.** I. G. Farbenind. A.-G. Brit. 397,851, Aug. 29, 1933. The gases are passed through an elec. precipitator to remove dust, then cooled indirectly to below  $100^\circ$  and moistened by spraying in  $\text{H}_2\text{O}$ . The  $\text{H}_2\text{SO}_4$  fog is then sep'd. as relatively strong acid, together with other impurities, by passage through a 2nd elec. pptn. plant.

**Cleaning metal surfaces.** Jacob Glaymann and Jacques Martin. Fr. 754,044, Oct. 30, 1933. Metal surfaces to be cleaned are made the electroneg. element of a battery, the electropos. element of which is any more electropos. metal. The alk. electrolyte is such that, under the conditions of working, min. solution of the anode occurs and polarization is impossible.

**Oils for electrical apparatus.** Soc. artsienne de force et lumière. Fr. 752,857, Oct. 2, 1933. The oils are protected against alteration by keeping them in closed app. in the presence of inert gases, the variations in vol. being allowed for by the use of a gasometric bell.

**Drawing wire.** Allgemeine Elektrizitäts-Ges. Ger. 579,797, June 30, 1933. Rolled wire, before drawing, is subjected to a short electrolysis in  $\text{Ca}(\text{OH})_2$  soln., the wire forming the anode.

**Copper oxide rectifiers for use with high voltages.** Herbert Kahler (to Westinghouse Elec. & Mfg. Co.). U. S. 1,936,792, Nov. 28. In producing rectifier elements, Cu is heated to  $1000\text{--}1025^\circ$  for a few min. in an oxidizing atm. and then cooled during a period of several min. to about  $490^\circ$ , further cooled at room temp. during several

min. and finally quenched (suitably in water at room temp.).

**High-frequency apparatus for making ozone.** Edmond Bégot. Fr. 753,352, Oct. 14, 1933.

**Apparatus for producing and utilizing ozone.** Louis E. Beuret and Roger Cazaud. Fr. 750,951, Aug. 24, 1933.

**Arc lamps.** Siemens & Halske A.-G. Brit. 397,680, Aug. 31, 1933. In a high-pressure arc lamp having a metallic vapor filling, e. g., Cd or Zn, the wall through which the rays are transmitted is protected against positions by covering it, at least in part, by openwork metallic structures which are not connected to an external source of potential.

**Carbon-electrode arc lamps with magnetic arc control.** James O. Armstrong. Brit. 397,517, Aug. 25, 1933.

**Discharge lamps.** Patent-Treuhand Gesellschaft für elektrische Glühlampen m. b. H. (to the General Electric Co. Ltd.). Brit. 397,774, Aug. 31, 1933. To prevent excessive strains in a luminous tube 2 or more parts of the glass tubing are joined with gas-tight joints by flexible

metal tubes which may be of spring steel or bronze and, preferably, are partially or wholly corrugated. Cf. C. A. 27, 5012.

**Electron lamps.** Telefunken Ges. für drahtlose Telegraphie m. b. H. Fr. 753,772, Oct. 24, 1933.

**Electron lamps with adjustable cathode.** Telefunken Ges. für drahtlose Telegraphie m. b. H. Fr. 751,059, Aug. 26, 1933.

**Electric lamps.** Royal Frank Strickland (to The British Thomson-Houston Co. Ltd.). Brit. 397,887, Aug. 24, 1933. In lamps in which a sealed bulb, e. g., of borosilicate glass transmitting ultra-violet rays, filled with inert gas or vapor, e. g., Hg, contains current leads, e. g., of Ni with W parts sealed into the stem, arc electrodes, e. g., of W, and a filament, e. g., of W, across the leads so that, on starting, the filament glows first and the arc then strikes, the electrodes are formed as coils and parts of the filament adjacent its ends are disposed within these coils, the difference between the starting and operating voltages being thus reduced.

## 5—PHOTOGRAPHY

E. P. WIGHTMAN

**Color cinematography.** Wm. van D. Kelley. U. S. 1,937,823, Dec. 5. A positive film strip has alternate frames carrying red values and blue-green values, resp., one series of the frames being given a color corresponding to its color values, and the other frames being grayed to balance the light-transmitting qualities of the colored frames.

**Anti-halation photographic layers.** Kodak-Pathé. Fr. 751,146, Aug. 28, 1933. Salts of cellulose esters of a dicarboxylic acid are prep'd. by esterifying regenerated cellulose with a dicarboxylic acid anhydride, in the presence of an org. base such as pyridine, decomposing the resulting product with an acid stronger than the 2nd carboxylic group of the dicarboxylic acid corresponding to the anhydride used, and neutralizing the acidity of the product by means of a base, such as an alkali or an amine, to obtain a sol. salt. Examples are given of the prep'n. of an acetophthalate and an acetosuccinate of cellulose and triethanolamine, and others are mentioned. The products are used to make anti-halation layers.

**Photographic anti-halation layers.** I. G. Farbenind. A.-G. Fr. 751,299, Aug. 30, 1933. Filtering or anti-halation layers are composed of colloids with which are incorporated dyes obtained by condensing mol. aunts. of aromatic or cyclic aldehydes with compds. having reactive CH<sub>2</sub> groups. Examples are given of the prep'n. of compds. from 4-dimethylamido-benzaldehyde-2-sulfonic acid with (1) barbituric acid, (2) thiobarbituric acid and 3-hydroxythionaphthene with (1) Na *o*-benzaldehyde-sulfonate, (2) *m*-hydroxybenzaldehyde, (3) Na benzaldehyde-disulfonate and 3-hydroxyselenonaphthene with Na *p*-benzaldehydesulfonate. Cf. C. A. 28, 57<sup>a</sup>.

**Light-sensitive layers.** Maximilian P. Schmidt and Edward Sprongerts (to Kalle & Co. A.-G.). U. S. 1,936,957, Nov. 28. A suitable base such as paper carries as a single coloring matter an aromatic diazo comp'd., such as that derived from "H-acid" or the like, which contains at least 2 benzene nuclei and which, in the benzene nucleus not contg. the diazo group, contains at least one free coupling position and is therefore capable of coupling with itself on exposure to light and treatment with a suitable alk. soln.

**Light-sensitive emulsions.** I. G. Farbenind. A.-G. Fr. 751,416, July 19, 1933. Addn. to 731,508. Carbo-cyanines which are substituted by alkyl groups in the polymethine chain are used for sensitizing Ag halide emulsions to red and infra-red. The formulas are given of halides of 3,3'-dimethyl-6,6'-dimethyl- $\alpha,\alpha'$ -di-, 3,3'-dimethyl- $\beta,\beta'$ -di-, 3,3'-dimethyl- $\beta,\delta,\beta'$ -tri-methylhepta-thiocarbocyanine, 3,3'-diethyl- $\beta$ -naphthothio- $\delta$ -, 3,3'-diethyl- $\alpha$ -naphthothio- $\beta,\beta'$ -di- and 1,1'-dimethyl-2,2'-quino- $\delta$ -methylheptacarbocyanine, 3,3'-diethyl-5,5'-

dimethoxy- $\gamma$ -methylpenta- and 3,3'-diethyl- $\delta$ -methylhepta-selenocarbocyanine, 1,1'-diethyl-3,3'-tetra-methyl- $\alpha,\alpha'$ -dimethyl- $\gamma$ -ethylindocarbocyanine and the methylsulfate of 1,1'-dimethyl-4,4'-quino- $\delta$ -methylheptacarbocyanine.

**Photographic emulsions.** Bruno Claus. Fr. 752,847, Sept. 30, 1933. Very finely granular emulsions are obtained by subjecting the emulsions, during or after mixt., to mech. vibrations or oscillations, preferably of high frequency.

**Toning photographic images.** E. Mayer & Benedik. Fr. 751,594, Sept. 6, 1933. A coloring or toning bath for photographic images is composed of phosphates or arsenates and molybdates mixed in stoichiometric aunts. or not, and with the addn. of strong acids such as HCl, HF, HCNS or H<sub>2</sub>SO<sub>4</sub>.

**Maintaining photographic fixing baths at a substantially uniform silver concentration.** Louis Weisberg and Willard F. Greenwald (to Weisberg & Greenwald, Inc.). U. S. 1,937,179, Nov. 28. A portion of the bath is continuously withdrawn, electrolyzed at a cathode c. d. of 25-75 amp. per sq. ft. to effect sepn. of Ag in the form of non-colloidal Ag<sub>2</sub>S, and the pptd. Ag<sub>2</sub>S is sepd. from the soln.; the temp. of the latter is suitably adjusted and it is then returned for further use in the fixing bath.

**Photographic developer.** Marion C. Reed (to B. F. Goodrich Co.). U. S. 1,937,844, Dec. 5. Developers are used contg. compds. such as *m*-methyl-*p*-hydroxy-*N*-phenylmorpholine or the like as active developing agent.

**Photographic plates and films.** I. G. Farbenind. A.-G. Brit. 397,740, Aug. 31, 1933. See Ger. 570,991 (C. A. 27, 4183).

**Photographic plates and films.** I. G. Farbenind. A.-G. Ger. 584,662, Sept. 22, 1933. A halation-preventing coating sol. in alk. developing or fixing baths, consists of a colored colloidal layer insol. in water, the binding agent for the coloring matter being a synthetic resin contg. a salt-forming OH or COOH group. Thus, the plate or film is coated on its rear side with a colloidal prep'n. contg. a resin made by condensing salicylic acid with *p*-CH<sub>3</sub>O, and fuchsin and iso-BuOH. Cf. C. A. 27, 4183.

**Treating photographic negatives.** Alfred Glowa. Ger. 584,663, Sept. 22, 1933. Developed and fixed negatives or transparencies are immersed in a bath contg. an aq. soln. of Na<sub>2</sub>PO<sub>4</sub>, Na<sub>2</sub>CO<sub>3</sub> and Na<sub>2</sub>SiO<sub>3</sub> for 1-2 min. before further washing. The process reduces the time required for washing and drying.

**Photographic paper.** Kalle & Co. A.-G. (Rudolf Zahn inventor). Ger. 581,697, Aug. 1, 1933. Light-sensitive surfaces for producing tanned prints are prep'd. by coating the surfaces with a colloidal layer contg. diazo compds.

whose light-decompn. products have tanning properties. 1 Thus the paper may be coated with a layer of an emulsion contg. gelatin,  $\text{Fe}_2\text{O}_3$ ,  $\text{AcOH}$ , water and the  $\text{ZnCl}_2$  double salt of the diazo compd. of 4-amino-1-(*N*-methyl-4,5,6,7-tetrahydro-2-naphthyl)-aminobenzene.

**Lecithin photographs.** Elizabeth Wolter. Ger. 584,562, Sept. 21, 1933. A sensitive layer for the above consists of lecithin, an org. Fe salt and nitrocellulose.

**Photomechanical printing.** Ralph E. Hurst and Charles E. Meulendyke. U. S. 1,938,290, Dec. 5. A basic metallic sheet such as Cu plated with an inert metal such as Ag, Ni or Cr and carrying a colloid layer contg. a sensitive Ag salt is exposed, the Ag image is developed,

and the colloid dissolved out (suitably by  $\text{H}_2\text{O}$  soln.) under the selective control of the Ag image. U. S. 1,938,291 also relates to sensitized plated metal plates as used in this process.

**Engraving printing cylinders.** Nerses Bechak. U. S. 1,938,313, Dec. 5. The cylindrical surface of a metal roller is coated with a sensitized acid-resisting soln. having a shellac base; a flexible transparent pos. film is attached to the circumference of the roller, and after the design is printed on the sensitized surface development is effected in a developing bath contg. a coloring material, forming a colored resist surface upon the roller, and the exposed parts of the surface are subsequently etched.

## 6 -INORGANIC CHEMISTRY

A. R. MIDDLETON

**A study of some reactions between dry inorganic salts.** E. H. Thomas and Lyman J. Wood. *J. Am. Chem. Soc.* 56, 92 7(1934).— $\text{KCl}$ - $\text{NaBr}$  mixts. were examd. above and below the fusion temp. and double decompn. was found to occur in both cases. Several other reactions ( $\text{KCl}$ - $\text{NaF}$ ,  $\text{KCl}$ - $\text{NaI}$ ,  $\text{KCl}$ - $\text{NaNO}_3$ ,  $\text{KCl}$ - $\text{AgBr}$ , etc.) were also investigated by means of the x-ray spectrograph and are reported.

**Formation of carbonyls and related compounds.** Arthur A. Blanchard, John R. Raffet and Wm. B. Adams, Jr. *J. Am. Chem. Soc.* 56, 16 17(1934); cf. *C. A.* 27, 3416.—Carbonyls of Ni and Co and cobalt nitrosyl tricarbonyl were prepd. by the treatment of alk. suspensions of sulfide or cyanide with CO or CO-NO mixt. Vapor pressure and vapor density data for  $\text{CoNO}(\text{CO})_3$  are given.

**Constitution of neodymium, samarium, europium, gadolinium and terbium.** F. W. Aston. *Nature* 132, 930 1(1933).—By use of the mass spectrograph the isotopes 142, 144 and 146 of Nd (in decreasing order of abundance) are shown present, with 143 and 145 also occurring. Sm gives a strong pair, 152 and 154, and a triplet, 147, 148 and 149. Eu contains 151 and 153 in roughly equal abundance. Gd shows 155, 156, 157, 158 and 160 to be present; faint effects at 152 and 154 are attributed to Sm impurities. Tb shows only one line, 159, although its at. wt., 159.2, would suggest a second.

**Addition reactions with hydrogen and oxygen atoms at low temperatures.** K. H. Gebel and P. Hartek. *Ber.* 66B, 1815 25(1933).—The reactions of H atoms at  $-190^\circ$  with  $\text{HCN}$ ,  $(\text{CN})_2$ ,  $\text{SO}_2$ ,  $\text{C}_2\text{H}_2$ ,  $\text{C}_2\text{H}_4$  and  $\text{C}_2\text{H}_6$ , and of O atoms at  $-183^\circ$  with  $\text{NO}$ ,  $\text{CO}$ ,  $\text{SO}_2$ ,  $\text{NH}_3$ ,  $\text{MeNH}_2$ ,  $\text{Me}_2\text{N}$ ,  $\text{HCl}$ ,  $\text{C}_2\text{H}_2$ ,  $\text{C}_2\text{H}_4$  and  $\text{C}_2\text{H}_6$  were studied. H atoms did not react with  $\text{NH}_3$ ,  $\text{N}_2\text{O}$  and  $\text{MeNH}_2$ , and O atoms did not react with  $\text{HCN}$ ,  $\text{N}_2\text{O}$  and  $\text{H}_2$ . No evidence was found for the existence of an oxide of Xe. L. E. Steiner.

**The reciprocal salt pair  $\text{Ca}(\text{NO}_3)_2 + 2\text{KCl} \rightleftharpoons 2\text{KNO}_3 + \text{CaCl}_2$  at  $-10^\circ$ .** I. Klichevskii and R. K. Izkovich. *Z. anorg. allgem. Chem.* 215, 103 4(1933).—The authors have studied the equil. shown in the title and found that to obtain the max. yield of  $\text{KNO}_3$  (74.5% of initial  $\text{Ca}(\text{NO}_3)_2$ ) the soln. after the crystn. of  $\text{KNO}_3$  must be satd. with respect to  $\text{CaCl}_2$  and  $\text{KCl}$ . Conclusion: The prepn. of  $\text{KNO}_3$  from  $\text{Ca}(\text{NO}_3)_2$  at  $-10^\circ$  is not economically feasible.

**The colors of the copper salts.** Wilder D. Brainerd and Harris W. Rogers. *J. Phys. Chem.* 37, 1061-73 (1933).—Hantzsch's theory is supported that color identity for solid, vapor and soln. occurs when the chromophoric group is the same and that change of color connotes a difference in the chromophoric group; this is independent of the degree of ionization but becomes less intense at lower temps. The anhyd. cupric ion is colorless; with 3 or 2 mols. of  $\text{H}_2\text{O}$  the ion is green; with 3 or more blue.  $\text{NH}_3$  has practically the same effect in Cu complexes as  $\text{H}_2\text{O}$  but the shade of blue is different. Certain anhyd. double Cu salts are red and must have the same chromophoric group as  $\text{CuCl}_2$  vapor, which is probably a pseudo salt.

A. P. Sachs

**The solubility of cupric chloride in water and the transition temperatures of its hydrates.** The tetrahydrate. Erich Boye. *Z. anorg. allgem. Chem.* 215, 75 80(1933).—The soly. of  $\text{CuCl}_2$  in water has been detd. between  $-43.4^\circ$  (cryohydrate  $\text{H}_2\text{O}-\text{CuCl}_2(\text{H}_2\text{O})_4$  with 39.9%  $\text{CuCl}_2$ ) and  $116.8^\circ$  (b. p. of satd. soln. with 55.0%  $\text{CuCl}_2$ ) by analysis of satd. solns. at 31 temps. The transition temps. between hydrates are 4:3:  $15.0^\circ$ , 3:2:  $25.78^\circ$ ; 2:1:  $42.2^\circ$ . A new hydrate  $\text{CuCl}_2(\text{H}_2\text{O})_4$  is described: it has light-blue needles, which do not become green in presence of moisture; it is unstable, losing  $\text{H}_2\text{O}$  slowly even at  $0^\circ$ .

**A phosphide of nitrogen.** P. Renaud. *Bull. soc. chim.* 53, 692 7(1933).—The action of Na on  $\text{PNCl}_2$  gives an impure form of PN contg. 10% Cl. The action of  $\text{NH}_3$  and  $\text{PNCl}_2$  gives a product contg. 2% Cl; if this is heated *in vacuo* a rather pure form of PN is obtained. The compd. is grayish black, has an odor like  $\text{H}_2\text{S}$ , is insol. in  $\text{H}_2\text{O}$ ,  $\text{EtOH}$ ,  $\text{Et}_2\text{O}$  and  $\text{CS}_2$ , but reacts readily with  $\text{Na}_2\text{O}$  and fused  $\text{NaNO}_3$ .

**Some reactions of anhydrous thorium tetrabromide with organic liquids.** Ralph C. Young. *J. Am. Chem. Soc.* 56, 29 31(1934).—The reactions of anhyd.  $\text{ThBr}_4$  with a no. of org. liquids were studied. Such compds. as  $\text{ThBr}_4 \cdot 4\text{C}_2\text{H}_5\text{OH}$ ,  $\text{ThBr}_4 \cdot 3\text{C}_6\text{H}_5\text{COOC}_2\text{H}_5$  and  $\text{ThOBr} \cdot 0.5\text{C}_6\text{H}_5\text{COCH}_3 \cdot \text{H}_2\text{O}$  were obtained. Their prepn. and properties are given.

**Fission of carbon monoxide on iron oxide and iron.** II. A. Bahr and V. Jessen. *Ber.* 66B, 1238 47(1933); cf. *C. A.* 24, 561. —Pure  $\text{Fe}_2\text{O}_3$  (9.7% C) can very probably be prepd. from Fe and CO at  $225^\circ$  or lower; at 230–400 a mixt. of  $\text{Fe}_2\text{O}_3$ ,  $\text{Fe}_3\text{C}$ , with free C probably results; while above  $400^\circ$  only  $\text{Fe}_3\text{C}$  (8.68% C) is formed. Carbonized products obtained by means of Fe oxide always contain O; detection of combined C by hydrogenation with H is not quite trustworthy in this case and must be performed at  $255-60^\circ$ . The products obtained with Fe up to  $330^\circ$  are free from O; at higher temps. the oxidizing action of the liberated CO is observed. The hydrogenation of combined C with H can take place at  $280-300^\circ$ . Carbon formation occurs relatively rapidly; subsequently, the main reaction is the sepn. of free C. W. C. Fernelius.

**The reversible conversion of the dimetaphosphates in to the condensed salts of Graham.** Paul Pascal and Bonnemaman. *Compt. rend.* 197, 381 4(1933).— $\text{Na}(\text{PO}_3)_2 \cdot 6\text{H}_2\text{O}$  is obtained by heating  $\text{Ag}_2\text{P}_2\text{O}_7$  at  $145^\circ$  for 15 days,  $\text{Ag}_2\text{P}_2\text{O}_7 = \text{Ag}_2(\text{PO}_3)_2 + 2\text{Ag}$ , treating with aq.  $\text{NaCl}$  at  $0^\circ$ , and pptg. by alc. (cf. *C. A.* 27, 2898). If heated for a shorter time the product is gummy, because of incomplete transformation; if for longer, complex poly metaphosphates (Graham's salts), pptd. as oils, are formed.  $\text{Ag}_2\text{H}_2\text{P}_2\text{O}_7$ , heated at  $320^\circ$  and similarly treated, gives an uncrystallizable, oily, hydrated Na polymetaphosphate (apparent mol. wt. in dil. soln. is 488; viscosity of a 1% soln. is 25 times that of  $\text{H}_2\text{O}$ ). After 3 weeks the mol. wt., cond. and viscosity become those of the dimetaphosphate, the ready change of which to acid pyrophosphate explains the slightly acid character of solns. of Graham's salts.

W. C. Fernelius

The decomposition of Vyatka phosphorite by hydrochloric acid and the precipitation of the obtained phosphoric acid by limestone and milk of lime. I. Mirkin, S. Perel'man and I. Nikonova. *J. Chem. Ind. (Moscow)* 1933, No. 7, 56-62; cf. *C. A.* 25, 4650.—The full theoretical amt. of HCl must be used when this acid decomposes phosphorite. It is best to use 10% HCl soln., to avoid too much later washing. The phosphorite does not have to be finer than 20-mesh. Finely ground limestone will ppt. all the  $H_2PO_4$  formed if sufficient time is allowed, but in practice it is best to end the neutralization with  $Ca(OH)_2$ .

Hetero- and iso-poly acids. A. R. Middleton. *J. Chem. Education* 10, 720-32 (1933).—An outline of the nature and properties of hetero- and iso-poly acids and of the theories regarding their structure. Special consideration is given to the work of Roschheim (*C. A.* 16, 1194) and of Jander (*C. A.* 27, 4187). Louise Kelley

Intermediate states of reduction of chromic acid. T. R. Ball and Keith D. Crane. *J. Am. Chem. Soc.* 55, 1800-4 (1933).—In the reduction of chromic acid with  $FeSO_4$ ,  $Hg_2SO_4$ ,  $SnCl_2$  and  $H_2C_2O_4$ , quinquivalent Cr was detd. as an intermediate product; there was no evidence of quadrivalent Cr. A preliminary indication of trivalent Sn will be further investigated. M. McMahon

Decomposition of formic acid by sulfuric acid. Robert I. DeRight. *J. Am. Chem. Soc.* 55, 4761-4 (1933).—Measurements of the decomn. of  $HCO_2H$  by  $H_2SO_4$  in large excess, by means of a rotary shaker, have been extended to a concn. of 100%  $H_2SO_4$ . If  $HCO_2H$  is in large excess the decomn. proceeds indefinitely. Qualitatively the effect of  $SO_2$  on the reaction is similar to that obtained in cases of oxalic, citric and malic acids by Wiig (*C. A.* 25, 568).

Constitution of hydrazoic acid and the azides. A. Hantzsch. *Ber.* 66B, 1349-54 (1933).—Alkyl azides (non-

electrolytes) show discontinuous or selective ultra-violet

absorption and are assigned the structure  $\begin{array}{c} N \\ \diagup \quad \diagdown \\ N \end{array} NR$  (cf. *C. A.* 27, 3459). The cyclic structure is also assigned to  $HN_3$  because of its similarity to  $N_3R$  and its existence in  $H_2SO_4$  soln. as the trisulfate. Since liquid  $HN_3$  is assord., the

structure is expanded to  $NH \begin{array}{c} N \dots N \\ \diagup \quad \diagdown \\ N \dots N \end{array} NH$ . The alkali

and  $NH_4$  azides are electrolytes with continuous or general absorption in which the pos. metals, as cations, are equally bound to all the neg. atoms of the anions. The feebly pos. metals are united in their salts (pseudo salts) to a single N atom and exhibit a markedly different absorption. It is assumed, therefore, that the azide ion is sym. and is thus distinct from nearly all other anions in the absence of a central atom. Cyanogen azide (cf. *C. A.* 22, 3138) is more strongly absorbent than other azides, is hydrolyzed normally to  $N_2CONH_2$  and  $N_2COOH$ , and therefore con-

tains 2 CN; it is  $NC.N \begin{array}{c} N \dots N \\ \diagup \quad \diagdown \\ N \dots N \end{array} N.CN$ .

W. C. Fernelius

Magnetic anisotropy in crystals of *trans*-dinitrotetraminecobaltic chloride (Strook) 2. Reaction between HI and  $Cl_2$  (Mooney, Reid) 2.

Bourion, F., Conduché, A., Isabey, Jean, Meyer, F., Olmer, L. J., and Tourneux, C. *Traité de chimie minérale*. T. VIII. Éléments des terres rares, cuivre, argent, or, mercure. Published under the direction of Paul Pascal. Paris: Masson et Cie. 1205 pp. F. 210. Cf. *C. A.* 27, 3893.

## 7- ANALYTICAL CHEMISTRY

W. T. HALL

Titration with adsorption indicators. III. New adsorption indicators for the argentometric titration of iodine. Yumitsu Uzumasa and Yasuo Miyake. *J. Chem. Soc. Japan* 54, 1043-6 (1933); cf. *C. A.* 27, 5673. Bromocresol purple (I), phenolphthalein (II), methyl red (III), phenol red (IV), cochineal (V) and azolitmin (VI) are excellent adsorption indicators for the titration of  $I^-$  with  $AgNO_3$ . The change in color at the end point: I violet  $\rightarrow$  green, II pink  $\rightarrow$  purple, III yellow  $\rightarrow$  orange red, IV pink  $\rightarrow$  blue, V violet  $\rightarrow$  green, VI brown  $\rightarrow$  dark green. The indicators are sensitive to 0.01 N iodide soln., except VI which cannot be used for the titration of a soln. less than 0.02 N. The titration is made in a slightly alk. condition, with a few drops of 1% indicator soln.

K. Kitsuta  
The indicator properties of *p*-nitrophenylacetylhydrazine, 2,4-dinitrophenylacetylhydrazine, and 2,4,6-trinitrophenylacetylhydrazine. Albert Bloom and Arthur Osol. *Am. J. Pharm.* 105, 551-3 (1933).—All 3 indicators were found to be satisfactory in the titration of strong acids. In alk. solns. the colors fade and are unreliable.

W. G. Gaessler  
Azo coupling in volumetric analysis. E. Rostovtzeva. *Imitokra. ochnaya Prom.* 3, 308 (1933).—In the titration of diazonium salts some compds. give coagulated azo dyes, which form coarsely granulated ppts. with occlusion of the component and the resulting low values. By use of protective colloids, such as gum arabic and gelatin, the coagulation of the dye and the necessity of using excessive diln. of the titration medium are precluded, the results are more accurate and the time required is shortened.

Chas. Blanc  
Cerimetry. Reinaldo Vanossi and Raoul Ferramola. *Ann. chim. anal. chim. appl.* 15, 529-44 (1933).—See *C. A.* 27, 40.

W. T. H.  
Separation of beryllium from the related elements of

the third group. P. Adami. *Ann. chim. applicata* 23, 428-32 (1933). Be can be sepd. from Fe and Al by first evap. to dryness twice with  $HCO_2H$ . The resulting formates are then placed in a Pt boat, and heated with  $HCO_2H$  in a long glass tube, sealed at one end and connected at the other end to a vacuum pump. Ignited under vacuum at 180-200°,  $Be(CO_2H)_2$  sublimates and crystallizes in the cold part of the tube. It is then dissolved in concd.  $HNO_3$ , reprecip. with  $NH_4OH$  and detd. as oxide. The Al and Fe formates are converted to oxides and detd. directly. The above method is not applicable in the presence of Ti, when there are low results because of incomplete sublimation of Be.

A. W. Contieri

The nephelometric determination of small amounts of bismuth. Luigi Malossi. *Rend. accad. sci. (Napoli)* [4], 2, 83-90 (1932).—This method is an adaptation of the microscopical method of Vanino and Treubert (*Ber.* 31, I, 1113 (1898)), whereby Bi is pptd. by the action of  $Na_2SnO_3$ . The method is sensitive to concns. of Bi from 0.0004% to 0.04% and is useful for detg. Bi in samples of com. Cu. Dissolve 20 g. of Cu in concd.  $HNO_3$ , evap. on the water bath with addn. of HCl until N oxide fumes cease to appear. Dil. and filter. To the filtrate add a satd. soln. of  $(NH_4)_2CO_3$  in slight excess. Filter and dissolve the residue which contains Bi, Pb, Fe and small amts. of Cu in hot dil. HCl and evap. the soln. to about 10 cc. Add 5-6 cc. of hot, filtered 0.5% agar agar soln. and 10-14 cc. of freshly prepd.  $Na_2SnO_3$  soln. (a slight excess of 20% NaOH added to 20%  $SnCl_2$  soln.) and compare the resulting turbidity with that obtained with standard solns.

Anne E. White

Determination of chromium by the mercurimetric method. Al. Ionesco-Matiu and S. Herscorici. *Bull. soc. chim.* 53, 1032-8 (1933).—The procedure consists in adding a soln. of  $HgNO_3$  to one of  $CrO_4^{2-}$  or  $Cr_2O_7^{2-}$  contg. no halide nor much  $H_2SO_4$ , removing the ppt. of

Hg<sub>2</sub>CrO<sub>4</sub> and washing it with the aid of the centrifuge and then detg. the Hg in the ppt. or titrating the excess Hg-NO<sub>3</sub>. In the former case, the ppt. is dissolved in 1-4 cc. of HNO<sub>3</sub>, the soln. is transferred to an Erlenmeyer flask, 8 cc. of H<sub>2</sub>SO<sub>4</sub> added and water to make a total vol. of 100 cc.; 2% KMnO<sub>4</sub> is added to effect oxidation and 10-20 drops of a 10% soln. of Na nitroprusside. The soln. is then titrated with 0.1 N NaCl soln. until the turbidity of nitroprusside disappears. The procedure was tested with solns. of K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, K<sub>2</sub>CrO<sub>4</sub> and chromic alum. In the latter case the Cr was first pptd. as hydroxide and then oxidized in alk. soln. with H<sub>2</sub>O<sub>2</sub>. W. T. H.

**Direct determination of chromium and vanadium in steel. o-Phenanthroline ferrous complex as indicator.** Hobart H. Willard and Philena Young. *Ind. Eng. Chem., Anal. Ed.* 6, 48-52 (1934).—The method depends upon the oxidation of Cr to chromic acid and of V to vanadic acid, reduction to Cr<sup>++</sup> and VO<sup>++</sup> by a measured vol. of standard FeSO<sub>4</sub> soln. and titration of the excess Fe with KMnO<sub>4</sub>, with o-phenanthroline as indicator, in a soln. of acidity so great that VO is not oxidized. Then the acidity is lowered, the temp. raised and the VO<sup>++</sup> oxidized to HVO<sub>3</sub> with KMnO<sub>4</sub>. Take 0.25 g. of steel and heat slowly with 20-5 ml. of 70% HClO<sub>4</sub>. Boil the resulting soln. 15-20 min. Cool, add 25 ml. of water and boil 3 min. to remove Cl<sub>2</sub>. Dil. to 250-300 ml., cool under running water, add 15 ml. of H<sub>3</sub>PO<sub>4</sub>, d. 1.37, a measured vol. of standard FeSO<sub>4</sub> soln. and 2-3 drops of indicator soln. (Dissolve the phenanthroline in 0.025 M FeSO<sub>4</sub> soln. so that the ratio of org. compd. to Fe is 3:1.) Titrate at once with 0.05 N KMnO<sub>4</sub> till the color changes from pink to a clear green. Add sufficient NaOAc to react with all the free HClO<sub>4</sub> present (1.6 g. for each ml.), heat to 50° and titrate at once with KMnO<sub>4</sub> to the same end point. W. T. H.

**Separation of gold from tellurium.** Victor Lenher, G. B. L. Smith and D. C. Knowles, Jr. *Ind. Eng. Chem., Anal. Ed.* 6, 43-5 (1934).—At a  $p_{H_2}$  somewhat greater than 1, Au can be pptd. quantitatively by HNO<sub>3</sub>. Suitable conditions are obtained by the presence of 1.5% HCl and Rochelle salt as a buffer. Au is also pptd. completely by FeSO<sub>4</sub> in the presence of 1-2% HCl. Under these conditions Te is not pptd. Detailed directions are given for carrying out the analysis. W. T. H.

**Determination of lead with picrolonic acid.** Friedrich Hecht, Wilhelm Reich-Rohrig and Hermann Brantner. *Z. anal. Chem.* 95, 152-63 (1933).—In a previous paper (Dworzak and Reich-Rohrig, *C. A.* 25, 5865) it was shown that picrolonic acid is a suitable reagent for the macro- and microdetn. of Ca. With this reagent, Pb forms a ppt. corresponding to the formula Pb(C<sub>10</sub>H<sub>7</sub>N<sub>3</sub>O<sub>4</sub>)<sub>2</sub>·1.5H<sub>2</sub>O. In water at 0° the soly. of the salt corresponds to about 7 mg. Pb per l. The reaction takes place best in a soln. which is neutral to litmus in a vol. of about 50 cc. per 0.1 g. Pb and in the absence of much alkali or NH<sub>4</sub> salt. As reagent a soln. of 2.64 g. picrolonic acid per l. is recommended. Special app. is described and shown for the microdetn. The procedure is particularly suitable for detg. Pb in the presence of small quantities of Pt such as are present in solns. after the use of Pt vessels. W. T. H.

**Determination of lead as lead hydrogen arsenate.** C. L. Dunn and H. V. Tartar. *Ind. Eng. Chem., Anal. Ed.* 6, 64 (1934).—An attempt was made to det. Pb as PbHAsO<sub>4</sub>, and it was found that at  $p_{H_2}$  = 4.6 fairly satisfactory results could be obtained, but the method is not as adaptable as is either the sulfate or chromate method for detg. Pb. W. T. H.

**Determination of lead as carbonate and its separation from silver by means of carbonic acid in the presence of a little pyridine.** A. Jilek and J. Kota. *Collection Czechoslov. Chem. Communications* 5, 396-410 (1933) (in French).—To the neutral soln. contg. not more than 0.2 g. Pb or 0.2 g. Ag, add an aq. 10% pyridine soln. until the reaction is alk. to methyl orange. Allow the mixt. to stand 5 min., add 5 ml. of 98% alc. and 15 ml. of the dil. pyridine soln. Introduce a stream of CO<sub>2</sub> for 45 min. Filter and wash with 100 ml. of water satd. with CO<sub>2</sub> and

contg. 4 ml. of alc. and 4 ml. of dild. pyridine. Weigh as PbCO<sub>3</sub> after drying at 100°. Make the filtrate acid with AcOH, evap. to a convenient vol. and det. the Ag as AgCl in the usual way. W. T. H.

**Iodometric determination of silver.** M. L. Josien. *Compt. rend.* 197, 1324-6 (1933).—The best conditions for the titration are obtained by adding the AgNO<sub>3</sub> soln. to an alkali iodide soln. contg. a drop of I<sub>2</sub> in alc. of such diln. that 1 drop of the AgNO<sub>3</sub> soln. will decolorize the soln. in the absence of halide. In this way the oxidation of I<sup>-</sup> to IO<sub>3</sub><sup>-</sup>, which takes place in the presence of considerable Ag<sup>+</sup>, is avoided. W. T. H.

**The titration of bivalent tin with potassium chlorate.** E. Azzarello and F. Abramo. *Ann. chim. applicata* 23, 438-50 (1933).—Polemic (cf. Kulwarskaja, *C. A.* 26, 5020). A. W. Contieri

**Conditions for the precipitation of zinc sulfide and of hydrated alumina add a method for the gravimetric separation of zinc and aluminum. III. Conditions for the precipitation and weighing of hydrated alumina.** J. N. Frers. *Z. anal. Chem.* 95, 113-38 (1933); cf. *C. A.* 28, 4312.—The literature concerning the pptn. and handling of Al<sub>2</sub>O<sub>3</sub>·xH<sub>2</sub>O ppts. is reviewed carefully and some further expts. are performed; as a result the following procedure is recommended: To 200 cc. of soln. contg. the equiv. of about 0.2 g. of Al<sub>2</sub>O<sub>3</sub> and 4 g. of NH<sub>4</sub>Cl or NH<sub>4</sub>NO<sub>3</sub>, add 10 drops of phenol red indicator soln., heat to boiling and add, while the soln. is cooling, some fresh NH<sub>3</sub> soln. (prepd. by passing NH<sub>3</sub> for 5 min. through about 200 cc. of water) until the indicator shows a color change. Boil 2 min. and filter through a 15-cm. ashless paper. Wash the ppt. with a hot soln. contg. 2% of NH<sub>4</sub> salt which has been made barely alk. to phenol red. Ignite at 1200° for 10 min. after careful drying and burning of the paper. Allow the uncovered crucible to remain 1 hr. in the desiccator and 10 min. in the balance case before weighing. IV. Separation of zinc from aluminum. *Ibid.* 138-42

The soln. should not contain more than 0.5 g. of Zn. Dil to 400 cc. and add 16 g. of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, 20 drops of tropaeolin 00 indicator soln. and sufficient freshly prepd. NH<sub>3</sub> soln. to make the soln. of the same color as that which the indicator gives with a comparison soln. prepd. by taking 400 cc. of water, 20 drops of tropaeolin 00 indicator soln. and just sufficient H<sub>2</sub>SO<sub>4</sub> to cause the change in color. Use some of this same soln. hot and satd. with H<sub>2</sub>S as a wash water. If the original soln. is alk. to the indicator, add sufficient H<sub>2</sub>SO<sub>4</sub> to give it the same color as that of the comparison soln. To the soln. to be analyzed add finely shredded filter paper pulp equal to 1/2 of an 11-cm. ashless filter, heat to boiling, remove the flame and conduct a stream of H<sub>2</sub>S through the soln. at a lively rate for 10 min. Continue passing the gas at a slower rate for 30 min. In this way a ppt. of pure ZnS is obtained which will not run through a good filter paper if it has been allowed to stand in the funnel covered with water for 1 hr. Filter off the ZnS and wash thoroughly. Ignite the ppt. and filter in a glazed crucible with abundant access of air for about an hr. until all the C of the filter paper is consumed. Then heat in a glazed Rose crucible for 10 min. at dull redness in a stream of H<sub>2</sub>S. Allow to cool 5 min. in the H<sub>2</sub>S stream, and weigh as ZnS. In the filtrate det. Al as described in Part III of this paper. W. T. H.

**Determination of nitrogen by combustion in the electric arc.** W. D. Treadwell and Th. Zurrer. *Helv. Chim. Acta* 16, 1180-7 (1933).—The detn. of N in gaseous mixts. has been accomplished by Antropoff (*C. A.* 14, 1470) by oxidation in the elec. arc and absorption of the nitrous oxides formed in strong KOH soln. A considerable improvement consists in keeping the gas moving across the arc formed between 2 stout Pt wires and interposing a soln. of dil. NaOH in the path of the gas. Then, by measuring the decrease in elec. cond. of the NaOH soln. the percentage of N absorbed can be computed. The necessary app., procedure and method of computing the results are explained in detail. The loss in cond. is proportional to the N content of the gas provided it is in the presence of sufficient O<sub>2</sub>. Pure N<sub>2</sub> has no effect upon the cond. The NaOH soln. contains a mixt. of nitrite and nitrate after

the absorption, but the relative proportions of these constituents depends largely upon the prevailing conditions under which the expt. is conducted. W. T. H.

**The bromine method for determining ammonia nitrogen in chemically pure salts.** B. I. Levi. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 92, 165-8 (1932).—L. shows that the error involved in detg.  $\text{NH}_3$  by measuring the vol. of  $\text{N}_2$  evolved by the action of  $\text{Br}_2$  in an alk. soln. lies in the method of adding the  $\text{Br}_2$  water. J. S. Joffe

**The bromine method for the determination of nitrogen in technical products and in fertilizers.** M. L. Chepelevetzkii, S. I. Pozdnyakova and R. D. Fain. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 92, 168-76 (1932). In detg. N present as  $\text{NH}_4$  salt by the  $\text{Br}_2$  method, as outlined by L. (preceding abstract), the  $p_{\text{H}}$  of the medium is important. The most satisfactory reaction is in the  $p_{\text{H}}$  interval of 7.5 to 9.5. The authors suggest the use of buffer phosphate solns. in place of the  $\text{NaHCO}_3$  used by Levi. In the presence of  $\text{Fe}^{+++}$  some of the  $\text{NH}_3$  may be oxidized to  $\text{NO}_2$ . By adding  $\text{PO}_4^{---}$  the  $\text{Fe}^{+++}$  effect is eliminated. J. S. Joffe

**The bromine method in determining total nitrogen in calcium cyanamide.** M. L. Chepelevetzkii and R. D. Fain. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 92, 177-80 (1932).—To 5 g. of  $\text{CaCN}_2$  in a 500-cc. Kjeldahl flask add 15 g. of powd.  $\text{K}_2\text{SO}_4$  mix., and add 50 cc. of concd.  $\text{H}_2\text{SO}_4$ . Heat slowly over an open flame for 30 min. and then keep slowly boiling for 45 min. Transfer the soln. to a 500 cc. measuring flask, make up to the mark and take 50 cc. of soln. for the analysis, first filtering if necessary. J. S. Joffe

**Determination of nitrates by the bromine method.** M. L. Chepelevetzkii and R. A. Fiskina. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 92, 180-4 (1932).—By means of Al powder (3 g. for 0.25 g.  $\text{KNO}_3$  in 50 cc. of 10%  $\text{H}_2\text{SO}_4$  soln.) the nitrate is reduced to  $\text{NH}_4$ . J. S. Joffe

**Use of aeration in Kjeldahl distillations.** W. B. Melman, R. Melampy and W. D. Myers. *Ind. Eng. Chem., Anal. Ed.* 6, 63-4 (1934).—Studies on the recovery of  $\text{NH}_3$  during aeration at different temps. illustrate the advantage to be gained with respect to time required and lack of lumping. W. T. H.

**Direct determination of cementite in iron.** Walter Paulkloh and Oskar Klockl. *Z. anorg. allgem. Chem.* 215, 1-54 (1933).—Carbide C is usually detd. by subtracting the graphite from the total C. In this paper an attempt is described to make the direct analysis depending on the detn. of the Fe content of the residue insol. in dil.  $\text{H}_2\text{SO}_4$  and the analysis of the evolved gases, which contain over 90%  $\text{H}_2$ . The results were not altogether satisfactory, as the results are dependent upon the time spent in dissolving the same in dil.  $\text{H}_2\text{SO}_4$ , the temp. employed and the physical condition of the cementite. W. T. H.

**Detection and determination of fluorides.** I. M. Korenman. *Z. anorg. allgem. Chem.* 216, 33-40 (1933).—Fluoride can be detd. by measuring the loss in color which a soln. of  $\text{H}_2[\text{TiO}_2(\text{SO}_4)_2]$  undergoes when it reacts with  $\text{F}^-$  to form colorless  $\text{H}_2\text{TiF}_6$ . A soln. contg. 0.15 mg. Ti per cc. is a suitable standard. To the  $\text{F}^-$  soln. add 5 cc. of the standard, followed by 3 cc. of 3%  $\text{H}_2\text{O}_2$  and water to make 25 cc. Compare with a standard in the colorimeter, dilg. the stronger soln. until it matches the weaker one. A sensitive test paper for  $\text{F}^-$  can be prepd. by taking 0.25 g.  $\text{Zn}(\text{NO}_3)_2$  in 60 cc. of water, mixing with a filtered soln. of 0.15 g. of Na alizarine sulfonate in 40 cc. of alc. and dipping pieces of ashless filter paper in the mixt. The dry paper should be moistened with dil. HCl when used as a test. The intense violet-red lake becomes yellow when  $[\text{TiF}_6]^-$  is formed. W. T. H.

**Argentometric estimation of iodides with cinchonine-bismuth nitrate as indicator.** R. Uzel. *Collection Czechoslov. Chem. Communications* 5, 383-95 (1933) (in English).—In an acid soln.,  $\text{Bi}^{+++}$ , cinchonine and  $\text{I}^-$  give an orange-red ppt. of  $\text{C}_{20}\text{H}_{27}\text{N}_3\text{O}_2\cdot\text{HBiI}_4$ . The reaction can be used as a test for  $\text{I}^-$  or for  $\text{Bi}^{+++}$ . For the volumetric detn. of  $\text{I}^-$ , add a little of the reagent (dissolve 2.33 g. of  $\text{Bi}_2\text{O}_3$  in 10 ml. of hot, concd.  $\text{HNO}_3$ , dil. somewhat with water and add 2.94 g. of cinchonine; dil. to 100 ml., add

0.1 g. of urea to remove any  $\text{HNO}_3$  present) and titrate with standard  $\text{AgNO}_3$  soln. until the red color disappears and the ppt. is all AgI of pale yellow color. The titration takes place best at  $p_{\text{H}}$  about 4. Before starting the titration, therefore, add 3-5 drops of 2 N  $\text{HNO}_3$  to 10-50 ml. of iodide soln. and 0.5-1 ml. of the indicator soln. The results given averaged 0.5% too low. The titration succeeds fairly well in the presence of considerable  $\text{Br}^-$  provided some isopropyl alc. is added to suppress the ionization of the halides; about 50% of the alc. should be used. If  $\text{CN}^-$  is present, it is necessary to use more  $\text{HNO}_3$  and titrate more slowly toward the last. If considerable  $\text{Fe}(\text{CN})_6^{---}$  is present, it is well to add some  $\text{Zn}^{++}$ . Similarly,  $\text{Zn}^{++}$  should be added if  $\text{Co}(\text{CN})_6^{---}$  is present. With nitroprusside, it is best to work at a greater diln. and match the end point with a suspension of AgI in nitroprusside soln. W. T. H.

**New volumetric method for determination of sulfate.** V. R. Damerell and H. H. Strater. *Ind. Eng. Chem., Anal. Ed.* 6, 19-21 (1934).—A procedure is described in which the end point of the reaction between  $\text{BaCl}_2$  and  $\text{SO}_4^{--}$  is detd. by counting the time necessary to produce a yellow coloration of "turpeth" when a portion of the titrated soln. is added to a suitably prepd. nearly neutral soln. of  $\text{Hg}(\text{NO}_3)_2$  on a spot plate. As long as appreciable quantities of  $\text{SO}_4^{--}$  remain in the soln., the color quickly assumes a tint exceeding that of a color standard made from dil.  $\text{K}_2\text{Cr}_2\text{O}_7$ ,  $\text{K}_2\text{SO}_4$  and  $\text{BaCl}_2$ . When less color develops in 30 sec. the reaction is considered finished. The  $\text{BaCl}_2$  soln. should be standardized similarly, as the results do not correspond precisely to the stoichiometric equivalents. The procedure is recommended for routine work. W. T. H.

**The effect of acetic acid upon traces of lead chromate.** Lawrence T. Fairhall and Keiji Akatsuka. *J. Am. Chem. Soc.* 56, 14-15 (1934).—As little as 0.01 mg. of Pb in 50 ml. of soln. contg. 1 drop of glacial  $\text{AcOH}$  and a little  $\text{K}_2\text{CrO}_4$  gives a clearly visible Tyndall beam, but when the acid is absent no Tyndall effect is observed. The reason lies in the fact that  $\text{PbCrO}_4$  forms a *cryst.* ppt. in the former case and an amorphous ppt. in the latter. The  $\text{AcOH}$  has no appreciable effect on the soly. of  $\text{PbCrO}_4$ . W. T. H.

**Toxicological detection of hydrocyanic acid.** Pedro Peluffo. *Anales asoc. quim. farm. Uruguay* 36, 95-118 (1933).—A discussion, with bibliography. L. E. G.

**The silver iodide test for hydrocyanic acid.** Denis L. Fox. *Science* 79, 37 (1934).—Guignard's test with Na picrate paper is very delicate for detecting traces of HCN in the air but is not altogether specific. The following test, therefore, is valuable for confirmation. Place 1 drop of 5% KI soln., 1 drop of 0.001 N  $\text{AgNO}_3$  and 1 cc. of 5% KOH in a small clean test tube. A faint bluish cloud of AgI will form. Draw air through the liquid, and if HCN is present in the air, the turbidity will disappear. W. T. H.

**Determination of borate ion in ores of borax.** H. L. Pavuc. *Ind. Eng. Chem., Anal. Ed.* 6, 45-6 (1934).—Digest 2.5 g. of sample with 5-10 ml. of water and 10 ml. of 6 N HCl in a covered vessel heated on the water bath. Filter into a 250-ml. measuring flask. To the filtrate (about 200 ml.) add strong NaOH soln. until nearly neutral to methyl red. Boil 15 min. under a reflux condenser to remove  $\text{CO}_2$ . Cool, wash down the sides of the condenser and complete the neutralization with  $\text{Ca}(\text{OH})_2$  soln. added up to the 250-ml. mark. Mix, filter, and to an aliquot part of the filtrate add methyl red and sufficient HCl to give an acid reaction. Then add NaOH from a buret until a full lemon color is obtained. To the soln. then add resorcinol and titrate to a phenolphthalein end point. W. T. H.

**Determination of mercurous mercury, chloride or bromide ion.** L. v. Zombory and L. Pollak. *Z. anorg. allgem. Chem.* 215, 255-6 (1933).—Z. has already recommended bromophenol blue and bromocresol green (C. A. 24, 569) as indicators for titrating  $\text{Hg}^+$ ,  $\text{Cl}^-$  or  $\text{Br}^-$ . In this paper, chlorophenol red or bromocresol green is shown to serve a similar purpose. To det.  $\text{Cl}^-$  or  $\text{Br}^-$  add 5-10 drops of a soln. contg. 0.1 g. of the indicator in 100 cc

of 20% alc. and titrate with standard  $\text{HgNO}_3$  soln. until the indicator changes to a lilac color. To det.  $\text{Hg}^+$ , add an excess of  $\text{KBr}$  or  $\text{KCl}$  and titrate the excess with standard  $\text{HgNO}_3$  soln. W. T. H.

**A rapid method for quantitative estimation of arsenic in arsphenamine.** Harold N. Wright. *Proc. Soc. Exptl. Biol. Med.* 31, 170 2(1933). In Gaebel's method (C. A. 5, 2895) of direct titration of As in arsphenamine with a standard I soln., the reaction is incomplete. If the initial  $p_H$  is not below 2, the reaction reaches a point of equil. when  $7.55 \pm 0.03$  mols. of I (theoretical 8.0) has been used. If this is taken into consideration, the results are good. C. V. Bailey

**A manometric micro method for determination of carbon in organic compounds.** Donald D. Van Slyke, Irvine H. Page and Esben Kirk. *J. Biol. Chem.* 102, (35-49) (1933). Modifications of the original method of Backlin (C. A. 25, 1887) are described, the org. material being oxidized with a mixt. of  $\text{CrO}_3$ ,  $\text{H}_2\text{SO}_4$  and  $\text{H}_3\text{PO}_4$  and the  $\text{CO}_2$  detd. in the chamber of the Van Slyke-Neill blood-gas app. After absorption with  $\text{NaOH}$  the  $\text{CO}_2$  is set free by acidifying and its vol. detd. With 0.2-0.6 mg. C the error is below 0.7%, and the time required for 1 analysis is 10 min. K. V. Thimann

**Qualitative method for selenium in organic compounds.** M. J. Horn. *Ind. Eng. Chem., Anal. Ed.* 6, 34-5(1934).

To detect Se in plants grown on soil contg. Se, digest 1 g. of the dried sample in a Kjeldahl flask with 40 cc. of concd.  $\text{H}_2\text{SO}_4$  and 0.2 g. of  $\text{HgO}$  until the mixt. is colorless. Cool and make up to a definite vol. with concd.  $\text{H}_2\text{SO}_4$ . To 5 cc. of the cooled digest, add 2 drops of 3% aq. soln. of codeine sulfate, cooling and shaking after each drop. A green color changing to blue develops if Se is present. To test a soil, centrifuge the cooled digest and apply the test to the clear, supernatant soln. The depth of color shows, by comparison with the standards, the quantity of Se present. W. T. H.

**Platinized silica gel as a catalyst in gas analysis. II. Oxidation of the methane hydrocarbons.** Kenneth A. Kobe and E. Bruce Brookbank. *Ind. Eng. Chem., Anal. Ed.* 6, 35-7(1934); cf. C. A. 27, 2107. The conclusions drawn from a series of tests are: (1) No oxidation occurs with  $\text{C}_2\text{H}_6$  at  $350^\circ$ , with  $\text{C}_2\text{H}_4$  at  $230^\circ$ , with  $\text{C}_2\text{H}_2$  at  $130^\circ$  or with  $\text{C}_2\text{H}_6$  at  $120^\circ$  when heated with  $\text{O}_2$  in a tube contg. platinized silica gel. Oxidation starts at about  $20-5^\circ$  higher but is incomplete even at  $400^\circ$ . (2)  $\text{H}_2$  and  $\text{CO}$  can be oxidized simultaneously at  $300^\circ$  in the presence of  $\text{CH}_4$ , but the results are inaccurate if higher homologs are present as in city gas. (3) A comparison of the  $\text{CuO}$  method with that of the catalyst tube method shows that the catalyst introduced no more error, due to absorption, than do the liquid reagents. W. T. H.

**Critical study of the determination of ethane by combustion over platinum in the presence of excess oxygen.** Martin Shepherd and Joseph R. Branham. *Bur. Stand. J. Research* 31, 783-97(1933) (Research Paper No. 625). The slow combustion of  $\text{C}_2\text{H}_6$  over glowing Pt in the presence of  $\text{O}_2$  was followed by measuring the contraction in vol., the vol. of  $\text{CO}_2$  produced and the  $\text{O}_2$  consumed. The observations invariably gave too high values for the first and last and too low values for the  $\text{CO}_2$  formed. This may be due to loss of ethane and  $\text{CO}_2$  in the distributor and  $\text{CO}_2$  absorbed by the  $\text{H}_2\text{O}$ . Fairly good values are obtained by applying corrections for these errors. The results conform closely to the equation  $\text{C}_2\text{H}_6 + 3.153 \text{ O}_2 = 1.994 \text{ CO}_2 + 2.520 \text{ H}_2\text{O}$ , where  $\text{TC}$  is the total contraction of the gas vol. W. T. H.

**Detection of trichloroethylene and other organic solvents containing halogen.** A. Bruning and M. Schnetka. *Arch. Gewerbehyg. Gewerbehyg.* 4, 740 7(1933).—The Fujiwara reaction was used for the detn. of  $\text{C}_2\text{HCl}_3$ . White rats were killed with  $\text{C}_2\text{HCl}_3$  and kept for 27 days. The organs were then removed, slightly acidified with tartaric acid and st. am-distd. Fractions of the distillate were tested colorimetrically with the following amts. of  $\text{C}_2\text{HCl}_3$  per g. organ: brain 0.02 mg., lungs 0.2 mg., liver 0.13 mg., heart and kidneys 0.09 mg., stomach and intestines 0.14 mg. Helen Lee Gruel

**A new method for determining acetic acid anhydride.** E. Berl and H. Türck. *Z. anal. Chem.* 95, 143-52(1933).—A calorimetric method is proposed in which the detn. of  $\text{Ac}_2\text{O}$  is based upon the measurement of the heat of sapon when the reaction between the anhydride and 15%  $\text{AcOH}$  is made to take place adiabatically in a Weinhold-Dewar vessel. The method is rapid and accurate. W. T. H.

**Microdetermination of lactose.** J. M. Clavera and F. Moreno Martin. *Bull. soc. chim.* 53, 1103(1933).—Fromageot and Moulin (C. A. 27, 3184) have recently described an adaptation of a well-known method for detg. dextrose to the detn. of lactose. C. and M. have described a similar method (C. A. 25, 203). W. T. H.

**A new color reaction for the microestimation of *d* fructose.** Kichinosuke Yamada. *Japan. J. Med. Sci. II. Biochem.* 2, 93-105(1933).—"Cryogénine Lumier," a French dye, is  $\alpha$ -benzamidsemicarbazide. It forms characteristic compds. with sugars. A hot soln. of glucose acidified with  $\text{HCl}$  to which a small quantity of the cryogénine is added develops a reddish violet color. With a levulose soln. the dye develops a bluish violet color. In alk. soln. both sugars develop a yellowish orange color, but regain the original color upon acidification. A 12%  $\text{HCl}$  concn. is optimum. Heating for 3 min. in a water bath brings out the max. color. The test tube is then cooled with running water. Under some conditions, however, concns. of glucose, equiv. to those found in blood, fail to yield the color reaction. Levulose, on the other hand gives a pos. reaction in as small a quantity as 0.002 mg. This new reaction exceeds the diphenylamine method for the estn. of levulose in simplicity and definiteness. B. S. Levine

**New method for determining pyridine in dilute solution.** Mircea V. Ionescu and Horia Siusanschi. *Bull. soc. chim.* 53, 1087-96(1933).—A dil. aq. soln. of pyridine (Py) unites with an aq. soln. of  $\text{HgCl}_2$  or  $\text{CdCl}_2$  to form a ppt. of  $[\text{CdPy}_2]\text{Cl}_2$  or  $[\text{HgPy}_2]\text{Cl}_2$ . By measuring the time that it takes to give a noticeable ppt. the quantity of pyridine can be detd. A very complete bibliography is given. W. T. H.

**Determination of small quantities of nitrobenzene in oils.** C. E. Anding, Jr., B. Ziebel and W. M. Mulisoli. *Ind. Eng. Chem., Anal. Ed.* 6, 41-3(1934).—The method described depends on heating the sample under a reflux condenser with a measured vol. of standard  $\text{Ti}_2(\text{SO}_4)_3$  soln. in an atm. of  $\text{CO}_2$  while constantly agitating the liquid. After the heating, the soln. is cooled and the excess  $\text{Ti}$  detd. by titrating with standard ferric alum soln., adding  $\text{NH}_4\text{CNS}$  toward the last. When 20%  $\text{Ti}^{4+}$  in excess is added, the reduction of the nitrobenzene is about 98%, complete but with  $\text{SnCl}_2$  only 80% reduction is obtained even when an excess of 150% is added. W. T. H.

**Aminometry.** D. Vorländer, Josef Fischer and Felicitas Wildner. *Ber.* 66B, 1789 9(1933).—Vorländer and Wolferts (C. A. 17, 3169) in their studies with amino-azo compds. have shown that the change in color which they undergo on treatment with  $\text{HCl}$  in the absence of water is to be regarded as an addn. of  $\text{HCl}$  to the amino group rather than a mere salt formation. In other words, they regard the amino function as not merely that of a base. In this paper it is shown that many other amines, such as tripropylamine, benzylmethylamine, diethylamine, piperidine, toluidine, xylydine, cumidine, naphthylamine, an. choline, strychnine and brucine, can be titrated in  $\text{CHCl}_3$  soln. with an anhyd. soln. of  $\text{HCl}$  in  $\text{CHCl}_3$  with a soln. of dimethylaminoazobenzene in alc. as indicator. At the end point the soln. changes from yellow to red. W. T. H.

**Technic in chemical analyses of casein.** R. S. Snyder and H. C. Hansen. *Ind. Eng. Chem., Anal. Ed.* 5, 400-12(1933).—The conditions suitable for detg.  $\text{H}_2\text{O}$ , N, fat and  $p_H$  are described. Cond. values are given and shown to be related to acidity, ash content and soly. The borax soly. test needs further investigation. H. K. Salzberg

**Detn. of nitrate N by Devarda's method (Bach) 11B.** Analytical and quant. lines of Ag, As, Bi, Cd, Cu, Hg, Pb, Sb and Sn in the arc spectrum (Péla de Rubies, Anat. Barges) 3.

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIER

Some relationships between the reflectivities of sulfide ore minerals. F. Coles Phillips. *Mineralog. Mag.* 23, 458-62(1933).—See C. A. 27, 2114. A. M. Brant

The solubilities of metallic sulfides in alkali sulfide solutions. John W. Gruner. *Econ. Geol.* 28, 773-7(1933).—Expt. indicates that hot alkali sulfide solns. do not play an important role as carriers of metals, with the possible exception of Sb, As and Hg. A. M. Brant

The occurrence of gallium in the sulfide ores of Ridder, Altai. A. A. Grinberg, A. N. Filippov and I. I. Yasvonskii. *Compt. rend. acad. sci. U. R. S. S.* 1933, 69-71. The richest source of Ga was the Zn concentrate obtained by flotation. It contained 5-8 mg. Ga per kg., chiefly in assocn. with sphalerite. S. Bradford Stone

Silver- and bismuth-bearing galena from Leadville. E. P. Chapman and R. E. Stevens. *Econ. Geol.* 28, 678-85(1933).—The mineral is light- to steel-gray in color and has a brilliant metallic luster and dark gray streak. The cubic cleavage is poorly developed, and the etch patterns with HCl, HNO<sub>3</sub> and FeCl<sub>3</sub> differ from galena. Analysis shows 6.40% Ag, 12.15% Bi, but the x-ray pattern resembles galena. It is probably a solid soln. of Ag<sub>2</sub>S.Bi<sub>2</sub>S<sub>3</sub> in galena. A. M. Brant

Pyrite in coal beds of the Ruhr. H. Winter and G. Free. *Gedachn.* 69, 794-801(1933).—Pyrite is present mostly in massive form—"sulfur balls." It does not contain noble metals. During formation, vitrain has taken it up more readily than durain. Pyrite is also found as an incrustation on the cell walls of fusain, and sometimes fills the cells. In the Ruhr the mineral may be pyrite, marcasite or a mixt. of the 2. J. D. Davis

Portlandite, a new mineral from Scawt Hill, Co. Antrim. E. Tilley. *Mineralog. Mag.* 23, 419-20(1933).—Crystals of Ca(OH)<sub>2</sub> were found assocd. with coarse-grained asfwillite and calcite. The phys. and optical properties agree with those of artificial rhombohedral Ca(OH)<sub>2</sub>. The name *portlandite* is proposed. A. M. Brant

A new barium plagioclase feldspar. S. R. Nockolds and E. G. Zies. *Mineralog. Mag.* 23, 448-57(1933). The Ba content of a rock from the Broken Hill district proved to be present in a *barium-anorthite*. The recalcd. av. analysis is: SiO<sub>2</sub> 44.6, Al<sub>2</sub>O<sub>3</sub> 33.0, CaO 14.0, BaO 5.7, Na<sub>2</sub>O 2.0, K<sub>2</sub>O 0.7, sum 100%; sp. gr. 2.872. It is optically -; optic angle 78°;  $\alpha = 1.571$ ,  $\beta = 1.580$ ,  $\gamma = 1.585$ . The cleavage (010) and (001) are well developed, the angle being approx. 94°. A. M. Brant

Piedmontite in quartz-muscovite-schist from Shotover Valley, western Otago, New Zealand. F. J. Turner. *Mineralog. Mag.* 23, 416-18(1933).—The piedmontite occurs as slender prismatic crystals assocd. with muscovite. It is intensely pleochroic,  $\alpha$  clear canary-yellow,  $\beta$  pale anethyst,  $\gamma$  deep purplish red. Sign of elongation is +, and the optic angle is large. A. M. Brant

The crystal form and molecular unit of rinkite. R. Gossner and O. Kraus. *Centr. Mineral. Geol.* 1933A, 369-74. Rinkite is orthorhombic with  $a = 18.47$ ,  $b = 5.67$ ,  $c = 7.46$  A. U. The space group could not be definitely detd., but may be  $V_h^{22}$  or  $V_h^{24}$ , with 4 mols. in the unit cell;  $d = 3.458$ . Ce is probably quadrivalent, replacing Ti. Michael Fleischer

Zeolites. V. Mesolite. Max H. Hey. *Mineralog. Mag.* 23, 421-47(1933); cf. C. A. 27, 2010. New and compiled chem. data, optical and x-ray data indicate that mesolite is an independent species, iso-structural but not isomorphous with natrolite and scolecite. The unit cell has dimensions  $a = 56.7$ ,  $b = 6.56$ ,  $c = 1844$  A.,  $\beta = 90.01^\circ$ , and contains  $\text{Na}_{10}\text{Ca}_{10}\text{Al}_{10}\text{Si}_{10}\text{O}_{400}\cdot 64\text{H}_2\text{O}$ . The space group is  $C_2$ . A small but definite pyroelectric effect was obtained,  $b$  being the polar axis. Goniometric data are given and optical properties, vapor pressure and base exchange are discussed in detail. A. M. Brant

The dusky apatites of the Eakdale (Cumberland)

granite. Brian Simpson. *Geol. Mag.* 70, 375-8(1933).—Large amts. of finely divided inclusions occur in the apatite crystals. Lack of uniformity of disposition indicates their prior existence and incorporation by the apatite as it crystd., rather than simultaneous crystn. A. M. B.

Meteoritic iron and silica glass from the meteorite craters of Henbury (Central Australia) and Wabar (Arabia). L. J. Spencer. *Mineralog. Mag.* 23, 387-404(1933); cf. C. A. 26, 4775; 27, 2911.—The meteoric irons from these localities are similar in structure and compn. Both are medium octahedrites with 7.3% Ni. The larger pieces show normal lamellar structure, but the smaller show a granulation which indicates heating above 850°. Analyses of the meteoric irons and iron-shale which occurred in large quantities, also of silica glass and sandstone, are given. Black spots in the vesicular silica glass abundant at Wabar proved to be nickel-iron. Indications are that on impact of the mass of meteoric iron with the earth's crust an explosion occurred which backfired everything out to form the crater. Part of the meteorite was vaporized and also the sandstone, forming the vesicular glass. Small pieces were torn from the meteorite and their structures altered by heating. A. M. Brant

The depth zones in ore deposition. L. C. Craton. *Econ. Geol.* 28, 513-55(1933).—The depth relations of hydrothermal ore minerals are discussed and a classification into 5 zones is made. A. M. Brant

Prospecting in Kenya by earth-augering. A. J. P. Walter. *Mining Mag.* 49, 329-41(1933).—Over 60,000 ft. of sampling by this means has been completed in the Kakamega gold field and hardly a hole has failed to reveal at least a speck of Au. The granite penetrating the underlying metamorphic rocks is remarkable for its marginal basic differentiates, and a series, gradually increasing in acidity, can be traced from the chilled, highly basic edge to the coarse porphyritic granite itself, within less than 5000 ft. Au is found in quartz veins, as a mineralization along fault-planes (but with little or no vein quartz), in contact deposits with pyrite and arsenopyrite, in mineralized dikes, and in highly oxidized leached sulfide lodes. Mineralized fault-planes are likely to prove the most valuable. The procedure adopted in sampling is described in detail. A. W. Furbank

Wall-rock mineralization along Ontario gold deposits. George W. Rain. *Econ. Geol.* 28, 705-43(1933).—A study of wall-rock mineralization along Au lodes in this district gives a rough measure of the ore value and aids in the interpretation of diamond-drill results. Mineralization fringes of a rotation type on pyrite metacrusts indicate high-grade lodes in the Pearl Lake deposit, while compressional fringes indicate low-grade lodes, and absence of fringes barren lodes. The relative amt. of replacement of feldspars and groundmass of brittle intrusive rocks by chlorite indicates the grade of ore in the adjacent lode at Kirkland Lake. A. M. Brant

Special features of fine gold from Snake River, Idaho. Thomas H. Hite. *Econ. Geol.* 28, 686-91(1933); cf. *Ibid.* 250-65.—The flour Au is in flattened oval or disk-shaped flakes. Many disks are coated with CaCO<sub>3</sub> or clay and have thickened rims. The av. ratio of thickness to diam. is 1:5. The wt. varies from 5000 grains or "colors" per 1 cent value of the typical flour Au down to 4,400,000 colors. A. M. Brant

The chalcocite and native copper types of ore deposits. Edson S. Bastin. *Econ. Geol.* 28, 407-46(1933).—The standard types of Cu deposits contg. chalcocite and pyrite or pyrrhotite are thought to indicate an abundance of Fe and S in the solns. from which they were deposited. Deposits characterized by rich Cu minerals, native Cu, chalcocite and bornite have resulted from a removal of Fe and S from ores of the standard type by a process of chalcocite downward enrichment, deposition from ground waters within bodies of sedimentary rocks and from waters of shallow lagoons. The presence of org. remains or bac-

terial action generating  $H_2S$  are considered to cause the reduction. A 2nd group of ores carrying rich Cu minerals, in which native Cu is abundant, appear to have resulted from the removal of Fe and S from the magmatic solns. by interaction with wall-rock. The Lake Superior and Corocoro deposits are of this type. A selected bibliography on Cu deposits of the Red Beds type is given.

A. M. Brant

**Formation of the copper deposits of Corocoro, Bolivia.** Friedrich Ahlfeld. *Centr. Mineral. Geol.* 1933A, 375-82.—Contrary to Bastin (preceding abstr.), there is no evidence of hydrothermal action. The deposits were probably formed by slow deposition from cold descending solns. contg. reducing agents such as  $FeSO_4$ . M. Fleischer

**A chalcocite deposit, Great Bear Lake, Canada.** Christopher Rikv. *Econ. Geol.* 28, 496-501(1933).—A 1-2 ft. vein of massive chalcocite lies in sharp contact with granite country rock which has been altered to a distance of 4 ft. on each side of the vein. Bornite, covellite, klaprotholite, quartz and barite are present. Microscopic evidence favors a hypogene origin. A. M. Brant

**The temperature of formation of the Mississippi lead-zinc deposits.** W. H. Newhouse. *Econ. Geol.* 28, 744-50(1933).—Liquid inclusions contg. a bubble are present in the sphalerite. By heating a polished section and inspecting with a microscope the temp. at which the bubble disappeared could be detd., and may well be the temp. of deposition. The results harmonize with data on assocd. mineralization and paragenetic relations. In the Tri-state district the temp. of deposition was 115-35° and in the upper Mississippi valley 80-105°. A. M. Brant

**The Miami-Picher zinc-lead district.** W. A. Tair. *Econ. Geol.* 28, 463-79(1933); cf. C. A. 26, 1547.—T. agrees with the magmatic origin theory, but holds that the chert is primary, laid down at the same time as the limestone. The breccias were formed by soln. of the limestone by ground water, after which magmatic solns. deposited jasperoid, sulfides and later minerals in the brecciated zones. A. M. Brant

**Catalysis and its bearing on origin of Lake Superior iron-bearing formations.** Carl Zapffe. *Econ. Geol.* 28, 751-72(1933).—The physicochem. and biochem. pptn. of Fe and Mn from soln. in run-off ground waters is discussed. Expts. at Brainerd, Minn., indicate that both catalysis and bacterial action may cause the pptn. and that some similar action in nature may have operated to produce the Lake Superior Fe formations. A. M. Brant

**Magnetite ores of northern New Jersey.** Laurence L. Smith. *Econ. Geol.* 28, 654-77(1933).—The ore bodies conform to the foliation of the country rock. Structural and microscopic evidence indicates an origin by both displacement and replacement. The ore solns. were end-phase aqueo-igneous differentiates from the same magma from which the granitic gneisses were derived. The ore deposition was preceded by injection of pegmatites and followed by hydrothermal solns. A structural weakness detd. the places of ore deposition. A. M. Brant

**The origin of Chilean saltpeter.** Julius Stoklasa and Josef Penkava. *Chem.-Ztg.* 57, 913-15(1933); cf. Kautter, C. A. 27, 2401.—Arguments are given in favor of the theory that the nitrates were formed by oxidation of  $NH_4$  salts of volcanic origin. Michael Fleischer

**The composition and origin of certain commercial clays of northern Idaho.** Edward L. Tullis and F. B. Laney. *Econ. Geol.* 28, 480-95(1933).—Residual clays from granitic and metamorphic rocks and from basalt are found. The clay minerals were formed from feldspar, biotite and muscovite. Kaolinite and the intermediate products in each case are described and chem. analyses given. The origin of the clays is attributed to weathering and not hydrothermal action. Chem. analyses of both residual and transported clays are given. A. M. Brant

**The origin of the asphalt deposits of western Kentucky.** Wm. L. Russell. *Econ. Geol.* 28, 571-86(1933).—Field relations suggest that the oil from which the asphalt was produced came from the shales in the Chester series. The deposits in general are not related to faults. Wells in the Cypress at shallow depths contain brackish water in the

lower part and heavy oil and asphalt above, indicating that the oil was altered by circulating ground water before it reached the surface. A. M. Brant

**The question of the origin of petroleum.** Karl Krejci-Graf. *Kali* 27, 235-7, 251-2, 263-5(1933).—A discussion of the question of the origin of petroleum and of the petroleum matrix, including in particular recent investigations of F. Hecht (Senckenbergiana 14, 199-200(1932)) and Potonié, (C. A. 26, 4535). Marion E. Headington

**A territory which may justify the testing for petroleum.** V. Charrin. *Chaleur & ind.* 14, 487-90(1933).—The Tertiary basin of Alès is a possible oil or asphalt-bearing field. Karl Kammermeyer

**The determination of rock constituents by semi-micro methods.** Winifred C. A. Guthrie and Christina C. Miller. *Mineralog. Mag.* 23, 405-15(1933).—The app. and details of procedure are given for a more rapid analysis of igneous rocks. A. M. Brant

**Some theoretical aspects of contamination in acid magmas.** S. R. Nockolds. *J. Geol.* 41, 561-80(1933).—The importance of the volatile constituents of the magma is emphasized. Their chief function is to form a medium of low viscosity between the xenolith or margin rock and the magma through which material can diffuse with comparative freedom. This diffusion constitutes a reciprocal reaction which tends to stabilize the mineral phases of the xenolith by equil. with the magma. Mech. disintegration of the xenolith may be brought about by (1) soln. of certain phases by the magma, (2) the wedging action of crystg. material from the magma which gradually enters the xenolith and (3) actual injection of magmatic material, especially into schistose rocks. A. M. Brant

**Pegmatites.** Frank L. Hess. *Econ. Geol.* 28, 447-61(1933).—Pegmatites are divided into 3 groups with subgroups: (1) dikes, granitic and feldspathic; (2) veins, in insol. and sol. rocks; (3) metamorphic pegmatites, progressively replaced dikes or pipes. A survey of the literature dealing with the different types is made, and the term pegmatite is defined. A. M. Brant

**A tholeiite dike near Buxton, Derbyshire.** F. Wollerton Cope. *Geol. Mag.* 70, 414-22(1933).—The rock consists of augite and plagioclase crystal-aggregates sep'd. by a glassy mesostasis with Fe ore and a chlorite mineral. The chem. analysis compares fairly well with those of other tholeiites. *Xenoliths* are also described. A. M. Brant

**The genesis of oligoclase in certain schists.** F. J. Turner. *Geol. Mag.* 70, 529-41(1933).—The mineralogical changes in green schists and related quartz-feldspathic schists of sedimentary origin are discussed. Oligoclase normally appears as a product of dynamothermal metamorphism at relatively high grades. A zone of oligoclase may be recognized in areas of progressive regional metamorphism, and the mineral forms readily during purely thermal metamorphism of medium grade in the absence of stress. A. M. Brant

**An unusual occurrence of myrmekite, and its significance.** Edwin S. Hills. *Geol. Mag.* 70, 294-300(1933). This intergrowth of plagioclase and vermicular quartz was observed in a micatoscanite. It is thought to have developed during contact-metamorphism, a transfer of material taking place in the solid state under favorable physicochem. conditions. A. M. Brant

**Contact metamorphism of the slates of Minnesota by granite and gabbro magmas.** Frank F. Grout. *Bull. Geol. Soc. Am.* 44, 989-1040(1933).—Analyses show about av. compn. for the slates— $SiO_2$  about 61%. Granite and syenite intrusions changed the slates to biotite schists in zones from a few feet to several miles wide. The chem. compn. of these schists indicates that they received no contribution from the intruded magma except by liquid injection. Slates in the gabbro contact zone became hornfels. The sequence of minerals involves a change from sericite and chlorite to cordierite and biotite and later to pyroxene, plagioclase and magnetite. The amt. of quartz is reduced and the feldspars are recrystd. and become more calcic, coarser and fresher. The contact rocks for a few feet contain more  $CaO$ ,  $MgO$ , Fe oxide and

TiO<sub>2</sub> and less K<sub>2</sub>O, SiO<sub>2</sub> and H<sub>2</sub>O than the slates. Biotite schists formed by granite contact were later changed to non-schistose hornfels by gabbro intrusions. Factors of the different contact actions of granite and gabbro are the higher temps. and lower mineralizer content in the case of gabbro and pronounced dynamic effects in the walls in the case of the granite injections. A. M. Brant

The problem of serpentinization and the origin of certain chrysotile asbestos talc and soapstone deposits. H. H. Hess. *Econ. Geol.* 28, 634-57(1933).—Serpentinization is an autometamorphic alteration occurring during the last stages of the same cycle of igneous activity as the intrusion of the ultrabasic. The talc-soapstone type of alteration called steatitization occurs at a later time; it is hydrothermal in character and can be traced to nearby younger acid intrusions. Granular ultrabasics alter to soapstones, while serpentinized ultrabasics are altered to talc along their margins and fractures. The theory of serpentinization is drawn from a consideration of field evidence of the lack of vol. change, and distribution of alteration as unrelated to borders of the ultrabasic. Other factors are the apparent immobility of the serpentinizing solns. and the failure of minerals other than serpentine, magnetite and rarely chromite to develop. The addn. of water and silica to a rock of peridotitic or dunitic compn. is thought to account for most of the serpentine formed. A. M. Brant

Studies of the mountain materials in the Björnberg field. Sven Gavelin. *Geol. Fören. Förh.* 55, 455-98(1933).—Descriptive. Several new analyses are given. W. S.

An olivine-bearing conglomerate from the island of Raasay, Inverness-shire. Charles F. Davidson. *Geol. Mag.* 70, 272-4(1933).—The coarse sandy groundmass is composed of rounded grains of olivine, with augite and plagioclase feldspar. The cementing medium is largely calcite. The olivine and augite show little decomposition. A. M. Brant

The precipitation of calcium carbonate on the Great Bahama bank. Maurice Black. *Geol. Mag.* 70, 455-56(1933).—Org. agencies are extg. only a small amt. of CaCO<sub>3</sub> from the water. In the lee of Andros Island, the sea is floored by a deposit of aragonite mud, the aragonite being in extremely small needles which remain uncemented.

1 The deposit in part is due to the physicochem. pptn. of CaCO<sub>3</sub> from the water. The important centers of pptn. are the mangrove swamps, where ammonifying and sulfate-reducing bacteria bring about the formation and pptn. of CaCO<sub>3</sub>. The probable reactions are given. These aragonite needles are carried out onto the shoals by tidal action during rough weather. A. M. Brant

Helium and the problem of geological time. Wm. D. Urry. *Chem. Rev.* 13, 305-43(1933).—A discussion of the He method of detg. the age of a mineral, including such topics as the comparison of this method with the Pb method, the limitations and the reliability of the method, and the exptl. technic. References are given. L. K.

Beryllium and helium. I The helium contained in beryls of varied geological age. Lord Rayleigh. *Proc. Roy. Soc. (London)* A142, 370-81(1933); cf. *C. A.* 27, 4164.—The He content of over 60 specimens of beryl has been detd. and assocd. with the geological age of the samples. The median and max. quantities of He in cu. mm. per g. of sample assocd. with the different ages are, resp.: Archean 6.08, 77.6; Paleozoic 1.47, 16.8; Mesozoic 0.157, 2.27; Tertiary 0.0758, 0.384. The He in beryl has thus accumulated during geological time, and was not present initially. It does not arise from the decay of any short-lived radioactive constituent, and from previous work it is known not to be due to U or Th. Calvin Brous

## 9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, OSCAR E. HARDER AND RICHARD RIMBACH

Metal resources of New Mexico and their economic features. S. G. Lasky and T. P. Wootton. *New Mexico School Mines Bull.* No. 7, 178 pp.(1933); *Econ. Geol.* 28, 766.—A summary of metal resources, descriptions of all mining districts and individual mines, production, uses and marketing. E. J. C.

Gold outputs and mining activity of Southern Rhodesia, 1907 to 1932. S. Brooke Norris. *Southern Rhodesia Geol. Survey Bull.* No. 25, 20 pp.(1933); *Econ. Geol.* 28, 703 Statistical. E. J. C.

The story of McIntyre. J. P. Bickell, et al. *Eng. Mining J.* 134, 445-96(1933).—A symposium dealing with the gold mining and metallurgical operations of the McIntyre Porcupine Mines, Ltd., described by the members of the tech. staff. W. H. Boynton

Milling methods and cost at the concentrator of the Mount Isa Mine Ltd., Mount Isa, Queensland. L. K. Jacobsen. *Proc. Australasian Inst. Mining Met.* No. 90, 191-225(1933).—The ores are complex mixts. of Pb, Zn, Fe and Ag in oxidized, semi-oxidized and sulfide form. A Pb concentrate is made by tabling, midlings being retabled. Tailings are reground. For flotation there are used per ton of ore: secondary ball mill—thiocarbamide 0.10; first series conditioning tanks—Na<sub>2</sub>S 4.00, Et xanthate 0.20, Aerofoat No. 25 0.10; second series conditioning tanks—Na<sub>2</sub>S 1.00, Et xanthate 0.20, Aerofoat 0.02 lb. For 1931-2, ore assayed Ag 5.5 oz., Pb 10.7% and Zn 4.1%. Pb concentrate assayed Ag 21.9 oz., Pb 44.4% and Zn 5.5%. Tailings contained Ag 1.6 oz., Pb 2.6% and Zn 3.8%.

Recoveries were Ag 77.1, Pb 80.1 and Zn 25.7%. Costs totaled 31.1330 s. per ton concentrates. A. H. Emery

Sintering and smelting mixed lead carbonate-lead sulfide concentrates at Mt. Isa, Queensland. F. A. Forward. *Proc. Australasian Inst. Mining Met.* No. 90, 125-89(1933).—The plant is described exhaustively. Alden H. Emery

The recovery of zinc and lead from blast-furnace slag at Trail, B. C. G. E. Murray. *Trans. Can. Inst. Mining Met.* 1933(in *Can. Mining Met. Bull.* No. 260), 562-5; cf. *C. A.* 27, 3176.—Discussion. Alden H. Emery

The solubility of tellurides in cyanide solution. P. F. Thompson. *Chem. Eng. Mining Rev.* 26(7), 90(1933).—"The detn. of the soly. products of the various tellurides and the measurement of the oxidation and reduction potentials of the tellurides would help to a better understanding of the process of dissolution." W. H. Boynton

Large cupola furnaces. Try-Chalons. *Rev. fonderie moderne* 27, 307-9(1933).—The work of Ehrhardt (*C. A.* 27, 3902) is discussed and suggestions are derived for greater economy in operation of a cupola furnace by reduction of height and improvement of combustion conditions. Max Hartenheim

Preheating of air blast in the cupola furnace. Try-Chalons. *Rev. fonderie moderne* 27, 316-18(1933).—It is shown how by preheating the air blast in cupola furnaces the output can be increased; instead of only 8-9 kg. of metal, 12.25 kg. for each kg. of burnt coke can be melted, and about 1/5 less air is required for each ton of

metal as the amt. of air required per kg. of coke remains the same. This, in turn, again reduces oxidation of the metal in the charge. Max Hartenheim

**Electric purification of blast-furnace gases.** M. Richarme. *Rev. met.* 30, 402-17, 423-52, 471-7 (1933).—Principles of electrostatic pptn. are given. Elec. equipment of different makes is described. Several plant installations are described in detail with their operating practice. J. Gat

**The fettling shop and efficiency.** W. G. Morgan. *Foundry Trade J.* 49, 337-9 (1933). D. Schaaf

**An apparatus for the growth of metal single crystals.** Maurice F. Hasler. *Rev. Sci. Instruments* 4, 656-60 (1933). R. II.

**Determination of dust content of new and waste gases in steel mill operation.** F. Lueth and K. Guthmann. *Arch. Eisenhüttenw.* 7, 343-51 (1933).—The necessity and economical advantages of removal of dust from gases used in metallurgical processes are pointed out; recent developments in dedusting installations and measurements of coarse and fine dust are described and different methods compared. In order properly to compare results obtained by different methods it is proposed to use as the unit of dust content of gases g. per cu. m. of dry gas at 0° and 760 mm. Hg. Max Hartenheim

**The manufacture and application of centrifugal castings.** T. R. Twigg. *Foundry Trade J.* 49, 321-3 (1933) D. Schaaf

**Commercial molding sand control for the modern iron-founder.** F. Hudson. *Foundry Trade J.* 49, 351-2, 360, 369-72 (1933). Downs Schaaf

**Structure of cast iron.** Maximilian Frh. v. Schwarz. *Forschungsarb. Metallkunde Röntgenmetallographie Folge* 10, 1-104 (1933).—A text dealing with all phases of the metallurgy of cast iron but with particular attention to microstructure. One hundred references. J. L. Gregg

**The design and construction of a precision high-power metallographic apparatus.** Francis P. Lucas. *Trans. Am. Soc. Steel Treating* 21, 1112-34 (1933).—See C. A. 27, 5096. W. A. Mudge

**Grain size and grain growth.** M. A. Grossmann. *Trans. Am. Soc. Steel Treating* 21, 1079-104 (1933).—See C. A. 27, 5096. W. A. Mudge

**The influence of the rate of cooling on the structure of eutectics.** G. Tammann and G. Moritz. *Z. anorg. allgem. Chem.* 214, 414-26 (1933).—On very slow cooling of a eutectic mixt. only grains form rather than bundles as with rapid cooling. The equation representing rate of cooling and crystal. is discussed. Expts. with binary eutectic mixts. of metals such as Cd, Sn, Pb, Bi and Zn show very different crystal. formations for a given sample depending on the time of heating. The structure of eutectic mixts., in wire form, altered in a definite manner on stretching. Certain ternary and quaternary eutectic mixts. of these metals were also studied. An analogy of dye distribution present in org. substances during crystal. is cited. R. H. Lambert

**Aluminum melting losses.** Wm. Ashcroft. *Metallurgia* 9, 42 (1933).—A general discussion with practical recommendations. J. L. Gregg

**Does aluminum have a transformation point?** Otto Tiedemann. *Metallwirtschaft* 12, 669-71 (1933).—The fact that the temp.-phys. properties curves of pure Al are straight lines without any irregularities has been set forth by some investigators as proof that Al has no transformation point, but in T.'s opinion it does not prove the case. He gives the examples of Fe, Ni, Co, Zn, Cd, Ag and Cu to show that in some cases changes in the temp.-phys. properties curves are not due to transformation points and in some cases transformations occur without noticeable changes in the curves. T. claims that Al does have a transformation point. Fourteen references. C. E. M.

**Investigations on the supposed allotropy of aluminum.** A. Schulze. *Metallwirtschaft* 12, 667-9 (1933).—The results are briefly reviewed of 20 published investigations on Al in which elec., thermal and x-ray methods are used. All of the more recent investigations agree in the conclusion that pure Al has no allotropic transformation point up

to 600°, but has a face-centered cubic lattice. The slight irregularities observed by some in the elec. resistance curves are caused by the presence of impurities in the Al. C. E. Macfarlane

**The solubility of copper in zinc.** M. Hansen and W. Stenzel. *Metallwirtschaft* 12, 539-42 (1933).—The samples were made from 99.99% pure Zn and electrolytic Cu and contained 0.58-4.03 at. % Cu. X-ray precision measurements were made on a series quenched from 395° Up to 2.08% Cu the  $\eta$  phase only appeared, with 3.10 and 4.15% Cu  $\eta + \epsilon$ . With rising Cu content the  $\eta$  diffraction lines are shifted. In the 3 and 4% Cu alloys there is no change in the  $\eta$  lines, but addnl.  $\epsilon$  lines appear. The 3 and 4% Cu alloys were also drawn at various temps. and examd. The soly. of Cu in Zn at 100-424° is shown diagrammatically. It is higher than it was formerly thought to be. The peritectic point, 424°, is at 2.73 at. % Cu or 2.68% by weight. The soly. at 395° is 2.43 at. %. The calcd. vol. decrease of the peritectic alloy against pure Zn is 1.4% or sp. gr. 7.236. Reheating should theoretically decrease this 0.005. Actual tests showed a decrease of 0.008 and 0.007. Samples quenched at 415° and drawn various lengths of time at 240°, 350°, 295° and 200° were examd. microscopically. The results agreed with the x-ray exams. Seventeen references. C. E. M.

**Zinc in lead-base bearing metals.** K. L. Ackermann. *Metallwirtschaft* 12, 618-19 (1933).—Small amts. of Zn added to Pb-Sb alloys form ZnSb, which changes to coarsely cryst. ZnSb at lower temps. When Sn is present, the structure is more complicated and secondary crystal. of free Zn takes place with lower Zn content than in the Sn-free alloys. The hardness and elastic limit of compression are increased, and the impact strength is lowered by Zn addns. to Pb-Sb and Pb-Sb-Sn alloys. The casting properties of bearing metals contg. Zn are very poor and are worse with increasing Zn content. The addn. of Cu, Ni, Fe or As has a very bad influence on the casting properties. The hardness and elastic limit of compression of Pb bearing metals contg. Cu are increased by the addn. of Zn provided the Sb content is high. Seven references. C. E. Macfarlane

**Zinc in bearing bronzes.** E. R. Thews. *Chem.-Ztg.* 57, 923-5 (1933).—A review. Zn exerts a favorable influence in many cases. Leopold Pöschel

**Mechanical properties of electrolytic zinc sheets.** O. Bauer and J. Weerts. *Metallwirtschaft* 12, 615-18 (1933).—From 0.01 to 0.06% of Pb, Fe, Cu and Cd have an appreciable effect on the mech. properties of hot-rolled sheet made from electrolytic Zn. Sheets which are rolled in one heat to 2 mm. thickness with a final temp. of 60-90°, but with various initial temps., have practically the same mech. properties at room temp. Zn alloyed with 0.9% Pb has about 25% higher tensile strength at room temp. than the av. Pb-free Zn, but its elongation and bending properties are lower. The properties of the alloyed Zn are still within the wide limits in which the pure Zn varies. The addn. of 0.9% Pb does not have much effect on the tensile strength at elevated temps., but the crit. temp. range for hot-working is widened. Twelve references. C. E. Macfarlane

**Zirconium.** G. H. Chambers. *Metals & Alloys* 4, 199-201 (1933).—History, properties and uses of finely divided Zr metal. Downs Schaaf

**Precipitation from supersaturated solid solutions after cold-working according to the thermal expansion diagram.** Franz Bollenrath. *Metallwirtschaft* 12, 569-73 (1933). Elektron (10.09% Al, 0.40% Mn, balance Mg), Lantal (4.20% Cu, 1.62% Si, balance Al) and duralumin (3.67% Cu, 0.48% Mg, balance Al) were heated above the soln. temp. and quenched in water. Bars of the first 2 were stretched in a tensile machine 9 and 18%, resp., immediately after quenching, and the duralumin was cold-rolled with reductions from 4 to 48%. The bars were then heated in a dilatometer to 600° and the results are given in graphs together with the differential quotient curves. Before the pptn. stage is reached a slight increase in thermal expansion indicates a rearrangement of atoms. With an increasing amt. of cold-working the coeff. of

expansion at the lower temp. is decreased and the temp. of the start of pptn., the greatest acceleration, the highest speed, and the end of pptn. are all reduced. With increasing cold-work the greatest acceleration of pptn. is increased and the temp. range of pptn. is narrowed. The effect is considerable with small amts. of deformation, but does not increase much after a certain point. In solid solns. supersatd. with 2 constituents the 2 ppt. in different temp. ranges without much influence on one another. The pptns. at low temps. changed more than those at higher temps. The soln. of both constituents takes place at the same temp. Micrographs of duralumin after being cold-worked 11% and reheated to various temps. are given. Fourteen references. C. E. Macfarlane

**Influence of chemical composition of cast iron upon its wear.** E. Soehnchen and E. Piwowarsky. *Arch. Eisenhüttenw.* 7, 371-2(1933).—The effects of Si, Ni, P, Cr, Cu and N upon the wear of cast Fe under rolling and gliding friction were investigated. The resistance against wear depends mainly on the kind of wear; the same material may behave very well under one kind of wear and may not stand up at all under another. Increased hardness is frequently connected with increasing resistance against wear but this is no general rule; deviations from this rule are due mostly to structural differences. A pearlitic gray Fe possesses considerably more resistance to wear than a ferritic gray Fe. Rolling friction depends to a great extent on the treatment of the surface. All processes which increase surface hardness (nitriding) or reduce simultaneously the tendency to oxidize (chrome plating) increase resistance against wear. The actions of the above-named elements with respect to these effects are described. Max Hartenheim

**Formation of graphite nucleuses in cast iron.** Erich Scheil, W. Ruff and E. H. Schulz. *Arch. Eisenhüttenw.* 7, 533-5(1933).—Different kinds of cast irons were studied to find in what manner the graphite nucleuses present in the melt grow. By examg. the different structures it was found that the no. of graphite nucleuses depends on the conditions of solidification; their no. increases with undercooling which means that the crystn. of graphite does not begin immediately at the residual nucleuses but that a certain starting time is required. The size of the graphite nucleuses decreases, however, with undercooling, as the crystn. velocity of the cementite eutectic increases faster than the crystn. velocity of the graphite eutectic. This is the reason the edges of castings tend more to white solidification than the core in spite of a higher no. of graphite nucleuses, but these conditions very likely bring about also the inverted hard-casting, i. e., a gray edge zone and a core wholly or partially solidified white. Besides nucleus-destroying conditions in the melt, there exist also nucleus-propagating conditions of which the most important is the access of O from the surface; as soon as an oxide film was formed on the surface of the melt an increase of nucleus formation was observed. Max Hartenheim

**Tempering black and white cast irons.** Heinrich Springkamper. *Giesserei* 20, 541-8(1933).—The effects of C content, annealing temp. and time on black-heart and white-heart castings are described. C. L. Wilson

**Wear investigations on various automobile-cylinder cast irons.** A. Wallich and Joh. Gregor. *Giesserei* 20, 517-21, 548-55(1933).—The relations between wear and hardness, Ni-Cr content and structure were studied. Curtis L. Wilson

**Some experiments on the heat treatment of malleable cast iron.** J. E. Hurst. *Foundry Trade J.* 49, 355-9(1933). Downs Schaaf

**The role of lime in desulfurization of iron and steel.** Ivan Trifonov and D. Mirev. *Arch. Eisenhüttenw.* 7, 337-41(1933).—Transformations going on between mixts. of  $\text{CaO} + \text{FeS}$ ,  $3\text{CaO} + \text{FeS}$ ,  $\text{CaS} + \text{FeO}$ , at different temps. were investigated by lab. tests with finely powd. mixts., and the S content was detd. from the end product. Reaction between  $\text{CaO}$  and  $\text{FeS}$  begins at about  $500^\circ$ , increases with temp. at first exponentially and has a max. at  $775^\circ$  with 39.56% sol. S in the form of  $\text{CaS}$ . A retardation in the reaction curve sets in at  $730^\circ$  and at  $910^\circ$  a

min. with only 3.8%  $\text{CaS}$  is reached; from this point the reaction increases again and reaches 48.4% at  $1100^\circ$ , remaining const. for higher temps. The curve shows that up to  $730^\circ$  the reaction proceeds according to  $\text{CaO} + \text{FeS} \rightarrow \text{CaS} + \text{FeO}$  which has an equil. between  $500^\circ$  and  $730^\circ$ . The simultaneous sudden decrease of  $\text{CaO}$  and  $\text{CaS}$  in the reaction product between  $730^\circ$  and  $910^\circ$  points to a compd. between  $\text{CaO}$  and  $\text{FeS}$  or between  $\text{CaS}$  and  $\text{FeO}$  of which the former is the more probable. Seven references. Max Hartenheim

**Thermal conductivity of irons and steels and some other metals in the temperature range 0 to  $600^\circ$ .** S. M. Shelton and W. H. Swanger. *Trans. Am. Soc. Steel Treating* 21, 1001-77(1933).—The conductivities in  $\text{w./cm.}^{-1}/\text{degree}^{-1}$  have been detd. over temp. ranges between  $0^\circ$  and  $600^\circ$  for Zn, Ni, a few Cr-Ni alloys and 20 irons and steels selected as typical examples of com. materials used for a variety of purposes. The method and app. are described. A comparative method of measurement was used, all values being referred to the thermal cond. of Pb, assumed to be  $0.352 \text{ w./cm.}^{-1}/\text{degree}^{-1}$  at  $0^\circ$ . For the pure metals and the irons and low alloy steels the thermal cond. decreases with increase in temp. The cond. of the high-alloy steels and that of the Ni alloys increase with increase in temp. In general, the conductivities of all the materials tested are linear functions of the temp. within the range in which measurements were made. A noteworthy exception is Ni for which a sharp change from a neg. to a pos. temp. coeff. of thermal cond. occurs at the temp. of the magnetic transformation. For the ferrous alloys, an increase in the amt. of alloying constituents in Fe causes, in general, an increase in the temp. coeff. of thermal cond. Many conflicting factors make generalizations impossible. W. A. Mudge

**Notch-toughness and width of lines in exposure of steel to x-ray interferences.** R. Siebel, R. Berthold and P. Koetzschenke. *Arch. Eisenhüttenw.* 7, 355-8(1933).—No relations could be found between notch-toughness and width of spectral lines of hard and heat-treated steels. Max Hartenheim

**Influence of quenching conditions upon the internal stresses of steels.** II. Buchler and E. Scheil. *Arch. Eisenhüttenw.* 7, 359-63(1933).—The influence of different cooling conditions upon the residual stresses which are produced by the co-action of heat stresses and transformation stresses was studied in Ni steels. The actions of the 3 most important influences on magnitude and distribution of residual stresses, i. e., thermal shrinking before transformation, expansion after transformation proper, and thermal shrinking after transformation, disappear one after the other with reduction of quenching temp. If the quenching temp. is lowered to the beginning of martensite formation, the influence of transformation on the residual stresses increases; the latter become smaller if heat stresses already exist, and already existing transformation stresses are increased. Lowering of quenching temp. in the range between beginning and end of martensite formation has the reverse effect. At quenching temps. below the end of martensite formation only heat stresses exist which become smaller with decreasing quenching temp. A practical consequence is that the temp. of baths for hardening of low-C steels should preferably be in the neighborhood of the lower end of martensite formation if residual stresses are to be reduced, and somewhat above the beginning of martensite formation for steels which possess predominantly transformation stresses. Care should, however, be exercised to make sure that the cooling velocity is sufficiently great to secure uniform hardening. Max Hartenheim

**Scaling of steel at heat-treating temperatures.** C. Uphogrove. *Univ. Mich. Eng. Research Bull.* No. 25, 36 pp.(1933).—The effects of temp., time, rate of flow and the partial pressure of the oxidizing agent were studied in relation to the scaling of S.A.E. 1015 steel. Investigation was made of the scaling of steel at  $927^\circ$  with different mixts. of  $\text{CO}_2$  and  $\text{H}_2\text{O}$  vapor; a flow of 30 ft. per min. and a time of contact of 2 hrs. were used. The effects of

various gas-air combustion atms. on the scaling of S.A.E. 1015, C steels and alloy steel were studied at 927°.

Downs Schauf

**Influence of different alloying elements upon the hardenability of steel by quenching.** H. Esser, W. Ellender and H. Majert. *Arch. Eisenhüttenw.* 7, 367-70 (1933).—Influence of Cr, Co, Mn, Ni, Si, V and W upon the velocity of quenching required in steels with 0.3-1.5% C for transformation of martensite was investigated. For all C contents Mn and Ni shift the crit. quenching velocity to lower values, while Cr, Si and W increase it for higher contents. V behaves similarly but the crit. cooling velocity increases with V content if quenched from temps. up to about 100° above the  $A_{c1}$  point. Co always reduces hardenability. The reason for the different actions of the alloying elements is seen in influence on the range of permanency and transformation velocity of the  $\gamma$ -solid soln.

M. Hartenheim

**Low-temperature impact strength of some normalized low-alloy steels.** John J. Egan, Walter Crafts and A. B. Kinzel. *Trans. Am. Soc. Steel Treating* 21, 1136-46 (1933).—C-Cu, Zr, Chromanil, Ni-V and Ni-Cu steels were studied. Many are suitable for engineering application down to -80°. High impact resistance at a temp. down to -80° may be obtained in low alloy normalized steels having a strength of less than 80,000 lb./sq. in. by combining a deoxidizing or austenite-forming element (Zr or V) with a carbide-forming element (Cr). When suitably combined with another alloy, Cr, Ni, Cu, Mn and Mo improve the low-temp. impact strength. The Cr-Cu combination gave highest values.

**Thermal measurements on heat-treated aluminum alloys.** W. Fraenkel. *Metallwirtschaft* 12, 583-5 (1933). The alloys contained (1) 4% Cu, (2) 4% Cu and 0.5% Mg, (3) 4% Cu, 0.5% Mg and 0.5% Mn. One alloy rod and one pure Al rod, each insulated with asbestos, were carefully placed in an elec. furnace so that they would heat up at the same rate. One thermocouple registered the temp. of the alloy bar and another the difference in temp. between the 2 bars. The furnace was heated at the rate of about 12° per min. up to the m. p. of the alloy. The samples had all been quenched from 500° and some were tested immediately; others aged. The differential curves show a max. near 250°, a pronounced min. at 310-60° corresponding to pptn., and 2 maxima at about 400° and 490°. The amt. of pptn. indicated by the curves is greater in the aged than in the freshly quenched condition. Apparently no pptn. takes place during aging. In the Mg-free alloy the various points occur at higher temps. than in the other 2 alloys. There is less variation in the curves between the 3 alloys than between the same alloy with various treatments.

C. E. Macfarlane

**The aluminum bronzes.** E. J. Marsh and E. Mills. *Aircraft Eng.* 5, 251-5, 280-8 (1933).—Although the normal 10% Al bronze is very popular and possesses excellent mech. properties and high resistance to fatigue, it can be improved by the introduction of one or more other alloying elements. Fe, Ni, Mn and Pb are the principal metals employed; the effects of these addns. are studied separately. In choosing die or core materials for casting this alloy, a good grade of cast iron should be chosen, and particular attention paid to ensure that neither a S content of 0.10% nor a P content of 0.35% should be exceeded. Surface protection of the mold can be afforded by calorizing or by Cr electroplating; details and analyses for these processes are given. The mechanism of solidification is discussed with the aid of an Al-Cu equil. diagram, and the properties of each metallographic constituent are dealt with in detail. The  $\delta$ -constituent is hard and brittle, and in most applications treatments with particular reference to cooling rates have to be selected to ensure its absence. But it is of great value as a constituent for bearing journals, and a comparison is made with other classes of alloy, such as those with Sn-base or Pb-base, in this field. The effects of heat treatment are fully illustrated with photomicrographs. In cleaning this material it is found that the Al content is not too high to prohibit the use of caustic or other alk. cleaners. Pickling in strong nitrosulfuric acid mixts. should not be adopted; the compns. of safe cleaners are given. The corrosion resistance as compared with that of other non-ferrous alloys is tabulated.

**The behavior of copper and zinc and their alloys toward tap water.** L. W. Haase. *Gesundh.-Ing.* 56, 577-82 (1933); cf. C. A. 27, 3019.—Waters contg. dissolved  $O_2$  will dissolve out Zn from brass pipes. The softer and more acid the water the more rapid is this action. The Cu and Zn act as a galvanic element, the Zn going into soln. Cu is superior to other metals usually used for water pipes in phys. and chem. properties and from the standpoint of health. When Cu is exposed to  $O_2$  and moisture,  $Cu(OH)_2$  is first formed, which in contact with metallic Cu is then reduced to  $Cu_2O$ . The very thin, very tenacious film of the latter formed serves to protect the Cu from further attack. This process may require years in the atm., is complete in a week or so in cold water, and in less time in hot.  $O_2$  must be present. The patina, a porous layer of difficultly sol. basic Cu salts subsequently formed (its compn. depends upon the salts present in the water), has no protective action, protection being due solely to the underlying  $Cu_2O$  layer. This is proved by the fact that although a patina forms in  $O_2$ -free water where no oxide can form, the Cu continues to dissolve. In the absence of the oxide film the patina actually favors the soln. of the Cu, since its electrode potential is higher than that of Cu. The formation of the  $Cu_2O$  film may be hastened by the addn. of nitrates, nitrites and bicarbonates to the water. The role of protective metal coatings on other metals is discussed, especially those of Sn and Zn. Corrosion of the more base metal may "enoble" it, reverse the p. d., and thus favor the soln. of the other metal. The working of brass and Cu pipes and methods of making connections are discussed.

M. G. Moore

**Should copper be coated with tin?** L. W. Haase. *Gesundh.-Ing.* 56, 593-5 (1933); cf. preceding abstr.—Sn used to coat Cu pipes carrying drinking water should be very low in Pb. A high Pb content decreases porosity and brittleness, but the Pb tends to dissolve as the anode of a Pb-Cu galvanic element and render the water unsafe for drinking. In the Cu-Sn element formed at a break in the Sn surface, the Sn at first goes into soln., protecting the Cu.  $O_2$ ,  $CO_2$  and Ca salts attack the Sn, forming an incrustation more electro-pos. than Cu, so that the Cu then dissolves. In contact with such waters Sn-coated pipes deteriorate faster than uncoated pipes. Sn-coated

pipes are recommended for only very soft cold water high in  $\text{CO}_2$  and low in  $\text{O}_2$ . Such waters will dissolve sufficient Cu from uncoated pipes to acquire a taste. Heat treatment of Sn-coated pieces leads to the formation of a Sn bronze alloy which, being more electropositive than Sn, causes the latter to dissolve.

**Examination of Roman copper from Wigtownshire and North Wales.** G. Clement Whittick and J. A. Smythe. *Proc. Univ. Durham Phil. Soc.* 9, 99-104 (1932-33).—Analyses of a metal cake showed it to be a leaded  $\alpha$ -bronze.

Leopold Pessel

**Investigation of systems gold-copper through measurement of resistance at low temperatures.** V. Pospisil. *Ann. Physik* 18, 497-514 (1933).—Fifty-nine Au-Cu alloys with 10-100% of the atoms being Au were investigated in the quenched and tempered condition by detg. the ratios of the elec. resistance at  $-195^\circ$  and  $-252.4^\circ$  to the value at  $0^\circ$ . The method appears as advantageous as that of sp. resistance measurement. The  $r$  (ratio)-isotherms of the quenched alloys indicate the formation of solid solns. The  $r$ -isotherms of tempered alloys possess deep, sharp minima at 25 and 50 atom % Au, indicating the formation of  $\text{AuCu}_2$  and  $\text{AuCu}$ . At 75 atom % Au the  $r$ -isotherms of the tempered alloys proceed higher than that of the quenched alloy. This points to the formation of a special modification of the solid solns. in this concn. region. The results are compared with those of other investigators.

Calvin Brous

**Etching procedure for the metallographic examination of the alloys of the platinum metals.** F. Beck. *Metallwirtschaft* 12, 636-7 (1933).—Ordinary etching solns. and fused salt mixts. are not satisfactory for Re-Pt, Re-Rh and Re-Ir alloys. Good results are obtained by pouring molten NaCl into a small graphite crucible contg. a Pt triangle which serves as cathode. The NaCl is kept molten at about  $860^\circ$  by means of a gas burner, and the specimen to be etched, which is attached to a Pt wire, is immersed in the crucible and forms the anode. A current of 3 amps./sq. cm. at 2.5 v. is passed through the bath for 5-15 secs., depending on the compn. of the alloy. The specimen is then dipped in distd. water, dried in alc. and is ready for examn.

**Protection against corrosion and corrosion resistance of a binary solid solution.** L. Graf. *Metallwirtschaft* 12, 585-7, 602-3 (1933).—A review and summary of recent literature on the subject, especially the work by G. Tammann. Twenty-two references.

C. F. Macfarlane

**Protection of cooling systems in internal-combustion engines against corrosion.** V. O. Krenig and S. E. Pavlov. *Korrosion u. Metallschutz* 9, 268-73 (1933).—The individual potentials in multi-metal combinations were measured at  $20^\circ$  and  $80^\circ$ , with tap water and solns. of  $\text{K}_2\text{Cr}_2\text{O}_7$  in tap water as electrolytes. Combinations of Fe, 64-36 brass, Al contg. 9% Cu, and of Fe, 64-36 brass, Al contg. 9% Cu, Zn, were used. The qual. corrosion picture of these metals was observed.  $\text{K}_2\text{Cr}_2\text{O}_7$  forms quickly protective coatings on the metals under test, 0.05% being found sufficient at  $20^\circ$ . Protective properties of the film are retained after removing the metal from the liquid and exposing it to air and water vapors. At  $80$ - $90^\circ$  the concn. of the  $\text{K}_2\text{Cr}_2\text{O}_7$  must be increased to 0.2% to induce protection. Under these conditions Fe becomes nobler than Al. The presence of nobler metals, such as brass, decreases the protective effect of  $\text{K}_2\text{Cr}_2\text{O}_7$  upon Fe, requiring greater concn. of the former or the introduction of Zn as protector. The presence of chlorides in the water requires an increase of the  $\text{K}_2\text{Cr}_2\text{O}_7$  concn. up to 1%. Even a concn. of 5% cannot protect Fe against sea water.

Leopold Pessel

**Hot-shortness and intercrystalline corrosion of austenitic chromium-nickel steels.** Max Schmidt and Otto Jungwirth. *Korrosion u. Metallschutz* 9, 293-302 (1933); cf. C. A. 27, 4199.—From phys. tests, performed on austenitic alloys at different temps., it is concluded that hot-shortness is due to reversible changes taking place in the temp. range of approx.  $600$ - $900^\circ$ . Bars of a steel contg. Cr 18, Ni 8, Ta 1, Mo 1.5% were forged from the initial temp. of  $1080^\circ$  to final temps. varying between  $1000^\circ$  and  $600^\circ$ . In another series of forging expts. the bars were forged from initial temps. varying between  $700^\circ$  and  $1000^\circ$  to a final temp. of  $600^\circ$ . Etching of the cross-sections proved the bars to be perfectly sound. In test bars heated to  $1100^\circ$  before being cooled to the breaking temp., no hot-shortness was found, while it was well in evidence in bars that had been heated from room temp. to the breaking temp. In tests made at  $700^\circ$  and  $870^\circ$ , the ductility increased sharply with increasing breaking speed. Pptn. phenomena causing hot-shortness can be suppressed by high initial temps. and by quick deformation, which explains their absence in hot-forged austenitic Cr-Ni steels. Intergranular corrosion of these steels and the means available for its prevention are discussed. Diagrams are given showing the influence of the C contents of an 18% Cr-8% Ni steel, annealed at  $700^\circ$ , upon its magnetic satn. and its potential.

Leopold Pessel

**The corrosion of zinc in chloride solutions.** C. W. Borgmann and U. R. Evans. *Trans. Electrochem. Soc.* 65, 24 pp. (preprint) (1934).—The corrosion of Zn was studied, in the cast and rolled conditions and in various degrees of purity, under conditions of partial immersion in KCl solns., sea water and distd. water. The results in KCl soln. show some striking differences to former expts. on wholly immersed Zn and to those on Fe (wholly or partly immersed). The corrosion of the sheet specimens continues to rise with the concn. instead of falling off at high concns., as in cases where the corrosion rate is limited by "O starvation." On the cast specimens, the absence of H evolution is a surprising feature. The results provide little hope of materially increasing the resistance of Zn to any of the liquids studied by eliminating or adding other metals, by protecting the cut edges or by avoiding abrasion of a rolled surface.

C. G. F.

**Elec. cond. and equil. diagrams of binary alloys (Grube, Vosskühler) 2.** App. for taking samples of ore on conveyors (U. S. pat. 1,937,473) 1. App. for calcining ores (U. S. pat. 1,937,413) 1. Furnace for burning ores (Ger. pat. 579,615) 20. App. for removing water from, or

579,754, June 30, 1933. The adhesion of superposed thin metal sheets during annealing is prevented by dipping the stacked sheets, after pickling and washing, in a soln. of Cr salt which, during the annealing, leaves a layer of oxide between the sheets. Solns. of alkali chromate or bichromate are preferred.

**Metal articles.** Egyesült Izzólámpa és Villamossági R.T. Fr. 753,776, Oct. 24, 1933. Articles (wires, rods, incandescent substances, etc.) consisting of a single crystal or large crystals of a metal of high m. p. are made by compressing the metal powder, fritting in a neutral medium, working mechanically, and then reheating to the temp. corresponding to a rapid growth of the crystals or to recrystn., in a medium contg. O or compds. contg. O.

**Light metals.** Heraeus Vacuumsmelze A.-G. and Wilhelm Rohn. Ger. 581,590, July 29, 1933. Addn. to 563,652 (C. A. 27, 941). App. for obtaining light metals by reducing their oxides with C is described.

**Noble metals.** W. C. Heraeus G. m. b. H. (Georg Bauer, inventor). Ger. 584,844, Sept. 25, 1933. Pt, Au, etc., are extd. from slags, concentrates, ores, etc., by fusing with Cu and a Cu mat contg. 60% Cu in a reverberatory or elec. furnace under reducing conditions. The Cu mat contg. the desired amt. of Cu is produced by fusing Cu with sulfidic ores such as pyrites, adding oxides such as  $\text{Fe}_2\text{O}_3$  to oxidize the foreign metals, and reducing these to slag by addn. of  $\text{SiO}_2$ .

**Iron.** Eugen A. A. Gronwall and Harry J. H. Nathorst. Ger. 581,809, Aug. 4, 1933. A shaft furnace for obtaining Fe by reducing Fe ores with C is described.

**Iron.** Christian E. Kluijtmans. Ger. 583,765, Sept. 9, 1933. A black-short cast Fe contains C less than 2.00, Si 1.10-1.50, Mn 0.42-0.75, S less than 0.2 and P less than 0.2%. The metal is obtained by fusing white cast Fe in a cupola furnace and adding Fe-C, Fe-Mn, Fe-Si and coke as required.

**Malleable iron.** Walter Cotterill. U. S. 1,938,516, Dec. 5. Cast iron is subjected in a receptacle contg. an inert non-oxidizing gas such as N and CO to a preliminary heating and a further heating at an elevated temp. until substantially all the graphitic C in the cast iron has been absorbed by the iron; the temp. is then reduced to allow C pptn. to take place and a relatively small controlled proportion of an oxidizing gas such as air or O is admitted during at least a portion of the C-pptn. range to cause pptn. of the C as "temper carbon" and the oxidation of at least a portion of it.

**Making forging tools, etc., from cast iron.** Lucien I. Yeomans (to Universal Products Co.). U. S. 1,936,652, Nov. 28. The metal is cast in a chill mold, the casting is removed from the mold promptly after solidification and is immediately subjected to pressure in master dies to produce flow of the metal; the casting is removed from the master dies while at a temp. above that at which the tool is to be used, subjected to soaking at about 540-650° and then quenched.

**Water-absorbent pulverized iron.** Herbert E. A. McCarthy. Australia 8201/32, Aug. 24, 1933. Pulverized Fe is made water-absorbent by heating it to a temp. at which the surface and pores are freed from the water-repellent film. The Fe is used as a dressing for concrete surfaces and for the prepn. of metallic waterproofings.

**Steels.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 494,566, July 31, 1933. Addn. to 741,871 (C. A. 27, 3439). The thermal process of Fr. 741,871 is applied to Co-steels contg. Cr and Mo, e. g., Co 36, Mo 8, Cr 5.5, C 1% and Fe the rest.

**Steels.** Frederick Regar Bonte. Fr. 751,533, Sept. 5, 1933. A steel having a high C content or an Fe alloy contg. a ppt. of C is rolled or forged to manuf. an object, and this is heated to a temp. above the critical pt. to cause a large amt. of the C to pass into the graphite form. Steels contg. C 1.5-2 and Si 0.6-0.9% may be so treated.

**Steel.** Soc. d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine. Fr. 752,599, Sept. 26, 1933. Steels are recarburized before the action of the deoxidizing slag to reduce the amt. of slag and calmatives and to

improve the quality of the steel. The recarburization thus made is such that no final recarburization is necessary.

**Testing metals such as steel for soft spots.** Leslie E. Howard (to Simonds Saw and Steel Co.). U. S. 1,937,820, Dec. 5. The surface of the metal is abraded or polished with an abrasive material which produces scores varying in depth according to the relative softness of different portions of the surface; the surface is then illuminated and light effects are observed which indicate relative degrees of hardness and softness.

**Refining steel, etc.** Paul Girod. Fr. 42,584, Aug. 23, 1933. Addn. to 738,493 (C. A. 27, 1857). Feldspars (K or Na or mixed) are used to give fluidity to the slags used in Fr. 738,493.

**Rustless steel.** Soc. industrielle et commerciale des aciers. Fr. 754,263, Nov. 3, 1933. Steel contg. Cr 6-40, Mn 0.8-40 and C up to 1% contain also Ti and (or) V in such a proportion that the C is fixed by one of these constituents and the max. is not above 6%. A preferred compn. is Cr 15-25, Mn 0.8-40, C up to 1 and Ti or V up to 4%. Part of the Mn may be replaced by Ni. Up to 6% total of Cu, Co, Mo and Si and up to 10% of Al may also be present.

**Steel alloy.** James P. Gill (to Vanadium-Alloys Steel Co.). U. S. 1,938,221, Dec. 5. A steel alloy for dies used in the die-casting of Al contains C 0.2-0.5, Si 0.1-1.5, Mn 0.1-1.0, Cr 3-8, Mo 1.5-2.75, W 0.5-2.0 and Ni 0.5-2.0%, the remainder being mainly Fe.

**Steel alloys containing molybdenum.** Joseph V. Simmons (to Cleveland Twist Drill Co.). U. S. 1,937,334, Nov. 28. Steel alloys which are suitable for cutting tools, etc., contain, besides Fe, C 0.5-1.3, Cr 0.2-10.0, Mo 0.6-15.0, Si 0.1-0.45 and W in a proportion of about 5-40% the amount of Mo present (with at least 0.2% W).

**Alloys.** Siemens-Schuckertwerke A.-G. (Ger. 577,709, June 3, 1933. An alloy with coefficient of expansion values which form a sym. curve for heating and cooling consists of Fe with Mn 15-30%, C less than 0.5, and up to a 10% total addn. of any or all of the following, Si, Cu, Co or W.

**Alloys.** Heraeus-Vacuumschmelze A.-G. and Wilhelm Rohn. Ger. 579,694, June 29, 1933. Alloys free from C are prepd. by reducing oxides of metals of the 5th and 6th groups of the periodic table, which m. above 1000°, with commercially pure H in the presence of a metal which is chemically or physically united to the metals liberated by the reduction. Thus, oxides of Ni or Fe are reduced in the presence of Fe or Ni, resp.

**Alloys.** Henri Durand. Fr. 753,702, Oct. 23, 1933. Alloys resistant to  $\text{H}_2\text{SO}_4$  and particularly useful for elec. accumulators contain either (1) Sn 60, Pb 40, (2) Sn 80, Sb 5, Cu 15 or (3) Sn 60, Cu 20 and Zn 20%. To each of the molten alloys is added at the last moment before casting 15 g. of  $\text{CuSO}_4$  and then 10 g. of  $\text{Bi}_2(\text{SO}_4)_3$  for each 25 kg. of metal.

**Dental alloys.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Fr. 754,056, Oct. 31, 1933. Dental alloys contain Ag 60-90, Pd 40-10 and Sn 0.5-5 parts. Zn, Mn and Cd may be present up to 3-5%. Part of the Pd may be replaced by Pt or Au.

**Dental alloys.** Soc. industrielle de thérapeutique scientifique appliquée (S. I. T. S. A.). Fr. 751,425, Sept. 4, 1933. Alloys for making dental amalgams are reduced to fine powder and made into tablets which are suitably grooved for easy division into required proportions.

**Aluminum alloys.** Gustaf N. Kirsebom and Callow Ltd. Brit. 307,844, Aug. 25, 1933. See Fr. 749,346 (C. A. 27, 5711).

**Aluminum alloys.** Charles Delassus. Fr. 750,703, Aug. 17, 1933. Alloys for pistons, etc., contain Al 90-2, Cu 4-5, Mg 1-2, Ni 0.5-0.7, Mn 0.06-0.1, Ti 0.05-0.1, Cr 0.1-0.3 and W 0.5-1%.

**Aluminum alloys.** Aluminium Ltd. Fr. 750,760, Aug. 18, 1933. Alloys contain Si 5-25, Mg 0.02-3% and the rest Al.

**Aluminum alloy.** Oscar T. Lemmens. Fr. 751,154, Aug. 28, 1933. An alloy contains Al 91, Ni 3, Sn 2, Cr 2, Mg 1, Cd 0.5 and Cu-B 0.5%.

**Aluminum alloys.** Bezault Frères (S. à r. l.). Fr. 754,266, Nov. 3, 1933. Alloys of Al contain Cu, Si and Mg with or without Ti. Examples are Al 97, Cu 1, Si 1 and Mg 1% and Al 95, Cu 3, Si 1 and Mg + Ti 1%. The proportion of Ti is not above 0.3%.

**Separating constituents of aluminum-silicon alloys.** Oskar Schober (to American Lurgi Corp.). U. S. 1,938,046, Dec. 5. For sepg. Al-Si alloys into a higher-Si and a lower-Si fraction, the fluid fraction of the mixt. at a temp. at which the higher-Si fraction of the alloy is present in a solid state and the lower-Si fraction in a liquid state is forced through a filter bed contg. grains or small lumps of alumina, which retain the solid fraction.

**Copper alloys.** Donald K. Crampton (to Chase Cos., Inc.). U. S. 1,938,172, Dec. 5. Alloys contg. no Ni or at most substantially less than 1% Ni are formed of Cu 75-95, Al 0.5-4.0, Sn 0.25-2.0%, the balance being mainly Zn. These alloys are resistant to corrosion by saline waters.

**Copper alloys.** Naraina Das-Chopra. Fr. 753,562, Oct. 10, 1933. Hard alloys of Cu are prep'd. by heating together Fe, Al and Cu to a temp. at which an exothermic action is produced, whereby the temp. of the molten metal is notably increased. An example contains Cu 80, Fe 1, Al 2, Zn 13 and Sn 4%.

**Refining a copper-calcium alloy.** Harvey N. Gilbert (to E. I. du Pont de Nemours & Co.). U. S. 1,937,650, Dec. 5. An alloy contg. Cu and Ca is melted and H, N or NH<sub>3</sub> is passed through the melt.

**Copper-zinc alloys.** Maurice Legu. Fr. 750,947, Aug. 22, 1933. A white alloy of high resistance contains approx. Cu 47, Zn 38, Ni 12.5, Mn 1.5, Pb 0.6 and Al 0.4%.

**Gold alloys.** G. Siebert G. m. b. H. Ger. 584,549, Sept. 21, 1933. Au alloys consist of 5-25% of metals of the Pt group, 0.05-5% of metals of the Fe group and the rest Au. Alternatively, the Au may be replaced by a mixt. of Au and Ag contg. at least 60% Au. Also, Cu up to 5% may be added. The alloy is heated just below its m. p. (900°), chilled, and tempered at 500-50°.

**Iron alloys.** Karl Arnds. Ger. 575,000, Sept. 13, 1933. A hard Fe alloy for casting consists of C 2-3, Si 0.5, Mn 1.5-2.5, P 0.1, S 0.03 and at least 20% of spongy Fe.

**Iron and chromium alloys.** Bernhard Vervoort. Fr. 533,968, Oct. 28, 1933. See Brit. 392,264 (C. A. 27, 3303).

**Nickel alloys.** Reinhard Straumann. Fr. 42,520, Aug. 4, 1933. Addn. to 735,009 (C. A. 27, 946). An example of an alloy suitable for watch springs, particularly for thermo-compensated oscillating systems, contains Ni 60, Fe 16, Cr 15, Mn 2, Mo 6.5 and Be 0.5%.

**Hard tantalum alloy for cutting tools.** Clarence W. Balke (to Ramet Corp. of America). U. S. 1,937,185, Nov. 28. Ta carbide powder is degasified in a vacuum at a temp. above 1600°, then mixed with 3-15% of powd. Ni, and the mixt. is heated in a vacuum to 1350-1400°. (C. A. 27, 4210).

**Treating brass with sodium.** Wm. F. Zimmerli (to E. I. du Pont de Nemours & Co.). U. S. 1,937,934, Dec. 5.

1 A Na-Zn alloy is employed for incorporation of Na with brass.

**Coating aluminum.** Aluminum Colors Inc. Fr. 754,077, Oct. 31, 1933. Al surfaces covered with oxide are dipped into a soln. of a salt, e. g., an acetate or sulfate of Ni or Co, whereby a practically insol. ppt. is obtained.

**Coating metal objects with molybdenum.** Patent-Treuhand-Ges. für elektrische Glühlampen m. b. H. (Hans Wolff, inventor). Ger. 580,748, July 15, 1933. 2 The objects are given a thin coating of a colloidal soln. of a reducible Mo compd. and then heated to above 900° in a reducing atm. Colloidal MoO<sub>3</sub> obtained by heating crystd. (NH<sub>4</sub>)<sub>2</sub>MoO<sub>4</sub> *in vacuo* is preferred. The resulting coating adheres strongly to the object.

**Black-finishing chromium-plated metal articles.** Hector R. Carveth (to E. I. du Pont de Nemours & Co.). U. S. 1,937,629, Dec. 5. Cr plated articles are treated in a molten salt bath contg. an alkali metal or alk. earth metal cyanide, e. g., in a bath formed from NaCN 45, Na<sub>2</sub>CO<sub>3</sub> 35 and NaCl 20%.

**Welding electrode.** David L. Mathias (to Westinghouse Elec. & Mfg. Co.). U. S. 1,936,799, Nov. 28. An electrode of welding metal is coated or filled with a resinate such as that of Na to supply a reducing gas for protecting metal in welding, together with a deoxidizer such as ferro-Mn, Ti or V to protect the resinate from oxidation, an alk. compd. such as CaCO<sub>3</sub> and flux.

**Coated welding electrode.** Robert S. Johnston (to John A. Roebbing's Sons Co.). U. S. 1,937,574, Dec. 5. A metal core is coated with asbestos and with an overlying coating contg. at least 46% of silica and also contg. a flux such as Ca, Ti and Mn oxides. Various details relative to the proportionate thickness of the coatings, etc., are described.

**Welding rod for use in arc welding.** Richard Stresau (to A. O. Smith Corp.). U. S. 1,936,693, Nov. 28. A rod of metal is provided with an extruded coating contg. finely divided cellulosic material, Na silicate and a material such as kaolin which facilitates even distribution of the ingredients in the extruded coating.

**Arc-welding steel.** N. V. Machinerieën-en Apparaten Fabrieken. Fr. 752,528, Sept. 25, 1933. The core of the electrodes carrying an appropriate covering is composed of cast steel obtained by a Siemens-Martin acid process from pure Fe. Fr. 752,529. The covering for the electrodes is composed of a paste of silicates of Na, K and Mg, as pure as possible and free from constituents carrying O or steel, other impurities particularly constituents liberating CO<sub>2</sub> and easily reducible oxides. It may contain reducing constituents or metals which will alloy with steel.

**Soldering aluminum bronze.** Paul Odani. Fr. 751,370, Sept. 2, 1933. A cleaning agent which permits Al bronze to be tinned and soldered is composed of a hydric acid and a volatile base such as NH<sub>3</sub>, hydrazine, MeNH<sub>2</sub> or EtNH<sub>2</sub>, in soln. in H<sub>3</sub>PO<sub>4</sub>.

**Copper solder.** Fried. Krupp A.-G. (Josef Hinnüber, inventor). Ger. 581,748, Aug. 2, 1933. A solder for sintered or fused carbide, nitride, silicide and boride alloys consists of Cu with 0.1-10% Al or Mn.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROULLER AND CLARENCE J. WEST

The isolation of free methyl and ethyl by the reaction of sodium vapor with methyl and ethyl bromide. E. Horn, M. Polanyi and D. W. G. Style. *Z. physik. Chem.* B23, 291-304 (1933).—The reactions: Na + RBr = NaBr + R were studied, where R = Me and Et. The presence of the free radicals at distances as great as 8 cm. from the point of formation was det'd. by reaction with Cl and I. By varying the pressure of Na vapor from  $2.5 \times 10^{-4}$  to  $90 \times 10^{-4}$  mm. and the temp. from 210° to 290°, the yield of the free radical dropped from 7 to 2%. The decrease in yield under these conditions is attributed to bimol. reaction. The rate const. of the reunion of the free radicals is of the order of  $10^{14}$ .

**Pyrolysis of unsaturated hydrocarbons.** Charles D. Hurd. *Ind. Eng. Chem.* 26, 50-5 (1934).—A review.

E. H.

**Acetylene formation in thermal decomposition of hydrocarbons.** H. H. Storch. *Ind. Eng. Chem.* 26, 58-60 (1934).

E. H.

**Halogens and halogen compounds in heat treatment of hydrocarbons.** A. W. Nash and J. Mason. *Ind. Eng. Chem.* 26, 45-50 (1934).

E. H.

**Preparation of methyl or ethyl iodide from iodoform.** R. H. Kimball. *J. Chem. Education* 10, 747 (1933).—By boiling CHI<sub>3</sub> with KOH in 95% EtOH, distg. off the EtOH, acidifying, filtering, making the filtrate alk. with

NaOH, and then heating it with com.  $\text{Me}_2\text{SO}_4$ , a 78% yield of MeI can be obtained, or, with com.  $\text{Et}_2\text{SO}_4$ , an 80% yield of EtI.

Louise Kelley

**Highly polymerized compounds. LXXXIV. Constitution of the polyoxymethylenes.** H. Staudinger and W. Kern. *Ber.* 66B, 1843-6 (1933); cf. Signer and Gross, *C. A.* 27, 4987. — Staudinger and Kern do not agree with the theoretical conclusions of Singer and Gross; the differing phys. behavior of the different polyoxymethylene hydrates can be simply explained by differences in the length of the chain in the mols.

C. A. R.

**The transformation of acetylene and acetaldehyde into acetone by the contact method.** N. D. Zelinskii, M. I. Ushakov, V. M. Mikhailov and Yu. A. Arbuzov. *J. Chem. Ind. (Moscow)* 1933, No. 7, 63-5. — An Fe-Mn catalyst is best. Natural Fe ores are unsuitable.  $\text{AcH}$  and  $\text{H}_2\text{O}$  give 96%  $\text{Me}_2\text{CO}$ ;  $\text{C}_2\text{H}_2$  and  $\text{H}_2\text{O}$  give 88%. If the gases from the latter reaction are again passed over the catalyst the yield is increased to 98%. Optimum conditions are  $440^\circ$ , a ratio of  $\text{C}_2\text{H}_2$  to  $\text{H}_2\text{O}$  of 1:10, and a rate of passage of the gas over the catalyst of 20.9 cc. per min.

H. M. Leicester

**Fluorination of organic compounds. Monofluoroacetone.** P. C. Ray, P. B. Sarkar and Anit Ray. *Nature* 132, 749 50 (1933). —  $\text{CH}_3\text{COMe}$  was prepd. from  $\text{CH}_3\text{CICOMe}$  and when it was refluxed with TlF in the presence of  $\text{Et}_2\text{O}$ ,  $\text{CH}_3\text{FCOMe}$ , b.  $72^\circ$ , was obtained. R. Brown

**A simplified method for the preparation of butyric acid.** Lallance A. Adair and E. J. Simmons. *Field and Lab.* 2, 31-2 (1933). The prepn. is carried out in 3 stages: (1) hydrolysis of  $\text{AcOBu}$  to the alc. (yield 56%), (2) oxidation of the alc. by means of  $\text{K}_2\text{Cr}_2\text{O}_7$  and  $\text{H}_2\text{SO}_4$  to  $\text{PrCO}_2\text{H}$ , and (3) sepn. of the acid as the Ca salt, treatment with concd.  $\text{H}_2\text{SO}_4$  and distn.

W. A. Moore

**Unsaturated aliphatic acids and their derivatives. IX. The configuration of  $\gamma$ -linoleotetrabromostearic acid.** Tsutomu Maruyama. *J. Chem. Soc. Japan* 54, 1073 81 (1933). — See *C. A.* 27, 1614. **XI. The configuration of  $\beta$ -linoleotetrabromostearic acid.** *Ibid.* 1082 7. —  $\beta$ -Linoleic acid (I) is made by debromination of  $\beta$ -linoleotetrabromostearic acid (II). Oxidation of I in acetone- $\text{KMnO}_4$  soln. gives caproic (III), malonic (IV), oxalic (V) and azelaic acid (VI). Treatment of II in alk. KOH at  $25^\circ$  for 1.5 hrs. gives octadeca-7,10-dibromo-6,9-dien-18-oic acid (VII); at  $150^\circ$  for 10 hrs. it gives octadeca-6,9-dien-18-oic acid (VIII). The Me ethers of VII and VIII, on oxidation with acetone- $\text{KMnO}_4$  soln., give III, IV, V and VI. Obviously the 2 Br atoms on the C atoms 6 and 7 and those on 9 and 10 in II take the *trans*-positions to each other. K. K.

**The cerebronic acid fraction. II.** P. A. Taylor and P. A. Levene. *J. Biol. Chem.* 102, 535-40 (1933); cf. *C. A.* 23, 817. — The higher-boiling fraction of the acids obtained on oxidizing cerebronic acid (I) was esterified and distd. from the middle fractions was isolated *lignoceric acid* (II),  $\text{C}_{24}\text{H}_{48}\text{O}_2$ , m.  $79.5-80.5^\circ$ , mixed m. p. with a sample of II from peanut oil,  $79.5-80.5^\circ$ . To ensure that II was really an oxidation product, the original I was esterified and fractionally distd., but II was completely absent.

K. V. Thimann

**Cerebronic acid. IX.** P. A. Levene and P. S. Yang. *J. Biol. Chem.* 102, 541 56 (1933). — Highly purified cerebronic acid (I),  $\text{C}_{24}\text{H}_{48}\text{O}_2$ , m. between  $98^\circ$  and  $102^\circ$  with different preps.,  $[\alpha]_D^{25}$   $3.95^\circ$  (2.1% in pyridine), was oxidized with  $\text{KMnO}_4$  and the product, m.  $73-6^\circ$ , extensively fractionated. About 7% consisted of acids of mol. wt. 340 3,  $\text{C}_{24}\text{H}_{48}\text{O}_2$ , m.  $71.5-4.5^\circ$ ; 32% had a mol. wt. 352 7,  $\text{C}_{24}\text{H}_{46}\text{O}_2$ , m.  $77-8^\circ$ , while 32% had a mol. wt. of 367-71,  $\text{C}_{24}\text{H}_{46}\text{O}_2$ , m.  $80.5-82^\circ$ . Since, from the preceding abstr., the  $\text{C}_{24}$ -acid was not previously present in I, the oxidation of I leads to the formation of 3 acids, and hence I is not, as claimed by Klenk (*C. A.* 23, 1415; 27, 2157) a homogeneous substance. The mol. wt. of I was confirmed by formation of *Me methoxycerebrionate*,  $\text{C}_{27}\text{H}_{50}\text{O}_3$ , m.  $58-9^\circ$ ,  $[\alpha]_D^{25}$   $17.9-19.7^\circ$  (1.2 1.9% in pyridine), and thence *methoxycerebronic acid*,  $\text{C}_{24}\text{H}_{46}(\text{OMe})\text{CO}_2\text{H}$ ,  $[\alpha]_D^{25}$   $17.5^\circ$  (1% in pyridine). The formula assigned to I by Klenk is therefore incorrect.

K. V. Thimann

**Oxidation and derivatives of *dl*- $\alpha$ -hydroxystearic acid.**

P. A. Levene and P. S. Yang. *J. Biol. Chem.* 102, 557 62 (1933); cf. preceding abstr. — In order to control the expts. with cerebronic acid (I), it is shown that by repeatedly esterifying crude *dl*- $\alpha$ -hydroxystearic acid (II), and sapon. with cold alc. NaOH, II could be obtained pure, m.  $84-6^\circ$ . Further, on oxidizing II with  $\text{KMnO}_4$ , esterifying and distg., all 3 fractions consisted only of margaric acid, *i. e.*,  $\text{KMnO}_4$  removes only 1 C atom (cf. Witzemann, *C. A.* 26, 2702). The 3 acids obtained on oxidation of I are hence derived from 3 compds. in the original I, which is therefore not a homogeneous substance. The following derivs. of II are described: *Me ester* (III), m.  $64-6^\circ$ , *dl*- $\alpha$ -hydroxystearyl hydrazide,  $\text{C}_{18}\text{H}_{33}\text{O}_3\text{N}_2$ , m.  $136-7^\circ$ , *Me dl*- $\alpha$ -methoxystearate, from III, b.p.  $138-4^\circ$ , m.  $37-8^\circ$ , and *dl*- $\alpha$ -acetylsteoric acid, m.  $64-5^\circ$ .

**Some unsymmetrical tetramethylene glycols.** C. F. H. Allen, C. V. Wilson and W. L. Ball. *Can. J. Research* 9, 432-5 (1933). — As intermediates for obtaining unsym. 1,4 dibromides several tetramethylene glycols have been prepd., by means of various procedures. Reduction of  $\text{EtO}_2\text{CCHPhCH}_2\text{CO}_2\text{Et}$  with Na and EtOH (Manske, *C. A.* 25, 1832) gives the *mono-Na salt* (I) of  $\text{HOCH}_2\text{CHPhCH}_2\text{CH}_2\text{OH}$  (II), m.  $70^\circ$ . Attempts to convert II into the dibromide which might be suitable for making a Grignard reagent were unsuccessful. A similar reduction of 2,4  $(\text{MeO})_2\text{C}_2\text{H}_4\text{CH}(\text{CO}_2\text{Et})\text{CH}_2\text{CO}_2\text{Et}$  gives  $\beta$ -(2,4-dimethoxyphenyl)butane-1,4-diol (III), m.  $89^\circ$ ; liquid diacetate, b.p.  $221-4^\circ$ . III gives no dibromide because of a tendency to lose HBr. III also readily dehydrates. Reduction of  $\text{EtO}_2\text{CCHMeCH}_2\text{CO}_2\text{Et}$  with Na and BuOH gives  $\text{H}(\text{CH}_2)_2\text{CHMe}(\text{CH}_2)_2\text{OH}$  (IV). The dibromide of IV gives no detectable amt. of Grignard reagent.  $\text{MeCH}(\text{OAc})(\text{CH}_2)_2\text{OAc}$  with HBr gives only *bromobutyl acetate*, b.  $92-4^\circ$ .  $\text{Br}(\text{CH}_2)_2\text{Cl}$  gives a small amt of Grignard reagent.

R. B. Sandhu

**Replacement of strongly positive hydrogen by halogen. III. Novel transformations of hypohalites.** Fritz Straub and Ruth Kuhnle. *Ber.* 66B, 1834 46 (1933); cf. *C. A.* 25, 73. — To bring out again the special role of the acetylenic bond in the reaction  $\text{R}_2\text{C}(\text{OH})\text{C} \equiv \text{CH} + \text{X}_2\text{O} \rightarrow \text{R}_2\text{C}(\text{OH})\text{C}(\text{X})\text{C}(\text{OH})\text{X}$  (X = halogen), the reaction has been applied to the corresponding ethylenic alcs. The result was a very peculiar transformation of an entirely different kind.  $\text{Me}_2\text{C}(\text{OH})\text{CH}:\text{CH}_2$  (I) shaken with the usual, strongly alk., 0.5 N KOBr soln. uses up 1 mol. in about 1 hr., giving 60% of 2-methyl-4-bromo-2,3-oxidobutane,  $\text{Me}_2\text{C}(\text{O})\text{CCH}_2\text{Br}$  (II), smoothly hydrolyzed to 2-methyl-1-

bromobutane-2,3-diol,  $\text{Me}_2\text{C}(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{Br}$  (III), which can be degraded by oxidation to  $\text{CH}_3\text{BrCO}_2\text{H}$  or  $\text{Me}_2\text{C}(\text{OH})\text{CO}_2\text{H}$ . As with the acetylenic alcs., the reaction depends greatly on the content of free alkali in the soln., provided it is kept within the range where the soln. no longer fades out and the formation of bromate is prevented. The reaction proceeds much less smoothly than with the acetylenic alcs., however, because the KOBr reacts further, although more slowly, on the oxide, yielding higher-boiling, more highly brominated products (including CBr<sub>4</sub> when 2.4 mols. KOBr are used). Hypoiodite (1 m KI added to the suspension of I in alkali) yields the *l analog* (IV) of II, which is likewise hydrolyzed to the *l*-glycol (V), while NaOCl does not attack I.  $\text{Et}_2\text{C}(\text{OH})\text{CH}:\text{CH}_2$  (VI) and  $\text{Me}_2\text{C}(\text{OH})\text{CH}:\text{CHMe}$  (VII) behave like I, whereas  $\text{Me}_2\text{C}(\text{OH})\text{CH}:\text{CHPh}$  does not; with the latter there is, to be sure, an extremely slow consumption of KOBr (approx. 1 mol. in 5 days) which, however, manifests itself only by the appearance of a little BzOH in the carbinol remaining for the most part unchanged. Even VI and VII react less smoothly than I and with widely differing velocities, VI requiring 24 hrs. for the consumption of 1 mol. KOBr while VII requires 15-20 min., and in both cases CBr<sub>4</sub> is already formed with only 1 mol. KOBr although much of the carbinol remains unchanged. As with the acetylenic alcs., it must be assumed that the first step in the process is a reaction of the hypohalite ion, in this case with the pos. H atom of the OH

group, and that the resulting unstable hypobromous ester stabilizes itself by rearrangement:  $I + BrO^- \rightleftharpoons [Me_3C(OBr)CH:CH_2] + OH^- \rightarrow II$ . The reaction of hypohalites with the at. grouping  $-CO_2CH_3-$  is also probably a reaction of the enol form, the pos. H being attacked and the halo ketone resulting from a rearrangement of the intermediate hypohalite ester:  $-C(OH):CH- + X.O^- \rightleftharpoons [-C(OX):CH-] + OH^- \rightarrow -CO_2CHX- + OH^-$ . Re-enolization makes the 2nd H atom susceptible to attack by the hypohalite ion.  $CH_2(CO_2H)_2$ , with NaOCl and KOBr in strongly alk. soln. readily yields the di-Cl and di-Br deriva., the bromination, under the same conditions, being 8-9 times more rapid than the chlorination. By this method  $CCl_2(CO_2H)_2$  has been obtained in cryst. form; in common with  $CBBr_2(CO_2H)_2$ , it is remarkably indifferent toward  $SOCl_2$ , from which it can advantageously be crystd. The strongly alk. KOBr soln. converts  $Me_3C:CHMe$  into its oxide:  $Me_3C:CHMe + OBr^- \rightarrow Me_3C.O.CHMe + Br^-$ ; the reaction is relatively slow

and its use for preparative purposes is limited by the fact that secondary reactions soon result in the splitting out of a Me group as  $CBr_4$ . This formation of  $CBr_4$  also always occurs in the prepn. of the brominated oxides from tertiary allyl alcs. Even the simple satd. tertiary alcs. are likewise broken down, very slowly, to  $CBr_4$  by strongly alk. KOBr;  $Me_3COH$  and  $Me_3EtCOH$  with 1 mol. KOBr reacted completely only after 10 days; no intermediate products could be isolated. With the primary alcs.

$MeOH$  and  $BzOH$  the difference in the reaction velocities is very characteristic;  $BzOH$  in 20 parts ether shaken with KOBr uses up 1 mol. in 10 min. while with  $MeOH$  only a little more than half reacts in 1 hr.  $BzH$  with 2 mols. KOBr is completely converted into  $BzOH$  in 10-15 min. while with NaOCl only 0.34 mol. reacts in 16 hrs. The dehydrogenation of  $PhCH_2OH$  to  $BzH$  is materially lower, even with KOBr; since the subsequent conversion to  $BzOH$  is instantaneous, half of the KOBr used up is to be attributed to the dehydrogenation to  $BzH$ . About 4 hrs. is required for the consumption of half of the KOBr; with 1 mol. KOBr, half of the alc. remains unchanged and very little of the intermediate  $BzH$  can be isolated. Both reactions are considered to be dehydrogenations through the intermediate hypohalite esters:  $PhCH_2OBr \rightarrow BzH + HBr$ , and  $PhCH(OH)OBr \rightarrow BzOH + HBr$ .  $PhCH:CHCHO$ , on the other hand, with 2 mols. KOBr gives phenylglycidic acid (VIII); the secondary reaction with the 2nd mol. of KOBr must again be very rapid, for with only 1 mol. KOBr half of the aldehyde remains unchanged. VIII itself reacts further, although more slowly, with the KOBr and is broken down to  $BzOH$ , which is found in small amt. among the by-products. The latter are quite unhomogeneous, easily sol. in water and in part brominated;  $PhCH:CHCO_2H$  was obtained in some expts. in about 5% yield. With 2.4 mols. NaOCl, the velocity of oxidation of  $PhCH:CHCHO$  is not markedly different but no VIII is formed; the aldehyde is oxidized chiefly to  $BzH$  (70%); even with only 1 mol. NaOCl, about 20%  $BzH$  is obtained. As with the tertiary alc., therefore, hypobromites and hypochlorites react quite differently with  $PhCH:CHCHO$ . II,  $b_p$  50.5-1.5°,  $d_4^{20}$  1.3907,  $n_D^{20}$  1.46265, 1.47232, 1.46522 for  $\alpha$ ,  $\beta$  and D at 20.1°,  $n_D^{20}$  1.47796. III, m. 48-9°. IV,  $b_p$  59°,  $d_4^{20}$  1.4613. V sublimes *in vacuo* at 35°, m. 54.5°. 3-ethyl-1-bromo-2,3-oxidopentane, from VI with KOBr,  $b_p$  72-3°. 2-Methyl-4-bromo-2,3-oxidopentane, from VII, obtained in not quite pure form (C, 1.36% low; H, 0.66% low; Br, 2.19% high),  $b_p$  63-4°,  $d_4^{20}$  1.208; glycol, m. 96-7°. Trimethylethylene oxide,  $b_p$  73.4°. Dichloromalononic acid, exceedingly hygroscopic needles, m. 109.11° (decompn.);  $PhNH_2$  salt, m. 101.5° (decompn.); dianilide, from the acid and  $PCl_5$  treated with excess of  $PhNH_2$  in ether, m. 129-30°.  $CBBr_2(CO_2H)_2$ , m. 130-1.5°. IV. Transformations of 1,1,3-trihaloindenes. Fritz Straus, Ruth Kühnel and Ruth Haensel. *Ibid* 1847-62.—The halogen in 1,1,3-trichloro- (I) and 1,1,3-tribromoindene (II) is not very reactive; II with

2.5% NaOMe loses only 0.5 atom in 6 hrs. and 1 atom in 24 hrs., and even the HI-AcOH method recommended for the detn. of pos. halogen in bromomalononic acids (Backes, West and Whiteley, C. A. 15, 2070) is very slow, requiring 8 hrs. for the replacement of 1 atom. Long boiling in aq. acetone, however, quite readily effects hydrolysis to the 3-haloindones, and these can be halogenated to the 2,3-dihaloindones. With NaI in acetone, II loses both 1,1-Br atoms and 2 of the residues combine to form 3,3'-dibromo-1,1'-biindenylene (III). With Zn dust in pyridine-AcOH or in boiling alc., III takes up 2 atoms H at the 1,1'-positions and at the same time the Br atoms are replaced by H, giving 3,3'-biindenyl (IV), which can be degraded to  $(o-HO_2CC_6H_4CO)_2$ . IV is also formed with surprising ease by rearrangement of the 1,1'-isomer with alkali. Whereas only 15 min. boiling is required for the complete conversion of II into III, I does not react completely even after 48 hrs. and the resulting 3,3'-dichloro-biindenylene (V) contains considerable amts. of 1,1',3,3'-tetrachloro-1,1'-biindenyl (VI), from which it can be sepd. only by quite tedious recrystn. This intermediate VI, when once formed, is strikingly resistant to further dehalogenation; it is practically unchanged by 24 hrs. boiling with NaI in acetone and does not react smoothly even with mol. Ag or Cu bronze in indifferent solvents. Only by very cautious treatment with Zn wool and AcOH can it be dechlorinated with any degree of certainty; the resulting V is merely an intermediate stage of a more deep-seated hydrogenation and can to some extent be isolated only because of its characteristic property of sepg. as a firmly adherent coating on the surface of the metal. III and V form beautiful,  $CrO_3$ -like crystals which are difficultly sol. and melt very high with decompn. From their structure, 2 stereoisomeric forms are possible; a more sol., lower-melting form of V, which rearranges into V at its m. p., has been isolated. III and V add halogens to form tetrahalides; which of the double bonds are involved has not been established. No evidence of autoxidation or sensitivity to light has been observed. The solns. of III and V are deep yellow; the absorption curve for III is given. IV, unlike the colorless, stable 1,1'-isomer, is orange-yellow and quickly autoxidizes in soln. in the air. It adds Br instantaneously to form a very characteristic 6 difficultly sol. dibromide (VII) (of which a more sol. form was observed) readily regenerating IV. Further bromination, however, is difficult and it has not always been possible to isolate the tetrabromide (VIII). Both dibromides are light lemon-yellow. The position of the Br atoms has not been established. The presence of a conjugated system in IV is readily shown by the formation, with maleic anhydride, of the

by 2 isomers, 1 of which (X) is colorless and is probably a stereoisomer, while the other (XI), obtained in only very small amt., is yellow and is perhaps formed by addn. with simultaneous shifting of the H atoms. Catalytic hydrogenation of IV gives a non-cryst. tetrahydro deriv. (XII), presumably 1,1'-bihydrindenyl. With NaOEt in alc., IV undergoes with  $(CO_2Et)_2$ ,  $BzH$ ,  $PhCH:CHCHO$  and anisaldehyde (but not with phenylpentadienal) the condensations through the methylene groups which are characteristic of indene; partial condensation (with only 1 of the  $CH_2$  groups) was never observed. The products obtained with  $BzH$  and  $PhCH:CHCHO$ , viz., 1,3-diphenyl-2,4,5,7-diphenyleneoctatetraene,  $PhCH:C:CH:CC:CH:C:$

$\text{C}_6\text{H}_5$   $\text{C}_6\text{H}_5$   
CHPh (XIII), and 1,12-diphenyl-4,6,7,9-diphenylenedecaheptaene (XIV), contain the C chain of the diphenylpolynes, but in them the uniform conjugation of the strepto-vinylene chain is disturbed by the 2 phenylene groups. XIII and XIV melt about 15° lower than the corresponding diphenylpolynes with the same no. of vinyl groups, and apparently not without decompn. In

marked contrast to IV, they are not autoxidizable; XIII in benzene in the light of a strong arc lamp does not take up O. No stereoisomeric forms have yet been obtained. They have a pronouncedly slighter tendency than the diphenylpolyenes to form mol. compds.; no compds. are obtained with picric acid and  $C_6H_5(NO_2)_2$ ; fused  $SbCl_5$  dissolves them with green color; only XIV gives with  $HClO_4$  in  $Ac_2O$  (but not in  $AcOH$ ) a green soln. and with  $SbCl_5$  in  $CHCl_3$  a green insol. product; on the other hand, XIII and XIV dissolve in  $SOCl_2$ ,  $AsCl_3$ ,  $CCl_3CO_2H$ , quinone and chloranil without characteristic colors, and in contact with Br vapor or I they form no deeply colored compds. The color of the XIII and XIV themselves is deeper than that of the corresponding diphenylpolyenes; XIII forms dark brown-orange needles with strong surface luster and yellow-orange streak, XIV light blood-red needles with red-orange streak; the concd.  $H_2SO_4$  soln. of XIII is blue, that of XIV green. The difference produced in the 2 series of compds. by the disturbance of the conjugation is most strikingly shown in the absorption curves. 3-Bromoindone, yellow, m. 57.5–8°, gives with  $H_2SO_4$  a deep violet color soon changing to red, and is characterized by its conversion into 3-anilinoindone, m. 205.6° (decompn.); with Br in  $AcOH$  it gives 2,3-dibromoindone, golden-yellow, m. 123°, giving a red-brown color with  $H_2SO_4$ , and with Cl it yields 2-chloro-3-bromoindone, golden-yellow, m. 98°, also giving a red-brown color with  $H_2SO_4$ . 3-Chloroindone, yellow, m. 57–7.5°; 2,3-dichloroindone, golden-yellow, m. 89°; 2-bromo-3-chloroindone, golden-yellow, m. 111–12°. III is sol. to the extent of about 0.1% in cold benzene, difficultly in concd.  $H_2SO_4$  with reddish yellow color and green fluorescence, the absorption limits of the soln. being 670 and (very sharply) 485 m $\mu$  down; tetrabromide, yellowish white prisms with blue indescence, m. 179° (decompn.). V, m. 231.5–2.5° (decompn.), mol. wt. in boiling benzene 285; tetrachloride, m. 209–11° (decompn.). VI, m. 172.2–3.2°, mol. wt. in freezing benzene 351, gives with Zn wool and  $AcOH$  in act. concn., along with V, an orange stereoisomer, m. 165.5–6.5°, of V. IV, m. 139.5–1.5°, mol. wt. in freezing benzene 233, dissolves in concd.  $H_2SO_4$  with dirty reddish brown color soon changing to olive-brown. IX, decompn. about 310° (Cu block). X, m. 254–6°. XI, m. 255.5–61°. XII, b<sub>p</sub> 194.5°, d<sub>4</sub><sup>20</sup> 1.0660, is insol. in concd.  $H_2SO_4$  and stable toward  $KMnO_4$ . VII, light yellow needles, m. 135.6° (decompn.), and amber-yellow prisms, m. 106–6.5° (decompn.). VIII, light yellow, turns brown around 150°, does not m. 250° (in another attempt to prep. the tetrabromide there was obtained a 3rd dibromide, leaflets with brownish shimmer, m. 184–6° (decompn.)). XIII, m. 217.5°, mol. wt. in freezing  $PhNO$  395; absorption in the  $H_2SO_4$  soln. appears from about 400 and 630 m $\mu$  down, with a weak band, in not too dil. solns., at about 550 m $\mu$ . XIV, m. 251°; absorption of the  $H_2SO_4$  soln. appears at about 440 and 630 m $\mu$  down. Anisaldehyde condensation product of IV, brown-orange needles with bluish surface luster, m. 214°, sol. in  $H_2SO_4$  with green color (absorption limits, 650 and 450 m $\mu$  down). Di-*tert* oxalate condensation product, Cu-red, m. 195–7°, sol. in concd.  $H_2SO_4$  with blue color (absorption limits, 450 and 600 m $\mu$ , with a distinct band at 502 m $\mu$ ). C. A. R.

Polymers of ring systems. II. An improved synthesis of hexamethylenimine. K. Ziegler and Ph. Orth. *Ber.* 66B, 1867–71 (1933), cf. C. A. 28, 117°. In the Müller and Sauerwald process of prep. hexamethylenimine (I) from dibromohexane in alc. with *p*- $MeC_6H_4SO_2NH_2$  and 2 mols.  $NaOH$  (C. A. 22, 3133), the reaction  $MeC_6H_4SO_2NHNa + Br(CH_2)_6Br \rightarrow MeC_6H_4SO_2NNa(CH_2)_6Br$  precedes the cyclization  $MeC_6H_4SO_2NNa(CH_2)_6Br \rightarrow MeC_6H_4SO_2N(CH_2)_6$ . If it is carried out in very high diln. the 1st phase is slowed up extraordinarily so that if the reagents are poured in slowly their concn. gradually increases until the  $Br(CH_2)_6Br$  and  $NaOEt$  are present together in considerable amts. and may give rise to a series of disturbing side reactions. Z. and O. have therefore effected the 2 steps separately by gradually adding to an equimol. mixt. of  $MeC_6H_4SO_2NH_2$  and  $Br(CH_2)_6Br$  in just the necessary amt. of boiling  $BuOH$  0.5 mol.  $BuONa$ , then dilg. with water, washing the  $BuOH$  layer with 2 *N*  $NaOH$  until free

from  $MeC_6H_4SO_2NH_2$ , removing the aq.  $BuOH$  and finally the  $Br(CH_2)_6Br$  in *vacuo* and effecting the cyclization of the resulting crude  $MeC_6H_4SO_2NH(CH_2)_6Br$  (yield, 65–70%) either by adding it gradually with 1 mol. alcoholate to a hot reaction medium or by slowly adding a cold concd. soln. of its Na salt to a hot solvent. To speed up the reaction, a solvent of higher b. p. than  $EtOH$  is preferable;  $PhCH_2OH$  is especially effective and is easily recovered. In this way pure cryst. I can be obtained in 50–60% yield (based on the  $Br(CH_2)_6Br$  used) in 2 hrs. C. A. R.

Basis for the physiological activity of onium compounds. XIII. Betaine amides. R. R. Renshaw and H. T. Hotchkiss, Jr. *J. Biol. Chem.* 103, 183–6 (1933); cf. C. A. 20, 3688; 21, 279; 27, 2432–3; 28, 751°. The max. muscarine action of *N*-substituted betaine amides is given by the *Me* deriv. in the alkyl series. The *Ph* deriv. gives a remarkably strong stimulating nicotine action but no muscarine action is found with the aryl compds. The following *N*-substituted betaine amides ( $RNHOCCH_2NMe_2Cl$ ) and their method of prep. are described: *R* = *Me*, m. 171–2°; *Et*, m. 203–4°; *Pr*, m. 165°; *Bu*, m. 177°; *Ph*, m. 223° (and bromide, m. 215°); *p*- $MeC_6H_4$ , m. 235° (decompn.); *p*- $HOC_6H_4$ , m. 198°; *o*-, m. 195°, and *p*- $MeOC_6H_4$ , m. 218°; *o*-, m. 160°, and *p*- $EtOC_6H_4$ , m. 215°; *p*- $N(C_2H_5)_2$ , m. 143–4° (and bromide, m. 235–6°),  $\alpha$ -, m. 165.5°, and  $\beta$ - $C_{10}H_7$ , m. 188°;  $(CH_3)_3$ , m. 219°.

XIV. Aryl ethers of choline. R. R. Renshaw and W. D. Armstrong. *Ibid.* 187–9; cf. C. A. 26, 2704.  $\beta$ -Phenoxyethyltrimethylammonium bromide produces a very marked stimulation of the blood pressure and the respiration. "The *Ph* radicals of the *N*-phenylamide of betaine and of the *Ph* ether of choline tend to have the same space relation with regard to the N atom of the  $(CH_3)_3N^+$  group in each substance, and the compds. would tend, therefore, to show the same selective adsorption on the nerve element producing similar types of physiol. response. This has been found to be true."  $\beta$ -Phenoxyethyltrimethylammonium bromide, prep. by the condensation of  $\gamma$ - $BrC_6H_4OPH$  and  $(CH_3)_3N$ , m. 167° (cor).  $\gamma$ -Phenoxypropyltrimethylammonium bromide, which results from the condensation of  $\gamma$ - $BrC_6H_4OPH$  and  $(CH_3)_3N$  in  $C_2H_5$ , m. 156° (cor). A. P. Lothrop.

The preparation and the quaternary ammonium decomposition of formocholine. T. D. Stewart and H. P. Kung. *J. Am. Chem. Soc.* 55, 4813–19 (1933).  $Me_3N(CH_2OAc)Cl$  (from  $AcOCH_2Cl$  and  $NMe_3$ ) hydrolyzed in 5 *N*  $HCl$  gives 34%  $Me_3N(CH_2OH)Cl$  (I), crystals from  $BuOH$ ; chloroplatinate m. 246° (decompn.).  $Et_3N(CH_2OH)Cl$  (II) is similarly prep. The rate of decompn. per min. of I and II at 25° and  $pH$  2–4 is given by  $\log K = a + pH$  where *a* is  $-4.017$  and  $-3.213$ , resp. This, and the relative stability of the  $OEt$  and  $OAc$  derivs., indicate a rapid disocn. of the quaternary ion to  $H$  ion and  $R_3NH^+CH_2O^-$ , which react slowly, giving  $R_3NH$  ion and  $HCHO$ .

H. A. Beatty. Anhydrides of mannitol. Percy Brigl and Hans Grunert. *Ber.* 66B, 1945–9 (1933).—In the older literature are recorded many observations on the elimination of 1 mol. water from mannitol (I) to form mannitanes and of 2 mols. to form mannides; the conditions under which this occurs are generally quite drastic and it is not surprising that the products are mostly amorphous and apparently not homogeneous. One of the chief reasons that mixts. are formed is probably that the 6 free HO groups in I can split off as water in a variety of ways. It seemed, therefore, that it might greatly simplify matters by starting with derivs. of I in which some of the HO groups are occupied, and 1,6-dibenzoylmannitol (II) (C. A. 26, 3233) was accordingly chosen. When it is heated above 220° or, better, a long time in boiling tetrachloroethane, it yields a mono- (II) and a dianhydride (III) still contg. the original Bz groups. II is apparently not an intermediate product in the formation of III, for it is not converted into III by further heating in  $C_2H_5Cl$ ; it would seem that II and III are formed by elimination of water in different ways from I. If the splitting off of the water involved 2 adjacent HO groups, with formation of a double bond, the resulting enol should easily rearrange into a ketone, but neither II nor III shows ketone

properties; they do not react with  $\text{PhNHNH}_2$  and do not reduce Fehling soln. There remains the other possibility that the water is eliminated from 2 HO groups with the formation of an O bridge. Of the presence of an ethylene oxide ring in II and III there is no evidence; they can be boiled under quite rigorous conditions with water (III even with  $\text{Ac}_2\text{O}$ ) without cleavage of a ring. The water must therefore be split off from HO groups which are further apart. Examin. of models shows there are 2 possibilities: (1) anhydization between the 2- and 5-HO groups, leaving the 3- and 4-HO groups which are in *trans*-positions to each other and should therefore split off as water only under very severe conditions; (2) elimination of water from the 2- and 4-HO groups, resulting in a 4-membered hetero ring, and furthermore from the 3- and 5-HO groups, thus giving a quite sym. dianhydride. II would then be a 2,5-anhydride, III a 2,4,3,5-dianhydride. To be sure, the chem. properties, especially of II, thus far observed are not easy to reconcile with such structures. The 2 HO groups in II can be detected by esterification with *p*- $\text{MeC}_6\text{H}_4\text{SO}_3\text{H}$ , but that they are adjacent cannot be proved; in all attempts to couple it with acetone,  $\text{HCHO}$  or  $\text{BzH}$ , II remains unchanged, nor does it react with  $\text{Pb}(\text{OAc})_4$ . Then, too, it is assumed that in the anhydization the Bz groups do not migrate from their original 1,6-positions; such a migration is conceivable although not very probable. The above structures are therefore only provisional suggestions. *Dibenzoylanhydromannitol* (II), m.  $137-8^\circ$ ,  $[\alpha]_D^{25} 3.2^\circ$  (abs. alc.). *Dibenzoyldianhydromannitol* (III), m.  $133^\circ$ , mol. wt. in freezing benzene  $343$ ,  $[\alpha]_D^{25} 225.7^\circ$  ( $\text{CHCl}_3$ ). *Di-p-toluenesulfonate* of II, m.  $142^\circ$ ,  $[\alpha]_D^{25} 57.9^\circ$  ( $\text{CHCl}_3$ ), is identical with the product obtained by Muller and v. Vargha as a by-product in the toluenesulfonation of I (C. A. 27, 4775). *1,2,5,6-Tetrabenzoyldi-p-toluenesulfonylmannitol* (IV), from tetrabenzoylmannitol and  $\text{MeC}_6\text{H}_4\text{SO}_2\text{Cl}$  in pyridine, m.  $136-7^\circ$ ,  $[\alpha]_D^{25} -4.8^\circ$  ( $\text{CHCl}_3$ ), gives with boiling  $\text{Ac}_2\text{O}$ - $\text{NaOAc}$  a sirup which does not crystallize when seeded either with the original IV or with tetrabenzoyldiacetylmannitol; under the same conditions in *ac*-benzoylmannitol is unchanged by  $\text{Ac}_2\text{O}$ - $\text{NaOAc}$ .

C. A. R.

The preparation of crystalline lactic acid. Henry Rosook, Hugh M. Huffman and Yun-Pu Liu. *J. Biol. Chem.* 102, 449 (1933).—The com. sirup was distd. at  $105^\circ$  and  $0.1$  mm., and the middle fraction, which resembled the prepn. of Krafft and Dyes (*Ber.* 28, 2589(1895)), was redistd. and recrystd. 3 times from a 1:1 mixt. of  $\text{Et}_2\text{O}$  and iso- $\text{Pr}_2\text{O}$ ; both *sarco*-(*l*+) and *d*-lactic acids were thus obtained pure. The *l*+ and the *d*- forms were also prepd. via the  $\text{Zn NH}_4$  salts by seeding (Purdie and Walker, *J. Chem. Soc.* 67, 616(1895)). The active forms both m.  $52.8^\circ$ , and had  $[\text{M}]_D^{25} +2.3^\circ$  and  $-2.3^\circ$ , resp., (8% aq. soln.); the *dl*-form m.  $16.8^\circ$ ; all 3 have the same disson. const.,  $pK_{25} 3.81 \pm 0.02$ .

K. V. Thimann

The preparation of pure thioglycolic acid. Franz Schutz. *Angew. Chem.* 46, 780-1(1933).—The Klason-Carlson method of prep.  $\text{HSCl}_2\text{CO}_2\text{H}$  from  $\text{ClCH}_2\text{CO}_2\text{H}$  +  $\text{NaHS}$ , which frequently gives low yields, was improved by the use of freshly prepd.  $\text{NaHS}$  which resulted in a completely pure product with 99% of the theoretical yield. The prepn. of  $\text{NaHS}$  and the exptl. procedure are described.

Karl Kammermeyer

Addition compounds of cystine and picric acid. Gerrit Tonnes. *Z. physiol. Chem.* 222, 1-2(1933).—When hot satd. aq. solns. of *l*-cystine and picric acid are mixed and cooled there occurs a sepn. of the amorphous complex: *l*-cystine + 1 picric acid, which has higher sp. rotation in  $\text{MeOH}$  than cystine alone. Addn. of  $\text{C}_6\text{H}_6$  to a soln. contg. this complex and  $0.5$  *M* picric acid in  $\text{MeOH}$  ppts. a 2nd complex: 6 *l*-cystine + 1 picric acid.

A. W. Dox

The diamino acid, canavanine. III. The constitution of canaline. Matsunosuke Kitagawa and Shin-ichi Monobe. *J. Biochem. (Japan)* 18, 333-43(1933); cf. C. A. 27, 2939.—Canaline is a monoamino acid resulting from the hydrolysis of canavanine by the liver enzyme canavanase. Canaline contains N which is not detected either by Van Slyke's or by the formal reaction but which on reduction, whereby 2 atoms of H are absorbed, is liber-

ated as  $\text{NH}_3$ . This non-amino N group in canaline is considered to be in combination with O as  $-\text{ONH}_2$ , which yields a  $\gamma$ -OH group on reduction. It resembles, therefore, in its behavior  $\text{PhCH}_2\text{ONH}_2$ , which is likewise converted on reduction to benzyl alc. and  $\text{NH}_3$ . S. M.

The methylphenylhydrazones of glyoxylic acid and its methyl ester. M. Busch and W. Reuner. *Ber.* 66B, 1770-1(1933).—It was reported (C. A. 10, 328) that the methylphenylhydrazones of  $\text{OHCCO}_2\text{H}$  and its esters could be obtained in only 1 form, but as Meyer had described a hydrazone of the Me ester m.  $159-60^\circ$  (*Ber.* 37, 3592(1904)) while Busch and his co-workers gave  $61-2^\circ$  as the m. p., Meyer's work has been repeated and it has been found that his product was the hydrazone of the acid, not of its Me ester. His *p*-nitrophenylhydrazone, charing at  $170-80^\circ$ , is likewise a deriv. of the acid, not the Me ester.

C. A. R.

Preparation of galacturonic acid from plant materials, with a note on some of its derivatives. Homi Ruttonji Nanji. *Biochem. J.* 27, 1163-5(1933).—Lemon peel was first extd. with 60% alc., the residue dried and hydrolyzed with 3%  $\text{H}_2\text{SO}_4$ , the  $\text{H}_2\text{SO}_4$  removed as the Ba salt, the filtrate partially evapd. and then decolorized with norite, and from the soln. the Ba galacturonate was pptd. by pouring into an excess of alc. The Ba salt was decompd. with  $\text{H}_2\text{SO}_4$  (see Link and Nedden, C. A. 26, 966). The cinchonine *d*-galacturonate and the phenylhydrazone of phenylhydrazine *d*-galacturonate were also prepd.

Benjamin Harrow

Ester enolates and ketene acetals. XVI. Carbon suboxide tetraethyl acetal as intermediate product in the transformation of ethyl  $\beta,\beta$ -diethoxyacrylate into diethyl diethylmalonate. Ilmuth Scheibler and Hans Stein. *Ber.* 66B, 1784-9(1933); cf. C. A. 27, 3195.—While the K salt of  $\text{PhCH}_2\text{CO}_2\text{Et}$  forms, with acyl halides, both *O*- and *C*-acyl derivs., it has thus far not been possible to obtain *O*-acyl derivs. of  $\text{CH}_2(\text{CO}_2\text{Et})_2$  (I) from its Na salt. Repetition of the expts. with  $\text{BzCl}$  gave only the known *C*-mono- and *C*-di-Bz derivs., and with  $\text{ClCO}_2\text{Et}$  were obtained the same results as by Adickes, Brunner and Licker (C. A. 25, 3625) who, because of an 8% deficit in the yield of *C*-derivs. ( $\text{CH}(\text{CO}_2\text{Et})_2$  and  $\text{C}(\text{CO}_2\text{Et})_2$ ), believe that there was also formed the *O*-deriv.,  $\text{EtO}_2\text{CCH}_2\text{C}(\text{OEt})\text{OC}_2\text{H}_5$  (II), and that this, during the reaction, lost  $\text{CO}_2$ , forming  $\text{EtO}_2\text{CCH}_2\text{C}(\text{OEt})_2$  (III), which could not be sepd. from the I (resulting from the reaction of the  $\text{CH}(\text{CO}_2\text{Et})_2$  and the Na salt of I). III, which has been prepd. by distn. of  $(\text{EtO})_2\text{CCH}_2\text{CO}_2\text{Et}$  (IV), stands, with its ester and acetal groups, between I and the hypothetical C suboxide tetra-Et acetal,  $(\text{EtO})_2\text{C}:\text{C}:\text{C}(\text{OEt})_2$  (V). Attempts were made to prep. V from III by 1 of the methods leading from  $\text{AcOEt}$  to  $\text{CH}_2:\text{C}(\text{OEt})_2$ . III differs from  $\text{CH}_2:\text{C}(\text{OEt})_2$  in the considerably greater ease with which it is hydrolyzed, and it was therefore not advisable to effect the "ketene acetal cleavage" on the "primary reaction product" obtained from the ester with  $\text{NaOEt}$ . The enolate was accordingly prepd. by means of  $\text{Ph}_3\text{CNa}$ ; as it is easily sol. not only in ether but also in petroleum ether, it could not be sepd. from the  $\text{Ph}_3\text{CH}$  formed simultaneously and the mixt. was therefore heated with  $\text{BzOEt}$  and then extd. with ether. The ether-insol. residue contained a little  $\text{BzONa}$ , indicating that some ketene acetal cleavage had occurred, but the product present, along with  $\text{BzOEt}$ , in the ether ext. could not be isolated. In another expt. the enolate and an equiv. amt. of free III (i. e., 2 mols. ester and 1 mol.  $\text{NaOEt}$ ) were heated a long time at  $130^\circ$  under reduced pressure and the product was extd. with ether. The only ether-sol. portion, b.  $106-9^\circ$ , was a mixt. of I and its *C*-mono- and *C*-di-Et derivs., and decompn. of the ether-insol. salts with anhyd.  $\text{HCO}_2\text{H}$  in ether gave more I and  $\text{CHEt}(\text{CO}_2\text{Et})_2$  (VI), together with much  $\text{CO}_2$ . The reaction is explained thus: III, by migration of an Et group from the O to an adjacent C atom, gives VI, a part of which is converted by the  $\text{NaOEt}$  into the enolate and is found as such in the ether-insol. salts. The I and its enolate (in the ether-insol. salts) come from the original III, for in its prepn. by distg. IV the latter breaks down not only into III +  $\text{EtOH}$  but also into I +  $\text{Et}_2\text{O}$  and the b. ps. of I and

III are so close together that the sepn. of the 2 esters by distn. is probably incomplete. The formation of  $\text{Et}_2\text{C}(\text{CO}_2\text{Et})_2$  (VII) presupposes the intermediate formation, through the enolate, of V which immediately rearranges into VII by migration of Et groups from the O atoms to the central C atom. C. A. R.

Glutaconaldehyde: acetals, oxime and ring closure of the latter to pyridine-*N*-oxide. Paul Baumgarten, Rudolf Merländer and Jörn Olshausen. *Ber.* 66B, 1802-9 (1933).—Of the 5 acetals which can theoretically be derived from the 2 isomeric forms  $\text{OHCCH}_2\text{CH}:\text{CHCHO}$  and  $\text{HOCH}:\text{CHCH}:\text{CHCHO}$  of glutaconaldehyde (I), its Na salt treated in MeOH with enough HCl to give a 1% soln. of free HCl yielded 3, *vis.*, 2-pentene-1,5-dial 1-di-Me acetal,  $\text{OHCCH}_2\text{CH}:\text{CHCH}(\text{OMe})_2$  (II),  $\delta$ -methoxy- $\alpha,\gamma$ -butadien- $\alpha$ -aldehyde di-Me acetal,  $\text{MeOCH}:\text{CHCH}:\text{CHCH}(\text{OMe})_2$  (III), and the bis(di-Me acetal)  $(\text{MeO})_2\text{CHCH}_2\text{CH}:\text{CHCH}(\text{OMe})_2$  (IV). That II has not the structure  $(\text{MeO})_2\text{CHCH}_2\text{CH}:\text{CHCHO}$  is established by the fact that it is also formed by cautious acid hydrolysis of III. It cannot be acylated or converted into an alkali salt; it behaves like an aldehyde (forming a well-characterized *p*-nitrophenylhydrazone (V)), adds 2 atoms Br and has phys. consts. agreeing with the aldehyde structure. Unlike other acetals, however, it is hydrolyzed by alkalis as well as by acids. III, as would be expected, does not react with alkalis and is hydrolyzed by dil. acids, which first split off the ethereal Me group. It smoothly adds 2 Br atoms; excess of Br results in substitution. IV likewise does not react with alkalis; toward dil. acids 1 of the acetal groups is more sensitive than the other so that with  $p\text{-O}_2\text{NC}_6\text{H}_4\text{NHNH}_2$  in AcOH IV gives also the hydrazone (V) of II. In the cold IV adds Br (2 atoms) only on long standing, a fact which can be made use of to det. whether IV is contaminated with II or III. Advantage must be taken of the differing behavior of II, III and IV toward acids and alkalis to sep. them, for their b. ps. are relatively so close to each other that sepn. by fractional distn. would be difficult. If the mixt. is poured into  $\text{K}_2\text{CO}_3$ , II is saponified, and III and IV can be sep. by distn. On the other hand, if the mixt. is poured into a soln. of a neutral salt, III and IV are partially saponified to II which is thus obtained almost exclusively. The Na salt of I with 1 mol.  $\text{NH}_4\text{OH} \cdot \text{HCl}$  and 1 mol. free  $\text{NH}_4\text{OH}$  in MeOH forms the *dioxime* (VI),  $\text{HON}:\text{CHCH}_2\text{CH}:\text{CHCH}:\text{NOH}$  or  $\text{HON}:\text{CHCH}:\text{CHCH}:\text{CHNHOH}$ , m. 88°, but it also reacts in a different way (especially with  $\text{NH}_4\text{OH} \cdot \text{HCl}$ ); in MeOH there are formed deep cherry-red solns. which with alkalis turn intensely blue but from which no definite products could be isolated. An especially striking property of VI is the ready ring closure to pyridine-*N*-oxide-HCl. II,  $b_p$  99-103°,  $d_4^{20}$  1.0228,  $n_D^{20}$  1.4520,  $\gamma$  37.2,  $E_D^{20}$  0.29,  $-P$  345.9. V, yellow-brown, m. 160-1°. III,  $b_p$  108-12°,  $b_n$  103-7°,  $d_4^{20}$  1.0324,  $n_D^{20}$  1.4348,  $\gamma$  36.1,  $E_D^{20}$  -2.02,  $-P$  375.4. IV,  $b_p$  115-18°,  $d_4^{20}$  1.0127,  $n_D^{20}$  1.4288,  $\gamma$  33.6,  $E_D^{20}$  -0.78,  $-P$  452.0. Glutaconaldehyde anil oxime, like VI, is readily converted into pyridine-*N*-oxide (by short boiling in  $\text{PhNO}_2$ ). The acyl derivs. of the enol form of I, which had previously been described as colored (C. A. 19, 517), can be obtained perfectly white by suitable recrystn.;  $\delta$ -acetoxy- $\alpha,\gamma$ -butadien- $\alpha$ -aldehyde, m. 75.5°;  $\delta$ -BzO compd., m. 118-19° (the phenylhydrazones of the latter has the correct compn.,  $\text{C}_{14}\text{H}_{15}\text{O}_2\text{N}_2$ ; *o*-nitrophenylhydrazones, cinnabar-red needles with golden luster, m. 183-4°; azine, yellow, m. 187°).

C. A. R.

*d*-Xyloketose. Otto Th. Schmidt and Rudolf Treiber. *Ber.* 66B, 1765-9 (1933).—Xylose (I), refluxed 4-5 hrs. in dry pyridine, is converted to the extent of 13.5-24% into *d*-xyloketose (II) (judging from the rotation of the product (8-12°) and assuming that xylose is simultaneously formed in very small amt. at most). Most of the unchanged I is removed by crystn., whereby the proportion of II in the product is increased to 83-9%, and the II is isolated as the *p*-bromophenylhydrazones (III), which is considerably less sol. in water and aq. alc. than the corresponding deriv. (IV) of I. III, m. 128-9°,  $[\alpha]_D^{20}$  23.7  $\pm$  0.3° in  $\text{C}_6\text{H}_5\text{N}$  15 min. after soln.,  $-31.2 \pm 0.3^\circ$  after 7 days, depresses

the m. p. of IV to 110-15°. II, hygroscopic sirup,  $[\alpha]_D^{20}$   $-33.2 \pm 0.4^\circ$ , reduces cold Fehling soln. in a few sec. and cold Pierson soln. much more rapidly than fructose or I, cold  $\text{NH}_3\text{-AgNO}_3$  in a few min.,  $\text{KMnO}_4$  in  $\text{Na}_2\text{CO}_3$  immediately, neutral  $\text{KMnO}_4$  in a few min., dil. Br water in a few hrs. The equil. between I and II cannot be measured by the Willstätter-Schudel method, as II is attacked by alk. I. I does not reduce 2,6-dichlorophenol-indophenol or acid I soln. In the Wheeler and Tollens phloroglucinol test for pentoses it behaves differently from the aldopentoses; the soln., instead of becoming violet-red, quickly turns yellow, then brown, and, in 30 sec., black. With  $\text{PhNHNH}_2$  it gives *d*-xylosazone readily and in good yield. The yield, based on the I used, is small (5 g. III from 27.2 g. I). C. A. R.

The action of pyridine on sugars. P. A. Levene and Douglas W. Hill. *J. Biol. Chem.* 102, 503-71 (1933). By gently refluxing solns. of sugars in 8 times their wt. of pyridine, evap. off the pyridine and taking up in water, part of the aldose is converted into the corresponding ketose, which can be detd. by the difference between aldose and total sugar figures. With dextrose the yield of fructose was only 11.7% and not 30% as claimed by Danilov, *et al.* (C. A. 25, 920). Mannose, however, gave a 30% and rhamnose a 16% yield of the ketoses, *i. e.*, *cis*-2,3-sugars are more easily converted than *trans*-2,3-sugars. Correspondingly xylose and ribose gave 11 and 8% yields, while xylose and arabinose gave none. The reaction is reversible, the yields representing equilibria, and varying with the temp. of heating. By refluxing fructose for 4 hrs. in pyridine, 44% was converted to aldose.

K. V. Thimann

Nitrogenous sugars. V. Synthesis of peptide-like substances from amino sugars and amino acids. III. Acetylated glucopeptides. Alfred Bertho and Joseph Maier. *Z. physiol. Chem.* 222, 139-47 (1933); cf. C. A. 26, 3778, 5910.—A peptide linkage between the  $\text{NH}_2$  of glucosamine and the  $\text{CO}_2\text{H}$  of amino acids is effected by condensation of the tetraacetylglucosamine, in which the  $\text{NH}_2$  is unsubstituted, with an azidoacyl halide, and catalytic hydrogenation of the product. Tetraacetylglucosamine in  $\text{CHCl}_3$  when treated with  $\text{N}_3\text{CH}_2\text{COCl}$  and pyridine yielded 75-80% of tetraacetyl(azidoacetyl-*N*)-glucosamine, m. 131°,  $[\alpha]_D^{20}$  6.1°, which was hydrogenated in AcOEt by  $\text{PtO}_2$  catalyst to 70-75% of tetraacetyl(glycyl-*N*)-glucosamine (I), m. 161-2° (decompn.). The latter reacted with  $\text{NH}_3$  in MeOH to form  $\text{AcNH}_2$  and a hygroscopic amorphous product which easily reduced Fehling soln. and could not have been a cyclic anhydride such as that previously obtained with the corresponding alanyl deriv. Condensation of I with  $\text{MeCHBrCOCl}$  in the presence of pyridine yielded 60% of tetraacetyl( $\alpha$ -bromopropionylglycyl-*N*)-glucosamine, m. 162°. Similarly, I and  $\text{Me}_2\text{CHCH}_2\text{CHBrCOCl}$  gave 50% of tetraacetyl( $\alpha$ -bromoisocaprolylglycyl-*N*)-glucosamine, m. 174-5°. Treatment of the latter with  $\text{NH}_3$  in MeOH converted it into leucylglycyl-*N*-glucosamine, decompn. 132°. Tetraacetyl(alanyl-*N*)-glucosamine (II) and  $\text{Me}_2\text{CHCH}_2\text{CHBrCOCl}$  yielded tetraacetyl( $\alpha$ -bromoisocaprolylalanyl-*N*)-glucosamine, m. 169-70°,  $[\alpha]_D^{20}$  10.7°. II and  $\text{MeCHN}_3\text{COCl}$  gave tetraacetyl( $\alpha$ -azidopropionylalanyl-*N*)-glucosamine, m. 139° (evolution of gas), which was hydrogenated to tetraacetyl(dialanyl-*N*)-glucosamine, m. 212° (decompn.). Chondrosamine condensed with  $\text{MeCHBrCOCl}$  to  $\alpha$ -bromopropionyl-*N*-chondrosamine, m. 181.5°, a mutarotating substance representing the  $\alpha$ -form, which yielded with  $\text{NH}_3$  a viscous sirup lacking the properties of a glucopeptide anhydride. A. W. Dorr

Sulfur-sugars and their derivatives. XVIII.  $\beta,\beta$ -Diglucoosyl sulfoxysulfide. Wilhelm Schneider and August Bansa. *Ber.* 66B, 1973-5 (1933); cf. C. A. 25, 4232.—Tetraacetyl-*d*-glucosido-*S*-thiuronium bromide (I) (C. A. 22, 4108) with  $\text{KNO}_3$  and AcOH gives a compd.  $\text{C}_{24}\text{H}_{38}\text{O}_{12}$  (II), m. 169°, mol. wt. in boiling  $\text{CHCl}_3$  680 ( $c$  1.75), 707 ( $c$  0.99),  $[\alpha]_D^{20}$   $-41.34^\circ$  to  $-41.91^\circ$  in  $(\text{CHCl}_3)_2$ . II is also obtained from  $\beta$ -glucothiosine tetraacetate (III) with  $\text{NaNO}_2$ -AcOH through an unstable thionitrite (as evidenced by a transitory reddening of the reaction mixt.),

In its formation from I, the  $\text{HNO}_3$  evidently first splits out the 2 N atoms and the resulting glucoacid thiocarbonate decomps. into  $\text{CO}_2$  and III which then forms II as above.  $\beta, \beta$ -Diglucoosyl disulfide octaacetate (IV) in  $\text{AcOH}$  with  $\text{H}_2\text{O}_2$  likewise yields II. These facts suffice to prove that II is *octaacetyldiglucoosyl sulfoxysulfide*,  $\text{Ac}_8\text{C}_{12}\text{H}_{20}\text{O}_{17}\text{S}_2\text{O}$ .  $\text{C}_6\text{H}_5\text{O}_4\text{Ac}$ . On hydrolysis according to Zemplén it yields a sirup from which, by acetylation with  $\text{Ac}_2\text{O}-\text{C}_6\text{H}_5\text{N}$ , is obtained IV.

**Carbohydrates. XVIII. Benzoates of glucofuranose.** Percy Brigl and Hans Grüner. *Ber.* 66B, 1977–83 (1933); cf. C. A. 27, 4216.—The 2,6-benzoate of glucose obtained by the  $\text{H}_3\text{BO}_3$  method gives, again by the  $\text{H}_3\text{BO}_3$  method, a tribenzoate (I) which with  $\text{BzCl}$  in  $\text{CHCl}_3-\text{C}_6\text{H}_5\text{N}$  yields glucofuranose pentabenzoate, m. 143–4°,  $[\alpha]_D^{20} -55.1^\circ$  ( $\text{CHCl}_3$ ). As it had already been shown that none of the Bz groups in I is in the 1-position and as the diacetate of I is a sirup,  $[\alpha]_D^{20} 32.3^\circ$  ( $\text{CHCl}_3$ ), which does not crystallize when seeded with the  $\alpha$ -form, m. 162–3°,  $[\alpha]_D^{20} 140.6^\circ$  ( $\text{CHCl}_3$ ), or the  $\beta$ -form, m. 202°,  $[\alpha]_D^{20} 111.9^\circ$  ( $\text{CHCl}_3$ ), of 1,4-diacyl-2,3,6-tribenzoylglucopyranose obtained from 1,2,3,6-tetrabenzoylglucose with  $\text{Ac}_2\text{O}-\text{ZnCl}_2$ , I must be the 2,5,6-compd. Attempts were made to prep. it in another way; 3-acetyl-5,6-dibenzoylacetoneglucose with  $\text{AcOH}-\text{H}_2\text{SO}_4$  at 50° gives 5,6-dibenzoylglucose (II), m. 135–6°,  $[\alpha]_D^{20} -15.0^\circ$  in abs. alc. 10 min. after soln., 19.9° (const.) after 2 hrs., which strongly reduces Fehling soln., but attempts to introduce another Bz group into the 2-position with, e. g.,  $\text{H}_3\text{BO}_3$  were unsuccessful;  $\text{BzCl}$  in  $\text{C}_6\text{H}_5\text{N}-\text{CHCl}_3$  gave  $\alpha$ -pentabenzoylglucofuranose, m. 119–20°,  $[\alpha]_D^{20} 60.3^\circ$ . A no. of reactions were carried out with II, however. With  $\text{Ac}_2\text{O}-\text{C}_6\text{H}_5\text{N}$  it gave crystals, m. 80–125°,  $[\alpha]_D^{20} 8.68^\circ$  ( $\text{CHCl}_3$ ), apparently a mixt. of the  $\alpha$ - and  $\beta$ -1,2,3-triacetates, which on renewed treatment with  $\text{Ac}_2\text{O}-\text{ZnCl}_2$  yielded a homogeneous product, presumably the  $\beta$ -triacetate, m. 97–8°,  $[\alpha]_D^{20} -41.6^\circ$  ( $\text{CHCl}_3$ ). With  $\text{HCl}-\text{Me}_2\text{CO}$ , II gave the *monoaacetone compd.*, m. 118°,  $[\alpha]_D^{20} 41.4^\circ$  ( $\text{CHCl}_3$ ), entirely different from the sirupy product described by Ohle and Dickhauser (C. A. 20, 3081) under the same name; with  $\text{Ac}_2\text{O}-\text{C}_6\text{H}_5\text{N}$  it yields the 3-acetate used for prep. II. Nor can O. and D.'s product have been anywhere near pure 3,6-dibenzoylacetoneglucose (IV), since the sirupy 3-benzoate,  $[\alpha]_D^{20} 26.5^\circ$  (alc.) (5,6-diacyl-2,3,6-tribenzoylglucose, m. 77–8°,  $[\alpha]_D^{20} -26.7^\circ$  ( $\text{CHCl}_3$ )), with  $\text{BzCl}-\text{C}_6\text{H}_5\text{N}$  yields IV as crystals, m. 108–9°,  $[\alpha]_D^{20} -4.6^\circ$  ( $\text{CHCl}_3$ ), which form the 5-*p*-toluenesulfonate, m. 143°,  $[\alpha]_D^{20} -23.8^\circ$  ( $\text{CHCl}_3$ ) (Ohle *et al.*, C. 1 24, 1351).

**Septanose derivatives. III. Hydrolysis of  $\alpha$ -methylgalactoseptanoside.** Fritz Micheel and Fritz Suckfüll. *Ber.* 66B, 1957–8 (1933); cf. C. A. 28, 110–11.—For an approx. 1% soln. in 0.01 N HCl of the septanoside,  $[\alpha]_D^{20}$  (water), the half-time value of hydrolysis at 95° is about 28 min. and the velocity const. is around  $2 \times 10^{-3}$  time in min., natural logs, as compared with  $3-12 \times 10^{-2}$  for furanosides and  $2-7 \times 10^{-4}$  for pyranosides under the same conditions. The 7-membered septanose ring is not strained, even if the angle between the O valences should be materially smaller than 110°. The ease with which furanosides are hydrolyzed can therefore not be ascribed to a possible ring strain resulting from an assumed smaller angle. On the other hand there seems to be some indication of a parallelism between the instability of the free sugars (furanoses, septanoses) and the ease of hydrolysis of their glucosides.

**Reactions catalyzed by aluminum chloride. VIII. Action of aluminum chloride on hexane and heptane, alone and in the presence of halogen derivatives. A conversion of paraffin into cycloparaffin hydrocarbons.** Costin D. Nemitescu and Alexander Drăgan. *Ber.* 66B, 1892–900 (1933); cf. C. A. 27, 4781.—The study of the action of  $\text{AlCl}_3$  on cyclic hydrocarbons has been extended to normal paraffins. These were found to undergo not only isomerization, dehydrogenating condensation to higher hydrocarbons and cleavage of the chain to lower paraffins but also another unexpected reaction, *vis.*, a dehydrogenating cyclization to mono- and bicyclic cycloparaffins. Hexane at the b. p. (68–9°) evolves no or only very little combusti-

ble gases, and the  $\text{AlCl}_3$  (either freshly sublimed or hydrated) remains unchanged in appearance. The greater part of the hexane is converted into a lower-boiling isomer, probably 2- or 3-pentane or a mixt. of the 2. The hydrogenation product is pentane and the only dehydrogenation product identified with certainty is cyclohexane. No product boiling higher than cyclohexane (80°) is formed. In the presence of a halogen deriv. ( $\text{AcCl}$ ) there are obtained the same pentane, hexane and cyclohexane fractions in about the same relative amts., and in addn. higher-boiling, benzene-like fractions (up to 248°) which are completely satd. but contain less H than the paraffins of the same b. p. The 100–40° fractions have the compn.  $\text{C}_8\text{H}_{18}$ , and therefore have but 1 ring; evidence was obtained of the probable presence of 1,3-dimethylcyclohexane in the 120–5° fraction. The fractions boiling around and above 200° are bicyclic cycloparaffins,  $\text{C}_{10}\text{H}_{18}$ , rich in those of the compn.  $\text{C}_{12}\text{H}_{22}$ . Heptane is more sensitive toward  $\text{AlCl}_3$  than hexane, and there is a distinct difference in the action of anhyd.  $\text{AlCl}_3$  and of  $\text{AlCl}_3$  to which water has been added. The former remains solid and powdery, even after long boiling, while the latter quickly liquefies to a brown lower layer; the anhyd. salt yields only satd. products while the hydrated  $\text{AlCl}_3$  gives, in addn., considerable amts. of polymerized olefins which remain combined with the  $\text{AlCl}_3$  in the lower layer. With hydrated  $\text{AlCl}_3$  heptane yields considerably more gaseous cleavage products (propane, butane) than with anhyd.  $\text{AlCl}_3$ . If not enough water has been added, the evolution of gas soon ceases but begins vigorously again as soon as more water is added. Heptane, too, gives both lower- and higher-boiling hydrocarbons than the original  $\text{C}_7\text{H}_{16}$ . The former are exclusively paraffins (propane, isobutane, a pentane fraction and a hexane fraction (2- or 3-methylpentane), but no  $\text{CH}_4$ ,  $\text{C}_2\text{H}_6$  or butane, were isolated). A large part of the heptane is recovered as isoheptanes b. 87–93°. The higher-boiling products are cycloparaffins, both monocyclic (including 1,3-dimethylcyclohexane) and bicyclic (chiefly  $\text{C}_{10}\text{H}_{18}$ ). The lower layer obtained with hydrated  $\text{AlCl}_3$  gives with water a fraction volatile and one not volatile with steam; the former contains, together with small amts. of an olefin b. around 100° (probably a heptene or methylcyclohexene), chiefly compds. of the compn.  $\text{C}_{10}\text{H}_{18}$ ; the non-volatile part has approx. the compn.  $(\text{C}_7\text{H}_{14})_n$ . In the presence of halogen derivs. ( $\text{Et}$ ,  $\text{Pr}$ ,  $\text{iso-Pr}$ ,  $\text{Bu}$  chloride) heptane reacts very vigorously, the halide being reduced to the hydrocarbon ( $\text{PrCl}$  gives 90% propane); the heptane is broken down to only a very small extent to lower paraffins but gives much higher-boiling cycloparaffins and a lower layer contg. olefins.

**Ferric chloride and other metallic chlorides in the Friedel-Crafts reaction.** E. Wertyporoch, I. Kowalski and A. Roeske. *Ber.* 66B, 1232–8 (1933).— $\text{FeCl}_3$  dissolves at 0° in  $\text{Et}$ ,  $\text{Pr}$ ,  $\text{iso-Pr}$ ,  $\text{Bu}$ ,  $\text{iso-Bu}$ ,  $\text{Am}$ ,  $\text{iso-Am}$  and hexyl chlorides to the extent of 0.2–0.5%; in  $\text{EtBr}$  to the extent of 0.9%. The cond. of these solns. increases with the concn. The molar conds. are const. in concd. soln. with the alkyl chlorides (about 0.02 mol.  $\text{FeCl}_3$  per l.) and in moderate concns. with acyl chlorides,  $\text{BzCl}$  and  $\text{AcCl}$ , (0.1–0.3 mol.  $\text{FeCl}_3$  per l.), indicating the formation of stable complexes. On standing the sp. and molar conds. of solns. of  $\text{FeCl}_3$  in all the chlorides increase, with weak evolution of  $\text{HCl}$ , because alkylenes are formed which enter the complexes and form well-conducting salts. At 18°  $\text{FeCl}_3$  is sol. in  $\text{BzCl}$  to the extent of 14.2%, in  $\text{AcCl}$  14.7%. The color of the solns. and strong cond. without evolution of  $\text{HCl}$  show that the carbonyl O is the reason for a highly colored and well-conducting complex. On addn. of  $\text{C}_2\text{H}_5$  or  $\text{C}_6\text{H}_5$  to  $\text{EtCl}$  or  $\text{EtBr}$  solns. of  $\text{FeCl}_3$ ,  $\text{HCl}$  is gradually evolved, and there is an increase in cond. This slight increase compared with the high value of  $K$  in  $\text{AlCl}_3-\text{C}_6\text{H}_5$  complexes in  $\text{EtCl}$  is due to the fact that  $\text{FeCl}_3$  is very slightly sol. in  $\text{EtCl}$  or  $\text{EtBr}$  and that these solns. become conducting, partly as the result of the formation of unsatd. compds. and their introduction into the complex and subsequent displacement by the  $\text{C}_2\text{H}_5$  or  $\text{C}_6\text{H}_5$  added. In solns. of  $\text{FeCl}_3$  in  $\text{BzCl}$  and  $\text{AcCl}$  a deep red-brown color develops on addn. of the corresponding ketones,  $\text{Ph}_2\text{CO}$

and PhCOMe. In the very highly conducting solns. of  $\text{FeCl}_3$  in  $\text{AcCl}$  the cond. is not increased; in  $\text{BzCl}$   $K_c$  increases after 15 min. to 1.5 times its original value, a proof that the formation of the complex takes place gradually through conversion of  $\text{Ph}_2\text{CO}$  into the  $\text{BzCl-FeCl}_3$  complex. This behavior leads to the assumption that the formation of alkyl- or acylbenzenes from hydrocarbons and alkyl or acyl chlorides in the presence of  $\text{FeCl}_3$ , as well as in the case of the Al-halogen compds., is restricted by the formation of a conducting ternary complex, and that in this complex a loosening of the halogen bond in the alkyl or acyl chloride and of the H bond in the hydrocarbon takes place. The stabilization results from escape of  $\text{HCl}$  and formation of alkyl- or acylbenzenes. The complexes are formed in much smaller quantity than with the easily sol.  $\text{AlCl}_3$  or  $\text{AlBr}_3$ . A mixt. of  $\text{EtBr}$ ,  $\text{C}_6\text{H}_6$  and  $\text{FeCl}_3$  (sublimed) was boiled on a water bath 2-4 hrs. The liquid was decompd. at  $0^\circ$ , extd. with  $\text{Et}_2\text{O}$ , and the  $\text{Et}_2\text{O}$  soln. distd. The yield (about 3.4%, calcd. on  $\text{C}_6\text{H}_6$ ) was a mixt. of mono-, di-, tri- and tetraethylbenzenes, together with about 0.1% of solid  $\text{C}_6\text{Et}_6$ , m.  $127^\circ$ . When  $\text{FeCl}_3$  was used in the prepn. of  $\text{Ph}_2\text{CH}_2$ ,  $\text{Ph}_2\text{CH}$ ,  $\text{Ph}_2\text{CCl}$ ,  $\text{Ph}_2\text{CO}$  and  $\text{PhCOMe}$ , the yields were usually only about half those obtained when  $\text{AlCl}_3$  was used. The reaction of 47 g.  $\text{C}_6\text{H}_6$ , 17 g.  $\text{CH}_2\text{Cl}_2$  and 33 g.  $\text{FeCl}_3$  gave in the  $\text{C}_6\text{H}_6$  layer 0.5 g.  $\text{Ph}_2\text{CH}_2$ , traces of  $\text{Ph}_2\text{CH}$  and 0.5 g. of a resin, and in the water layer 13 g. of a condensation product which could not be distd. From the reaction of 125 cc.  $\text{C}_6\text{H}_6$ , 25 g.  $\text{PhCH}_2\text{Cl}$  and 48 g.  $\text{FeCl}_3$  there was obtained in the  $\text{C}_6\text{H}_6$  layer 8.5 g.  $\text{Ph}_2\text{CH}_2$ , 0.5 g.  $\text{PhCH}_2\text{I}$ , 3.5 g. of a yellow oil b<sub>m</sub>  $300^\circ$ , 5 g. of a brown yellow oil b<sub>m</sub>  $270-80^\circ$ , and 5 g. of a non-distillable resin; 11 g. of a resin was obtained from the aq. layer. The reaction of 100 g.  $\text{C}_6\text{H}_6$  with 20 g.  $\text{CHCl}_3$  and 18 g.  $\text{FeCl}_3$  gave in the  $\text{C}_6\text{H}_6$  layer 0.5 g.  $\text{BzH}$ , 4.5 g.  $\text{Ph}_2\text{CHI}$ , 0.5 g.  $\text{Ph}_2\text{COH}$ , and 1 g. residue. From 40 g.  $\text{C}_6\text{H}_6$ , 16 g.  $\text{CCl}_4$  and 15 g.  $\text{FeCl}_3$  was obtained 8 g. of  $\text{Ph}_2\text{CCl}$ . Reaction of 20 g.  $\text{C}_6\text{H}_6$  with 18 g.  $\text{AcCl}$  and 40 g.  $\text{FeCl}_3$  gave 4 g. of  $\text{PhCOMe}$  and 2 g. of undistillable condensation products. From the reaction of 55 g.  $\text{C}_6\text{H}_6$  with 15 g.  $\text{BzCl}$  and 18 g.  $\text{FeCl}_3$  was obtained 13.5 g.  $\text{Ph}_2\text{CO}$ , 1 g. of a higher condensation product and 4 g.  $\text{BzOH}$ .  $\text{BeCl}_2$  in  $\text{EtBr}$  did not react with  $\text{C}_6\text{H}_6$ .  $\text{PhCCl}_2$  (10 cc.) was heated with 2 g. sublimed  $\text{BeCl}_2$  for 4 hrs. at  $150^\circ$ . The  $\text{Et}_2\text{O}$  ext. gave 0.5 g. *m*-trichloromethyldiphenyldichloromethane, b<sub>m</sub>  $150-60^\circ$ . In the presence of chlorides of Hg, Tl, Th, Ti and Sn,  $\text{C}_6\text{H}_6$  and  $\text{EtBr}$  do not form ethylbenzenes even at  $150^\circ$  in a bomb tube; neither does  $\text{CHCl}_3$  react with  $\text{BzCl}$  or  $\text{C}_6\text{H}_6$  in the presence of  $\text{ZnCl}_2$ .

**Organic sulfur compounds. XXIV. "Free" radicals with univalent sulfur.** A. Schönberg, E. Rupp and W. Gumlich. *Ber.* 66B, 1932-45 (1933); cf. *C. A.* 27, 3197.—The investigations which led Schönberg to accept, with reserve, the view that diaryl disulfides and thiacyl disulfides of the aromatic series can disoc. into free radicals have been completed and confirm this view. The name *thyl* is suggested for these radicals with univalent S. Dil. solns. of  $(\alpha\text{-C}_{10}\text{H}_7\text{CS})_2\text{S}_2$  (I) in  $(\text{CH}_2\text{Br})_2$  at  $97^\circ$ ,  $\text{PhOMe}$  at  $100^\circ$ ,  $\text{C}_{10}\text{H}_7$  at  $100^\circ$  and phenanthrene at  $110^\circ$  do not obey Beer's law; the deviations are extraordinarily large (the results in  $\text{Ph}_2\text{O}$  and xylene are not reported for lack of space). The same is true of  $\text{Ph}_2\text{S}_2$  (II) in  $\text{C}_{10}\text{H}_7$ ,  $\text{PhOMe}$  and  $(\text{CH}_2\text{Br})_2$  at  $100^\circ$ , while biphenylene disulfide in phenanthrene at  $110^\circ$  does obey the law. The intensely green soln. of Schlenk's  $\text{Ph}(p\text{-PhC}_6\text{H}_4)\text{C(ONa)}\cdots$  (III) added to II or I in ether immediately becomes colorless; this is ascribed to the reaction  $\text{III} + \text{PhS}\cdots \rightarrow [\text{Ph}(\text{PhC}_6\text{H}_4)\text{C(ONa)SPh}] \rightarrow \text{PhC}_6\text{H}_4\text{COPh} + \text{PhSNa}$ . I reacts instantaneously with  $\text{CH}_3\text{N}_3$  (the structure of the resulting amorphous product has not been established) and II with

$\text{Ph}_2\text{CN}_3$  gives  $\text{Ph}_2\text{C(SPh)}_2 + \text{N}_2$ , just as  $\text{Ph}_2\text{C}\cdots$  gives  $\text{CH}_2(\text{SCPh})_2 + \text{N}_2$  with  $\text{CH}_3\text{N}_3$ . Even under mild temp. conditions, solns. of I dissolve heavy metals, like Zn and Ag:  $\text{C}_{10}\text{H}_7\text{C}(\text{:S})\text{S}\cdots + \text{Ag} \rightarrow \text{C}_{10}\text{H}_7\text{C}(\text{:S})\text{SAg}$ . Although I and II in solid form and in soln. are stable toward atm. O, this does not disprove the radical disocn. theory, for the diarylnitrogen radicals and the phenanthroxyls are relatively quite stable. Certain problems in connection with the thyls are briefly discussed, such as: the fact that it has thus far not been possible to detect disocn. by mol.-wt. detns.; the possibility of applying the results of optical measurements to the detn. of the disocn. const.; the role of disproportionation, etc.

C. A. R.

**Arylthioniums.** Ch. Courtot and T. Y. Tung. *Compt. rend.* 197, 1237-9 (1933).— $\text{AlCl}_3$  acting on diphenylsulfone in benzene at  $40^\circ$  for 4 days yields triphenylthionium chloride (I),  $\text{Ph}_3\text{SCl}$ , m.  $277^\circ$ . I unites with  $\text{HgCl}_2$ , forming  $\text{Cl}_2\text{HgPh}_3\text{SCl}$ , m.  $214^\circ$ . Condensation of diphenylsulfone with *o*- and *m*-xylene yields *o*-xylyldiphenylthionium chloride (failed to crystallize) and the *m*-isomer, m.  $179^\circ$  (monohydrate, m.  $123-4^\circ$ ). *p,p'*-Ditolylsulfone treated similarly in benzene, toluene, *o*-xylene, *p*-xylene and cumene give the following: phenylditolylthionium chloride, m.  $193-4^\circ$  (monohydrate, m.  $125-7^\circ$ ; trihydrate, m.  $63^\circ$ ); triolylthionium chloride, m.  $228^\circ$  (monohydrate, m.  $138-40^\circ$ ; tetrahydrate, m.  $51-2^\circ$ ); *o*-xylylditolylthionium chloride, m.  $118-20^\circ$  (dihydrate, m.  $56-7^\circ$ ); *p*-xylylditolylthionium chloride, not cryst. but with  $\text{HgCl}_2$ , m.  $86-7^\circ$ . The tetramethyl-2,4,2',4'-diphenylsulfone condensed with toluene and *o*-xylene gives dixylylditolylthionium chlorides, m.  $94-7^\circ$ , and trixylylthionium chloride, m.  $103-5^\circ$  (trihydrate, m.  $102-5^\circ$ ). Phenyl-*p*-tolylsulfone, m.  $73^\circ$ , condenses with benzene, *o*- and *p*-xylene, yields thioniums with 3 different aryl radicals: diphenyl-*p*-tolylthionium chloride, m.  $232-4^\circ$ , *o*-xylylphenylditolylthionium chloride, m.  $74-6^\circ$  (trihydrate, m.  $59-60^\circ$ ), and *m*-xylylphenylditolylthionium chloride, m.  $73-4^\circ$ .

W. J. Peterson

**Derivatives of *o*-aminophenol.** Lukas Galatis. *Ber.* 66B, 1774-9 (1933).—When an excess of  $\text{Ac}_2\text{O}$  is allowed to react some hrs. at  $100-20^\circ$  on *o*- $\text{PhCH:NC}_6\text{H}_4\text{(OH)}$ , the anil gives 50% each of the *O*-acetate,  $\text{PhCH:NC}_6\text{H}_4\text{(OAc)}$  (I), and of the stable isomer *N*-acetyl-2-phenylbenzoxazoline (II), m.  $98.5^\circ$ . The yield of II cannot be increased by heating for several hrs. or by satg. the  $\text{Ac}_2\text{O}$  with  $\text{NaOAc}$ , and at room temps. only small amts. of it are formed. The  $\text{AcOH}$  liberated in the formation of I evidently adds to the azomethine group of a 2nd mol. of the anil, forming the intermediate compd.  $\text{HOOC}_6\text{H}_4\text{NACCH(OH)Ph}$  (III) which gives II by elimination of water. III is so stable in the cold that when the  $\text{Ac}_2\text{O}$  is allowed to react on the anil at room temp. and the gradually liquefied mass is poured into  $\text{NaHCO}_3$  there is obtained a thick oil consisting chiefly of a mixt. of equal parts of I and III, for when it is poured into  $\text{HCl}$  it gives at once  $\text{BzH}$ ,  $\text{HOOC}_6\text{H}_4\text{NHAc}$  and 2-methylbenzoxazole, with  $\text{AcOC}_6\text{H}_4\text{NH}_2$  as an intermediate product. If the thick oil is heated 2 hrs. at  $100-20^\circ$ , it yields 50% II on hydrolysis. The addn. of  $\text{AcOH}$  to the azomethine group does not occur in the absence of  $\text{Ac}_2\text{O}$ . In working up the acetylation product with acids there were sometimes formed small amts. of  $\text{AcNHC}_6\text{H}_4\text{OAc}$ , m.  $124^\circ$ , especially when the  $\text{Ac}_2\text{O}$  was satd. hot with  $\text{NaOAc}$ . II is easily isolated, but at the expense of I, by freeing the reaction product of excess of  $\text{Ac}_2\text{O}$  by pouring into  $\text{NaHCO}_3$ , taking the pptd. oil up in ether, shaking with  $\text{HCl}$  to destroy the I, evapg. and removing the  $\text{BzH}$  and methylbenzoxazole with steam. It is slowly decompd. by hot dil. mineral acids into  $\text{AcNHC}_6\text{H}_4\text{OH}$  and  $\text{BzH}$ , likewise by boiling alkalis. It slowly dissolves in concd.  $\text{HCl}$  with intermediate formation of a thick yellowish oil which after a few hrs. changes into a thick felt of needles of the  $\text{HCl}$  salt of a substance m.  $245-55^\circ$ .

C. A. R.

**Some derivatives of  $\alpha$ -bromoisovaleric acid.** Mario Covello. *Rend. accad. sci. (Napoli)* [4], 2, 73-83 (1932).—C. prepd. the  $\alpha$ -bromoisovaleryl derivs. of salicylamide, *o*-anisidine, pseudocumidine,  $\alpha$ -naphthylamine and bromodithiylacetylurea. The last was included in the hope of detg. whether the Br would increase its hypnotic action,

but the deriv. obtained was much less sol. and less active. All compds. prepd. were recrystd. to const. m. p. and analyzed for Br and N. The physiol. action was detd. by the technic of Dubois by the effect on fish. Four g. salicylamide and 5.2 g.  $\alpha$ -bromoisovaleryl bromide (I) were mixed in a chilled flask and slowly heated on a sand bath. At 160° much HBr was evolved; the mixt. was then cooled and washed repeatedly with dil.  $\text{Na}_2\text{CO}_3$  soln. The crude product was dissolved in 70% alc. and decolorized with animal charcoal. From the filtrate  $\alpha$ -bromoisovalerylsalicylamide (II), m. 198°, crystd. In water it gave an intense violet color with  $\text{FeCl}_3$  showing that the phenolic OH had not been acylated. To 4 g. I in 20 cc. benzene was added a soln. of 3 g. *o*-anisidine and 2.4 g.  $\text{Na}_2\text{CO}_3$ . After the lively effervescence subsided the mixt. was refluxed 4 hrs. and the soln. filtered and allowed to evap. to half its vol. to give crystals of  $\alpha$ -bromoisovaleryl-*o*-anisidine (III), m. 110.5°. The similarly prepared soln. of  $\alpha$ -bromoisovalerylpseudocumidine (IV) was filtered hot and allowed to crystallize; IV m. 109°.  $\alpha$ -Bromoisovaleryl- $\alpha$ -naphthylamine (V) m. 106°, and  $\alpha$ -bromoisovalerylbromodiethylacetyleurea m. 110.5°. Aq. solns. tested with Clark's indicators had the following  $p_{\text{H}}$  values: 5.8, 4.5, 6.1, 6.8 and water 6.6. Their partition coeffs. in water-oil were, resp., 1.08, 1.04, 0.98, 0.94, 0.49. The times required to cause a fish swimming against the current in a rotating vessel to reverse its direction and to completely narcotize it show a definite parallel between the hypnotic strengths of these compds. and their partition coeffs.

Anne E. White

***p*-Nitro-*o*-anisidine.** A. A. Gribov, E. A. Ivanov and / Salomatina. *Antinokrasochayaya Prom.* 3, 238 45 (1933).—Lab. investigation of the existing methods of prepn. of *p*-nitro-*o*-anisidine (I) produced the following optimum results. *p*-Toluenesulfonanisidine, m. 127.5–29° (from alc.), was gradually added at room temp. to 1.3 mols.  $\text{HNO}_3$  dild. to 10%, and the whole was refluxed with much stirring in a water bath for 8 hrs. at 80–90°, then the *nitrotoluenesulfonanisidine* (II) was filtered off and dried at 70–80°, producing 94% II, m. 167–9° (theory 169–70°). The spent acid in the filtrate can be used again by adding fresh acid to 10%  $\text{HNO}_3$ . The addn. of Hg salts failed to catalyze the reaction. Higher concns. and higher temps. caused excessive resinification of the reaction products. II, m. 168–70° (from xylene), sapond. by stirring with 3 vols. of 90%  $\text{H}_2\text{SO}_4$  for 20 hrs. at 18–20° (or for 2–3 hrs. at 25–30°), cooling the reaction mass to 10° and pouring into cold water, filtering and drying at 60–70°, produced 91% I, m. 135–7° (resp. 136–9°), which gave dycings on  $\beta$ - $\text{C}_6\text{H}_5$  of a dirtier and different shade than the standard I. By dilg. the reaction mass with small pieces of ice from 90 to 60%  $\text{H}_2\text{SO}_4$ , filtering off the mixed ppt. of the sulfate of I and *p*- $\text{MeC}_6\text{H}_4\text{SO}_3\text{H}$ , and sepg. I from the mixt. with  $\text{Na}_2\text{CO}_3$  in  $\text{H}_2\text{O}$ , there was obtained 87% I, m. 134–9°, which gave dycings equal to the standard. The work is being continued.

Chas. Blanc

**Preparation of *p*-azoxyanisole.** B. M. Bogoslovskii. *Antinokrasochayaya Prom.* 3, 304–7 (1933).—The method of Davies and Down (C. A. 23, 2953) for the production of *p*- $\text{MeOC}_6\text{H}_4\text{N}:\text{N}(\text{O})\text{C}_6\text{H}_4\text{OMe}$  (I) was improved. A yield of 80% *p*- $\text{C}_6\text{H}_4(\text{NO}_2)\text{OMe}$  (II), m. 52–3°, was obtained from *p*- $\text{ClC}_6\text{H}_4\text{NO}_2$  by the method of Ger. pat. 580,618. To a soln. of 50 g. metallic Na in 500 cc. 99–100% MeOH was added at once 50 g. II, and the mixt. was heated under an upright bulb condenser for 6 hrs. at 65–70°; the reaction mixt. was then poured into 1 l. cold  $\text{H}_2\text{O}$ , I was filtered off, washed with 300 cc. cold  $\text{H}_2\text{O}$  and dried at 60–70°, giving 96–7% I, m. 116.5–7°, transformation point 132–3°. Equal results were obtained when in the last 3 hrs. of heating a part (1/3) of the MeOH was allowed to distil off through an inclined condenser. The product without any further purification is equal to Kahlbaum I, showing a similar liquid anisotropic phase. Chas. Blanc

**Cleavage of aldehyde groups as formic acid from aromatic aldehydes. II. Polynitrobenzaldehydes.** Gunther Lock. *Ber.* 66B, 1750–55 (1933); cf. C. A. 28, 125–2, 4-(HO) $_2\text{C}_6\text{H}_3\text{CHO}$  on alkali fusion gives *m*- $\text{C}_6\text{H}_4(\text{OH})_2$  and  $\text{K}_2\text{CO}_3$  but no appreciable amts. of  $\text{HCO}_2\text{H}$

(about 1%); on the other hand, almost 1 mol.  $\text{H}_2$  is evolved. The CHO group is therefore not eliminated; the reaction consists in hydroxylation and simultaneous dehydrogenation to  $(\text{KO})_2\text{C}_6\text{H}_3\text{CO}_2\text{H} + \text{H}_2$ , the acid, under the conditions of the expt., splitting off  $\text{CO}_2$ . 2,1- $\text{C}_6\text{H}_3(\text{OH})_2\text{CHO}$  likewise gives 2- $\text{C}_6\text{H}_3(\text{OH})_2$ , without forming  $\text{HCO}_2\text{H}$ , and 2,4,6-(HO) $_3\text{C}_6\text{H}_2\text{CHO}$  yields phloroglucinol and  $\text{K}_2\text{CO}_3$ . 3,2,6- and 3,4,6- $\text{MeO}(\text{O}_2\text{N})_2\text{C}_6\text{H}_2\text{CHO}$  both give 2,4-( $\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{OH}$  and  $\text{HCO}_2\text{H}$ , and 2,6-dinitroisovanillin yields 3,5-dinitroguaiacol and  $\text{HCO}_2\text{H}$ . 3,4,6-HO( $\text{O}_2\text{N})_2\text{C}_6\text{H}_2\text{CHO}$ , 2,4-( $\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{CHO}$  and 2,4,6-( $\text{O}_2\text{N})_3\text{C}_6\text{H}_2\text{CHO}$  behave in the same way. The rule that only those aromatic aldehydes in which both H atoms adjacent to the CHO group are substituted by Cl eliminate the CHO group with alkalis therefore holds also for aldehydes with 2 nitro groups in the *o*- and *p*-position.

C. A. R.

**Alkylation of hydroxy aldehydes.** Sofiya I. Kanevska. *Arch. Pharm.* 271, 402 6 (1933).—The difficulties encountered in the alkylation of hydroxy aldehydes by methods commonly followed are pointed out, and a more generally applicable procedure is suggested for this purpose, which involves the use of *p*-toluenesulfonic esters (cf. Rodionov and K., *J. vns. chem. tech. Inst.* 1921; Rodionov, C. A. 20, 1795). Following this procedure expts. are described leading to the formation of veratric aldehyde, and ethyl ether of vanillin from vanillin, *amyl ether of vanillin (oxime)*,  $\text{C}_{11}\text{H}_{19}\text{O}_3\text{N}$ , m. 73–4°, *o*- and *p*- $\text{MeOC}_6\text{H}_4\text{CHO}$ , *o*- $\text{EtOC}_6\text{H}_4\text{CHO}$ , veratric aldehyde from protocatechuinaldehyde.

W. O. E.

**Addition of alkali alcoholates to acid esters. VIII. Sodium alcoholates and esters at high temperatures.** F. Adickes, S. v. Mullenheim and W. Simson. *Ber.* 66B, 1901 9 (1933); cf. C. A. 26, 4793. Scheibler (C. A. 26, 4794) believes that the formation of  $\text{NaOEt}$  when  $\text{BzOEt}$  and  $\text{NaOEt}$  are heated on the water bath according to Claisen, which Adickes attributes to sapon. of the  $\text{BzOEt}$ , is produced by the reaction  $\text{BzOEt} + \text{NaOEt} \rightarrow \text{BzONa} + \text{C}_6\text{H}_5 + \text{EtOH}$ . It had already been shown that when water is excluded at room temp. or in petr. ether at 45°, only traces of  $\text{BzONa}$  are formed. Two parallel expts. were now run in which both reaction mixts. were heated 1 hr. on the water bath and then 1 of them was heated another 8 hrs.; the increase in  $\text{BzONa}$  in the latter was only 4% (based on the total Na used). The far larger amt. of  $\text{BzONa}$  in much shorter time found by Claisen cannot therefore have been formed by the reaction suggested by Scheibler. The study of the action of Na alcoholates on esters at about 180° has been extended to a no. of other esters. Just as the alkyl halides and the esters of  $\text{H}_3\text{PO}_4$ ,  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$  give ethers with alcoholates, so also were ethers obtained with  $\text{BzOMe}$ ,  $\text{BzOCH}_2\text{Ph}$ ,  $\text{CO}(\text{OC}_6\text{H}_5)_2$  and *o*- $\text{C}_6\text{H}_4(\text{CO}_2\text{CH}_2\text{Ph})_2$ . Side reactions always seem to occur, however, which result in the formation of water and hydrolysis of the esters, so that the yield of ethers is only 50–83% of that to be expected from the amt. of acid formed and 50–100% of the missing ether is found as the alc. Repetition of Scheibler's expts. gave results different from his. The reaction by no means proceeds solely according to the equation given by him. Apparently he identified  $\text{C}_6\text{H}_5$  in the evolved gas only qualitatively. Quantitatively, it contains 96% CO to 4%  $\text{C}_6\text{H}_5$ , and there is no relation between the amt. of  $\text{C}_6\text{H}_5$  and that of  $\text{BzONa}$  formed. The evolution of CO is doubtless analogous to the decompn. of  $\text{HCO}_2\text{Et}$ .  $\text{PhOEt}$  would be expected instead of EtOH but none was detected; the decompn. fragments ( $\text{Ph}$ ,  $\text{EtO}$ , CO, H,  $\text{C}_2\text{H}_5$ ) combine in all kinds of ways. Some  $\text{PhCOMe}$  and  $\text{CH}_3\text{Bz}$  were found.  $\text{HCHO}$  was detected in the decompn. of *o*- $\text{C}_6\text{H}_4(\text{CO}_2\text{Et})_2$  under the same conditions, by the formation of methylenebisindandione, resulting from condensation of the  $\text{HCHO}$  with 2 mols. indandione formed intramol. analogously to the reaction  $\text{ester} \rightarrow \text{o-acetylbenzoic ester} \rightarrow \text{indandione}$ . In view of the small amt. of  $\text{C}_6\text{H}_5$  evolved and the possibility of the formation of water by side reactions, there is no exptl. evidence that the Scheibler reaction predominates.  $\text{BzOPr}$  with  $\text{PrONa}$  behaves like  $\text{BzOEt}$  as regards the amts. of CO,  $\text{BzOH}$ ,  $\text{PrOH}$  and un-

changed ester found. BzOPh reacts with sufficient velocity only at 250–70°. No ether is formed. Partial reification apparently supplies the water for the sapon. of a large part of the ester, 8%, of which is also rearranged into *p*-HOCH<sub>2</sub>COPh. CO(OEt)<sub>2</sub> boils so low that no reaction occurs under atm. pressures; no expts. were made in sealed tubes. C. A. R.

**Arylaliphatic β-hydroxy acetals and their products of hydrolysis.** Marcu Rothbart. *Compt. rend.* 197, 1225–7 (1933).—A series of hydroxy acetals and their corresponding aldehydes have been prepd. conforming to a technic previously described by R. (C. A. 27, 3918): *Benzoyloxyacetal* b<sub>11</sub> 143°, d<sub>4</sub><sup>20</sup> 1.0020, n<sub>D</sub><sup>20</sup> 1.4875; *benzoyloxyacetaldehyde* b<sub>11</sub> 109–11°, d<sub>4</sub><sup>20</sup> 1.1107, n<sub>D</sub><sup>20</sup> 1.5345; *anisoyloxyacetal* b<sub>11</sub> 181°, d<sub>4</sub><sup>20</sup> 1.0398, n<sub>D</sub><sup>20</sup> 1.492; *anisoyloxyacetaldehyde* b<sub>11</sub> 157–60°, d<sub>4</sub><sup>20</sup> 1.1110, n<sub>D</sub><sup>20</sup> 1.5119 (semicarbazone, m. 160–0.5°); *β-phenylethoxyacetal*, b<sub>11</sub> 126–8°, d<sub>4</sub><sup>20</sup> 0.9785, n<sub>D</sub><sup>20</sup> 1.4770; *β-phenylethoxyacetaldehyde*, b<sub>11</sub> 120°, d<sub>4</sub><sup>20</sup> 1.068, n<sub>D</sub><sup>20</sup> 1.5216 (semicarbazone, m. 88.5°); *β-phenyl β-methylethoxyacetal* b<sub>11</sub> 130–2°, d<sub>4</sub><sup>20</sup> 0.9831, n<sub>D</sub><sup>20</sup> 1.475; *β-phenyl β-methylethoxyacetaldehyde*, b<sub>11</sub> 134–6°, d<sub>4</sub><sup>20</sup> 1.054, n<sub>D</sub><sup>20</sup> 1.520 (semicarbazone, m. 80–80.5°); *α-phenylethoxyacetal*, b<sub>11</sub> 138–40°, d<sub>4</sub><sup>20</sup> 0.9772, n<sub>D</sub><sup>20</sup> 1.4671; *2-phenyl-2-propoxyacetal*, b<sub>11</sub> 150–2°, d<sub>4</sub><sup>20</sup> 0.9756, n<sub>D</sub><sup>20</sup> 1.4780; *3-phenyl-2-methyl-2-propoxyacetal*, b<sub>11</sub> 115–18°, d<sub>4</sub><sup>20</sup> 0.9730, n<sub>D</sub><sup>20</sup> 1.4775. The hydrolysis of the acetal deriv. of PhCH<sub>2</sub>CH<sub>2</sub>OH with 7% H<sub>2</sub>SO<sub>4</sub> gives 60% aldehyde. The acetal deriv. of hydratropic alc. yields 76% aldehyde on treatment with 5% H<sub>2</sub>SO<sub>4</sub>. The benzoyloxy and anisoyloxy derivs. are more easily hydrolyzed, the 1st yielding 61% of the aldehyde (with 1% H<sub>2</sub>SO<sub>4</sub>); the latter some anisic alc. but no aldehyde. W. J. Peterson

**Syntheses with acids of the type RCH:CHCH<sub>2</sub>CO<sub>2</sub>H, and some mixed organomagnesium derivatives.** D. Ivanov and G. Pchenichni. *Compt. rend.* 197, 1230–1 (1933).—PhCH:CHCH<sub>2</sub>CO<sub>2</sub>H (I) with the Mg derivs. of iso-PrCl and α-C<sub>10</sub>H<sub>15</sub>Br yields after carbonation 2-phenylethenylmalonic acid, m. 133°. I with *m*-MeC<sub>6</sub>H<sub>4</sub>MgBr gives 6-phenyl-3-*m*-tolyl-2-phenethenyl-3-hydroxy-5-hexen-1-*oic* acid, m. 138–9°. With *p*-MeC<sub>6</sub>H<sub>4</sub>MgBr I yields the 6-*p*-tolyl isomer, m. 165°. With the PhMgBr, the 3,6-di-*Ph* compd., m. 142–3°, is obtained. With RCH:CHCH<sub>2</sub>CO<sub>2</sub>H (II) as starting material, iso-PrMgCl reacts to form 2-*α*-butenylmalonic acid, m. 100°. PhMgBr reacts with II to give 3-phenyl-2-*α*-butenyl-3-hydroxy-5-octen-1-*oic* acid, m. 145°. *p*-MeC<sub>6</sub>H<sub>4</sub>MgBr and VI give the 3-*p*-tolyl homolog, m. 124.5°. W. J. P.

**Constituents of the kawa root. XIV. Cinnamoyl-acetic ester.** W. Borsche and M. Lewinsohn. *Ber.* 66B, 1792–801 (1933); cf. C. A. 27, 3716.—The characteristic constituents of kawa root are derivs. of γ-unsatd. β-ketonic acids, RCH:CHCOCH<sub>2</sub>CO<sub>2</sub>H, whose esters can be prepd. synthetically by deacetylation of the corresponding acylated acetoacetic esters. As these esters contain the characteristic grouping COCH<sub>2</sub>CO<sub>2</sub>Et of AcCH<sub>2</sub>CO<sub>2</sub>Et, they should be capable of being used for all kinds of syntheses, just like AcCH<sub>2</sub>CO<sub>2</sub>Et itself. Some of these syntheses have been carried out with the initial member, *Et* cinnamoylacetate (I), of this series of esters. I, obtained in about 50% yield, together with PhCH:CHAc, PhCH:CHCO<sub>2</sub>H, etc., by partial hydrolysis of PhCH:CHCOCH<sub>2</sub>AcCO<sub>2</sub>Et with 75% AcOH on the water bath, m. 46°; *Cu* deriv., (C<sub>15</sub>H<sub>11</sub>O<sub>4</sub>)<sub>2</sub>Cu, deep green, almost black, prisms, m. 185–7°; 2,4-dinitrophenylhydrazones, red, m. 170–1°. With PhNHNH<sub>2</sub> in hot AcOH it yields, through the intermediate phenylhydrazones, 1-phenyl-3-styryl-5-pyrazolone, brownish, m. 148–9°. *Et* α-(2,4-dinitrophenyl)cinnamoylacetate, from I in ether, Na in alc. and 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>Cl in boiling ether, orange, m. 120–1°, hydrolyzed by water at 130° to *ω*-cinnamoyl-2,4-dinitrophenyl, brown, m. 152–3°. *Et* dicinnamoylacetate (4 g. from 4.4 g. I in ether, NaNH<sub>2</sub> and PhCH:CHCOCl), canary-yellow, m. 129°, converted by water at 120–30° into CH<sub>3</sub>(COCH:CHPh)<sub>2</sub>, m. 142°. When I is heated under 15 mm., only a small portion distills over unchanged; most of it remains in the flask as a brown resin changed by MeOH into a brown cryst. powder which after repeated extrn. with hot MeOH m. 162°; it is the corresponding

1 dehydracetic acid, 6-styryl-3-cinnamoyl-2,4-pyrone. With Pd and H in alc. I gives *Et* 8-phenyl-β-ketovalerate (II), b<sub>11</sub> 170–1° (3 g. from 4.4 g. I) (2,4-dinitrophenylhydrazones, orange-yellow, m. 78°); the residue remaining in the vacuum distn. of the ester yields 6-(*ω*-phenylethyl)-3-dihydrocinnamoyl-2,4-pyrone, m. 95°, converted by fuming HCl at 120° into 2,6-bis(*ω*-phenylethyl)-4-pyrone, m. 140°. 4-(*ω*-phenylethyl)-7-hydroxycoumarin, from II and *m*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub> in concd. H<sub>2</sub>SO<sub>4</sub>, m. 175–6°. *Et* 1,6-diphenyl-1,4-diketohexane-3-carboxylate, from II and Na in ether with PhCOCH<sub>2</sub>Br, yellow oil converted by concd. NH<sub>4</sub>OH and MeOH into the iminoketo ester, m. 147°, and by PhNH<sub>2</sub> in AcOH on the water bath into *Et* 1,5-diphenyl-2-(*ω*-phenylethyl)pyrrole-3-carboxylate, m. 139–40°. *Et* 8-phenyl-α-cinnamoyl-β-ketovalerate, from II, NaNH<sub>2</sub> and PhCH:CHCOCl, yellowish, m. 57° (*Cu* compd., light green, m. 204–5°), converted on heating into 1,7-diphenyl-3,5-diketo-1-heptene, m. 84–5° (*Cu* compd., green, m. around 200°). *Et* 8-phenyl-α-acetyl-β-ketovalerate (III), from AcCH(COCH:CHPh)CO<sub>2</sub>Et with colloidal Pd and H in alc., b<sub>01</sub> 130° (*Cu* compd., blue, m. 136°), gives with 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NHNH<sub>2</sub> in MeOH and HCl on the water bath a yellow cryst. ppt. consisting chiefly of *Et* 1-(2',4'-dinitrophenyl)-5-methyl-3-(*ω*-phenylethyl)pyrazole-4-carboxylate (IV), m. 144–5° (1 g. from 1 g. of III), with a very small amt. of the pyrazolone

4 (O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>N:N:C(CH<sub>2</sub>CH<sub>2</sub>Ph).CHAc.CO, m. 178° (the

structures of these 2 compds. have not been established; the isomers with the substituents on the 3- and 5-C atoms interchanged might well be formed). IV is in part hydrolyzed to 1-phenyl-3,5-diketohexane, b<sub>11</sub> 153–5°, which is more readily obtained pure by catalytic hydrogenation of PhCH:CHCOCH<sub>2</sub>COMe and with *m*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub> in AcOH satd. cold with HCl gives methyl(*ω*-phenylethyl)-7-hydroxybenzopyrylium chloride, very hygroscopic yellow crystals, isolated as the FeCl<sub>3</sub> complex, C<sub>15</sub>H<sub>11</sub>O<sub>4</sub>Cl.FeCl<sub>3</sub>, brown tables with bronze luster, m. 154°. *Et* α-(3,4-methylenedioxy)cinnamoylacetate (15 g. from 19.2 g. CH<sub>3</sub>(O)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CH:CHCO<sub>2</sub>H converted with SOCl<sub>2</sub> in benzene into the chloride and treated with AcCHNaCO<sub>2</sub>Et in ether), yellow, m. 104° (*Cu* compd., light green, m. 208°), gives with 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NHNH<sub>2</sub> in MeOH-HCl a pyrazole, 6 C<sub>22</sub>H<sub>18</sub>(O<sub>2</sub>N)<sub>4</sub>, dark yellow, m. 212°, and a (methylenedioxy)cinnamoylacetone dinitrophenylhydrazones, C<sub>15</sub>H<sub>10</sub>O<sub>4</sub>N<sub>4</sub>, brick-red, m. 200°. Boiling 75% AcOH breaks down the ester almost exclusively into Cl<sub>2</sub>O<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CH:CHCO<sub>2</sub>Et, but in *N* NaOH satd. cold with NH<sub>3</sub> gas it yields *Et* (3,4-methylenedioxy)cinnamoylacetate (1.5 g. from 3 g. of the acetoacetate), yellowish, m. 58–60° (*Cu* compd., dark green, m. 222°; 2,4-dinitrophenylhydrazones, red, m. 204°). *Et* 8-(3,4-methylenedioxyphenyl)-α-acetyl-β-ketovalerate has thus far been obtained only as an oil and therefore analyzed as the *Cu* compd., dull blue prisms, m. 173°, sol. in ether with deep blue color; with 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NHNH<sub>2</sub> it gives a dark yellow pyrazole, m. 175°, and a 1-(methylenedioxyphenyl)-3,5-diketohexane dinitrophenylhydrazones, brownish yellow, m. 116°. *Et* (α-phenylcinnamoyl)acetoacetate, from PhCH:CHCO<sub>2</sub>Et, through the chloride, with AcCHNaCO<sub>2</sub>Et, oil (*Cu* compd., light gray-green, m. 125°), gives with water at 130° 1,2-diphenyl-3,5-diketo-1-hexene, yellow, m. 81°, and with 75% AcOH on the water bath *Et* (α-phenylcinnamoyl)acetate (9.5 g. from 13.5 g. of the acetoacetate), yellowish, m. 91° (*Cu* compd., bright green, m. 213°), hydrolyzed to PhCH:CHCOMe, m. 56°.

C. A. R.

**Lichen substances. XXXII. Tenuiorin, a methyl glyrophosphate monomethyl ether.** Yasuhiko Asahina and Masaiti Yanagita. *Ber.* 66B, 1910–12 (1933); cf. C. A. 28, 134.—The pith of *Lobaria pulmonaria* f. *tenuior* Hu gives no color with KOH and therefore contains no stictic acid but there has been isolated from the thalli, in addn. to some mannitol, 1.6% of a new depside, *tenuiorin*, C<sub>22</sub>H<sub>24</sub>O<sub>10</sub> (I), m. 178–80°, then resolidifies and decomps. 238°, gives no color in alc. with FeCl<sub>3</sub> or bleaching powder, forms a colorless alk. soln. which on boiling becomes red and shows blue fluorescence; it is somewhat sol. in K<sub>2</sub>CO<sub>3</sub>, insol. in KHCO<sub>3</sub>, sol. in cold H<sub>2</sub>SO<sub>4</sub> without color, in hot

acid with brown color. On exhaustive methylation with  $\text{CH}_3\text{N}_3$  it yields a tri-Me ether, m.  $195^\circ$ , identical with Me gyrophorate tetra-Me ether. *Triacetate*, prepd. with  $\text{Ac}_2\text{O}-\text{H}_2\text{SO}_4$ , m.  $195^\circ$ . With KOH in boiling MeOH I gives Me everninate and Me orsellinate. I is also formed by partial methylation of gyrophoric acid with  $\text{CH}_3\text{N}_3$ . I is assigned the structure  $2,6,4\text{'-Me(HO)}\{2',6',4'\text{-Me(HO)}\{2'',6'',4''\text{-Me(HO)}\}(\text{MeO})\text{C}_6\text{H}_2\text{CO}_2\}\text{C}_6\text{H}_2\text{CO}_2\text{Me}$ . C. A. R.

The coumarin group. II. Synthesis of certain coumarinaldehydes; the catalytic hydrogenation of acid chlorides. Theodor Boehm and G. Schumann. *Arch. Pharm.* 271, 490-513 (1933); cf. C. A. 25, 2145.—The odorous and non-odorous properties of the various coumarin derivs. are discussed from the standpoint of their chem. compn. Of the 6 possible coumarinaldehydes, only 1 was heretofore known. Accordingly, the question arose whether and to what extent the relative position of the CHO group affected the aroma. Attempts to prep. the unknown isomeric aldehydes, for the present notably the synthesis of coumarin-3-aldehydes, are described. In addn. thereto and for purposes of comparison, *umbelliferone-3-aldehyde* (IV) and *coumarin-3-acrylaldehyde* (VII) were also prepd. The general procedure followed was that of Rosenmund and the initial materials employed were the corresponding carboxylic acids, whose acid chlorides were reduced catalytically in presence of Pd. With respect to the physiol. properties of the new aldehydes, coumarin-3-aldehyde (I) no longer possesses the typical odor of coumarin, but has on the other hand the property of irritating the mucosa of the nose and throat. Since both odorous and irritant effects are not unrelated factors, it follows that the osmophoric aldehyde group in the osmophoric lactone ring of coumarin effects an increase in strength or potency of the coumarin itself. Reference is made to a similar phenomenon in the case of  $\text{PhCH:CH-CHO}$  (II) and  $\text{PhC:CClO}$  (III), wherein the double bond of the side chain of the former becomes a triple bond in the latter; while the odor of III is still reminiscent of II, it is no longer pleasant, but on the contrary irritating. This effect is obviously, as with coumarinaldehyde, due to superimposition of the osmophoric groups. In contrast to coumarinaldehyde IV behaves rather indifferently, merely emitting on heating a weak phenol-like odor. I and IV are therefore opposed to one another like coumarin and umbelliferone. No regularity exists, however, in this analogy. This is apparent in the following example: Et coumarincarboxylate (V) is odorless, while the corresponding umbelliferone ester (VI) smells strongly of coumarin, a marked reversion of the relationship previously noted. Worthy of note too is the fact that IV still remains indifferent when the phenolic HO is replaced by  $\text{AcO}$  or the  $\text{OCOC}_2\text{Me}$  group. Normally, VII is odorless, but on heating to the m. p. emits a weak coumarin-like odor. Substitution of the osmophoric  $\text{NO}_2$  group for the CHO radical effects no change therein. This  $\text{NO}_2$  deriv., coumarin-3- $\alpha$ -nitroethylene (VIII), was obtained by condensation of I with nitromethane. I also reacts in a normal manner with  $\text{CH}_2(\text{CN})_2$ ,  $\text{CH}_2(\text{CO}_2\text{H})_2$ ,  $\text{CNCH}_2\text{CONH}_2$  and  $\text{CN-CH}_2\text{COCH}_2\text{CO}_2\text{Et}$ . Contrary to expectation, all these condensation products were odorless. An abnormal result was observed in the condensation with  $\text{CH}_2\text{COCH}_2\text{CO}_2\text{Et}$ , the reaction being carried out in alc. in the presence of  $\text{C}_6\text{H}_5\text{N}$ . In this instance a well-defined cryst. product of the compn.  $(\text{C}_7\text{H}_5\text{O}_3)_n$  was formed, the constitution of which is as yet unexplained. The condensation with  $\text{CH}_2(\text{COEt})_2$  was equally irregular, in that the substance obtained had the constitution IX. Only after treatments with  $\text{Ac}_2\text{O}$  and consequent splitting off of  $\text{H}_2\text{O}$  did it yield the unsatd. compd. (X), which should have been the immediate product of condensation. IX merits especial interest, since, if the formula given is correct, which there is no reason to doubt, here for the first time no unsatd. compd., but instead a  $\beta$ -HO compd. results from a Knoevenagel condensation. This is insofar of importance since the character of the Knoevenagel reaction has in spite of all attempts to clarify it remained more or less a mystery. A broader basis has thus been created for the future treat-

ment of the problem. The results of the first attempts to prep. I were unfavorable. Only after numerous expts. had shown that a partial poisoning of the catalyst by introduction of certain foreign material via Rosenmund and co-workers did not necessarily lead to satisfactory yields of aldehydes, more attention was directed, and with success, to the temp. (relatively low) prevailing in the soln. (xylene) during the catalytic reduction. *Coumarincarboxylic*

$\text{C}_6\text{H}_4\text{CH:CCCH(OH)CH(CO}_2\text{Et)}_2$

(IX)

chloride,  $\text{C}_{10}\text{H}_7\text{O}_2\text{Cl}$ , obtained from the corresponding acid with  $\text{CSCl}_2$ , m.  $147.8^\circ$ , yielded on reduction I, m.  $131.2^\circ$  (*p*-nitrophenylhydrazone,  $\text{C}_{16}\text{H}_{11}\text{O}_4\text{N}_3$ , yellow, m.  $287.8^\circ$  (decompn.); *semicarbazone*, yellow, m.  $265-6^\circ$  (decompn.); *oxime*, m.  $207^\circ$  (decompn.)). [With II. H. Hansen.] *Coumarin-3-acrylic acid*, m.  $266^\circ$  (*Et* ester, yellow, m.  $122^\circ$ ; *acid chloride*, yellow, m.  $197.8^\circ$ ); the acid yielding on reduction VII, faintly yellow, m.  $155.6^\circ$  (*p*-nitrophenylhydrazone, m.  $289.90^\circ$  (decompn.); *oxime*, m.  $207^\circ$ ; *semicarbazone*, m.  $242^\circ$ ). VIII, m.  $143.4^\circ$ . IX, yellowish needles with 1 mol.  $\text{H}_2\text{O}$  of crystn., m.  $207^\circ$ . I condensed with  $\text{CH}_2(\text{CO}_2\text{H})_2$  gave *coumarin-3-methylenemalononic acid*,  $\text{C}_{12}\text{H}_8\text{O}_6\text{H}_2\text{O}$ , yellow, m.  $207^\circ$ . I with  $\text{CH}_2(\text{CO}_2\text{Et})_2$  gave IX, m.  $117^\circ$ , which with  $\text{Ac}_2\text{O}$  gave X, brilliant leaflets, m.  $93-5^\circ$ . Condensation of I with  $\text{Ac-CH}_2\text{CO}_2\text{Et}$  yielded the product  $(\text{C}_7\text{H}_5\text{O}_3)_n$ , m.  $81-2^\circ$ . With  $\text{CH}_2(\text{CN})_2$ , I gave *coumarin-3-methylenemalononic dinitrile*, yellow, m.  $198^\circ$  (decompn.). Among other condensation products characterized are: *coumarin-3-[ $\alpha$ -cyanoacrylic amide]*,  $\text{C}_{12}\text{H}_8\text{O}_2\text{N}_2$ , yellow, m.  $233^\circ$ ; *Et coumarin-3-acryloxyacrylate*, yellow, m.  $202^\circ$ ; *condensation product*,  $\text{C}_{17}\text{H}_{11}\text{O}_4\text{N}$ , from resorcinol aldehyde,  $\text{CH}_2(\text{CO}_2\text{Et})_2$ , and  $\text{C}_6\text{H}_5\text{N}$ , m.  $152-4^\circ$ , yields with  $\text{Na}_2\text{CO}_3$  soln. the strong odor of  $\text{C}_6\text{H}_5\text{N}$ , and on addn. of HCl the *Et* umbelliferone-3-carboxylate, m.  $171^\circ$ , previously described by Pechmann and Graeger (*Ac deriv.*,  $\text{C}_{14}\text{H}_{11}\text{O}_6$ , m.  $153-4^\circ$ , in neutral alc. soln. fluoresces faintly blue; the corresponding acid,  $\text{C}_{12}\text{H}_7\text{O}_6$ , m.  $210-11^\circ$ , is likewise faintly fluorescent in aq. alc. soln., and the *chloride*, m.  $189-90^\circ$ , the latter on reduction giving the aldehyde, faintly yellow, m.  $165.6^\circ$ , faintly bluish green fluorescent (*p*-nitrophenylhydrazone, m.  $280^\circ$  (decompn.)). *Carbomethoxyumbelliferone-3-carboxylic acid*,  $\text{C}_{14}\text{H}_9\text{O}_7$ , m.  $214-15^\circ$ . The corresponding *carbomethoxy deriv.*, m.  $167^\circ$  (*acid chloride*, m.  $144.5^\circ$ ; *aldehyde*, m.  $134.5^\circ$ , fluoresces strongly bluish green (*p*-nitrophenylhydrazone, m.  $263.5^\circ$ )). IV forms yellow prisms carbonizing above  $300^\circ$  (*p*-nitrophenylhydrazone, red, carbonizes above  $300^\circ$ ); *oxime*, yellow, m.  $224.5^\circ$ . *Di-daphnetin-3-carboxylate*,  $\text{C}_{12}\text{H}_9\text{O}_6$ , yellow, m.  $231-2^\circ$  (*di-Ac deriv.*, m.  $129.30^\circ$ ); *free acid*, yellow, m.  $263^\circ$  (*di-Ac deriv.*, m.  $213-14^\circ$ ). W. O. E.

*d-Epicamphor*. Yasuhiko Asahina and Morizo Ishide, with T. Joyama. *Ber.* 66B, 1913 17 (1933).—*d*-5-Ketocamphor (I), m.  $210-12^\circ$ ,  $[\alpha]_D^{25} 106^\circ$ , in ether and KCN in cold water treated with  $\text{CO}_2$  give 86% of a mixt. of hydroxy nitriles hydrolyzed by fuming  $\text{H}_2\text{SO}_4$  in the ice chest to 2 stereomeric *5-hydroxy-camphor-5-carboxamides* (or structural isomers):  $\alpha$ -, m.  $248-9^\circ$ ,  $[\alpha]_D^{25} -1.24^\circ$  (abs. alc.), and  $\beta$ -, m.  $190-1^\circ$ ,  $[\alpha]_D^{25} 44.79^\circ$  (abs. alc.). The free  $\alpha$ -acid, from the amide and 10% HCl heated 20 hrs. at  $100^\circ$  in sealed tubes, m.  $151.2^\circ$ ,  $b_p$  about  $250^\circ$  almost without decompn.,  $[\alpha]_D^{25} -0.48^\circ$  (abs. alc.) (*semicarbazone*, m.  $267^\circ$  (decompn.)); *quinine salt*, m.  $178^\circ$ , is oxidized by  $\text{Na}_2\text{Cr}_2\text{O}_7-\text{H}_2\text{SO}_4$  at  $60^\circ$  to I. Free  $\beta$ -acid, obtained from the amide with 10% HCl after only 2 hrs., m.  $153^\circ$ , boils without decompn. *in vacuo*,  $[\alpha]_D^{25} 21.58^\circ$  (*semicarbazone*, m.  $225^\circ$  (decompn.)); *quinine salt*, m.  $219^\circ$ , is also oxidized to I by  $\text{Na}_2\text{Cr}_2\text{O}_7$  in the cold. The semicarbazone of the  $\alpha$ -acid heated with Na and alc. 20 hrs. at  $180^\circ$  gives *5-hydroxy-camphane-5-carboxylic acid*, m.  $151^\circ$ ,  $[\alpha]_D^{25} -59.2^\circ$  (abs. alc.);  $\beta$ -isomer, m.  $130^\circ$ ,  $[\alpha]_D^{25} -39.8^\circ$ . These 2 acids with  $\text{CrO}_3-\text{H}_2\text{SO}_4$  on

the water bath give *d*-epicamphor (II), m. 183–4°,  $[\alpha]_D^{25}$  50.0° (abs. alc.); semicarbazone, m. 236° (decompn.); Br deriv., from II and Br in  $\text{CHCl}_3$  on the water bath, prisms, m. 133–4°,  $[\alpha]_D^{25}$  80.9° (abs. alc.). As can be shown with models, II (5-ketocamphane) is the mirror image of the 3-isomer (ordinary 1-epicamphor). Since epicamphor can be converted through the bornylene-2-hydroxamic acid into a camphor of opposite rotation it is possible by the above method to pass from *d*-camphor through II to *l*-camphor. C. A. R.

**Degradation of 4-phenylcamphor to phenylisocamphoric acid.** Maria Brädt-Savelberg and Joseph Buchkremer. *Ber.* 66B, 1921 32(1933); cf. C. A. 25, 3982.—To establish beyond doubt the position of the Ph group in "4-phenylcamphor" (I) (Naruckin, *et al.*, C. A. 24, 841), the authors attempted to degrade it, like the 4-Me analog, to *sym*-phenylisocamphoric acid (II) but met with such unexpected difficulties that for a time they thought I must be the 6-Ph compd. The oxime of I with boiling  $\text{Ac}_2\text{O}$  gives a viscous, honey-like acetate,  $b_p$  150–60°, which on distn. decomposes in part into  $\text{AcOH}$  and phenyl- $\alpha$ -campholenic nitrile (III) but the greater part resinifies. III, m. 80°, mol. wt. in benzene 230.5, is obtained more readily by boiling the oxime with dil.  $\text{H}_2\text{SO}_4$  (d. 1.18), while 50%  $\text{H}_2\text{SO}_4$  gives a compd.  $\text{C}_{10}\text{H}_{16}\text{O}_2$ ,  $b_p$  143–5°, m. 52–3°, which is probably phenyl- $\beta$ -campholenolactone. III is best prepd. by heating the oxime with  $\text{PhSO}_2\text{Cl}$  in pyridine, although there is formed as by-product an extraordinarily stable compd.,  $\text{C}_{10}\text{H}_{16}\text{ON}$ , m. 203–4°, which is unchanged by boiling 50%  $\text{H}_2\text{SO}_4$  and hardly at all by fusion with  $\text{KOH}$ ; long heating with 30%  $\text{KOH}$  in  $\text{MeOH}$  at 180° converts it to a small extent into phenyl- $\alpha$ -campholenic acid (IV) and it is therefore thought to be the campholenolactam. III heated in a Ag vessel 20 hrs. at 150° with a mixt. of 12 g.  $\text{KOH}$ , 6 g. water and 30 g. alc. gives the amide, m. 126–7°, and the free acid (IV) (4.5 g. from 6 g. III), m. 123–4° (Ag salt, darkens somewhat in the light), which can also be obtained, but in poorer yield, by fusion with  $\text{KOH}$  of the  $\omega$ -sulfonic acid of I, pearly leaflets, darkens 200°, m. 239–40° (decompn.), formed by allowing I to stand in a mixt. of 2 mols.  $\text{Ac}_2\text{O}$  and 1 mol. concd.  $\text{H}_2\text{SO}_4$ . Et ester of IV, from the Ag salt and  $\text{EtI}$ ,  $b_p$  125–6°, MR 79.97, 80.46, 1.70, 2.74 for  $\alpha$ , D,  $\beta$ - $\alpha$  and  $\gamma$ - $\alpha$ ,  $b_D$  -0.092, -0.092, 4.9%, 4.98%. Me ester, prepd. with  $\text{CH}_3\text{I}$ ,  $b_p$  122–3°. IV is for the most part unchanged by cold  $\text{HNO}_3$  (d. 1.4), but 2 g. neutralized with 0.1 N  $\text{KOH}$  gives with 1%  $\text{KMnO}_4$  (1.5 atoms O) 2.25 g. phenyldihydroxydihydro- $\alpha$ -campholenic acid (V), m. 252–3° (Ag salt, leaflets with 1  $\text{H}_2\text{O}$ , Na salt, difficultly sol. leaflets with 2  $\text{H}_2\text{O}$ ). Unlike the Me analog, V is very resistant to oxidation; it is not appreciably attacked by either  $\text{Ph(OAc)}_3$ , fused  $\text{KOH}$  or  $\text{HNO}_3$  (d. 1.3). Aq.  $\text{CrO}_3$  does not attack it (perhaps because of its slight soly.) but  $\text{CrO}_3$  in  $\text{AcOH}$  gives 2 products: a neutral compd.  $\text{C}_{10}\text{H}_{16}\text{O}_4$  (VI), m. 177–8° (semicarbazone, m. 200° (decompn.)), and a monobasic acid,  $\text{C}_{10}\text{H}_{16}\text{O}_4$ , m. 185°. The acid is supposed to be a phenylterphenylic acid and VI a "ketolactone." With  $\text{KOH}$  in boiling  $\text{MeOH}$  VI forms a monobasic acid  $\text{C}_{10}\text{H}_{16}\text{O}_4$  (VII), m. 205–6°, which decolorizes  $\text{KMnO}_4$ , gives a faint green color with  $\text{FeCl}_3$ , reduces Fehling soln. weakly, reacts with neither  $\text{NH}_4\text{OH}$  nor semicarbazide, is unchanged by boiling dil.  $\text{H}_2\text{SO}_4$  and with alk. Br soln. yields a dibasic acid  $\text{C}_{10}\text{H}_{16}\text{O}_6$ , m. 240–1° (decompn.). This acid was also isolated from the  $\text{KMnO}_4$  oxidation products of VI and VII. As these reactions offered no definite proof of the position of the Ph group in I, degradation of IV with  $\text{O}_3$  was attempted. IV itself gave no well-defined product other than a little  $\text{H}_2\text{O}$  but 10 g. of its Me ester in 80%  $\text{AcOH}$  yielded 7 g. of neutral products, sep'd. by means of  $\text{NH}_4\text{OH}$  into 2 oximic acids (m. 290° (decompn.) and 133–4°), and 2 g. phenylsoketocamphoric acid dilactone, m. 207–8°; the corresponding free acid is stable only in the form of its salts but with alk. Br soln. gives II, m. 184° (tri-K salt, powder with 1  $\text{H}_2\text{O}$ ). The 1st disocn. const. of II is 1.57 and  $1.39 \times 10^{-4}$  as det'd. with the quinhydrone and the H electrode, resp., in water. C. A. R.

**Asymmetric syntheses with platinum black.** G. Vavon

and Boleslawa Jakubowicz. *Bull. soc. chim.* 53, 1111–25 (1933).—See C. A. 27, 3027. G. G.

**2-Methyl-1,4-naphthoquinone.** Juan Madinaveita. *Anales soc. españ. fis. quim.* 31, 750–9(1933).—Addn. reactions of 2-methyl-1,4-naphthoquinone were exam'd. The diene addn. is much more difficult than with 1,4-naphthoquinone. On bleaching in daylight there is obtained a homogeneous product comprising a union of 2 mols. through its active double bonds. E. M. Symmes

**Course of the alkylation of enolates.** II. F. Adickes. *Ber.* 66B, 1984(1933); cf. C. A. 27, 3700.—The observation of Vanags (C. A. 28, 474) that the rearrangement of hindone into isobindone, which is not effected by boiling with alc. and  $\text{K}_2\text{CO}_3$ , occurs in the hydrolysis of the pure *O*-ether under the same conditions is not contrary to but in harmony with A.'s findings in the alkylation of malonic esters that *C*-alkylations do not necessarily proceed through *O*-ethers. C. A. R.

**Anthracene derivatives.** X. Edward de Barry Barnett, Norman F. Goodway and John Wm. Watson. *Ber.* 66B, 1876 91(1933); cf. C. A. 27, 287.—When the condensation of  $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$  (I) with *m*- $\text{C}_6\text{H}_4\text{Cl}_2$  (Goldberg, C. A. 26, 723) is carried out in tetrachloroethane instead of an excess of *m*- $\text{C}_6\text{H}_4\text{Cl}_2$  as solvent, there is formed very little of the acid *o*-(2,4- $\text{Cl}_2\text{C}_6\text{H}_3\text{CO})\text{C}_6\text{H}_4\text{CO}_2\text{H}$  (II); a by-product, m. 176°, is obtained which is very probably 3,3-bis(2',4'-dichlorophenyl)phthalide. II boiled in aq.  $\text{NH}_4\text{OH}$  with Zn dust and  $\text{CuSO}_4$  gives 2',4'-dichlorodiphenylmethane-2-carboxylic acid, m. 128°, dehydrated in concd.  $\text{H}_2\text{SO}_4$  at room temp. to 2,4-dichloroanthrone (III), yellow, m. 161°, which with  $\text{Ac}_2\text{O}$ - $\text{C}_6\text{H}_5\text{N}$  yields an anthranil acetate (IV), m. 170°. 2,4-Dichloro-10-bromoanthrone (V), from III and Br in  $\text{CS}_2$ , yellow, m. 157°; gives with  $\text{PhNH}_2$  at room temp. a 10-anilino deriv., yellow, m. 187°. 10-piperidino compd., m. 154°; 10-Ph deriv., from V with benzene and  $\text{AlCl}_3$ , m. 164°, yields with 3 mols.  $\text{PhCH}_2\text{MgCl}$  and subsequent treatment of the resulting dihydroanthranol with  $\text{HCl}$ - $\text{AcOH}$  2,4-dichloro-9-benzyl-10-phenylanthracene, yellow, m. 175°. 2,4-Dichloro-9-benzylanthracene, from III with  $\text{PhCH}_2\text{MgCl}$ , yellow, m. 163°, yields

with Br in  $\text{CS}_2$  the  $\omega$ -Br deriv.,  $\text{PhCHBrC} \begin{array}{c} \text{C}_6\text{H}_4 \\ \text{C}_6\text{H}_4\text{Cl}_2 \end{array} \text{CH}$ ,

6 yellow, m. 138° (slight decompn.), which in turn gives an  $\omega$ -piperidino deriv., yellow, m. 168°. 2,4-Dichloro-10-nitroanthrone, from IV slowly heated to 65° with  $\text{AcOH}$ - $\text{HNO}_3$ , m. 137° (decompn.), is rapidly decomp'd by  $\text{Ac}_2\text{O}$  in cold pyridine. 1,3-Dichloroanthrone (VI), from 1,3- $\text{Cl}_2\text{C}_6\text{H}_3(\text{CO})_2\text{C}_6\text{H}_4$  with Al powder-concd.  $\text{H}_2\text{SO}_4$ , m. 194°; anthranil acetate, m. 200°. 1,3-Dichloro-10-bromoanthrone (VII), m. around 180° (decompn.), 10-anilino deriv., m. 180°. With piperidine, VII, like 10-bromoanthrone itself but unlike V, yields 1,3,1',3'-tetrachloro-10-bromo-10,10'-bianthronyl, decompn. around 220–30°. Again, VI with  $\text{PhCH}_2\text{Cl}$  and  $\text{KOH}$  in boiling water gives 1,3-dichloro-10,10-dibenzylanthrone, m. 232°, like anthrone, while III forms only resinous products. 1,3-Dichloro-9-benzylanthracene, m. 127°, is obtained like the 2,4-isomer and with Br in  $\text{CS}_2$  gives 1,3-dichloro-10-bromo-9-benzylidene-9,10-dihydroanthracene, pale yellow, m. 197° (decompn.) (this and the corresponding deriv. of III are probably tautomeric mixts., with the I form predominating in the I case and the other form in the other), 10-piperidino deriv., m. 148°. 1,3-Dichloro-10-nitroanthrone, m. 154° (violent decompn.), forms with  $\text{Ac}_2\text{O}$ - $\text{C}_6\text{H}_5\text{N}$  an anthranil acetate, light yellow, m. 207°; the nitro derivs. of III and VI thus obey the law that they can be acetylated in pyridine only when there is no Cl atom in the *peri*-position to the  $\text{NO}_2$  group. 3,4,4',5'-Tetrachloro-9-benzophenone-2'-carboxylic acid, from 4,5- $\text{Cl}_2\text{C}_6\text{H}_3(\text{CO})_2\text{O}$ , *o*- $\text{C}_6\text{H}_4\text{Cl}_2$  and  $\text{AlCl}_3$ , m. 183°, is dehydrated by concd.  $\text{H}_2\text{SO}_4$  on the water bath to 2 tetrachloroanthraquinones; the orientation of the Cl atoms in these products was not proved directly, but it is probable that the less sol., pale yellow isomer, m. 348°, is the 2,3,6,7-compd. (VIII), and the other, golden yellow needles, m. 242°, is the 1,2,6,7-compd. (IX). VIII is only very slightly sol. in concd.  $\text{H}_2\text{SO}_4$  at 100° with orange color but easily in oleum

with red color, while IX is easily sol. in cold concd.  $H_2SO_4$ . Both give the anthraquinol test, VIII with some difficulty. Because of its insol., VIII with Al powder- $H_2SO_4$  did not give more than 5% of the anthrone m. 300° (decompn.), even after 6 hrs. at 30–40°. Attempts to obtain the anthrone by reduction and subsequent dehydration of the phthaloyl acid also failed. 3,4-Dimethyl-4',5'-dichlorobenzophenone-2'-carboxylic acid, from 4,5- $Cl_2C_6H_3(CO)_2O$ , *o*-xylene and  $AlCl_3$  in tetrachloroethane, m. 184°, gives chiefly what is almost certainly 6,7-dichloro-2,3-dimethylanthraquinone, m. 305°, reduced by Al powder- $H_2SO_4$  to the anthrone (X), pale yellow, m. 295° (anthranyl acetate, m. 226°); further reduction of the anthrone with Zn dust,  $CuSO_4$  and KOH in water splits off Cl with formation of 6-chloro-2,3-dimethylanthracene, m. 299° (under the same conditions 2,3-dichloroanthrone is smoothly reduced to the anthracene in about 3 hrs. but reduction of the anthraquinone is far from complete even after 50 hrs.; 2-chloroanthracene is obtained in the latter case). 10-Br deriv. of X, decomp. violently 175°, gives with piperidine in cold  $CHCl_3$  a difficultly sol., N-free product behaving like a dianthraquinone. With  $PhCH_2Cl$ ,  $PhCH_2OH$  and KOH in boiling water, X gives both the strongly fluorescent 10-benzylanthranil benzyl ether, m. 188°, and the 10,10-dibenzylanthrone, m. 252°. With  $PhCH_2MgCl$ , X yields the 9-benzylanthracene, yellow, m. 233°, easily converted into a 10-Br deriv., m. 220°. 2,3,6,7-Tetramethylanthracene, m. 299°, is obtained in 15 g. yield from 75 cc  $CH_2Cl_2$  and 100 cc *o*-xylene with  $AlCl_3$  in tetrachloroethane at 60–5°; it is easily converted into the 9,10-di-Br deriv., light yellow, m. 290° (decompn.), and oxidized by  $CrO_3$ -AcOH to the quinone, m. 326°. Contrary to the statements of Morgan and Coulson (C. A. 26, 447), the quinone, if finely divided (by rubbing or pouring a concd.  $H_2SO_4$  soln. into water), is readily reduced by Al powder- $H_2SO_4$  to the anthrone, pale yellow, m. 271° (anthranil acetate, pale yellow, m. 241°). With  $PhCH_2Cl$ ,  $PhCH_2OH$ , KOH and water the anthrone gives the 10,10-dibenzyl deriv., m. 244°; with  $PhCH_2MgCl$ , the 9-benzylanthracene, pale yellow, m. 235°, whose 10-Br deriv., yellow, m. 227°. Of the 16 derivs. of 9-benzylanthracene (XI) with 1 or more Me groups or Cl atoms on the side rings thus far studied, 6 with no  $\alpha$ -substituents behave like XI itself; the 10 others yield Br derivs. with a reactive Br atom, although the 1-Cl compd. also yields the normal 10-Br compd. 1,5-Dichlorobenzophenone-2-carboxylic acid, from 4,5- $Cl_2C_6H_3(CO)_2O$ , benzene and  $AlCl_3$  in tetrachloroethane, m. 208°, is dehydrated by concd.  $H_2SO_4$  to 2,3-dichloroanthraquinone, m. 265°, which with  $PhCH_2MgCl$  yields the 9-benzylanthracene, pale yellow, m. 164°, whose 10-Br deriv., light yellow, m. 169°. Zn dust (activated with  $CuSO_4$ ) and KOH reduce the anthrone to the anthracene. *o*-2-Fluorophenylbenzoic acid, m. 229°, from fluorene and I with  $AlCl_3$ , is reduced by Zn dust,  $CuSO_4$ ,  $NH_4OH$  and KOH in water to 2'-fluorophenylmethane-2-carboxylic acid, m. 190°, dehydrated by  $ZnCl_2$  at 180–90° to *lin*-indenanthrone, m. 207° (anthranil acetate, m. 203°); Br deriv., decomp. about 190°. With  $CrO_3$ -AcOH the anthrone gives *lin*-phthalofluorene, yellow, m. 269°, forms a red vat with alk.  $Na_2S_2O_4$  and is oxidized by  $CrO_3$  in AcOH- $H_2SO_4$  to the fluorenone, m. 367°, of Ullmann and Dasgupta (C. A. 8, 1584). With Zn dust,  $CuSO_4$  and NaOH the anthrone is smoothly reduced to *lin*-naphthofluorene, m. 317°, sol. in benzene with light blue, in concd.  $H_2SO_4$  with light green fluorescence, forms a di-Br deriv., m. 245° (deep seated decompn.), which does not visibly fluoresce either in benzene or in the green  $H_2SO_4$  soln. *o*-2-Fluorovindichlorobenzoic acid, from fluorene, 3,6- $Cl_2C_6H_3(CO)_2O$  and  $AlCl_3$ , m. 172°, is reduced by Zn dust,  $CuSO_4$ , KOH and  $NH_4OH$ , to a compd., m. 218°, whose compn.,  $C_{21}H_{14}Cl$ , indicates that a Cl atom has been split off. Addendum - *lin*-Benzofluorene had been synthesized from fluorene and succinic anhydride (cf. Koclsch, C. A. 27, 5070) some time ago; the results were almost completely identical with those of K. C. A. R.

Coloring constituents of alkanet root (*Anchusa tinctoria*, Lam.): I. Constitution of alkanin. II. Constituents

of the wax from alkanet root. Mangesh V. Betrahnet and Gopal Chandra Chakravarti. J. Indian Inst. Sci. 16A, 41–51, 52–3 (1933).—Powd. alkanet root was completely extd. with petr. ether. The residue from the concn. of the petr. ether was extd. with  $CHCl_3$ , and the viscous mass, left by the  $CHCl_3$ , was treated with cold  $Me_2CO$ . After removing the  $Me_2CO$ , the residue was extd. with 5% NaOH. The resulting soln. was partly neutralized by HOAc and finally by HCl, and a sticky mass pptd. The NaOH, and subsequent, procedure was twice repeated and the final residual solid was extd. with  $C_6H_6$ . A 1.2–1.5% yield of a dark red powder, alkanin (I), resulted. With fused NaOH and excess  $Ac_2O$  for 5 hrs. at 140° I gave a 70–80% yield of a tetra-Ac deriv.,  $C_{40}H_{34}O_{12}$  (II), brown crystals from HOAc. It decompd. at high temps., is sol. in AcOEt, and in  $Me_2CO$ , and is insol. in MeOH, EtOH, anil. alic.,  $Et_2O$ , and  $C_6H_6$ . After hydrolysis with KOH, in MeOH, and acidification, II gave I,  $C_{40}H_{34}O_{12}$ , a violet-red cryst. powder, shrinks 180°, and decomp. 220°. I, refluxed with aq. KOH and  $Me_2SO$ , gave a solid upon acidification; extn. with  $CHCl_3$ , and treatment with HOAc yielded brown crystals of dimethoxyalkannin (III),  $C_{40}H_{34}O_8(OMe)_2$ . BrCl in  $C_6H_5N$  with I gave brown crystals, from EtOH, of tetrabenzoylalkannin,  $C_{40}H_{34}O_8Bz_4$ . With  $NH_4OH$ -BaCl<sub>2</sub>, I, in abs. EtOH, gave blue ( $C_{40}H_{34}O_8$ )<sub>2</sub>Ba, insol. in  $H_2O$ , EtOH, and  $Et_2O$ . The K deriv. of I with  $PhCl$ , gave ( $C_{40}H_{34}O_8$ )<sub>2</sub>Ph. III, benzoylated in  $C_6H_5N$ , gave  $C_{40}H_{34}O_{10}$ , a dimethoxydibenzoylalkannin, brown crystals from HOAc. I, in  $C_6H_5N$ , was warmed for 2 hrs. at 100° with  $ClCO_2Et$ , and with HCl dicarbethoxyalkannin,  $C_{40}H_{34}O_8(OC_2H_5)_2$ , scpd., deep brown needles from dil. HOAc, decomp. 270°, and is hydrolyzed readily with dil. alkali. Dry Br<sub>2</sub> vapor on I gave a viscous mass, which, when washed with EtOH, dissolved in AcOEt, and filtered into petr. ether, gave hexabromoalkannin,  $C_{40}H_{34}O_8Br_6$ , a deep brick-red cryst. powder from HOAc, decomp. upon heating. I, treated with Br<sub>2</sub> in HOAc and kept at room temp. for 12 hrs., gave a ppt. with  $H_2O$ . Some of the ppt. was sol. in  $Et_2O$ . Tetrabromoalkannin,  $C_{40}H_{34}O_8Br_4$ , a brick-red powder from HOAc, blackened at 260°. The ether-insol. part was dibromoalkannin,  $C_{40}H_{34}O_8Br_2$ , red aggregates from HOAc. In HOAc at 100° for 3 hrs., Br<sub>2</sub> acted upon I, giving the hexa-Br compd. II was dissolved in HOAc and slowly treated with Br in HOAc at 100° for 1 hr. With  $H_2O$  a brown ppt. formed. This was extd. with  $CS_2$ ; the residue in HOAc plus 1 drop  $H_2O$  pptd. brown granular tetraacetyltetrabromoalkannin,  $C_{40}H_{34}O_8Br_4Ac_4$ , decomp. at about 280°. I was treated with  $HNO_3$  (d. 1.5) at 0°, and slowly warmed to room temp. Ice was added, and a part of the product dissolved. The insol. portion was a red-brown cryst. powder, from EtOH, m. 287°, with explosion. The structure has not yet been detd. The aq. filtrate was evapd. and the residue was extd. with  $Et_2O$ , which left, as a powder, colorless needles, m. 101°, from EtOH. This is ( $CO_2H$ )<sub>2</sub>. No definite compd. was isolatable from the  $Et_2O$  soln. I was treated with  $HNO_3$  (d. 1.2) for 48 hrs. at 100°, and  $H_2O$  pptd. an orange compd., prismatic crystals from HOAc, m. 297° (decompn.). The filtrate, evapd. and extd. with  $Et_2O$ , left a white powder from which ( $CO_2H$ )<sub>2</sub> was isolated. The ether soln. contained ( $CH_3CO_2H$ )<sub>2</sub>. II, in  $Ac_2O$ , was treated with  $HNO_3$  (d. 1.5) in  $Ac_2O$  and cooled. After 12 hrs.  $H_2O$  pptd. a red-brown cryst. powder,  $C_{40}H_{34}O_8N_2$ , dinitrotriacetylalkannin, from  $Ac_2O$ , blackens at 260°. I distd. *in vacuo* with Zn dust gave a yellow product from which  $\beta$ -methylanthracene, m. 198–200°, was isolated by dissolving in  $C_6H_6$ , washing with  $Na_2CO_3$  and with NaOH, evapg. and treating with EtOH.

A continuation of the research is in progress. I is best represented by

The petr. ether ext. of alkanet root was evapd. and treated with  $\text{Me}_2\text{CO}$ , leaving a reddish white wax. This was purified by soln. in  $\text{MeCOEt}$  and by refluxing with bogue-black for 4 hrs. Concn. of the filtrate gave white flakes, from  $\text{AcOEt}$  m.  $78^\circ$  (yield 0.18–0.2%),  $d^{20}_D$  0.9876,  $n^{20}_D$  1.488, sapon. no. 60.16, acid no. 12.92, unsaponifiable matter 58.56, I no. 12.2, mol. wt. of mixed acids 380. After sapon. by alc.  $\text{NaOH}$ , the soap was extd. with  $\text{Et}_2\text{O}$ ; the residue, acidified with  $\text{HCl}$ , gave 2 acids: one, m.  $68^\circ$ , is of undetd. nature; the other, m.  $76^\circ$ , is cerotic acid. The  $\text{Et}_2\text{O}$  ext. of the soap was evapd. and the residue, recrystd. from  $\text{EtOH}$ , m.  $68^\circ$ . It is carnaubyl alc. On oxidation with  $\text{CrO}_3$  in  $\text{HOAc}$  it gave a white solid, m.  $72^\circ$ , from  $\text{Et}_2\text{O}$ , which is carnaubic acid. Hence, the wax is chiefly carnaubyl cerotate.

G. Albert Hill

**Rotenone**, the active constituent of derris root. **XI**. **Rotenone resin**. Determination of rotenone and deguelin in rotenone resin. Sankichi Takei, Shikiro Miyajima and Minoru Ono. *Ber.* 66B, 1826–33 (1933); cf. *C. A.* 27, 3212; Clark and Claborn, *C. A.* 27, 80, and earlier papers. — The so-called rotenone resin (I) which accompanies cryst. rotenone (II) in derris exts. has about the same physiol. action on animals as II itself. Of the various cryst. substances which have thus far been isolated from I, only II and deguelin (III) are toxic. I–III, obtained in 15 g. yield from 300 g. I in ether shaken out twice with 2%  $\text{NaOH}$ , then washed with dil.  $\text{H}_2\text{SO}_4$  and water, kept over  $\text{Na}_2\text{SO}_4$  and repeatedly recrystd. from alc., m.  $160^\circ$ ,  $[\alpha]^{20}_D$  –23.22° (benzene), depresses the m. p. of II to  $140$ – $50^\circ$ , is not hydrogenated by H and Pd– $\text{BaSO}_4$  in alc. alkali but is racemized; oxime, m.  $220^\circ$ ; isoxime, m.  $160^\circ$ , gives a deep blue color with  $\text{FeCl}_3$ . Dihydrodeguelin (IV), from III in  $\text{AcOEt}$  with H and Pd– $\text{BaSO}_4$ , m.  $170^\circ$ , is identical with the  $\beta$ -dihydrorotenone obtained by Clark from isodihydrorotenone with concd.  $\text{H}_2\text{SO}_4$ . Application to III of the process for obtaining rotenolone from II gave deguelinol I (tephrosin), m.  $197^\circ$ , and II (isotephrosin), m.  $251^\circ$ , which with alc.  $\text{H}_2\text{SO}_4$  lose 1 mol.  $\text{H}_2\text{O}$  and yield dehydrodeguelin, m.  $227^\circ$ , and this in boiling alc. KOH takes up 2 mols.  $\text{H}_2\text{O}$  to form deguelinic acid, m.  $177^\circ$ . Sapon. of III, as in the prepn. of tubaic acid from II, yields  $\beta$ -tubaic acid, m.  $161^\circ$ , which gives an intense violet color with alc.  $\text{FeCl}_3$  and with H and Pd– $\text{BaSO}_4$  in  $\text{AcOEt}$  forms a *dshydro deriv.*, m.  $170^\circ$ , giving a red-violet color with alc.  $\text{FeCl}_3$  and also obtained by hydrolysis of IV. III in concns. of 0.02–0.002% is about half as toxic to the mud fish (*Cobitis fossilis*) as II, and in concns. of 0.001–0.0001% it is only  $1/10$  to  $1/100$  as active as II; I in high concns. is about as toxic as II but its toxicity decreases with diln. much more rapidly than that of II. Dehydrorotenone (V) and dehydrodeguelin (VI), which are formed quantitatively by the oxidation of II and III, resp., under certain conditions, crystallize with extreme ease and are very difficultly sol. in various solvents, and only V undergoes the isodihydro reaction, yielding quantitatively the alkali-sol. isodihydrodehydrorotenone, while VI remains unchanged. By means of these 2 reactions it is possible to det. quantitatively the II and III content of derris preps.; on 7 preps. the following results were obtained: total ether ext. 15.14–21.22, cryst. II 0–6.58, I 15.14–21.87, rotenolone and deguelinol in I 0–0.58, II in I 0.97–4.74, III in I 3.90–8.64, total II 0.97–7.75, total III 3.90–9.63%.

**The work of Paresch Chandra Dutta: indigoid dyes.** **III**. R. Tobler. *Ber.* 66B, 1757 (1933); cf. D., *C. A.* 27, 5332. — Indigoid dyes from 1,2-naphthoxythiophenes and isatins, as also from acenaphthenequinone, had already been described in Ger. pat. 453,087 (U. S. pat. 1,679,277, *C. A.* 22, 3786).

C. A. R.

**2-Benzoylimidazole**. Adolf Sonn and Paul, Greif. *Ber.* 66B, 1900–3 (1933). — Oddo and Mingoa (*C. A.* 23, 1641) assign the structure of 2-benzoylimidazole,  $\text{C}_{10}\text{H}_7\text{ON}_2$  (I), to the compd. (II), m.  $202$ – $3^\circ$ , obtained from imidazolylmagnesium bromide with  $\text{BzCl}$  and by Bamberger and Berlé (*Ann.* 273, 351 (1903)), who describe it as bis(benzoylamino)ethylene,  $\text{C}_{10}\text{H}_{10}\text{O}_2\text{N}_2$ , from imidazole with  $\text{BzCl}$  and  $\text{NaOH}$ . S. and G. have prepd. the true I by oxidation of 2-benzylimidazole (III) with  $\text{CrO}_3$

in boiling  $\text{AcOH}$  and find it m.  $161$ – $2^\circ$ , depresses the m. p. of II to  $148$ – $52^\circ$  and on bromination gives a 4,5-di-Br deriv. m.  $218$ – $20^\circ$  instead of O. and M.'s compd. m.  $255^\circ$ . In the bromination there are also formed red needles, m.  $117$ – $20^\circ$ , of a 1-bromo-2-benzoylimidazole perbromide,  $\text{C}_{10}\text{H}_5\text{ON}_2\text{Br}_3$ , which regenerates I with cold  $\text{NaHSO}_3$ . 2-Benzylimidazole-4,5-dicarboxylic acid (80 g. from 125 g. tartaric acid converted with red fuming  $\text{HNO}_3$  and concd.  $\text{H}_2\text{SO}_4$  into dinitrotartaric acid, filtered, dried *in vacuo* over KOH, taken up in ice water, extd. with ether and treated in the ether ext. with  $\text{PhCH}_2\text{CHO}$  and satd. alc.  $\text{NH}_3$ ) decomps.  $248^\circ$ ; 30 g. of the acid, heated with 150 g. anthracene at  $300^\circ$  until the evolution of  $\text{CO}_2$  ceases, gives 13–18 g. III, m.  $125$ – $6^\circ$ ; picrate, yellow, m.  $172^\circ$ . 2-Imidazolylphenylcarbinol (1 g. from 1.7 g. I with H and Pd in  $\text{AcOH}$ ), m.  $199$ – $201^\circ$ . C. A. R.

**Thiazoles.** **XIX**. **Synthesis of 2-(m-nitrophenyl)-benzothiazolyl p,p'-disulfide**. Marston T. Bogert and Richard B. Conklin. *Collection Czechoslov. Chem. Communications* 5, 443–7 (1933); cf. *C. A.* 26, 4815–4, 3- $\text{Cl}(\text{O}_2\text{N})\text{C}_6\text{H}_4\text{COCl}$  (22 g.) and (*o*- $\text{NH}_2\text{C}_6\text{H}_4\text{S}_2\text{Zn}$  (15.7 g.), after being heated 1 hr. on a steam bath, gave upon extn. with dil.  $\text{NaOH}$  2-(m-nitro-p-chlorophenyl)benzothiazole (I), m.  $105.5$ – $6.5^\circ$  (76% yield). I (17.43 g.), refluxed with 108 g. technical  $\text{Na}_2\text{S}$  in 300 cc.  $\text{EtOH}$  and 1.44 g. powd. S, gave 2-(m-nitrophenyl)benzothiazolyl p,p'-disulfide, yellow, m.  $292$ – $3^\circ$  (decompn.).

Julius White

**Homarine**, a hitherto unknown animal base. F. A. Hoppe-Seyler. *Z. physiol. Chem.* 222, 105–15 (1933). — The trigonelline isomer, isolated from lobster, Noah's ark and *Arbatia pustulosa*, is the methylbetaine of picolinic acid and is now designated *homarine*. When heated at  $200^\circ$  with concd.  $\text{HCl}$  it yields picolinic acid. Unlike trigonelline it gives the pine-shaving reaction which distinguishes  $\alpha$ - from  $\beta$ - and  $\gamma$ -pyridine derivs. The following salts of homarine are described: *HCl*, decomposes  $170$ – $5^\circ$ , *regular chloroaurate* (1:1), m.  $188$ – $90^\circ$ , *irregular chloroaurate* (4:3), m.  $138$ – $41^\circ$ , *chloroplatinate*, m.  $197$ – $8^\circ$  (decompn.), *picrate*, m.  $155$ – $60^\circ$  (decompn.), *Et ester chloroplatinate*, m.  $199$ – $206^\circ$  (decompn.). For purposes of comparison homarine was prepd. synthetically by methylation of picolinic acid with  $\text{Me}_2\text{SO}$  and  $\text{Ba}(\text{OH})_2$ . The salts of the synthetic product showed the same m. ps. as those of the natural homarine. The 2nd isomer, the methylbetaine of isonicotinic acid, was prepd. in the same manner by methylation of isonicotinic acid ( $\gamma$ -pyridine-carboxylic acid). This formed a *HCl salt*, m.  $255$ – $60^\circ$  (decompn.), *regular chloroaurate*, m.  $233$ – $4^\circ$  (decompn.), *chloroplatinate*, m.  $222$ – $3^\circ$  (decompn.), and *picrate*, m.  $215$ – $7^\circ$ , and was therefore not identical with homarine. Although trigonelline is widely distributed in plants and occurs also in animals, homarine has thus far been found only in animals. Its possible derivation from lysine, arginine, citrulline, ornithine, proline and glutamic acid by simple chem. reactions is pointed out.

**Pyrimidines: their amino and aminooxy derivatives** Treat B. Johnson and Dorothy A. Hahn. *Chem. Rev.* 13, 193–303 (1933). — A review with numerous references.

Louise Kelley

**Alkaloids of the cactus Trichocereus candicans Br. and Rose**. L. Reti. *Compt. rend. soc. biol.* 114, 811–14 (1933). — The fresh plant (approx. 95% water) contains 0.05% each of hordenine (anhaline) and p-HOC $\text{C}_6\text{H}_4\text{CH}_2\text{CH}_2\text{NMe}_2\text{OH}$ , also traces of other alkaloids. L. E. G.

**Cichoriin and the constitution of esculin and scopolin** K. W. Merz. *Arch. Pharm.* 271, 449 (1933). — Supplemental to an earlier paper (cf. *C. A.* 27, 3685), the formula proposed for esculin as *O*-gluco-6,7-dihydroxycoumarin was first accepted by Head and Robertson, and later corroborated by Macbeth. Seka and Kallir showed that the 6-hydroxy-7-methoxycoumarin is identical with the hydrolytic product of methylated esculin; they found subsequently that, contrary to statements of Glaser and Kraus, in the introduction of the glucose residue in 6,7-dihydroxycoumarin no esculin but rather an isomeric glucoside is formed, identical with the natural glucoside cichoriin, and that scopolin is its Me ether. W. O. E.

The identity of corynantheine and the amorphous alkaloid extracted from *Pseudocinchona africana*. Raymond-Hamet. *Compt. rend.* 197, 860-2 (1933).—An amorphous alkaloid extd. by Fourneau (1929) and by R.-H. from *Pseudocinchona africana* is identical with one extd. from yohimbine by Karrer and Solomon (*C. A.* 21, 588).

W. Gordon Rose

**Hedyotine**, an alkaloid from the root of *Hedyotis auricularia*. B. B. Dey and S. Lakshminarayanan. *Arch. Pharm.* 271, 485-90 (1933).—The root of *H. auricularia* contains the alkaloid "hedyotine" (I),  $C_{18}H_{22}O_4N_2$ ; the free base is golden yellow and, when freshly prepd., is stable when suspended in  $H_2O$ , but changes rapidly on drying. Meyer's reagent and silicotungstic acid afford the most delicate tests for the alkaloid. Of the 2 N atoms, only 1 possesses basic properties. *I.HCl*,  $C_{18}H_{22}O_4N_2Cl$ , m. about 250° (decompn.); *nitrate*, m. about 252° (decompn.); *picrate*, deep yellow prisms practically insol. in the usual org. solvents, m. 205° (decompn.); *aurate*, bright yellow powder, m. 305 10° (decompn.); *platinate*,  $I.HCl \cdot 0.5PtCl_4$ , yellow; *tetrachloroiodide*, pale yellow, m. 167 70° (decompn.). The alkaloid contains no OMe groups.

W. O. E.

**Lupine alkaloids. VIII. Synthesis of  $\beta$ -lupinine.** K. Winterfeld and F. W. Holschneider. *Ber.* 66B, 1751 6 (1933); cf. *C. A.* 27, 725.—Although the work of W. and H. on the constitution of lupinine indicated clearly that the  $CH_2OH$  side chain is on C atom 1 (Stelzner notation for quinolizine, with N = 10), Clemo and Raper suggested recently that it might be on another C atom 3. W. and H. have accordingly synthesized a 1-methylated norlupinine ring, which proved to be identical with "natural"  $\beta$ -lupinine (I), thus confirming their earlier work.  $CH_3(CH_2Br)_2$  was converted with  $NaOEt$  into  $Br(CH_2)_4OEt$  and the latter treated with Mg and  $\alpha$ - $C_6H_5NCOMe$  (II), giving  $\alpha$ -pyridyl( $\omega$ -ethoxypropyl)methylcarbinol (III) (8.2 g from 8.2 g. of the ketone),  $b_p$  142 4°, stable to  $KMnO_4$ , whose  $HCl$  salt was hydrogenated in abs. alc. with  $Pt(O_2)_4$  black to the *piperidyl* compd. (IV),  $b_p$  152 3° (yield, almost quant.), and this with boiling  $H_2$  yielded I,  $b_p$  16 7° (III salt, m. 261 2°; *picrate*, m. 163°; chloroaurate, m. 143-4°).  $Br(CH_2)_4OPh$ ,  $b_p$  125-8°, with Mg and II gave, instead of the analog of III, 1,6-diphenoxyhexane, m. 83°, almost exclusively. With  $PBr_3$ , IV likewise gave a product with a lupinine-like odor but the yield was materially smaller than with III.

C. A. R.

**Mitragyna and its alkaloids.** Raymond-Hamet and L. Millat. *Bull. sci. pharmacol.* 40, 593 600 (1933).—The botanical description of different species is given. *M. purifolia* contains a gum, resin, wax and 0.15% of a cryst. alkaloid. *M. rotundifolia* contains 0.27% of the alkaloid mitravarsine, m. 237°, easily sol. in acids and alkali. It contains 2 MeO groups and has probably the formula  $C_{22}H_{26}O_4N_2$ . The  $HCl$  salt m. 208 10°. *M. perica* contains an amorphous alkaloid *mitragynine*, m. 102 6°. It can be distd. at 5 mm. pressure between 230-40°. It is prepd. by means of the cryst. *picrate*, m. 223-4°. The  $HCl$  salt m. 243°, the acetate m. 142° and the trichloroacetate m. 157°. The pharmacol. action of the alkaloid is reviewed and the reactions with the usual alkaloid reagents are described.

A. E. Meyer

**Chemical investigation of *Toddalia aculeata* Pers. I. Two new alkaloids and a neutral crystalline substance from the root bark of *T. aculeata*.** B. B. Dey and P. Parameswaran Pillay. *Arch. Pharm.* 271, 477-85 (1933).

*T. aculeata* (Hindu: Janglikalmirch; Tamil: Milakutani) is a climbing shrub occurring in the lower Himalaya and in west and southern India. The entire plant but especially the root bark finds use in medicine as a tonic, stimulant and antipyretic, the last-named action being greater than that of quinine, its tonic effect greater than that of Calumba. Its utility in malaria is now questioned. Contrary to the finding of Perkin and Hummel berberine does not occur in the plant. The root bark does contain, however, 2 alkaloids: *toddaline* (I), a tertiary colorless monacid base,  $C_{26}H_{34}NO_4$ , m. 269-70°, totally insol. in hot  $H_2O$ , in contrast to both modifications of berberine, almost insol. in abs. alc. This base like berberine contains 2

OMe groups, but no *N*-Me group. The other alkaloid, *toddalinine* (II),  $C_{18}H_{24}O_4N \cdot 0.5H_2O$ , m. 180-200° (decompn.), is a very strong base, passing readily on manipulation of its  $HCl$  salt into an isomeric non-basic substance of like compn.; it contains a OMe and a NHMe group. Both alkaloids are apparently closely related and probably belong among the alkaloids of the berberine group. The  $MeOH$  ext. of the root bark yielded *toddaline* 0.1-0.12, *toddalinine* 0.1, lactone 0.8, resin 7.0, glucoside (crude) 0.8, fatty oil 3.0, lac-like substance 0.1%. The following substances are more particularly described: *lactone*,  $C_{18}H_{22}O_6$ , rhombic prisms m. 132 132.5°; I, first isolated as white amorphous powder m. 255-8°, slowly changing on evap. its  $CHCl_3$  soln. into needles, which after washing with  $EtOAc$  m. 269 70°; the crude alkaloid undergoes a remarkable change on treatment with abs. alc. and rubbing with a drop of strong  $NH_3$ , thereby yielding a white cryst. powder m. 204-6°, apparently another form of the alkaloid; it gives the same  $HCl$  salt as the pure base m. 269-70°; I.  $HCl$  contains 1 mol.  $H_2O$ , yellow needles m. 205 6° (*aurate*, m. 201 2°; *platinate*, m. 254 6°; *picrate*, m. 237 8°; *nitrate*, m. 235-9° (decompn.); *sulfate*, m. 236 9° (decompn.)). II yields salts for the most part insol. (acetate excepted) in  $H_2O$  and alc. II.  $HCl$ , bright yellow needles, m. 283 5° after losing 2 mols.  $H_2O$  of crystn. at 110°; *platinate*,  $(C_{18}H_{24}O_4N)_2 \cdot H_2PtCl_6$ , orange-yellow, m. about 280 5°; *aurate*, yellow, m. 231 2° (decompn.); *picrate*, bright yellow, m. 230 5° (decompn.). The relative behavior of the 2 alkaloids and berberine, when treated with various alkaloidal reagents, is appended.

**Vegetable cardiac poisons. I. The constitution of uzarin.** R. Tschesche. *Z. physiol. Chem.* 222, 50 7 (1933).—Uzarin, the aglucone of uzarin, a glucoside present in the root of an African species of *Gomphocarpus*, is shown to contain the same C skeleton as the genins from digitalis glucosides. Hydrolysis of uzarin does not yield the genin as such but splits off 2  $H_2O$  to form an  $\alpha$ -dianhydrouzarin, m. 263-5°. Catalytic hydrogenation of the acetate then sat. 3 double bonds and yields a mixt. of  $\alpha$ -hexahydrodianhydrouzarin *acetate*, m. 248°,  $[\alpha]_D^{25}$  3.9°, and its  $\alpha$ -isomer, m. 205°,  $[\alpha]_D^{25}$  20.2° sepd. by fractional crystn. Hydrolysis of the acetates gave  $\alpha$ -hexahydrodianhydrouzarin (I), m. 217°,  $[\alpha]_D^{25}$  11.4°, and the  $\alpha$ -isomer (II), m. 230°,  $[\alpha]_D^{25}$  20.2°. Oxidation of I with  $CrO_3$  in  $AcOH$  converted the tertiary alc. grouping into  $CO$ , yielding the  $\alpha$ -ketone, m. 248-9°,  $[\alpha]_D^{25}$  39.3° (*oxime*, decomp. 275 8°), which was reduced by  $Hg-Zn$  to the  $\alpha$ -lactone, m. 178°,  $[\alpha]_D^{25}$  11.3°. Oxidation of I by  $CrO_3$  at a higher temp., sepn. of the acid and neutral products, and further oxidation of the latter, gave the  $\alpha$ -lactonedicarboxylic acid, m. 270°,  $[\alpha]_D^{25}$  37.6° (*di-Me ester*, m. 134-5°,  $[\alpha]_D^{25}$  18.7°). By similar procedures the  $\alpha$ -ketone, m. 216-7°,  $[\alpha]_D^{25}$  42.5° (*oxime*, decomp. 251 3°),  $\alpha$ -lactone (III), m. 180°,  $[\alpha]_D^{25}$  24.3°, and  $\alpha$ -lactonedicarboxylic acid (IV), m. 245-6°,  $[\alpha]_D^{25}$  38.5° (*di-Me ester*, m. 146-7°,  $[\alpha]_D^{25}$  25°) were obtained. Distn. of IV with  $Ac_2O$  gave the *pyroktonone*, m. 215°,  $[\alpha]_D^{25}$  150.9° (*oxime* decomp. 248-50°). From the pyridine mother liquor of the crude dianhydrouzarin,  $\beta$ -dianhydrouzarin, m. 236-7°,  $[\alpha]_D^{25}$  4.95° (*acetate*, m. 167-8°,  $[\alpha]_D^{25}$  4.9°), was obtained in small yield. This likewise took up 3  $H_2$  on catalytic hydrogenation. III gives no m.-p. depression with the octahydrotrianhydroperiplogenin of Jacobs, and both are crystallographically identical. The structural differences between the aglucones of heart poisons from various sources are due merely to the no. and position of OH groups on the same C skeleton. II. The dehydrogenation of uzarin with selenium. (Preliminary paper.) R. Tschesche and H. Knick. *Ibid.* 58-62.—Dehydrogenation of uzarin with Se at 320-40° yields a hydrocarbon  $C_{18}H_{16}$ , m. 124-5°, which is identical with

groups was detd. by the Van Slyke method. Below are the increases, in percentage of the original values, after heating 24, 72, 120 and 216 hrs., resp.: I, 0, 11.0, 12.8, 17.1; II, 10.2, 21.3, 25.9, 35.2; III, 4.3, 11.4, 17.1, 24.3; IV, 7.2, 18.8, 29.5, 42.8. This would indicate that in a series of polypeptides of analogous structure the velocity of hydrolysis increases as the chain is lengthened up to a certain point but tends to a const. value as the chain is still further lengthened; in any case there is nothing to indicate that polypeptides become more resistant to hydrolysis as the length of the chain is increased. That with gelatin hydrolysis becomes detectable only quite late may perhaps be due to the fact that immediately after soln. more or less intact gelatin micelles may still be present in the hot soln. and the peptide unions are for a time protected to a certain extent from hydrolytic attack. C. A. R.

**Crystalline chlorocruorin.** H. M. Fox and J. Roche. (*Compt. rend.* 197, 874-6 (1933).—Elementary analyses and absorption spectra of chlorocruorin are reported.

W. Gordon Rose

**The bile acids.** XLI. Martin Schenck. *Z. physiol. Chem.* 222, 131-8 (1933); cf. *C. A.* 28, 1664.—In the conversion of the blue nitroso compd.  $C_{26}H_{47}NO_3$ , obtained from the dioxime of bilianic acid by  $HNO_3$  treatment whereby 1 oxime is split off and the other rearranged, into biloidic acid by further  $HNO_3$  treatment, a colorless intermediate product seps. in gelatinous form. This product is neither a ketonitrilic acid nor the corresponding acid amide but a *nitro deriv.*  $C_{26}H_{45}NO_3$ , decomp. 250° 8°. With  $Ph_2NH$  and  $H_2SO_4$  it gives an intense blue color. The same substance may be obtained by treatment of the blue nitroso deriv.  $C_{26}H_{47}NO_3$  with  $HNO_3$ . Excess of 10%  $NaOH$  at room temp. converts it into bilianic acid.  $HNO_3$  at water-bath temp. converts it into biloidic acid, and  $Zn-AcOH$  reduces it to the 7-monoxime of bilianic acid. In this last reaction the formation of a transient blue color was not observed, probably because the intermediate nitroso deriv. immediately passes into the same. The nitroso deriv. was, however, obtained by treatment of the oxime with  $HNO_3$ . A. W. Dox

**An oxidation product of  $\alpha$ -ergosterol.** Th. Achternann. *Z. physiol. Chem.* 222, 70-2 (1933).—Oxidation of ergosterone by  $CrO_3$  in  $AcOH$  gave 25% of an unsatd. diketone,  $C_{28}H_{44}O_2$ , m. 183°,  $[\alpha]_D^{25}$  105.9°, and not the  $\alpha$ -diketone product described by Heilbron (*C. A.* 26, 4340). Catalytic hydrogenation of the diketone gave  $\alpha$ -ergosterol. This oxidation product therefore retains the original C skeleton of ergosterol. The oxidation consists merely in the conversion of a  $CH_2$  at  $C_7$  or  $C_{11}$  to  $CO$ .

A. W. Dox

Phosphorous and phosphoric acid esters (U. S. pat. 1,930,985) 18. Solvents (Fr. pat. 763,801) 13. Oxidation catalyst (U. S. pat. 1,937,381) 18.

**Hydrocarbons.** I. G. Farbenind. A.-G. (Hermann Zorn and Friedrich Vogel, inventors). Ger. 579,565, June 29, 1933. High-boiling hydrocarbons are converted into lower-boiling forms by hydrogenation under pressure in the presence of catalysts consisting of carbonyl compds. of metals of the 6th group of the periodic system, alone,

mixed, or mixed with carbonyl compds. of the 8th group. Carbonyls of W and Mo are mentioned.

**Hydrocarbons.** I. G. Farbenind. A.-G. (Hans Krzika and Werner Wolff, inventors). Ger. 583,536, Sept. 5, 1933. Crude hydrocarbons are purified by treatment with  $\alpha,\beta$ -unsatd. aliphatic carbonyl compds. such as maleic anhydride.

**Hydrocarbons.** I. G. Farbenind. A.-G. Fr. 754,000, Oct. 28, 1933. Gaseous hydrocarbons are transformed into hydrocarbons having a double bond and the mols. of which contain less H than the original hydrocarbons by heating them to 570-1200° under practically normal pressure and in the presence of a small amt. of a gas contg. free O.

**Aromatic hydrocarbons.** I. G. Farbenind. A.-G. Brit. 397,901, Aug. 28, 1933. Aromatic OH compds. in the vapor phase are circulated with H under pressure over customary catalysts, the time of contact being so short that a substantial part, preferably 10-40%, of the OH compd. remains unconverted. Examples are given of the conversion into corresponding hydrocarbons of (1) PhOH, over Mo sulfide, (2) the crude phenolic oil mixt. obtained by dephenolizing low-temp. carbonization water from brown coal over a pressed mixt. of graphite and W sulfide and (3) crude cresol, over V sulfide.

**Heat treatment of hydrocarbons.** I. G. Farbenind. A.-G. Fr. 750,869, Aug. 21, 1933. In processes, such as the conversion of aliphatic to aromatic hydrocarbons, polymerization of  $C_2H_4$  and its homologs and  $C_2H_2$ , splitting or destructive hydrogenation of oils, etc., the substances to be heated are enclosed in a vessel interiorly coated with a metal, particularly Cr, Mo, Fe or Pb, obtained by decompn. of a volatile compd. of the metal. Alkyl or CO compds. of the metal or volatile chlorides may be used.

**Apparatus for the high-pressure heat-splitting of hydrocarbons.** Sigbert Seelig. Ger. 579,502, June 27, 1933. **Oxidizing hydrocarbons.** I. G. Farbenind. A.-G. (Christoph Beck and Heinrich Diekmann, inventors). Ger. 579,988, July 3, 1933. Solid or liquid non-aromatic hydrocarbons, waxes, etc., are oxidized by treatment with  $HNO_3$  at high temps., the amt. of  $NO_2$  in the reaction mixt. being kept at a high value by increasing the pressure or by leading in  $NO_2$ .

**Stabilizing chlorinated hydrocarbons.** The Roessler & Hasslacher Chemical Co. Brit. 397,915, Sept. 4, 1933. See Fr. 732,569 (*C. A.* 27, 304). Amylene is excluded. Brit. 397,914, Sept. 4, 1933, is confined to the use of amylenes.

**Recovery of unsaturated hydrocarbons from gaseous mixtures.** Martin Müller-Cunradi, Otto Eisenhut and Heinrich Schilling (to I. G. Farbenind. A.-G.). U. S. 1,938,083, Dec. 5. A gaseous mixt. contg. unsatd. hydrocarbons, such as a mixt. contg.  $C_2H_4$  and H, is washed with a normally liquid alicyclic ketone contg. more than 3 C atoms, such as cyclohexanone to dissolve the unsatd. hydrocarbons.

**Olefins.** I. G. Farbenind. A.-G. Ger. 583,564, Sept. 6, 1933. High-mol. olefins with more than 6 C atoms are prepd. by leading suitable alcs. over water-splitting catalysts at reduced pressure. Thus, dodecyl alc. is led over active C impregnated with  $H_3PO_4$  at 22 m. pressure and 250° to give a 90% yield of dodecylene. Other examples are given.

**Olefins.** I. G. Farbenind. A.-G. (Hans Hauber, inventor). Ger. 583,685, Sept. 7, 1933. Olefins contg. S compds. as impurities are heated in the presence of a Si catalyst to give transformation products. Thus, the gas from a lignite distn. is led through a steel tube contg. powd. Si. The  $C_2H_4$  of the distn. gas is converted to butylene,  $C_2H_6$ ,  $C_4H_8$  and toluene. About 74% of the  $C_2H_4$  is converted to  $C_2H_6$  and toluene.

**Hydrogenating heterocyclic compounds.** The Good-year Tire & Rubber Co. Fr. 750,852, Aug. 21, 1933. Compds. such as pyridine, pyridylpyrroles, benzopyrrole, quinaldine, lepidine, acridine, etc., are hydrogenated under pressure of 100-220 atm. at about 225°, using Ni on a support as catalyst. Examples are given of the prepn. of

2- (b, 135.5-8.5°) and 4-phenethylpiperidine (b, 126-30°).

**Dehydrating organic liquids.** I. G. Farbenind. A.-G. (Theodor Wallis, inventor). Ger. 584,705, Sept. 28, 1933. Addn. to 573,539 (C. A. 27, 4240). In dehydrating vaporized org. liquids by the aid of  $\text{CaSO}_4$  as described in 573,539, the  $\text{CaSO}_4$  is prevented from coagulating into a solid mass by intermixing inert finely powd. substances such as talcum,  $\text{Al}_2\text{O}_3$ ,  $\text{SiO}_2$ , gel, etc.

**Organic bases.** Knoll A.-G. Chemische Fabriken, Karl F. Schmidt and Wilfrid Klavohn. Ger. 583,565, Sept. 21, 1933. Org. bases contg. the group  $-\text{C}=\text{N}-\text{C}-$ , or their cleavage or transformation products, are prepd. by the action of  $\text{N}_2\text{H}$  on org. compds. in the presence of a catalyst. Org. compds. contg. only 1 double linkage, except aromatic ring compds., or 1 OH group or a halogen atom are used. Thus,  $\text{BuCl}$  is treated with  $\text{N}_2\text{H}$  in the presence of  $\text{CHCl}_3$  and concd.  $\text{H}_2\text{SO}_4$  to give an 80% yield of the base  $(\text{CH}_3)_3\text{C}:\text{NCH}_3$ . The prepn. of the following is also described; the acetate of 3-methyl-1-hydroxy-7-octanone, b. 131.2° at 8 mm., 7-amino-3-methyl-1-octanol, b. 135.45° at 11 mm., 2-methyl-1,6-diaminoheptane, b. 130.3° at 9 mm., N-dehydro-6-methyl-3-isopropylhexamethylenamine, b. 195.7°, N-dehydro-2-methylhexamethylenamine, b. 158.62°, antihomomethylene-N-dehydrocamphidine, b. 214.16° at 7 mm.; campholsidine acid nitrile, b. 111°, N-dehydrocampholsidine acid nitrile, b. 154.5° at 10 mm., and dehydropiperidineundecane acid, m. 97.9°.

**Catalytic processes involving carbon monoxide.** E. I. du Pont de Nemours & Co. Brit. 397,852, Aug. 29, 1933. Reactions in the gaseous phase involving CO, other than the catalytic decompn. of CO to form C black, are accelerated by small amts. of halogens, H halides, alkyl halides or N oxides, e. g., 0.1-5% by vol. Solid catalysts or inert materials acting as catalysts in the presence of the above substances are preferably also used. The halogens and H halides are suitable in reactions between ales. and CO to form acids, esters and ethers; H halides, for the formation of esters from alkyl ethers and CO, org. acids from paraffin hydrocarbons and CO and org. amines from  $\text{NH}_3$  and CO; and alkyl halides, for the prepn. of acyl chlorides from alkyl chlorides and CO. Other reactions are the formation of acyl chlorides from hydrocarbons, Cl and CO, ales and aldehydes from CO and steam and aldehydes from hydrocarbons and CO. In an example a mixt. of CO,  $\text{HCl}$ ,  $\text{MeOH}$  vapor, H and  $\text{H}_2\text{O}$  vapor is passed under 700 atm. pressure through a reaction chamber contg.  $\text{CuCl}_2$  supported on charcoal and maintained at 350°.  $\text{AcOH}$  and  $\text{MeOAc}$  are obtained.

**Aliphatic alcohols from alkyl halides.** Wm. J. Hale (to Dow Chemical Co.). U. S. 1,938,453, Dec. 5, 1933. In reactions such as that of  $\text{EtCl}$  with aq.  $\text{NaOH}$  soln. to form  $\text{EtOH}$ , the formation of alkyl ether is restrained by adding such ether to the reacting materials.

**Aromatic alcohols.** Ludwig Valik and Irene Valik. Brit. 398,136, Sept. 7, 1933. In the production of aromatic ales., especially phenylethyl ales. and their homologs, by the action of alkylene oxides upon aromatic hydrocarbons in presence of a condensing agent, e. g.,  $\text{AlCl}_3$ , the alkylene oxide is dild. with an inert gas, e. g., air,  $\text{N}$ ,  $\text{CO}_2$ . The temp. should not exceed 55° and may be maintained at 5-10°. An aliphatic or aromatic amine or  $\text{NH}_3$  may be introduced with the alkylene oxide to neutralize the  $\text{HCl}$  produced, at least 0.75 parts  $\text{AlCl}_3$  to each part of hydrocarbon being used. The ales. are sep'd from the hydrocarbon by distn. and may be purified by treatment with  $\text{KMnO}_4$  and  $\text{NaHSO}_3$  or with a mineral oil or wax.

**Araalkyl alcohols.** I. G. Farbenind. A.-G. Fr. 752,478, Sept. 23, 1933. Araalkyl ales. are prepd. by causing an alkylene oxide or halohydrin to act on approx. the equimol. amt. of a metal compd. of an aromatic hydrocarbon contg. up to 2 condensed rings. Thus, p-tolylethyl alc., b. 113.7° (its phenylurethan, m. 115°), is obtained from Na p-tolyl and ethylene oxide.

**Dehydrating aqueous alcohol.** Adolf Gorhan (to Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler). U. S. 1,936,836, Nov. 28. Vapors of aq. alc. are

contacted with a dehydrating liquid in such amt. as to render the alc. water-free (the dehydrating liquid comprising KOAc and NaOAc is rendered anhyd. by heat and dissolved in abs. alc. without passing through the solid state). Cf. C. A. 27, 1983.

**Secondary alcohols.** Wm. Engs and Richard Z. Moravec (to Shell Development Co.). U. S. 1,938,177, Dec. 5, 1933. See Can. 335,977 (C. A. 27, 5761). U. S. 1,938,178 relates to hydrolyzing esters obtained from olefins, at a temp. below that at which the alc. formed distills off while neutralizing the generated acid, reducing the free acid content to a value substantially below that maintained during hydrolysis, and then recovering the alc. produced.

**Diacetone alcohol.** Henri Guinot (to Usines de Melh). U. S. 1,937,272, Nov. 28. In producing diacetone alc. by the catalytic condensation of acetone, acetone is subjected to the action of an alk. condensing agent such as KOH dissolved in a solvent such as alc. which is miscible with acetone and diacetone alc., the condensing agent being present in a quantity, as free alkali, of about "one-thousandth mol." per l. of acetone.

**Alcohols and esters.** E. I. du Pont de Nemours & Co. Brit. 397,938, Sept. 7, 1933. The catalytic reduction by H of aliphatic monocarboxylic acids to produce ales. and (or) esters is effected by means of a catalyst prepd. by dissolving  $\text{Zn}(\text{NO}_3)_2$  (preferably predominating),  $\text{Cd}(\text{NO}_3)_2$  and  $\text{Cu}(\text{NO}_3)_2$  in  $\text{H}_2\text{O}$  and pptg. the metal chromates by adding a soln. of  $\text{CrO}_3$  and  $\text{NH}_3$ ; the reaction mixt. is neutralized by more  $\text{NH}_3$  and the ppt. washed, dried at 100°, ignited at 400°, granulated and pressed into tablets. Among examples the catalyst is heated to 550° in a stream of H in a steel pressure vessel, the H pressure is then raised to 2000 lb. per sq. in. and lauric acid is pumped over the catalyst while H is drawn through the app. the product contains lauryl alc. and lauryl laurate. High yields of esters are obtained by high rates of flow and relatively low temps. Cf. C. A. 27, 4240.

**Esters of isoborneol.** Karl Stephen. Ger. 580,111, July 13, 1933. These are prepd. by treating pure  $\text{HCl}$  and  $(\text{HCO}_2)_2\text{Pb}$  with 10-12 times the theoretical amt. of 95-100%  $\text{HCO}_2\text{H}$  in the absence of Zn salts. Yield of 90% are obtained. Examples are given.

**Esters of high specific gravity from castor oil.** Cosimo Rosselli Del-Tureo (50% to French Society Legendre & Guillet). U. S. 1,936,831, Nov. 28. See Brit. 385,021 (C. A. 27, 4434).

**Catalysts for preparing esters.** Jerome Martin and Ignace J. Krehma (to Commercial Solvents Corp.). U. S. 1,937,281, Nov. 28. Catalysts initially comprising metal uranyl carbonates such as those of Ca, Sr, Ba, Mg, Zn, Ag or Pb and Ag carbonate are used for promoting reactions such as the production of  $\text{EtOAc}$  from  $\text{EtOH}$ . Hydroxides of Al, Th, Zr and Be also may be used. U. S. 1,937,285 relates to the similar use of catalysts initially comprising metal uranyl compds., a Ag compd. such as Ag carbonate and a compd. of Cu, Ni, Fe or Co, such as Ni carbonate.

**Aromatic aldehydes.** Imperial Chemical Industries Ltd. Fr. 750,842, Aug. 19, 1933. Aromatic aldehydes are prepd. by treating, at 60° or more, an aromatic hydrocarbon or an ether of a mono- or poly-hydric phenol or a halogenated aromatic hydrocarbon having one or more side chains (the halogen being in the ring and (or) the side chain) with  $\text{AlCl}_3$ ,  $\text{HCN}$  (or a metal cyanide) and  $\text{HCl}$ , the proportion of  $\text{AlCl}_3$  being in excess of 1 mol. of  $\text{AlCl}_3$  for each CN group.

**Ketones; esters.** Schering-Kahlbaum A.-G. Brit. 397,505, Aug. 21, 1933. Aromatic hydrocarbons, aromatic amines, phenols and naphthols are condensed with carboxylic acids and their anhydrides at 100-350° in the presence of surface catalysts, e. g., active C, silica gel, bleaching earths. Aryl ketones are obtained from the hydrocarbons, amino ketones from the amines and phenol esters and hydroxy ketones from phenols (except in the case of phthalic anhydride, when phenolphthaleins are produced). Examples include the prepn. of (1)  $\beta$ -naphthyl phenyl ketone from  $\text{C}_{10}\text{H}_8$  and  $\text{BzOH}$  or  $\text{BzO}$  in presence of tansil (I), (2) a mixt. of anisic acid o-tolyl

ester and 1-methyl-2-hydroxy-5-anisoylbenzene from *o*-cresol and anisic acid in presence of I, (3) a mixt. of BzOH *o*-tolyl ester and *p*-benzoyl-*o*-cresol from *o*-cresol and BzOH in presence of I, silica gel or animal charcoal, (4) 1-hydroxy-2-benzoylnaphthalene from  $\alpha$ -naphthol and BzOH or Bz<sub>2</sub>O, using I, (5) phenolphthalein from PhOH and phthalic anhydride in presence of "frankonit" and (6) a mixt. of  $\alpha$ -naphthylbenzoylamine and 1-amino-2-benzoylnaphthalene from  $\alpha$ -naphthylamine and BzOH or Bz<sub>2</sub>O in presence of I.

**Amines.** I. G. Farbenind. A.-G. (Ludwig Mack and Otto Nicodemus, inventors). Ger. 580,517, July 12, 1933. Secondary or tertiary amines are reduced to a lower substitution stage by treatment with NH<sub>3</sub> under raised temp. and pressure. The process may be carried on in soln. Thus, NH<sub>3</sub>Cl, aq. NH<sub>3</sub> and aq. Me<sub>2</sub>NH are heated to 320° in a steel bomb. The reaction product is diluted with water and heated with NaOH. On removing the NH<sub>3</sub>, the product contains MeNH<sub>2</sub>, Me<sub>2</sub>NH and a little Me<sub>3</sub>N. Other examples are given.

**Amines.** The Goodyear Tire & Rubber Co. Fr. 751,286, Aug. 30, 1933. Tertiary heterocyclic amines are prepd. by causing a hydroxy compd. and a heterocyclic compd. contg. N and replaceable H attached to the N of the ring, to react at 175–250° in the presence of a catalyst such as reduced Ni. Examples are given of the prepn. of *N*-ethyl-, b. 125–9°, *N*-ethyl- $\alpha$ -methyl-, b. 145–7°, *N*-butyl- $\alpha$ -methyl-, b. 185–90°, *N*-butyl-, b. 167–72°, *N*-cyclohexylpiperidine, b. 98–100°. Cf. C. A. 28, 778, 779<sup>1</sup>.

**Hydrogenating amines.** The Goodyear Tire & Rubber Co. Fr. 750,903, Aug. 22, 1933. Primary aromatic amines are hydrogenated under pressure in the liquid phase at 175–250° in the presence of a reduced Ni catalyst on an appropriate support. The catalyst may be prepd. by adding a support contg. a sol. Ni salt, adding a basic carbonate and reducing the pptd. Ni carbonate.

**Lactones.** Rohm & Haas Co. Fr. 754,183, Nov. 2, 1934. Lactones, specially lactones of gluconic acid, are prepd. by heating an aq. soln., e. g., of gluconic acid with a glycol ether, extg. the water by distn. with a little glycol ether and crystg. the lactone. The gluconic acid may be made by the action of H<sub>2</sub>SO<sub>4</sub> on Ca gluconate in an aq. soln. of a glycol ether.

**Mercaptans.** Henkel & Cie. G. m. b. H. Fr. 751,117, Aug. 28, 1933. Hydroaromatic and aliphatic mercaptans of high mol. wt. are obtained by treating di- or polythiols with reducing agents. An example is given of the prepn. of *dodecyl mercaptan*, b. 142–5°, from didodecyl disulfide.

**Phenols.** Chemische Fabrik von Heyden A.-G. Fr. 751,008, Aug. 20, 1933. Phenols are dehydrated by adding a liquid such as PhCl which forms a min. b. p. mixt. with water, and distg.

**Phenols.** Chemische Fabrik von Heyden A.-G. Fr. 751,118, Aug. 28, 1933. Phenols are prepd. from aromatic chloro hydrocarbons by an alk. sapon. under pressure, in the presence of KCl or NaCl. The resulting soln. contains less dissolved phenol.

**Conversion of phenols and low-temperature tars to hydrocarbons.** Soc. des carburants synthétiques. Fr. 750,977, Aug. 16, 1933. The hydrogenation is carried out at a low pressure, e. g., 5–20 kg. per sq. cm. in the presence of oxides of Al, Cr, W, Mo, etc., which have been activated by heating to 700° or more. The temp. used is 360–430°, being kept below that at which reduction of the oxides begins.

**Nitrophenyl sulfones.** Hermann Landers (to General Aniline Works). U. S. 1,936,721, Nov. 28. By the reaction of a sulfonic acid salt on an *o*-dinitro compd. of the benzene series (preferably while heating in a solvent or diluent), products are obtained such as: 2-nitro-4'-methylidiphenyl sulfone, m. 156–7°; 5-chloro-2-nitro-4'-methylidiphenyl sulfone, m. 191°; 2-nitro-3'-methyl-4'-hydroxy-5'-carboxydiphenyl sulfone, decomp. 226–7°; 5-chloro-2-nitrophenyldihydroxyphenyl sulfone, m. 158–9°; 2-nitro-4'-chlorodiphenyl sulfone, m. 137–8°; 4,5-dichloro-2-nitro-4'-methylidiphenyl sulfone, m. 167°; and 2-nitro-4'-methoxydiphenyl sulfone, m. 149.5°. These

nitro compds. yield corresponding amino compds. on reduction. Various details of procedure are given.

**Terpenes.** Schering-Kahlbaum A.-G. (Hans Meerwein, inventor). Ger. 584,965, Sept. 27, 1933. In transforming terpenes, catalysts consisting of inorg. or inorg.-org. complex acids which do not give stable addn. products with terpenes are used at high temps., at reduced or ordinary pressures, and preferably in a current of in different gas, such as steam. Thus, terpenes are heated to 150° in the presence of H<sub>2</sub>SbO<sub>4</sub> to give nopinene  $\rightarrow$  pinene  $\rightarrow$  camphene. Other examples are given. Cf. C. A. 27, 4815.

**Anthrapyridone derivatives.** Chemische Fabrik vorm. Sandoz. Ger. 580,283, July 8, 1933. Addn. to 578,995 (C. A. 28, 781<sup>1</sup>). Further derivs. are prepd. by condensing the haloanthrapyridones of 578,995 with aromatic amines at temps. below 170°. Thus, acetyl-2,4-dibromoanthrapyridone is heated to 130–40° with *m*-xylylene, AcOK and CuSO<sub>4</sub> to give a condensation product. A table of haloanthrapyridones, aromatic amines and the colors of the resulting condensation products in H<sub>2</sub>SO<sub>4</sub> and PhNO<sub>2</sub> is given. Cf. C. A. 27, 4094.

**Anthraquinone derivatives.** I. G. Farbenind. A.-G. (Paul Nawiasky and Berthold Stein, inventors). Ger. 580,047, July 14, 1933.  $\alpha$ -Azidoanthraquinone-*o*-sulfonic acid is treated with Cl or agents yielding Cl. The resulting chloroazidoanthraquinone compds. are used as starting material for dyes. In an example, Na 1-azidoanthraquinone-2-sulfonate (obtained by treating the diazo compd. of 1-aminoanthraquinone-2-sulfonic acid with NaN<sub>3</sub>) is treated with concd. HCl and an aq. soln. of NaClO<sub>2</sub>. The product is 1-azidochloroanthraquinone. The prepn. of 1,5-diazido-2,6-dichloroanthraquinone is also described.

**Anthraquinone derivatives.** I. G. Farbenind. A.-G. Fr. 751,236, Aug. 20, 1933. Aminoanthraquinone sulfonyl chlorides of the formula NH<sub>2</sub>.A.SO<sub>2</sub>Cl (A is anthraquinone, substituted or not) are prepd. by causing PCl<sub>5</sub> to act on an aminoanthraquinonesulfonic acid or a salt thereof, preferably in the presence of POCl<sub>3</sub>. Examples are given of the prepn. of the 2-amino-3-, m. 207–8°, 1-amino-4-bromo-2-, m. 209–10°, and 1-amino-2-sulfonyl chloride, m. 220–2°, and of the 1-amino-4-bromo-2-sulfonamide, m. 220°, and 2-sulfonylhydroxyethylamide, m. 227–8°.

**Alkylisoquinoline derivatives.** Karl Kindler (Wilhelm Peschke, inventor). Ger. 579,819, July 1, 1933. Chlorides of 1-hydroxy-2-alkylisoquinolinetetrahydride-1,2,3,4 are prepd. by heating a hydrocarbon soln. of the formyl compd. of *N*-alkyl- $\beta$ -phenylethylamine with SOCl<sub>2</sub>. Examples describe the prepn. of hydrastinine chloride, m. 210°, lodal chloride, m. 186° and ethylnorhydrastinine chloride, m. 175°.

**Benzanthrone derivative.** I. G. Farbenind. A.-G. (Georg Kranzlein and Martin Corell, inventors). Ger. 579,653, June 20, 1933. The compd. 6,7-diphthaloylbenzanthrone, m. 325.6°, is prepd. by reducing linear diphthaloylbenzene to half-sided anthronol and treating this with an acrolein-forming substance in such as glycerol in strong H<sub>2</sub>SO<sub>4</sub>.

**Carbazole derivatives.** I. G. Farbenind. A.-G. Fr. 754,224, Nov. 3, 1933. Carbazole derivs. substituted by SO<sub>2</sub>H and OH groups in the 2-, 3-, 6- and 8-positions are prepd. by sulfonating carbazole at moderate temps. by sulfonating agents capable of fixing water, and fusing with caustic alkalis. Examples are given of the prepn. of 2,3,6,8-tetra-, 2-hydroxy-3,6,8-tri- and 2,8-dihydroxy-3,6-disulfocarbazole and 2,8-dihydroxycarbazole, m. 246–7°.

**Naphthalene derivatives.** I. G. Farbenind. A.-G. (Herbert Kracker, inventor). Ger. 580,519, July 12, 1933. 2-Hydroxy-3-arylaminoanthraquinones in which one of the H atoms of the amino group is replaced by a substituted or unsubstituted carbocyclic or heterocyclic residue and the other is unsubstituted or replaced by an alkyl, aralkyl or aryl group, are prepd. by heating 2,3-dihydroxynaphthalene with primary or secondary amines of the carbocyclic or heterocyclic series contg. no further NH<sub>2</sub> or OH groups in the *o*-position to the amino group. The

heating is carried to temps above 170° and the water formed in the reaction is distd off. The prepn of the following derivs of 2-hydroxynaphthalene is described: *i*-*p*-tolueno, m 144.5°, *i*-(*o*-methoxyanilino), m 105-6°, *i*-(*p*-methoxyanilino), m 95-6°, *i*-(*o*-chloroanilino), m 139.40°, *i*-(*p*-chloroanilino), m 179.40°, *i*-(*p*-ethoxyanilino), m 124.5°, *i*-(2-naphthylamino), m 159.60°, *i*-*o*-tolueno, m 152.3°, *i*-(1-naphthylamino), m 119.20°, *i*-phenylmethylamino, m 112.13°, *i*-(2-pyridylamino), m 62.4°, *i*-(6-quinolylamino), m 108.10°, *i*-(6-azadazolylamino), m 154.9°, *i*-(2-carbazolylamino), m 243-4°.

**Paraffin derivatives** I G Iarbennd A G Ger 570,651, June 29, 1933. Hydroxyalkoxy compds of the paraffin series are prep'd by reducing the corresponding oxy compds in the liquid phase in the presence of a finely divided catalyst. Thus, a mixt of  $\beta$ -methoxybutyraldehyde and MeOH is heated with H under a pressure of 5 atm in the presence of a Ni pumice catalyst. On removal of the catalyst, a 95.8% yield of methoxy-1-butanol, b<sub>158.9</sub>, can be distilled off. The prepn of ethoxy-1-butanol, b<sub>189.41</sub>°, 1,1-butylene glycol *i* butyl ether, b<sub>71</sub>°, methoxy-1-propanol, b<sub>76</sub>°, and *i* ethoxy-1-propanol, b<sub>77</sub>°, is also described.

**Pyrazolone derivative** Baptist Reuter Ger 580,696, July 14, 1933. The deriv 4-bromodithylacetylaminio-1-phenyl-2,2-dimethyl-5-pyrazolone, m 130°, is obtained by the action of 1 mol of bromodithylacetyl bromide or chloride on 2 mols of 4-amino-1-phenyl-2,2-dimethyl-5-pyrazolone in an indifferent solvent.

**Quinoline derivatives** Fritz Schouhofer and Hans Andersag (to Winthrop Chemical Co.) U S 1,935,047, Dec 5. By methods of the same character as described in U S 1,747,531 (C 1 24, 170) there are obtained 5-alkoxy-4-aminoquinolines contg basic substituents in the amino group are produced, more particularly quinoline derivs in which the alkoxy groups may be methoxy, ethoxy, allyloxy, isopropoxy, butoxy, isomethoxy and hexyloxy, and the substituted amino group NR<sub>2</sub> in which R<sub>2</sub> is a basic radical containing N and R<sub>1</sub> stands for hydrogen, an alkyl group or likewise for a basic radical containing N. These basic radicals may contain one or more N atoms, they may be represented by aliphatic, alicyclic, aromatic or heterocyclic N contg radicals. Likewise such radicals where aliphatic and alicyclic or aromatic or heterocyclic radicals are connected with each other may be used. These radicals may contain other like bound O and S atoms and may be substituted by other substituents, for example, hydroxyl group. Basic radicals of the most different kind may be employed, for example, dimethylaminoethyl, ethylaminobutyl, diethylaminopentyl, aminocyclohexyl or cyclopentyl, imino hydroxypentyl, N-piperidylmethyl, N-pyrrolidylpropyl, etc. Various examples with details and modifications of procedure are given.

**Quinoline derivative** J D Riddell de Huen A-G (Leo Schulte, inventor) Ger 583,705, Sept 8, 1933. The deriv 8-hydroxyquinoline is prep'd by heating one of its ethers with a salt of a strong inorg. acid and an aromatic base. Thus, the methyl ether of 8-hydroxyquinoline is heated with PhNH<sub>2</sub> and concd HCl.

**Vinylacetylene derivatives** I I du Pont de Nemours & Co. Ir 753,465, Oct 17, 1933. Monovinylacetylene is caused to react with an alkali metal, an alk. metal amide or a Grignard reagent, preferably in the presence of a solvent or diluent. The product of this reaction is caused to react with an aldehyde, ketone, carboxylic acid, ester, CO, a nitric, oxyanate, isothiocyanate, SO<sub>2</sub>, acid chloride, org. halide, arylsulfonic acid, metal halide or an ether such as ethylene oxide or Li orthoformate, and the product may be hydrogenated or polymerized by light or heat. The polymerization may be stopped at an intermediate stage to obtain coating, molding or impregnating compns. Examples are given of the prepn of Na vinylacetylide, vinylthiynylmethylthyl- (b<sub>75</sub>°, [α]<sub>D</sub><sup>20</sup> 1.4802, d<sub>4</sub> 0.8878), vinylthiynylmethyl (b<sub>67</sub>°), vinylthiynylethyl- (b<sub>62</sub>°, [α]<sub>D</sub><sup>20</sup> 1.48, d<sub>4</sub> 0.8875), vinylthiynylpropyl- (b<sub>48</sub> 9°, [α]<sub>D</sub><sup>20</sup> 1.4715, d<sub>4</sub> 0.875), vinylthiynyl

1-methyloctyl- (b<sub>4</sub> 98.5-9.5°, [α]<sub>D</sub><sup>20</sup> 1.4734, d<sub>4</sub> 0.8681), vinylthiynylmethylphenyl- (b<sub>4</sub> 125-6°, m 40-1°), vinylthiynyldiphenyl-, vinylthiynylmethyl- (b<sub>73</sub> 65°, [α]<sub>D</sub><sup>20</sup> 1.4851, d<sub>4</sub> 0.9112), vinylthiynylpropyl- (b<sub>10</sub> 74.6°, [α]<sub>D</sub><sup>20</sup> 1.4775, d<sub>4</sub> 0.892) and dimethylvinylthiynyl-carbinol, m 59-61°, 1-vinylethynylcyclopentanol, b<sub>7</sub> 104.5°, [α]<sub>D</sub><sup>20</sup> 1.5228, d<sub>4</sub> 1.0181, 1-vinylethynylcyclohexanol, b<sub>3</sub> 84, [α]<sub>D</sub><sup>20</sup> 1.5169, d<sub>4</sub> 0.9742, methylvinyl- (b<sub>73</sub> 5.59.2°, [α]<sub>D</sub><sup>20</sup> 1.4406, d<sub>4</sub> 0.7401), ethylvinyl- (b<sub>73</sub> 84.5.5.3°, [α]<sub>D</sub><sup>20</sup> 1.4522, d<sub>4</sub> 0.7492), butylvinyl- (b<sub>10</sub> 59.00°, [α]<sub>D</sub><sup>20</sup> 1.450, d<sub>4</sub> 0.783) and heptylvinyl acetylenic, b<sub>74</sub> 5.5°, [α]<sub>D</sub><sup>20</sup> 1.466, d<sub>4</sub> 0.7962, vinylthiynyltriphenylmethane, m 134.5°, and naphthylamide of vinylpropionic acid, m 125.5°. The prepn of various polymerized products, lacquers, varnishes, enamels, etc., is also given.

**Formyl halide addition compounds** I G Iarbennd A G Ir 750,871, Aug 21, 1933. See Brit 391,400 (C A 27, 5085).

**Aliphatic sulfuric acid compounds** Fritz Schlotterbeck Ger 579,655, June 29, 1933. Addn to 454,458. Mixt. of aliphatic H<sub>2</sub>SO<sub>4</sub> compds and polymerized H<sub>2</sub>SO<sub>4</sub> compds are obtained by sulfonating oils with excess of H<sub>2</sub>SO<sub>4</sub> at low temps and sepg the resulting layer of polymerized reaction product from the soln of monomeric H<sub>2</sub>SO<sub>4</sub> compds.

**Tetrazo compounds** I G Iarbennd A-G Ir 751,300, Aug 31, 1933. See Ger 580,353 (C A 28, 18).

**Condensation products** I G Iarbennd A-G (Otto Irosbach and Ernst Rott, inventors) Ger 551,122, Sept 2, 1933. Products of the type Ph<sub>3</sub> are obtained by passing vaporized hydrocarbons, preferably diluted by mixing with other gases, over catalysts comprising difficultly reducible oxides of alk. earth or earth metals and C at temps above 700°. Thus a catalyst of MgO and C obtained by heating MgO with C<sub>2</sub>H<sub>4</sub> is used to convert vaporized C<sub>2</sub>H<sub>2</sub> to Ph<sub>3</sub> in 90% yield is obtained.

**Condensation products from acetylene and ammonia** Leo Schlicht and Hans Rotger (to I G Iarbennd A-G) U S 1,936,993, Nov 28. A mixt of NH<sub>3</sub> and C<sub>2</sub>H<sub>2</sub> is passed, at 200-400°, over a catalyst comprising several oxide metal compds which are not reduced or melted by the reaction gases at the temp employed, such as Zn and Pb oxides and alumina or silica gel, etc., in order to produce acetonitrile and pyridine bases for denaturing alc. Cf C 1 27, 817.

**Condensation products of the anthraquinone series** Heinz Scheyer (to General Aniline Works) U S 1,939,045, Dec 5. By treating a dimolecular conversion product of methylenedianiline or its substitution product corresponding probably to one of the formulas R<sup>1</sup>HC(CH<sub>2</sub>)<sub>2</sub>HR<sup>2</sup> and RCH<sub>2</sub>CHR<sup>3</sup> in which R is C<sub>6</sub>H<sub>4</sub> and

**Reactions with ketene** Carbide & Carbon Chemical Corp. Ir 750,801, Aug 19, 1933. See Brit 397,022 (C A 28 7502).

**Alkyl chlorides** Paul Ernst (to A Wacker Gas- und elektrochemische Industrie) U S 1,937,269, Nov 28. See Ger 541,066 (C A 26, 2468).

**Alkyl chlorides** Alexander Wacker Gas- und elektrochemische Industrie G m b H (Paul Ernst, inventor) Ger 583,471, Sept 4, 1933. Addn to 541,566 (C 1 26, 2468). Alkyl chlorides are prep'd by leading vaporized alcs and HCl over catalysts contg P acids at temps above 220°. Thus, EtOH vapor and HCl are led over active C impregnated with H<sub>3</sub>PO<sub>4</sub> at 240-300° to give EtCl.

**Acetylene tetrachloride** I G Iarbennd A G

Brit. 397,961, Sept. 7, 1933. See Fr. 739,183 (C. A. 27, 1894).

**Organic acid chlorides.** Monsanto Chemical Works. Brit. 397,775, Aug. 31, 1933. Org. acid chlorides, contg. acid impurities and sometimes  $H_2O$ , are treated in the liquid state with inorg. basic substances (excluding  $NH_3$ ), whereby the acidic impurities react, and the acid chloride is then sepd. therefrom. In examples  $AcCl$ ,  $BzCl$ , phthalyl chloride and *p*-toluenesulfonyl chloride are freed from traces of  $HCl$  and the resp. org. acids by treatment with  $CaO$ ,  $MgO$  or  $Ca(OH)_2$ , filtered and distd.  $CuCl$ ,  $ZnO$ ,  $PbO$  and  $Al_2O_3$  are also specified. The carbonates of the above metals and of alkali metals may be used while inferior results are obtained by using alkali metal hydroxides.

**Carbamic acid chloride.** Erich Theis (to I. G. Farbenind. A.-G.). U. S. 1,937,328, May. 28. See Brit. 396,840 (C. A. 28, 488<sup>9</sup>).

**Acid chlorides such as those of coconut oil acids.** Robert V. Townend (to Pilot Laboratories, Inc.). U. S. 1,936,739, Nov. 28. For producing an acid chloride, a higher aliphatic acid material is reacted with  $PCl_5$ , the phosphorous acid is removed from the resulting product (suitably by stratification) and remaining trichloride is converted to pentachloride by passing  $Cl$  through the mixt., and the  $PCl_5$  is sepd.

**Chlorides of aminoanthraquinonesulfonic acids.** I. G. Farbenind. A.-G. (Georg Kranzlein, Hans Schlickebaum and Ludwig Schörnig, inventor). Ger. 580,648, July 14, 1933.  $PCl_5$  is caused to react on the acids in the presence of  $POCl_3$ . Thus, Na 2-aminoanthraquinone-3-sulfonate is treated with  $PCl_5$  and  $POCl_3$  to give a sulfonyl chloride m. 208<sup>9</sup>. Another example describes the prepn. of the sulfonyl chloride of 1-amino-4-bromoanthraquinone-2-sulfonic acid, m. 209–10<sup>9</sup>.

**Alkyl hypohalites.** Richard M. Deanesly (to Shell Development Co.). U. S. 1,938,175, Dec. 5. For prepg. an alkyl hypohalite, a monohydric aliphatic alc. is caused to react with water and a halogen such as  $Cl$  or  $Br$  in the presence of an alk. agent such as  $NaOH$  or  $KOH$  present in substantially equiv. proportion to the alc., the water being present in such limited quantity that the reaction is carried out in a two-phase mixt. which is maintained under agitation.

**Halogenated pyridinoanthraquinones.** Max A. Kunz, Karl Koerberle and Gerd Kochendörfer (to General Aniline Works). U. S. 1,937,154, Nov. 28. By the halogenation of pyridinoanthraquinone or its substitution products, various pyridinoanthraquinones are formed contg.  $Cl$ ,  $Br$  or  $I$  (or 2 or more halogens) which may be used as dye intermediates or for prepg. other compds. and which in general form yellow to orange solns. with concd.  $H_2SO_4$ . Numerous examples with details and modifications of procedure are given.

**Biphenylene sulfide.** I. G. Farbenind. A.-G. (Eduard Ischmur and Eugen Himmer, inventors). Ger. 579,917, July 3, 1933.  $Ph_2$  is heated with  $S$  in the presence of  $Al$  halide. An 80% yield is obtained.

**Organic thiocyanates and their derivatives.** Hans P. Kaufmann. Ger. 579,818, July 3, 1933.  $Cu(SCN)_2$  or an intimate mixt. of a cupric salt and a salt of  $HCNS$  are treated with the desired org. compd. Thus,  $PhNH_2$  in  $MeOH$  is treated with  $Cu(SCN)_2$  to give *p*-aniline thiocyanate. The same result is obtained by treating  $PhNH_2$  with a mixt. of  $CuSO_4$  and  $NH_4CNS$ . The prepn. of the following is also described, bis(1-phenyl-2,3-dimethyl-5-pyrazolone-4)disulfide, m. 256<sup>9</sup>, 6-methyl-, 6-chloro-, 6-ethoxy- and 6-carbethoxy-2-aminobenzothiazole.

**Organic thiocyanates.** Kali-Chemie A.-G. Fr. 753,557, Oct. 10, 1933. Thiocyanates are made by treating quaternary  $NH_4$  bases of cyclic compds. (the  $N$  atom of which is combined with a  $COOH$  or  $OH$  group in the form of a ring of the kind of betaine) by means of  $HSCN$  or treating their salts by means of thiocyanates. Examples are given of the prepn. of thiocyanates of pyridine- and quinoline-betaine.

**Thallium triethyl, etc.** Herbert P. A. Groll (to Shell Development Co.). U. S. 1,938,179, Dec. 5.  $Et_3Tl$  is formed by the action of  $LiEt$  on  $Tl$  diethyl chloride.

Mention is made of the similar obtainment of corresponding compds. of  $Au$ ,  $Ga$  and  $In$ .  $Tl$  diethyl triphenylmethyl is obtained by the reaction of  $Tl$  diethyl chloride with  $Na$  triphenylmethyl in ether. U. S. 1,938,180 relates to similar reactions, among which is described the production of  $R_4Pb$  by reaction of  $PbCl_4$  with  $LiEt$  in petroleum ether.

**Addition products of the pyridine series.** Max Hartmann and Max Seiberth (to Soc. pour l'ind. chim. à Bâle). U. S. 1,938,253, Dec. 5. Addn. products (suitable for use in isolation of the component pyridine compds. or as therapeutic agents) are formed by causing pyridine series compds. such as nicotinic acid, hydroxyhalo- or amino-pyridinecarboxylic acids or esters, or halides, amides, anhydrides or salts of these acids to react with alk. earth metal salts such as  $CaCl_2$ ,  $Cu(CNS)_2$ ,  $CaBr_2$ ,  $Ca$  salicylate,  $MgCl_2$ ,  $SrCl_2$ . Numerous examples are given with details of procedure involving the prepn. of addn. products of nicotinic acid, picolinic acid,  $\alpha$ -hydroxypyridine- $\beta$ -carboxylic acid, nicotinic acid chloride, nicotinic acid ethyl ester, nicotinic acid diethylamide, nicotinic acid methyl propylamide, picolinic acid diethyl amide, nicotinic acid amide and 2,4,6-trimethylpyridine-3,5-dicarboxylic acid diethyl ester.

**Arylides of hydroxybenzocarbazolecaboxylic acid.** I. G. Farbenind. A.-G. (Georg Kranzlein, Otto Limpach and Karl Hager, inventors). Ger. 580,581, July 13, 1933. The acid is condensed with an aromatic amine. Thus, 7,8-benzocarbazole-3'-hydroxy-2-carboxylic acid is suspended in  $PhCl$  and heated with  $PhNH_2$  in the presence of  $PCl_5$  to give the anilide of the acid. Other examples are given. These arylides can be coupled with bases to give fast black dyes.

**Hydroxy carboxylic acid arylides.** Karl Zahn and Heinrich Koch (to General Aniline Works). U. S. 1,936,926, Nov. 28. By condensing 2,3-hydroxynaphthoic acid or a substitution product with a 4-aminobiphenyl or a substitution product (inclusive of compds. such as 2-aminofluorene, 2-aminofluorenone, 2-aminocarbazole, 2-aminobiphenylene oxide or their substitution products), arylides are obtained of good affinity for vegetable fiber and suitable for coupling to form *azo dyes*. Among the products are 4-(3-hydroxy-2-naphthovlamino)biphenyl (I), m. 283<sup>9</sup>; 4'-ethoxy-I, m. 275<sup>9</sup>; 4'-nitro-I, m. 324<sup>9</sup>; 4'-chloro-I, m. 304-6<sup>9</sup>; 3-methoxy-I, m. 214-16<sup>9</sup>; 2,5-dimethoxy-I, m. 219-20<sup>9</sup>; 2,4',5-trimethoxy-I, m. 221-4<sup>9</sup>; 2,5-dimethoxy-4'-phenyl-I, m. 221-2<sup>9</sup>; 2'-methoxy-I, m. 214<sup>9</sup>; 4'-methoxy-I, m. 295-6<sup>9</sup>; 2'-nitro-I, 264-6<sup>9</sup>; 1-4'-sulfondimethylamide, m. 263-4<sup>9</sup>; 1-4'-sulfondimethylamide, m. 263-4<sup>9</sup>; 3-chloro-I, m. 257-8<sup>9</sup>; 3-methyl-I, m. 239<sup>9</sup>; 4-(7-bromo-3-hydroxy-2-naphthovlamino)biphenyl (II), m. 322-3<sup>9</sup>; 4-(6-methoxy-3-hydroxy-2-naphthovlamino)biphenyl, m. 302-3<sup>9</sup>; 2,5-dimethoxy-II, m. 233-4<sup>9</sup>; 2',3'-hydroxynaphthoyl-2-aminofluorene, m. 279-80<sup>9</sup>; 2',3'-hydroxynaphthoyl-2-aminofluorenone, m. 295-8<sup>9</sup>; 2',3'-hydroxynaphthoyl-2-aminocarbazole; and 2',3'-hydroxynaphthoyl-2-aminodiphenylene oxide, m. 300<sup>9</sup>. Various examples with details of procedure are given.

**Organic acids.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler (Karl Wiesler, inventor). Ger. 583,702, Sept. 8, 1933. Volatile org. acids are prepd. by suspending their salts in a powd. condition in an org. solvent and treating the suspension with concd.  $H_3PO_4$ . The resulting acid is sepd. from the mono and (or) di-phosphates formed by extrn. Thus, powd.  $AcONa$  is suspended in acetone and treated with concd.  $H_3PO_4$  to give  $AcOH$  and  $NaH_2PO_4$ . Other examples are given.

**Neutralizing aliphatic acids containing froth-producing substances.** Camille Dreyfus and Clifford L. Haney (to Celanese Corp. of America). U. S. 1,936,754, Nov. 28. Material such as dil.  $HOAc$  recovered from the acetylation of cellulose and contg. a froth-producing substance is treated at a temp. above 60° with an alk. substance such as  $Na_2CO_3$  which generates gas, and toward the end of the reaction a coagulant such as an  $Al$  or  $Fe$  salt is added in order to ppt. org. substances.

**Fatty acids.** I. G. Farbenind. A.-G. (Christoph Beck

and Helmut Weishach, inventors). Ger. 581,829, Aug. 3, 1933. In prepg. fatty acids by oxidizing paraffin hydrocarbons by treatment with  $\text{HNO}_3$  or oxides of N, the presence of polybasic acids in the end product is avoided by stopping the oxidation when the product is about 80% saponifiable. An example is given.

**Aromatic carboxylic acids.** Gewerkschaft Mathias Stinnes. Ger. 580,820, July 17, 1933. Mono- or polybasic aromatic acids are decarboxylated by heating their Ca salts in soln. or in the dry state in the presence of a small amt. of alkali, and at ordinary or raised pressure. Thus, phthalic acid is heated with water, CaO and NaOH to give a 90% yield of  $\text{C}_6\text{H}_6$ .

**Aralkylaryl carboxylic acids.** Alphons O. Jaeger and Lloyd C. Daniels (to Selden Co.). U. S. 1,937,963, Dec. 5. By effecting reaction of phthalide (or a homolog or substitution product), in the presence of  $\text{AlCl}_3$ , with  $\alpha$ -chloronaphthalene, 2-chlorobiphenyl, 4-chlorobiphenyl, diphenyl oxide, 2- or 4-chloro- or bromo-diphenyl oxide, methylnaphthalene, tetralin or acenaphthene or its halogen substitution products, corresponding aralkylaryl carboxylic acids are produced various of which are suitable for use as dye intermediates. Numerous examples with details of procedure are given.

**Arylamino-2-hydroxynaphthalene-3-carboxylic acids.** Leopold Laska and Oskar Haller (to General Aniline Works). U. S. 1,936,722, Nov. 28. By heating, to a temp. above  $200^\circ$ , an alkali metal salt of a 5- or 7-arylamino-2-naphthol with  $\text{CO}_2$  under pressure above 50 atm. (suitably 80–120 atm.), products are obtained such as: 6-anilino-3-hydroxy-2-naphthoic acid, m.  $230^\circ$ ; 6-(*p*-toluino)-3-hydroxy-2-naphthoic acid, m.  $245^\circ$  (decompn.); 8-anilino-3-hydroxy-2-naphthoic acid, m.  $214\text{--}15^\circ$ ; 6-(*p*-methoxyanilino)-3-hydroxy-2-naphthoic acid, m.  $240^\circ$ ; and 6-(1-naphthylamino)-3-hydroxy-2-naphthoic acid, m.  $272^\circ$ .

**Formic acid.** Schering-Kahlbaum A.-G. (Karl Rohde, inventor). Ger. 583,704, Sept. 12, 1933.  $\text{HCO}_2\text{H}$  is prepd. by treating alk. earth formates with  $\text{H}_2\text{SO}_4$  in the presence of volatile hydrocarbons. Thus,  $(\text{HCO}_2)_2\text{Ca}$  is treated with coned.  $\text{H}_2\text{SO}_4$  in the presence of  $\text{C}_6\text{H}_6$  to give a 93–5% yield of  $\text{HCO}_2\text{H}$ .

**Acetic acid.** Chemische Fabrik von Heyden A.-G. (Kurt Buchheim, inventor). Ger. 583,703, Sept. 8, 1933. AcOH is rendered anhyd. by rectification with addn. of dialkyl carbonate to lower the b. p. of the water. Thus, 50% AcOH is distd. with  $\text{Et}_2\text{CO}_3$  to give AcOH of 99.8–100% purity. Cf. C. A. 27, 4248.

**Acetic acid.** I. G. Farbenind. A.-G. (Walter Flemming and Walter Speer, inventors). Ger. 583,704, Sept. 13, 1933; Pt. 751,160, Aug. 28, 1933. AcOH is prepd. by subjecting methyl ethyl ketone in the liquid phase to a catalytic oxidation with gaseous O at high temps. Examples are given.

**Acetic acid from aldehyde.** Horace F. Oxley and Walter H. Groombridge (to Celanese Corp. of America). U. S. 1,937,528, Dec. 5. Oxidation of aldehyde to HIOAc in the liquid phase is effected under such conditions that the concn. of the HIOAc does not rise to the point at which vigorous reaction would be prevented, as by maintaining the HIOAc concn. at 60–70% in a continuous process.

**Separating acetic acid and water.** C. F. Boehringer & Soehne G. m. b. H. (Richard Muller, Hans Hatzig and Erich Rahald, inventors). Ger. 584,571, Sept. 23, 1933. Mixts. of  $\text{Ac}_2\text{O}$ , AcOH and water are sepd. by reducing the temp. till the water and some of the AcOH freezes and seps. Further cooling results in total sepn. of first the water then the AcOH.

**Concentrating acids such as acetic acid.** Henry Dreyfus. U. S. 1,936,755, Nov. 28. Vapors of the aq. acid are mixed with vapors of a solvent for the acid comprising at least one ether of a monohydric phenol at a temp. about the b. p. of the acid, and the resulting mixt. is cooled to a temp. intermediate between the b. p. of water and the aliphatic-acid-solvent mixt. under the prevailing conditions, in order to effect fractional condensation. Various modifications of procedure are described.

**Apparatus for ketonizing acetic acid vapor.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler (Max Klar, Hans Walter and Hermann Schulz, inventors). Ger. 579,916, July 4, 1933.

**Lactic acid.** Chemisches Werk Klopfer G. m. b. H. Ger. 581,778, Aug. 2, 1933. Addn. to 533,853 (C. A. 26, 730). The method of 533,853 for solidifying pure lactic acid by cold-mixing with powd. pectin is modified by replacing the latter with solidified powd. vegetable mucous.

**Glycolic acid.** Consortium für elektrochemische Industrie G. m. b. H. (Martin Mugdan and Johann Stin, inventors). Ger. 581,828, Aug. 3, 1933. Glycolic acid is prepd. by heating  $(\text{AcO})_2\text{Cu}$  and alkali or alk. earth acetate solns. to 180–200° under pressure.

**Chlorinating propionic acid.** Röhm & Haas A.-G. Ger. 579,654, June 29, 1933.  $\text{EtCO}_2\text{H}$  and its liquid compds. free from N are chlorinated without the aid of a solvent and using less than the mol. amt. of Cl necessary for complete chlorination, and at temps. below the b. p. of  $\text{EtCO}_2\text{H}$ . Examples are given.

**Benzoic acid.** Bozel-Malétra (Soc. industrielle de produits chimiques). Fr. 753,918, Oct. 27, 1933.  $\text{H}_2\text{O}_2$  and its salts are prepd. by heating toluene with solns. of salts of hexavalent Cr to above  $100^\circ$  under pressure and in the presence of agents capable of neutralizing the alkali liberated and allowing easy sepn. of the  $\text{H}_2\text{O}_2$  or benzoates by filtration and subsequent concn. Examples are given of the use of  $\text{Na}_2\text{Cr}_2\text{O}_7$ .

**Benzoic acid.** Courtney Conover (to Monsanto Chemical Co.). U. S. 1,937,383, Nov. 28. A mixt. of benzoic and phthalic acids is treated with a reagent such as Na benzoate or  $\text{Na}_2\text{CO}_3$  capable of forming a phthalic salt which is non-volatile under the subsequent treatment, in insufficient quantity to combine with the benzoic acid, and the benzoic acid is then recovered from the mixt. by steam distn.

***p*-Hydroxybenzoic acid.** Lindley E. Mills and Win W. Allen (to Dow Chemical Co.). U. S. 1,937,477, Nov. 28. In prepg. *p*-hydroxybenzoic acid, with production of hydrated di-K *o*-hydroxybenzoate as an intermediate product, the latter is completely dehydrated by heating under sub-atm. pressure.

**Side-chain oxidations such as benzoic acid production from toluene.** Alphons O. Jaeger (to Selden Co.). U. S. 1,937,962, Dec. 5. Initial material to be oxidized such as toluene is vaporized and mixed with an O-contg. gas such as air in excess of that theoretically required and the mixt. is passed in series through a plurality of converters filled with a catalyst promoting side-chain oxidation such as K vanadyl vanadate. By use of other catalysts such as did zeolite catalysts contg. Ta, Mo, W and U, aldehydes such as benzaldehyde are mainly obtained.

**Sulfonic acids.** Hyman Limburg (to Flintkote Corp.). U. S. 1,937,521, Dec. 5. For obtaining sulfonic acids (such as those of acid sludge from spindle-oil refining) in purified form from an aq. liquid also contg. electrolyte, the liquid is treated with an org. base such as aniline with which the said electrolytes either form no compds. or only compds. which are water-sol., and the pptd. compds. of the org. base and sulfonic acids are sepd. from the remaining aq. liquid. Cf. C. A. 27, 4916.

**Iodomethanesulfonic acid or salts.** I. G. Farbenind. A.-G. (Heinrich Kloss, inventor). Ger. 581,818, Aug. 3, 1933. Addn. to 532,766 (C. A. 26, 480). Salts of  $\text{HSO}_3\text{I}$  or  $\text{H}_2\text{S}_2\text{O}_4$  or a mixt. of these are heated with a suspension of  $\text{CHI}_3$  in the presence or absence of acid-binding agents till the  $\text{CHI}_3$  disappears, the resulting iodomethanesulfonic acid or salt being sepd. Thus, a mixt. of  $\text{CHI}_3$ ,  $\text{CaCO}_3$ ,  $\text{Na}_2\text{SO}_4$  and water are heated to give the Na salt of the above acid. Cf. C. A. 27, 1010.

**Ketocholanic acids.** J. D. Riedel-E. de. Haën A.-G. (Friedrich Bordecker and Hans Volk, inventors). Ger. 584,704, Sept. 22, 1933. Addn. to 582,727 (C. A. 28, 782). In prepg. the above acids by the method of 582,727, i. e., by treating hydroxycholanic acid with aq.  $\text{H}_2\text{CrO}_4$  at mid temps., the hydroxycholanic acid is brought to the requisite finely divided condition by the aid of an

indifferent liquid insol. in water, such as xylene. Examples are given. Cf. *C. A.* 27, 5786.

**Haloanthraquinone- and haloanthraquinone-carboxylic acids.** I. G. Farbenind. A.-G. (Georg Kränzlein, Martin Corell and Ernst Diefenbach, inventors). Ger. 583,562, Sept. 6, 1933. The above acids and their aldehydes are prepd. by completely or nearly completely chlorinating benzophenones contg. a  $\text{CH}_3$  group in the *o*-position to the keto group, and contg. also a further  $\text{CH}_3$  group and a Cl atom. The product is treated with concd.  $\text{H}_2\text{SO}_4$  to produce anthraquinone-carboxylic acids or -aldehydes, or sapon. without  $\text{H}_2\text{SO}_4$ , to give chlorobenzophenone-carboxylic acids or -aldehydes, the ring being closed in the latter case by treatment with concd.  $\text{H}_2\text{SO}_4$ . Thus, 2,5-dimethyl-4-chlorobenzophenone of m. p.  $50^\circ$  (obtained by the condensation of 2-chloro-*p*-xylene with benzyl chloride) is dissolved in  $\text{C}_2\text{H}_5\text{Cl}$  and treated with Cl and ultraviolet light to give *o*-hexachloro-2,5-dimethyl-4-chlorobenzophenone, m.  $182^\circ$ . This is treated with concd.  $\text{H}_2\text{SO}_4$  to give 2-chloroanthraquinone-3-carboxylic acid, m.  $280^\circ$ . The prepn. of the following is also described, 2,6-dichloro-3,7-anthraquinonedicarboxylic acid, m.  $300^\circ$ , 2,7-dichloro-3,6-anthraquinonedicarboxylic acid, *o*-pentachloro-2,5-dimethyl-4-chlorobenzophenone, 2-chloroanthraquinone-aldehyde, m.  $230^\circ$ , 2,5,8-trichloro-3-anthraquinonecarboxylic acid, m.  $204^\circ$  and 4-chlorobenzophenone-3,6-dicarboxylic acid.

**Aliphatic anhydrides.** Henry Dreyfus. Brit. 397,472, Aug. 22, 1933. See Fr. 749,015 (*C. A.* 28, 492<sup>3</sup>).

**Mixed anhydrides.** Henkel & Cie. G. m. b. H. Fr. 751,571, Sept. 6, 1933. Mixed anhydrides of silicic acid and higher carboxylic acids are prepd. by the action of a Si halide or an anhydride of silicic acid and another acid on a carboxylic acid contg. at least 6 C atoms. Thus, silico-stearic anhydride is prepd. by the action of  $\text{SiBr}_4$  or silico-acetic anhydride on stearic acid. Other examples are given including the prepn. of silicobenzoic anhydride,  $(\text{C}_6\text{H}_5\text{COO})_2\text{Si}$ . The products may be used for hydrogenation.

**Mixed anhydrides of boric and organic acids.** Henkel & Co. G. m. b. H. Brit. 398,064, Sept. 7, 1933. Triacyl borates are prepd. by heating  $\text{H}_2\text{BO}_3$  or  $\text{B}_2\text{O}_3$  with 1 or more org. acids (other than  $\text{AcOH}$ ) in the presence of at least an equiv. quantity of an inorg. acid chloride or org. acid anhydride. In examples (1) tristearyl borate is obtained by heating stearic acid with  $\text{H}_2\text{BO}_3$  or  $\text{B}_2\text{O}_3$ , and  $\text{Ac}_2\text{O}$  and distg. off the excess  $\text{Ac}_2\text{O}$  with the  $\text{AcOH}$  formed and (2) cinnamic boric anhydride is prepd. by heating cinnamic acid with  $\text{H}_2\text{BO}_3$  in presence of  $\text{SOCl}_2$  until evolution of  $\text{HCl}$  ceases.

**Apparatus for catalytic reactions such as oxidation of naphthalene to form phthalic anhydride.** Benjamin E. Thomas (to Monsanto Chemical Co.). U. S. 1,936,610, Nov. 28. Various structural and mech. detail are described, adapted for use with fused salt baths or the like for heat control.

**Alkylating acid nitriles.** Karl Ziegler. Ger. 581,728, Aug. 2, 1933. Addn. to 570,594 (*C. A.* 27, 4251). The method of 570,594 for alkylating nitriles by treating them with halogenated alkyl or aralkyl compds. and  $\text{NaNH}_2$  is modified by replacing the latter by hydrides or org. substituted amides of the alkali or alk. earth metals. Thus, isobutyric acid nitrile is treated with  $\text{NaH}$  and benzyl chloride to give *o*-benzylisobutyric acid nitrile, b.  $117-18^\circ$  and 1.57<sup>1</sup>.

**Tertiary acid nitriles.** Karl Ziegler. Ger. 583,561, Sept. 6, 1933. Sec. nitriles of the general formula  $\text{R}_3\text{CHCN}$ , in which R represents alkyl (except vinyl) or aralkyl groups, are treated with alkali metal-, Mg- or halogen-Mg-substitution products of secondary aliphatic or hydroaromatic amines to form metal substitution products, these being then treated with halogen alkylene compds. or dialkyl sulfates. Thus, diallylacetonitrile is treated with dicyclohexylamine and  $(\text{C}_2\text{H}_5\text{Br})_2\text{Mg}$  soln. The product is then treated with allyl bromide, to give triallylacetonitrile. The prepn. of diethylallylacetonitrile, b.  $78^\circ$  at 15 mm., dimethylbenzylacetonitrile, m.  $57^\circ$  and

1 ethyldiundecylacetonitrile, b.  $195-200^\circ$  at 0.5 mm., is also described.

**Aminoanthraquinone nitriles.** Max Kugel (to General Aniline Works). U. S. 1,938,029, Dec. 5. By heating 1-amino-4-amino (or substituted amino) anthraquinone-2-sulfonic acid with KCN in aq. soln. to a temp. above  $65^\circ$  (suitably in a closed vessel for some time at above  $100^\circ$ ), products are obtained such as 1-amino-2-cyano-4-hexahydroanilinoanthraquinone, m.  $211-12^\circ$ ; 1-amino-3-cyano-4-hexahydroanilinoanthraquinone, m.  $239-40^\circ$ ; 1-amino-2-cyano-4-*p*-tolylaminoanthraquinone, 1-amino-3-cyano-4-*p*-tolylaminoanthraquinone, 1-amino-2-cyano-4-anilinoanthraquinone, 1-amino-2,3-dicyano-4-butylaminoanthraquinone, 1-amino-2-cyano-4-butylaminoanthraquinone, 1-amino-2-cyano-4-methylaminoanthraquinone and 1,4-diamino-2,3-dicyanoanthraquinone. Details of procedure are given for making all these compds. which, in general, form blue crystals.

**3-Methylalpentane.** Alexander Wacker Ges. fur elektrochemische Industrie G. m. b. H. Fr. 752,516, Sept. 25, 1933. One mol. of butyraldehyde is condensed with 1 mol. of  $\text{AcH}$  to form 3-methylal-2-pentanol  $\rightarrow$  3-methylal-2-pentene  $\rightarrow$  3-methylalpentane by fixation of H. The fixation of H may be pushed as far as the satd. alc. which is then dehydrogenated.

**3-Methylal-3-hydroxymethylpentane.** Alexander Wacker Ges. fur elektrochemische Industrie G. m. b. H. Fr. 752,493, Sept. 23, 1933. See Brit. 390,658 (*C. A.* 28, 492<sup>2</sup>).

**Acetylene.** N. V. de Bataafsche Petroleum Maatschappij. Fr. 751,284, Aug. 30, 1933.  $\text{C}_2\text{H}_2$  is extd. from gaseous mixts. contg. it by one or more solvents of the class comprising polyglycols, their esters, ethers or mixed ethers, e. g., diethylene glycol, dipropylene glycol, diethylene glycol diacetate or the acetate of the mono-Et ether of diethylene glycol.

**2-Butene.** I. G. Farbenind. A.-G. (Franz Runge and Martin Müller-Curadi, inventors). Ger. 583,790, Sept. 13, 1933. See U. S. 1,914,674 (*C. A.* 27, 4252-3).

**Copper-containing catalyst suitable for use in methanol synthesis from hydrogen and carbon monoxide.** Henry H. Storch (to E. I. du Pont de Nemours & Co.). U. S. 1,937,728, Dec. 5. A cuprammonium salt such as the sulfate or nitrate is treated (as by heating with  $\text{NaOH}$ ) to form a Cu-O compd. and the latter is reduced at a temp. below the m. p. of Cu.

**Isopropyl alcohol.** James W. Woolcock (to Imperial Chemical Industries Ltd.). U. S. 1,938,162, Dec. 5. Gases contg.  $\text{C}_3\text{H}_8$  are brought into contact with  $\text{H}_2\text{SO}_4$  contg. not more than a few percent of water dild. with about an equal amt. of glacial  $\text{HOAc}$ , at a temp. of about  $40^\circ$  so as to produce a reaction mixt. contg. a substantial amt. of iso-Pr H sulfate, which may then be converted into iso-Pr alc. by heating to eff. et hydrolysis.

**Acetone.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler (Hans Walter, inventor). Ger. 584,517, Sept. 21, 1933. Addn. to 577,705 (*C. A.* 28, 493<sup>4</sup>). The method of 577,705 for prepg. acetone by leading  $\text{C}_2\text{H}_2$  and H over an impregnated porous C catalyst free from Fe, at high temps., is varied by using catalysts consisting of active porous C impregnated with Cd, Zn and alkali or alk. earth metal compds. Examples are given.

**Acetaldehyde, etc.** Consortium für elektrochemische Industrie G. m. b. H. (Hans Deutsch and Willy O. Herrmann, inventors). Ger. 583,975, Sept. 14, 1933.  $\text{AcH}$ , acetone and  $\text{AcOH}$  are obtained by passing  $\text{C}_2\text{H}_2$  and H through a fused acid-reacting salt contg. less than 5% of water of crystn., at temps. between  $300^\circ$  and  $450^\circ$ . A fused mixt. of  $\text{ZnCl}_2$  and  $\text{AlCl}_3$  may be used.

**Benzanthronealdehydes.** I. G. Farbenind. A.-G. Fr. 753,970, Oct. 28, 1933. See Ger. 581,239 (*C. A.* 27, 5083).

**Vinyl ethers.** I. G. Farbenind. A.-G. (Walter Reppe, inventor). Ger. 584,840, Sept. 25, 1933. The ethers are prepd. by the action of  $\text{C}_2\text{H}_2$  on org. hydroxy compds. in the liquid phase at temps. above  $100^\circ$  in the presence of basic substances. Thus, a soln. of Na in abs. alc. is

subjected to a stream of N and  $C_2H_2$  in an autoclave to give a 95% yield of ethyl vinyl ether, b.  $36^\circ$ . The prepn. of the following is also described; vinyl amyl ether, b.  $111^\circ$ , ethylene glycol ethyl vinyl ether, b.  $128^\circ$ , ethylene glycol divinyl ether, vinyl phenyl ether, b.  $155-6^\circ$ , vinyl *m*-tolyl ether, vinyl  $\beta$ -tetrahydronaphthyl ether, b.  $143^\circ$ , vinyl isopropyl ether, b.  $64^\circ$ , di- and triethylene glycol vinyl ether, b.  $90-7^\circ$  and b.  $100^\circ$ , resp., vinyl octyl ether, b.  $75^\circ$ , ethyl octadecyl ether, b.  $190^\circ$ , vinyl decyl ether, b.  $110^\circ$ , vinyl dodecyl ether, b.  $120^\circ$ , monovinyl ether of diethanolamine, b.  $100-10^\circ$ , the divinyl ether of triethanolamine, b.  $120-30^\circ$ , vinyl butyl ether, vinyl tetradecyl ether, b.  $140-5^\circ$  and vinyl oleyl ether, b.  $170-5^\circ$ . Cf. C. A. 27, 730.

**Urea.** Alphonse Zieren. Ger. 579,567, June 29, 1933. Urea is prepd. by leading a gaseous mixt. contg. dry  $CO_2$  and  $NH_3$  in the proportion 1:2 over active C at  $100-140^\circ$ . The urea is removed from the catalyst by a liquid solvent such as alc. Yields of 88-9% are obtained. Examples are given.

**Urea synthesis.** Harry C. Hetherington (to E. I. du Pont de Nemours & Co.). U. S. 1,937,116, Nov. 28. In effecting urea synthesis by heating  $NH_3$  and  $CO_2$  to a temp. of at least  $150^\circ$  and under a pressure of at least 100 atm., unconverted  $NH_3$  carbamate is sepd. from the synthesis melt by distn. and the hot distillate is condensed by cooling it in the presence of substantial amounts of urea and free  $NH_3$ . Cf. C. A. 27, 3724.

**Bornyl oxalates.** Léon Darrasse, Etienne Darrasse, Lucien Dupont and Egon Elod. Fr. 751,275, Aug. 30, 1933. See Ger. 562,879 (C. A. 27, 1015).

**Tetrahydronaphthylamine.** I. G. Farbenind. A.-G. (Carl Wulff, inventor). Ger. 581,831, Aug. 3, 1933. Pure tetrahydronaphthylamine is obtained by sepg. a mixt. of *ar*-tetrahydro- $\alpha$ - and  $\beta$ -naphthylamine or *ar*- and *ac*-tetrahydro- $\beta$ -naphthylamine. This is effected by treating the mixt. with solvents in which *ar*-tetrahydro- $\beta$ -naphthylamine is insol. or only partly sol. below its m. p. and cooling to between  $15^\circ$  and  $-20^\circ$ . Thus, a mixt. of *ar*-tetrahydro- $\alpha$ - and  $\beta$ -naphthylamine is dissolved in benzene. The soln. is cooled to between  $-7^\circ$  and  $-10^\circ$ . The  $\beta$ -base is crystd. out and the  $\alpha$ -base remains in soln., from which it can be recovered, after filtration, by distn.

**Substituted acetamide.** Schering-Kahlbaum A.-G. (Karl Junkermann and Otto von Schiekh, inventors). Ger. 581,830, Aug. 3, 1933. Substitution products are obtained by introducing an acetyl group into the  $NH_2$  group of alkyl-, alkylalkenyl- or alkenyl-acetamides.

Thus, triallylacetamide is treated with  $Ac_2O$  to give acetyltriethylacetamide, m.  $92-3^\circ$ . The prepn. of acetyl-diethylpropylacetamide, m.  $74^\circ$ , and acetyltriethylacetamide, m.  $109^\circ$ , is also described.

**Cyclohexylcyclohexanol.** Howards & Sons Ltd., John W. Blagden and George C. H. Clark. Brit. 397,883, Sept. 1, 1933. Cyclohexylcyclohexanol and its homologs are prepd. by hydrogenating cyclohexylidenecyclohexanone or its homologs in presence of a catalyst belonging to the non-noble metal group, e. g., Fe, Ni or (and) Cu. The catalyst may contain a promoter, e. g.,  $MgO$ ,  $Cr_2O_3$ , and may be carried on a support. The hydrogenation is preferably under pressure, e. g., 10 atm. and at  $150^\circ$ . The cyclohexylidenecyclohexanone may be prepd. from cyclohexanol by condensation with agents such as caustic alkalis,  $NaOEt$ ,  $Ba(OH)_2$  or  $HCl$ .

**Pyrobenzanthrones.** I. G. Farbenind. A.-G. Fr. 753,828, Oct. 25, 1933. N condensation products are made by causing compds. capable of reacting like acrolein, e. g., acrolein, glycerol, aldol, crotonaldehyde and cinnamaldehyde, to react with pyridinonaphthalenes, the isocyclic rings of which contain at least one substituent chosen from the group  $=O$  and  $-OH$ , e. g., 3-hydroxy-1(*N*)-2- or 3-hydroxy-2(*N*) methyl-1(*N*)-2-pyridinonaphthalene, 1-naphthoquinoline-3,4-quinone and 2,3-phthaloylpyridine and their substitution products. To obtain good yields, oxidizing agents are added if the starting materials contain  $OH$  groups and reducing agents if they contain a quinone group. Examples are given of the prepn. of *N*(*N*)-1,9-pyrobenzanthrone of the formula

and of a *Bz*-3-hydroxy, a dibromo (m. above  $300^\circ$ ), a mononitro (m.  $285-6^\circ$ ), a monoamino (m.  $267-8^\circ$ ), a methoxy, a sulfo (m. above  $300^\circ$ ), a monocyano (m.  $305-7^\circ$ ), a carboxylic, a *Bz*-1-bromo and a *Bz*-1- $\alpha$ -anthraquinone deriv., also the 5-(*N*) compd. and derivs. thereof, also dyes obtained by condensing these compds. with pyrazoleanthrone.

## 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

### A—GENERAL

ARTHUR W. DOX

**Method for the separation of enzymes.** M. Sreenivasaya and N. Keshava Iyengar. *Nature* 132, 604 5(1933). About 20 cc. of enzyme ext. is frozen in a centrifuge tube and the frozen mass centrifuged at about 6000 r. p. m. for 15 min. Three distinct layers will form. The topmost layer is water, contg. the more easily diffusible enzyme fractions; the bottom layer represents the most concd. fraction of enzymes with high mol. or micellar wts. The method has been applied to the fractionation of intulase and invertase. Philip D. Adams

**Inhibitors in the decomposition of hydrogen peroxide by catalase.** Hubert N. Alyea and James Pace. *J. Am. Chem. Soc.* 55, 4801-6(1933).—No parallelism appears between the relative inhibitory powers of 19 org. compds. in the decompn. of  $H_2O_2$  by catalase at  $24^\circ$  and by light at  $75^\circ$  (C. A. 27, 1800). Mixing 12 inhibitors with catalase for 20 min. before addn. of  $H_2O_2$  does not increase the inhibitory powers; 7 other inhibitors appear to deactivate the catalase somewhat. The min. chain length is 2000. H. A. Beatty

**Pyrophosphatase in the placenta.** Isao Horii. *Arb. drilt. Abt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No.

4, 10 14(1933).—The amt. of pyrophosphatase in the human placenta decreases as pregnancy advances, while the opposite is true of orthophosphatase. M. L. C. B.

**The phosphatase content in various histological alterations of organs.** Isao Horii. *Arb. drilt. Abt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No. 4, 23-48(1933); cf. C. A. 27, 1647.—Cases of nephritis showing damage to the tubular epithelium show also a diminution of phosphatase activity. Atrophied testicles contain less phosphatase than active ones. Liver damaged by  $CCl_4$ ,  $CHCl_3$ , or P shows a decreased phosphatase content. Carcinoma mas show less phosphatase after irradiation. Phosphatase therefore occurs in connection with the cell cytoplasm. M. L. C. Bernheim

**Sulfatase.** Shinzaburo Fujita and Yasunobu Hosoda. *Arb. drilt. Abt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No. 4, 130 42(1933).—The ethereal sulfates of phenol and cresol are hydrolyzed by the sulfatase in takadiastase, with an optimum  $pH$  of 9.0. The deriv. of *p*-cresol is attacked more rapidly than its *o*- or *m*-isomers. M. L. C. Bernheim

**The fluorescence spectra of hyporcin and mycoporphyrin.** Ch. Dhéré. *Compt. rend.* 197, 948-50(1933).—The absorption and fluorescence spectra of hyporcin and

mycoporphyrin in both pyridine and alc. solns. indicate that they are identical.

Rachel Brown

The lipases of [human] blood serum. J. Nitzulescu, I. Ornstein and D. Herescu. *Compt. rend. soc. biol.* 114, 747-9(1933).—In general, serum lipase is greatly decreased in old age. Some exceptions were found.

L. E. Gilson

Influence of salts on the action of fumarase. Kurt P. Jacobsohn and Fernando Bela Pereira. *Compt. rend. soc. biol.* 114, 858-60(1933); cf. *C. A.* 27, 4822.— $Mg^{++}$  accelerates the action of fumarase;  $Ca^{++}$  does not. Inorg. phosphates have an activating effect but Na diphenylpyrophosphate does not.

L. E. Gilson

Lactic fermentation. E. Aubel and E. Simon. *Compt. rend. soc. biol.* 114, 905-7(1933).—Dried yeast, powd. dog muscle, acetone-extd., and muscle ext. prepd. by Thunberg's method had no effect whatever on the system, a glycerophosphate-pyruvic acid, but all 3 readily formed AcCHO and lactic acid from Mg hexosephosphate.

L. E. Gilson

Action of polyhydric phenols on urease; the influence of thiol compounds. Juda H. Quastel. *Biochem. J.* 27, 1116-22(1933). The high toxicities of catechol and hydroquinone toward urease are probably due to the presence of the corresponding quinones in the aq. solns. of the dihydric phenols. The protective effects of thiol compds. can then be explained as due to the reduction of the quinones to the dihydric phenols.

B. Harrow

Interaction of haloacetates and SH compounds. The reaction of haloacetic acids with glutathione and cysteine. The mechanism of iodoacetate poisoning of glyoxalase. Frank Dickens. *Biochem. J.* 27, 1111-51(1933).—Neutral solns. of  $ICH_2CO_2Na$  and glutathione form a thio-ether by elimination of NaI. The reaction follows the bimol. law. Bromo- and chloroacetates behave similarly but less vigorously. The iodoacetate inhibition of glyoxalase activity is reversed completely by the addn. of glutathione to the inactivated ext.

Benjamin Harrow

The biochemistry and physiology of glucuronic acid. I. The structure of glucuronic acid of animal origin.

John Pryde and Richard T. Williams. *Biochem. J.* 27, 1197-204(1933).— $\beta$ -Bornyl-*d*-glucuronide (I) was isolated as the Zn salt from the urine of human beings and dogs fed with borneol. I gives cryst. 2,3,4-trimethyl- $\beta$ -bornyl-*d*-glucuronide Me ester (II) by methylation with  $Ag_2O$  and MeI. II is converted into a mixt. of  $\alpha$ - and  $\beta$ -2,3,4-trimethylmethyl-*d*-glucuronide Me esters by the action of 0.2 *N*  $H_2SO_4$  in MeOH at 100°. Oxidation of the fully methylated glucuronic acid with  $HNO_3$  yields *d*-dimethoxysuccinic acid, *dl*-xylotrimethoxyglutaric acid (IV) and 2,3,4-trimethyl- $\delta$ -saccharolactone (III). The last 2 of these were identified as the cryst. diamides, while III was identified as the cryst. Me ester. The isolation of IV and III establishes a pyranoid structure for the glucuronic acid residue of bornylglucuronide. II. The methylation of glucurone of animal origin. *Ibid.* 1205-9.

—Glucurone (I), the anhydride of glucuronic acid, is obtained directly by the hydrolysis of borneolglucuronide. Methylation of I with  $Ag_2O$  and MeI gives 2 cryst. solids, trimethylglucurone and an unsatd. deriv., trimethylglucuralone. The bulk of I undergoes more extensive methylation because of the opening of the lactone ring. III. The structure of benzoylglucuronic acid. *Ibid.* 1210-15. —Conjugated glucuronates are either the glucoside-“ether” type, the glucoside-“ester” type (I) or a combination of these 2. Benzoylglucuronic acid (II), a type I, has been prepd. in a state of purity. Like all glucosides contg. a 1-Bz radical, II reduces sugar reagents because the Bz is easily hydrolyzed.

B. H.

The proteolytic enzymes of yeast. Thomas F. Macrae. *Biochem. J.* 27, 1229-30(1933).—The liberation of dipeptidase, aminopolypeptidase and protease by the autolysis of English top-yeast and Dutch bakers' yeast differs in several respects from the liberation of these enzymes from Löwenbriau yeast. Preps. of dipeptidase free from protease and aminopolypeptidase free from

dipeptidase and protease have been obtained from English top-yeast.

Benjamin Harrow

Studies on the relationship between chemical constitution and physiological action. V. Molecular dissymmetry and physiological activity. Leslie H. Easson and Edgar Stedman. *Biochem. J.* 27, 1257-66(1933); cf. *C. A.* 27, 315, 5313.—On the assumption that 3 of the groups linked to the asym. C atom in an optically active drug are concerned in its attachment to its specific receptor in the tissues, mol. dissymmetry and its assocd. optical activity have no direct influence on the magnitude of the physiol. activity of the drug. The same holds true for the relationship between mol. dissymmetry in a substrate mol. or in a sp. inhibitor and their power of combining with an enzyme. The theory is supported by the fact that the pressor activities of *d*-adrenaline and 3,4-(HO) $_2$ C $_6$ H $_3$ CH $_2$ CH $_2$ NIHMe are equal. A comparison of the mitotic activities of a no. of urethans shows agreement with theory.

Benjamin Harrow

The chemist and the public health. E. Gabriel Jones. *Chemistry & Industry* 1933, 1024-30.

E. H.

Urochrome and the participation of lyochromes in cell respiration. Kurt G. Stern and Guy D. Greville. *Naturwissenschaften* 21, 720(1933). The urochrome of urine contains a substance similar to the lyochromes (lactochrome, cytoflavine, yellow oxidation enzyme). The urochrome prepd. by adsorption on C or fuller's earth, AcOH or pyridine-McOH elution and purification by fractionated Me $_2$ CO-EtOH pptn. contains C 30.9, H 6.64, N 13.19, S 1.13%; the mol. wt. (Northrop-Anson method) is 2600; it contains 2% of paired glucuronic acid. Its aq. soln. gives continuous absorption from the visible violet on and blue-green fluorescence; it is only slightly toxic. Hyposulfite reduces it to a less colored substance, resistant to  $KMnO_4$ ; hence it is not urochromogen. The urochrome raises the spontaneous respiration of human or rabbit erythrocytes 2-4 times; rat cells do not react; it converts dissolved cryst. hemoglobin (horse or rat) into methemoglobin rapidly and almost quantitatively under aerobic or anaerobic conditions. Liver lyochrome has a similar action; both substances reduce oxidized cytochrome-c and helicorubin. On the basis of present results and those of Warburg a mechanism for cell respiration is suggested:  $O_2 \rightarrow$  Warburg's respiration enzyme  $\rightarrow$  cytochrome  $\rightarrow$  lyochrome  $\rightarrow$  substrate  $\leftarrow$  dehydrogenase.

B. J. C. van der Hoeven

Properties and occurrence of inducing substances. Joh. Hultfreter. *Naturwissenschaften* 21, 766-70(1933).—A review of work on “inductors” (Spemann), chem. substances which cause development of the embryonal ectoderm of amphibia into the central nervous system. They are present in certain parts of the embryo, e. g., the preformed mouth musculature, etc. Details on temp. and chem. stability are given. The inductor is present in exts. from many different organisms and animals: worms, molluscs, Crustacea, insects, fishes, amphibia, reptiles, birds and mammals; vegetable material is generally inactive. Evidence is given that glycogen itself is not the inductor, contrary to Fischer and Wehmeier (*C. A.* 27, 5379). The inductor is ether-sol. and occurs in glycogen-free hen embryo. The substance has not been chemically identified as yet; it is readily available, e. g., from calf liver (cf. H., *Arch. Entwicklungsmech. Organ.* (Abt. D., Z. Wiss. Biol.) 129(1933); Needham, *Chem. Embryol.* (*C. A.* 26, 1311)).

B. J. C. v. d. H.

The physical chemical nature of the “organisor.” C. H. Waddington, J. Needham and D. M. Needham. *Naturwissenschaften* 21, 771-2(1933).—A short review of studies on the chem. nature and action of the inductor (preceding abstr.). Conclusion: A chem. inducing substance is present in the cell-free ext.; it is decidedly ether-sol. and probably of lipid nature. Many references are given.

B. J. C. van der Hoeven

Amylosynthase. XVI. X-ray spectrography on synthetic starch. Toyosaku Minagawa. *J. Agr. Chem. Soc. Japan* 9, 907-15(1933); cf. *C. A.* 27, 5347.—Synthetic starches, polymerized from dextrin prepd. by enzyme, and from glycogen, gave a cryst. x-ray spectro-

gram. Natural starch has also a cryst. structure but differs somewhat from that of synthetic starch. Synthetic starch polymerized from sol. starch of glutinous rice was amorphous. XVII. *Ibid.* 916-19.—Natural dextrin was isolated from the grain and polymerized by amylosynthase into starch. A product obtained by heating glycogen with glycerol at 190-210° was also polymerized by amylosynthase. Amylosynthase lost the property of being salted out by  $(\text{NH}_4)_2\text{SO}_4$  after further purification. XVIII. *Ibid.* 919-21.—Two kg. of yeast was treated with a l. of  $\text{H}_2\text{O}$  and a small amt. of  $\text{PhMe}$  for 2 days at 25°. Alc. or  $\text{Me}_2\text{CO}$  was added to the ext. The ppt. was repeatedly reprecipitated with alc. or  $\text{Me}_2\text{CO}$ . The white powder thus obtained had no amylolytic action on starch, but accelerated the action of amylase. It appears to contain an enzyme complement which does not lose its activity at 80°.

Y. Kihara  
Enzymes of *Bombyx mori*. III. Tyrosinase and catalase in the blood of *Bombyx mori*. Kazuo Yamafuji. *J. Agr. Chem. Soc. Japan* 9, 940 8(1933); cf. C. A. 27, 3989.

The action of tyrosinase in the blood was optimum at  $\text{pH}$  6.6 and at 37°. It was stronger in the male than in the female. The Japanese or Chinese species of the silk worm has much more tyrosinase in the blood than the European. The optimum  $\text{pH}$  and temp. of catalase in the blood were, resp., 6.6° and 23°. Catalase was more abundant in the blood of the male and during vigorous growth. Variations in enzyme content during the life cycle of the silk worm were investigated. Y. Kihara

Bios. IX. So-called Bios I and II. Yasuji Hamamura and Mitsugi Chikamatsu. *J. Agr. Chem. Soc. Japan* 9, 1018-21(1933).—So-called Bios I and II were sepd. by  $\text{Ba}(\text{OH})_2$  from the rice bran by Luca's method. Bios II has only a growth-promoting action on yeast. The growth of the yeast must be compared for 20 days and more. Mixing Bios II with Bios I or inositol did not increase its action. The sepn. of Bios I and II was tried on tea leaves. The action of Bios II from tea leaves was very weak. Bios can be decomposed by treatment with  $\text{Ba}(\text{OH})_2$ . It is supposed that there are 2 kinds of Bios, one stable and another unstable to  $\text{Ba}(\text{OH})_2$ . X. Distribution of Bios in animals. Yasuji Hamamura and Kyoji Ohata. *Ibid.* 1090-4.—Bios was found abundantly in the leaves of plants and in the various organs of the fowl, especially the pancreas and the liver. Bios seems to have an important role in the animal body. Y. Kihara

Glucosulfatase. VII, VIII. Tokuro Soda and Iujio Egami. *J. Chem. Soc. Japan* 54, 1069-73(1933); cf. C. A. 27, 5354. The decompn. of glucose sulfate by the enzyme reached 90.6% at 30' when the phosphate was removed from the enzyme prepn. Glucosulfatase and phenolsulfatase cannot be sepd. by adsorption of the latter on active C. Glucosulfatase is also prepd. from *Polypus vulgaris*, *Ommastrephes sloani pacificus* and *Astrucyus manni*. K. Kutsuta

Studies on maltase. I. Maltase in the blood. Takezo Kokuryo. *Japan. J. Med. Sci. II Biochem.* 2, 115-30 (1933).—Maltase is present in the blood serum of the following animals: pig, dog, horse and sheep. Its presence was not detected in the blood serum of the cat, guinea pig, rabbit and man. In the dog, maltase is present in the serum and is absent from the red blood cells. The enzyme is most generally associated with the pseudoglobulins. Amylase always accompanies maltase. It is, however, associated more generally with the albumin fraction of the blood. II. The origin of maltase in the blood and urine. *Ibid.* 132-50.—The maltase of the blood and of urine originates partly from the pancreas and partly from the intestine. It is difficult to ascertain to what extent other body organs participate in the generation of the enzyme. The concn. of maltase in the blood and urine increases during starvation, after which it may regain its normal level or fall below it. Starvation does not affect the activity or concn. of amylase. III. Conditions influencing the action of maltase in the blood serum. *Ibid.* 161-74.—A 0.5% soln. of  $\text{NaF}$  used as an antiseptic augments the hydrolytic action of the maltase present in the blood serum of the dog. The addn. of 0.9%  $\text{NaCl}$  also activates the

maltase activity of blood serum. The blood serum of the dog and of swine shows a wide range of activity, the optimum being most likely at  $\text{pH}$  6.6. IV. Maltase of human urine. *Ibid.* 175 84.—The amt. depends on the sex. It varies in amt. with the density and acidity of the urine and in different diseases; e. g., in achylia pancreatica and in beriberi it is absent, while it is present in large amts. in Basdow's disease. It is more frequently found in the urine of persons giving a pos. Pirque reaction.

B. S. Levine

Photochemical changes of hydroxyproline and proline caused by x- and by ultra-violet radiation. J. P. Becker. *Strahlentherapie* 48, 296 307(1933).—The absorption spectra of l-proline (I) and of l-hydroxyproline (II) were detd. after radiation. I shows a band at 313  $\text{m}\mu$ . II radiated in soln. gives 2 bands at 257 and 313. The latter does not appear if the solid is radiated. Milton Levy

Light and metabolism. Ludwig Pincussen. *Strahlentherapie* 48, 308-18(1933); cf. C. A. 27, 4836. A lecture. Milton Levy

The influence of light on nutrition and metabolism of farm animals. Ernest Mangold. *Strahlentherapie* 48, 319 28(1933).—A lecture. Milton Levy

Enzyme and carbohydrate investigations of the aqueous humor. I. Permeability of the membrane and the enzyme contents of the aqueous humor. Josef Bock and Hans Popper. *Z. ges. expil. Med.* 90, 319 30(1933)

The amt. of diastase in the aqueous humor may be an index of the permeability of its membrane. The first humor obtained from rabbits is very low in enzyme content. The humor obtained an hr. later is very much higher and the amt. diminishes subsequently. The amt. of enzyme parallels the protein concn. III. Comparison of the sugar contents of first and second aqueous humors. *Ibid.* 604 7. The glucose concn. of the newly formed aqueous humor of the rabbit eye was compared with the other, normal, humor. The sugar was about 25% higher in the former, probably because of local hyperglucemia induced by the injury. Milton Levy

Human milk studies. XIV. A critique of the determinations of nitrogenous constituents. Betty Nina Fickson, Neva Stoner and Icie G. Macy. *J. Biol. Chem.* 103, 235 48(1933); cf. C. A. 26, 4086. A modified method for the complete pptn. of the proteins of breast milk is described involving the use of 0.1 cc. of 10%  $\text{Na}_2\text{WO}_4$  and 0.2 cc. of 0.666  $N$   $\text{H}_2\text{SO}_4$  per 1 cc. of milk. The filtrate may be used for the standard procedures of blood analysis and gasometric detns. for non-protein N constituents. A comparative study of  $\text{H}_2\text{WO}_4$  and  $\text{CCl}_3\text{CO}_2\text{H}$  as protein precipitants shows that fresh breast milk contains polypeptides and that there is a gradual increase of polypeptide N in the milk after removal from the breasts, indicating the presence of a proteolytic enzyme. There is also an enzyme present which is capable of converting urea to  $\text{NH}_3$ . The increase of amino N after the hydrolysis of the protein-free filtrates with  $\text{HCl}$  showed the presence of simple peptides or conjugated amino acids in fresh breast milk. Differences obtained with various methods of protein pptn. make possible a more comprehensive study of the N constituents of breast milk which have been little investigated and which promise to be of definite significance in the physiology and abnormalities of milk secretion. Forty references. A. P. Lothrop

The basic amino acids of serum proteins. Richard J. Block. *J. Biol. Chem.* 103, 261-7(1933).—Fractionation of fresh cattle serum by various concns. of  $(\text{NH}_4)_2\text{SO}_4$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{MgSO}_4$  and  $\text{NaCl}$  yielded fractions which differed in arginine, histidine and lysine contents. The results seem to indicate that the serum does not contain several independent proteins and that the fractions isolated by physicochem. methods are not pre-existent in the serum but result from the technic employed. The non-dissociable components contg. the higher percentage of lysine usually comprise the more sol. albumin fractions with which the lysine-low components might unite to form globulins. The results are consistent with Sørensen's hypothesis that the serum proteins are constructed from a large no. of nondissociable components. A. P. Lothrop

**The inactivation of mussel catalase by oxygen.** Graham W. Marks and Denis L. Fox. *J. Biol. Chem.* 103, 269-83 (1933).—Catalase in exts. prepd. from the mussel, *Mytilus californianus*, Conrad, is inactivated directly or indirectly by  $O_2$ , and also by  $N_2$  although at a lower rate. The quantity of  $H_2O_2$  decompd. is directly proportional to the enzyme concn. except at high concns. of enzyme and is independent of the  $H_2O_2$  concn. over certain ranges. The inactivation is a pseudounimol. reaction and the Arrhenius equation expresses the rate at lower temps.

**Sedimentation constants, molecular weights and isoelectric points of the respiratory proteins.** The Svedberg. *J. Biol. Chem.* 103, 311-25 (1933); cf. C. A. 27, 3255, 3960.—"Respiratory proteins contained in blood corpuscles have low sedimentation constns. and comparatively low mol. wts. Hemoglobin only occurs in the higher classes of the vertebrates. The corpuscle pigment of the lowest vertebrate, *Myxine*, has a lower sedimentation const. and lower mol. wt. than the hemoglobin of the higher vertebrates. Respiratory proteins dissolved in the blood plasma have, as a rule, high sedimentation constns. and high mol. wts. The only exception is the blood pigment of the *Chironomus* larvae. Within a well-defined animal group all species have, as a rule, the same sedimentation const. Biol. kinship, therefore, is usually accompanied by identity in the sedimentation const. Detns. of mol. wts. by means of sedimentation equil. measurements indicate that a system of simple multiples seems to obtain among the mols. of the blood pigments. Detns. of the isoelec. points of the respiratory proteins show that the blood pigments of the invertebrates so far studied are all much less alk. than the hemoglobin of the vertebrates. The isoelec. point varies from species to species. Even closely related forms have different isoelec. points. For a genus including several subgenera the isoelec. points lie closer together within a subgenus. The situation of the isoelec. point is therefore to a certain degree a measure of kinship."

**Nerve catalase.** F. O. Schmitt and R. K. Skow. *Am. J. Physiol.* 106, 404-13 (1933).—Frog nerve contains relatively little catalase. Nerve tissue contains a thermostable substance that actively catalyzes the oxidation of unsatd. fatty acids. It is unlikely that the oxidation catalyst is the heme residue of catalase alone.

**The presence of fibrinogen and pseudoglobulin in fibrin digests.** W. H. Welker, Geo. Gilman and Ludvig Hektoen. *Am. J. Physiol.* 106, 475-7 (1933).—Autolysis of beef fibrin and pepsin digestion of beef and horse fibrins yield free substances with the antigenic properties of fibrinogen and pseudoglobulin.

**The relationship of azo dyes to the coagulation of blood.** A. St. George Huggett and F. M. Rowe. *J. Physiol.* 80, 82-95 (1933).—The best anti-coagulant dyes are disazo direct dyes prepd. from tetrazotized diamines coupled with ammonaphtholsulfonic acids. Purification of the dye is essential.

**The chemistry of hormones and vitamins.** F. P. Mazza. *Boll. soc. ital. biol. sper.* 8, 945-1000 (1933).—The chem. and biol. relations between vitamins, hormones and enzymes are discussed. The review covers the chemistry of vitamins A, D, E, B<sub>1</sub>, B<sub>2</sub>, B<sub>6</sub>, C and the follicular and testicular hormones. Two hundred and twenty references.

**The proteins of the striated muscles of the frog. Elementary analysis.** G. Bucciardi. *Boll. soc. ital. biol. sper.* 8, 1190-3 (1933).—The water-insol. substances extd. from striated frog muscles by a satd. oily soln. of chloral hydrate have the following elementary compn. based on an ash-free and HCl-free product: C 54.06; H 8.07; N 16.37; and S 1.10%. The water-sol., non-coagulable fraction contains: C 57.44; H 7.55; N 14.21; O 21.8%. The water-sol., heat-coagulable fraction contains: C 52.81; H 7.14; N 16.93; S 1.16%.

**Precipitation of proteins by neutral salts.** G. Sandor, A. Bonnefoi and J. J. Perez. *Compt. rend.* 197, 1254-6 (1933).—The pptn. of natural proteins by neutral salts is not due to an isoelec. precipitability; the soly. on the

contrary passes through a max. at the isoelec. point ( $p_H$  6) for globulins and is excessively increased at the isoelec. point ( $p_H$  4.8) for albumins. The soly. curve shows a sharp break with albumins. The soly. begins to diminish, then increases, and finally decreases again, reaching a max. at  $p_H$  6.6. The precipitability of natural proteins by neutral salts appears to be comparable to those of the classic ampholytes.  $(NH_4)_2SO_4$  ppts. proteins because the protein sulfates are slightly sol. salts; they ppt. then, when their dissocn. diminishes because of an excess of sulfate or of H ions. The proteins are kept in soln. by the same forces as those which disperse crystalloids. The soly. curve of albumin shows further that proteins are not simple ampholytes, but resemble mixts. of several chem. species.

**Oxidations by erythrocytes and the catalytic influence of methylene blue. I. The oxidation of lactate to pyruvate.** Wm. B. Wendel. *J. Biol. Chem.* 102, 373-83 (1933).—Defibrinated dog blood or the washed erythrocytes are able to oxidize lactic to pyruvic acid in the presence of methylene blue, but only very slightly in its absence. Pyruvic acid itself is not oxidized. As the oxidation proceeds, the spectrum of methemoglobin appears. From the O consumption in the presence of  $d$ -glucose it appears that about 80% of the latter is oxidized by channels other than via lactate to pyruvate. **II. Methemoglobin and the effect of cyanide.** *Ibid.* 385-401.—Solns. of methemoglobin in presence of normal dog erythrocytes or erythrocytes in which the pigment has been converted to methemoglobin by  $AmNO_2$  are able to oxidize lactic to pyruvic acid, but the oxidation is inhibited by HCN. If, however, methylene blue is added the oxidation is greatly increased, and the increase is not inhibited, or is even accelerated, by HCN. The increased oxidation is therefore not due to methemoglobin (cf. Warburg and Christian, C. A. 26, 5976). The rate of oxidation is proportional to the amt. of methylene blue added at concns. below  $3.10^{-3} M$ . Further, since both HCN and semicarbazide accelerate the oxidation, while addnl. pyruvic acid inhibits it, the reaction is probably reversible, as it is in other biol. systems (cf. Baumberger, Jurgensen and Bardwell, C. A. 27, 5621, and Wurmser and DeBoc, C. A. 26, 5819).

**The action of sulfhydryl compounds on insulin.** Oskar Wintersteiner. *J. Biol. Chem.* 102, 473-88 (1933).—Insulin was treated with cysteine in  $N_2$  and the rates of cysteine oxidation and of insulin inactivation were followed. Cryst. insulin was completely inactivated when about  $1/2$  of the total S present was calcd. to have been reduced from the S-S form. Although the reactions were roughly parallel, the max. reduction was not proportional to the physiol. activity, so that if the activity depends upon S-S groups it must involve only relatively few of the total no. present in the mol. Insulin is also inactivated by thioglycolic and thiolactic acids as fast as by cysteine, between  $p_H$  6 and 8. HCN has no effect on the inactivation by any of these compds. The rate of inactivation increases very rapidly with  $p_H$  between 6 and 8. The liberation of  $NH_3$  is not involved in the reaction, although the reduced product appears to lose  $NH_3$  faster than the original insulin.

**Gas and electrolyte equilibria in blood. XVII. The effect of oxygenation and reduction on the carbon dioxide absorption curve and the  $pK'$  of whole blood.** Donald D. Van Slyke and Julius Sendroy, Jr. *J. Biol. Chem.* 102, 505-19 (1933).—The increase in combined  $CO_2$  caused by removing 0.001  $M$  of  $O_2$  at  $p_H$  7.4 is, for horse blood, 0.00052  $M$  and for dog blood, 0.00045  $M$ . The difference is thus of the same order as the corresponding difference between the 2 cryst. hemoglobins. A similar difference between the total buffer values of dog and horse blood is also parallel to the difference between the same property of the cryst. hemoglobins. The older data on whole blood are recalcd.

**The heat precipitation of insulin.** Vincent du Vigneaud, Robert H. Sifferd and Robert R. Sealock. *J. Biol. Chem.* 102, 521-33 (1933).—The liberation of  $NH_3$  from insulin in 0.1  $N$  HCl at 70-100° shows no connection with the

formation of a ppt. of the heat-denatured protein. The heat ppt. can be redissolved in dil. NaOH of  $pH$  11.4, and if after 5 mins. the soln. is acidified the insulin remains in soln. However, it is in changed form, since it is now more readily pptd. by heat or acid than the original insulin. The temp. coeff. for heat pptn. of insulin is only 4 for  $10^\circ$ , as against values of 50 to 9000 for other proteins. Insulin inactivated by  $H_2S$  or  $HCN$  lost the property of being pptd. by heat. K. V. Thimann

The first dissociation constant,  $pK'_1$ , of carbonic acid in hemoglobin solutions and its relation to the existence of a combination of hemoglobin with carbon dioxide. Rodolfo Margaria and Arda Alden Green. *J. Biol. Chem.* 102, 611-34 (1933).—The first dissocn. const.,  $pK'_1$ , of  $H_2CO_3$  in the presence of hemoglobin varies approx. linearly with  $pH$ , and at const. ionic strength varies with the hemoglobin concn., the deviation from the normal value being greater with reduced than with oxidized hemoglobin solns. The effects can be simply explained on the basis of combination between hemoglobin and  $CO_2$  (cf. Henriques, *C. A.* 25, 4019). This is confirmed by the fact that the O dissocn. curve of hemoglobin is moved to the right in the presence of  $CO_2$ . The presence of hematin does not alter  $pK'_1$ . The changes in combined  $CO_2$  on oxygenating blood are thus due to changes both in  $pH$  and in  $CO_2$  bound to hemoglobin. K. V. T.

The existence of a urea precursor depot in kidney tissue. Isben Kirk. *J. Biol. Chem.* 102, 683-90 (1933).—The expts. of Rehberg and Hlem (*C. A.* 27, 126) are confirmed, more  $NH_3$  being set free from a mixt. of frog kidney and jack bean than corresponds to the urea detd. by the xanthidrol reaction. The kidneys of dog and rat do not give this effect. Tests for arginase in frog kidney were pos., but in rat and dog kidney neg. Hence it is probable that the excess  $NH_3$  arises from the action of arginase on the jack-bean ext., and not from any urea precursor in the kidney tissue. K. V. Thimann

Studies on oxidation-reduction. XX. Adrenaline and related compounds. Eric G. Ball and Tung-Fon Chen. *J. Biol. Chem.* 102, 691-719 (1933); cf. *C. A.* 27, 5622.—The app. of Ball and Clark (*C. A.* 25, 4561) for detn. of potentials in flowing mixts. is reduced in size and modified; no change in c. m. f. is introduced by streaming of the mixt. past the electrodes. With this app. the oxidation-reduction potentials of the unstable dihydroxybenzene derivs. were detd. For 10 derivs. of catechol, including adrenaline and adrenalone,  $E_0'$  at  $30^\circ$  lies between 0.713 and 0.809 v., while for 3 derivs. of hydroquinone,  $E_0'$  is between 0.696 and 0.793. The normal potential of catechol is 96 mv. more pos. than that of hydroquinone, and a similar relation holds in general for the derivs. The introduction of a  $CO_2H$  makes the potential about 90 mv. more pos. In all the cases studied the curve of potential against  $pH$  has a slope of 0.06 v. At alk. reactions the acid groups of the reductants may dissociate and the dissocn. consts. may be detd. from the potential- $pH$  curves; the dissocn. consts. of catechol are  $6.61 \cdot 10^{-10}$  and  $5.25 \cdot 10^{-12}$ . Also at alk. reactions the oxidants of all the systems are much more unstable, the ring becoming readily broken; introduction into the mol. of an ionizable side chain increases the instability. All the dihydroxybenzene derivs. studied would be in the completely reduced state in living tissues. K. V. T.

Buffer intensities of milk and milk constituents. II. Buffer action of calcium phosphate. E. O. Whittier. *J. Biol. Chem.* 102, 733-47 (1933); cf. *C. A.* 23, 4487.—Equations for the ionic equilibria in solns. of Ca phosphates in presence of solid  $CaHPO_4$  or  $Ca_3(PO_4)_2$  are developed. K. V. Thimann

Fibrinogen and a plasma globulin which promotes clotting. Adolf Schmitz. *Z. physiol. Chem.* 222, 155-60 (1933).—Fibrinogen prepn. by Hammarsten's method of salting out with NaCl and by Mellanby's method of pptn. with AcOH are not identical. The Hammarsten prepn. is a mixt. of closely related proteins which cannot be fractionated, while the Mellanby prepn. is a mixt. of actual fibrinogen and a globulin precipitable by half satn. with  $(NH_4)_2SO_4$ . The globulin promotes coagulation and

appears to be identical with Mellanby's prothrombase. Its flocculation max. lies at  $pH$  5.3-5.6. The coagulation velocity is independent of the concn. of fibrinogen except at dilns. greater than 0.04% where coagulation is incomplete. A. W. Dox

The diamino acid, canavanine (Kitagawa, Monohe) 10. Electrometric titration of creatine ester hydrochloride, etc. (Failey, Brand) 2. Bile acids (Schenck) 10.

Lechers Lehrbuch der Physik: für Mediziner, Biologen und Psychologen. 7th ed. Edited by Stefan Meyer and Egon Schweidler. Leipzig: B. G. Teubner. 473 pp. M. 16.20.

Enzyme solutions. Richard Voss. Ger. 581,894, Aug. 4, 1933. Stable aq. solns. of enzymes of  $pH$  value 8-9 are obtained by using borax and weak acids as buffer mixts. Thus, pancreatin is dissolved in an aq. soln. of borax and salicylic acid, with an addn. of 0.25% toluene.

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

Pinacyanol as a histological stain. Frederick Proeschel. *Proc. Soc. Exptl. Biol. Med.* 31, 79-81 (1933).—A stable stock soln. consists of 0.5 g. of pinacyanol in 100 cc. of abs. EtOH or MeOH; this may be dild. 1:3 or 1:5 according to the required staining intensity. It is a nuclear and protoplasmic stain and permits detailed morphological and histochem. cell studies. C. V. Bailey

Industrial preparation of redistilled water for biological purposes. Physicochemical characteristics of the product. R. Cliquet, J. Guilbert and H. Péneau. *Bull. soc. chim. biol.* 15, 1044-69 (1933).—See *C. A.* 28, 576 L. E. Gilson

Determination of adrenal-cortex hormone by morphine resistance. L. F. Leloir and A. Novelli. *Compt. rend. soc. biol.* 114, 798-9 (1933).—Adrenalectomy makes rats more sensitive to morphine. Ext. of adrenal cortex can be assayed by detg. the quantity required to enable an adrenalectomized male rat to survive what would otherwise be a lethal dose (8 mg./100 g.) of morphine-HCl. L. E. Gilson

Technic of determining the true toxicity of tetanus toxin. S. Mutermilch, M. Helin and E. Salamon. *Compt. rend. soc. biol.* 114, 1005-8 (1933). L. E. Gilson

A stainless steel, high-pressure ultra-filter. Sidney J. Folley and Alexander T. Robert Mattick. *Biochem. J.* 27, 1113-15 (1933). The app. has proved valuable for clarification of biol. solns. unaffected by centrifuging, sterilization of bacteriol. media without application of heat and fractionation of colloidal solns. by ultrafiltration. Benjamin Harrow

Approximate determination of spermine in single human organs. Geoffrey A. Harrison. *Biochem. J.* 27, 1152-6 (1933). The dried material is extd. with trichloroacetic acid. An aliquot part of the filtrate is pptd. with picric acid. The crude spermine picrate is converted into the hydrochloride and then into the phosphate which is m. sol. in 25% alc. The spermine phosphate is sepd., washed, dried and weighed. The spermine contents of individual normal prostates obtained post-mortem vary enormously. Benjamin Harrow

The technic of assaying posterior pituitary extracts for oxytocic activity. John M. Gulland. *Biochem. J.* 27, 1216-17 (1933).—The outlet of the bath is joined by a sleeve of rubber tubing to a two-way glass tap; one limb of this can be closed by a pinch-clip and is also fitted with a side-tube. Warm Ringer soln. enters the side-tube by a siphon which has neither tap nor pinch-clip. The bath is emptied through the outlet, and simultaneously the siphon from the reservoir is flushed out with warm Ringer soln. by opening the pinch-clip. When the pinch-clip is closed, the bath is filled by turning the barrel of the glass tap through  $180^\circ$ , and then through  $90^\circ$  to close the tap. Benjamin Harrow

Cholesterol determination in blood. Alfred Bloch. *Schweiz. med. Wochschr.* 63, 1106-7 (1933).—For the col-

orimetry of the Leiberman Burchard reaction elec. light is better than daylight. The spectral compn. of the light and the presence of a brown pigment in the reaction are the detg. factors.

Milton Levy

The determination of the iodine number of the fatty acids of blood. Wilhelm Brandt, Karl Hinsberg and Georg Holland. *Z. ges. expl. Med.* 90, 216-24(1933).—Extn. of blood fat is best accomplished with EtOH, petr. ether mixt. (9 : 1). Sapon. should be avoided but if necessary is best done with NaOH. Rupp and Brachmann's (C. A. 20, 2758) soln. gave the best values for I no. M. L.

Sugar determination with the step photometer. W. Neuweiler. *Z. ges. expl. Med.* 90, 534-9(1933). The Folin and Malmros (C. A. 23, 4492) detn. of blood sugar can be used successfully with the step photometer.

Milton Levy

Preliminary results on certain biochemical applications of polarographic studies with the dropping mercury cathode. A. Roncato. *Holl. soc. ital. biol. sper.* 8, 1163-8 (1933).—The applications of polarography in biochemistry may be classified into 3 groups: (1) qual. and quant. studies; (2) studies on "maxima phenomena;" (3) studies directed toward interpreting the nature and mode of action of cathodic reduction processes. Examples given are detn. of lactic acid and the polarographic measurements of the surface activity of bile and EtOH. Lactic acid is easily transformed into AcH which can be detd. by the polarographic method with an accuracy of 0.01 mg. Bile in a concn. of 1 : 50,000 reduces the height of the O max.  $\frac{1}{2}$  and in a concn. of 1 : 6666 suppresses it completely. The action of bile on O maxima may be detected polarographically in a diln. of 1 : 200,000, and since the concn. of biliary acids in the bile is about 0.1% then a concn. of 1 : 20,000,000 of biliary acids can displace the O adsorbed on the surface of the Hg. On the contrary, EtOH tends to become adsorbed on the cathode Hg drop and displace the adsorbed O with a force which is 10,000 times less than that exerted by bile. The polarographic method, therefore, may be used to study surface phenomenon from the kinetic side.

Peter Masucci

The determination of nitrate nitrogen by Devarda's method; its application in biological media. D. Bach. *bull. sci. pharmcol.* 40, 459-70(1933). The 5 cc. of soln. employed should contain the nitrates in a concn. of not more than 0.05 N and represent 0.2 N NaOH. Add 0.25 g. of Devarda's alloy and heat to 70°. The reduction of  $\text{NH}_4^+$  is complete in less than 10 min. The  $\text{NH}_3$  is carried off by steam *in vacuo* and detd. in the usual way. The error for quantities of nitrate contg. about 1.75 mg. N is approx. 1%. Most biol. substances do not yield  $\text{NH}_3$  in the conditions of the assay. The  $\text{pH}$  must be about 10. The presence of substances which reduce the disocn. of the alkali requires a readjustment of the  $\text{pH}$ . The concn. Devarda's alloy frequently includes traces of  $\text{NH}_3$ .

A. E. Meyer

The diagnostic use of iodine in thyrotoxicosis. J. H. Means. *Ann. Internal Med.* 7, 439-44(1933).

John T. Myers

Electrolytes in human tissue. I. The digestion of tissue and other biological material and the subsequent determination of various electrolytes. Glenn E. Cullen and Walter E. Wilkins. *J. Biol. Chem.* 102, 403-13 (1933).—The tissue is dried at 105-110° for 10-40 hrs. and 10 cc. of 1 : 1  $\text{HNO}_3$  added per g. dry tissue. Soln. is complete after about 2 days and the filtrate is then used for the detn. of all ions. Ca is detd. by adding oxalic acid, centrifuging and titrating the supernatant liquid with  $\text{KMnO}_4$ ; Mg, K, Na and phosphate are detd. by modifications of standard methods. The accuracy is about 1%, and the methods are rapid. II. The electrolyte content of hearts and other tissues from cases with various diseases. *Ibid.* 415-23.—A large no. of analyses of the inorg. constituents of muscle, heart, liver and kidney from human subjects are given. K. V. T.

Improvements in manometric micro-Kjeldahl and blood urea methods. Donald D. Van Slyke and Victor H. Kugel. *J. Biol. Chem.* 102, 489-97(1933).—Sep. solns.

of NaOH and Br<sub>2</sub> in KBr are used for gasometric analysis of urea solns. in place of NaOBr. Substances other than urea which are capable of giving  $\text{N}_2$  when treated with NaOBr are pptd. with the blood proteins in Somogyi's method; the filtrate from this method is suitable for urea detns.

K. V. Thumann

Determination of ammonia in blood. Donald D. Van Slyke and Alma Hiller. *J. Biol. Chem.* 102, 499-504 (1933).—The  $\text{NH}_3$  is aerated off and detd. by Berthelot's PhOH-NaOCl reaction, (cf. Thomas, C. A. 6, 3241). The method is sensitive to about 0.001 mg.%, and thus has an accuracy of 1.2% for blood.

K. V. T.

A new method for separating pressor and oxytocic substances from the posterior lobe of the pituitary gland. Raymond L. Stehle. *J. Biol. Chem.* 102, 573-90(1933).—The active material is pptd. from the 0.5% HOAc ext. of the glands with EtOH, redissolved, freed from inert compds. with  $\text{Fe}_2(\text{SO}_4)_3$ , Ba(OH)<sub>2</sub> and colloidal Fe, evapd. to dryness and dissolved in 96% alc. Addn. of EtOAc then yields 3 fractions, in the first of which the pressor, and in the last the oxytocic, substance predominates. The 2 end fractions are purified by fractional pptn. with EtOH and EtOAc, giving glassy preps. from which 95% of the oxytocic and 91% of the pressor constituent, resp., had been removed. The pressor fraction appears to be of protein nature.

K. V. Thumann

A convenient and accurate method for the determination and detection of carbon monoxide in blood. A. A. Christman and E. L. Randall. *J. Biol. Chem.* 102, 595-600 (1933). The blood is diluted with 2 vols. water, treated with acid ferricyanide, and the gases are passed into a bulb contg. 3 cc. of a soln. of 500 mg.  $\text{PdCl}_2$  in 500 cc. 0.05N HCl. After shaking for 20 min., 0.1 cc. of 10% aq.  $\text{Al}_2(\text{SO}_4)_3$  is added to flocculate the colloidal Pd, and the excess  $\text{PdCl}_2$  is detd. colorimetrically by addn. of water, excess KI and 1% gum ghatti soln. The method is convenient and can be used with CO satns. of 1.50%, and is not affected by the presence of  $\text{H}_2\text{S}$  or embalming fluid in the blood; the presence of 100 mg. NaCN per 100 cc. blood increases the apparent amt. of CO.

K. V. T.

Comparison of gasometric, colorimetric and titrimetric determinations of amino nitrogen in blood and urine. Donald D. Van Slyke and Esben Kirk. *J. Biol. Chem.* 102, 651-82(1933).—The detn. of amino acids in urine by the formalin titration agrees satisfactorily with detn. by the gasometric method. In blood, both of these methods agree with the titration in Me CO soln., providing that lactic, acetoacetic or other org. acid are not present in quantity. On grounds of convenience the micro-gasometric method is preferred for detn. of the amino acids of blood and the formalin titration for those in urine.

K. V. Thumann

The action of ammonia on phenols. Benjamin Harrow, I. M. Chamelin and Harry Wagreich. *Science* 78, 514 (1933).—Some 20 phenol-like compds. were investigated in an attempt to det.  $\text{NH}_3$  in urine by means of the phenol-NaClO color reaction; the color developed with phenol is the most stable. Results compare favorably with those obtained by Folin's aeration method.

R. C. Vanden Bosche

Determination of cholesterol in blood. Hirendranath Banerji. *J. Indian Chem. Soc.* 10, 573-6(1933).—Fat-free filter paper on which 0.25 cc. of oxalated blood has been placed is dried at 37° and then extd. for 2 hrs. with 3 cc. of  $\text{CHCl}_3$ . The vol. is made up to 5 cc. with  $\text{CHCl}_3$ , 2 cc.  $\text{Ac}_2\text{O}$  and 0.1 cc. concd.  $\text{H}_2\text{SO}_4$  are added and the mixt. is allowed to stand for 15 min. The color developed is matched with a cholesterol standard.

R. C. Vanden Bosche

Detection of trichloroethylene and other org. solvents contg. halogen (Brüning, Schnetka) 7. Detn. of Fe—adaptation of the mercaptoacetic acid colorimetric method to blood (Leavell, Ellis) 12.

**Irradiating extracts with ultra-violet rays.** Kurt Hembd and Vitam Fabrik biologische Präparate G. m. b. H. Ger. 577,170, Aug. 10, 1933. Addn. to 568,900 (preceding abstr.).

## C-BACTERIOLOGY

CHARLES B. MORREY

**The carotenoids of bacteria.** Erwin Chargaff. *Compt. rend.* 197, 946-8(1933).—*S. lutea* contains 2 carotenoids: a hydrocarbon with strong absorption bands at 460 and 440 and a weak band at 415  $m\mu$ , which is adsorbed on alumina fibers, and a xanthophyll with strong absorption bands at 460 and 440  $m\mu$ , which is adsorbed by alumina fibers but not by  $CaCO_3$ . *S. aurantiaca* contains  $\beta$ -carotene and partially esterified zeaxanthin with absorption bands at 485 and 455  $m\mu$ . *Staph. aureus* contains only a xanthophyll, probably zeaxanthin, with absorption at 483 and 453  $m\mu$ . *M. phlei* contains  $\beta$ - and  $\gamma$ -carotenes. The latter is 4% of the total hydrocarbon content. A small amt. of nonesterified xanthophyll with absorption bands at 460 and 427  $m\mu$  and lutene are also present.

Rachel Brown

**Transfer of fixed nitrogen from bacterium to host in soy bean.** G. Bond. *Nature* 132, 748-9(1933). A definite quant. relation exists between the fixation and the transfer of N from bacterium to host, a fact which favors the theory of excretion.

Rachel Brown

**Hitherto unknown activators for the growth of lactic acid bacteria.** A. D. Orla-Jensen. *J. Soc. Chem. Ind.* 52, 374-9T(1933). Of all the lactic acid bacteria tested, *S. liquefaciens* is the only one able to ferment glucose sterilized alone in distd. water. If tap water is used, fermentation as a rule takes place if the temp. has been high enough. The small amt. of alkali present in tap water is sufficient to transform the sugar mol. into a less stable condition. If sugar is sterilized together with methylglyoxal, or this is added to the finished substrate, there is no activation, or but a slight amt. But if methylglyoxal is heated with autolyzed yeast, the activating power is exerted at once. The activating matter cannot be methylglyoxal as such, but must be one of its compds. with certain nitrogenous substances. AcH is quite ineffective toward lactic acid fermentation, but furfuraldehyde has nearly the same activating influence as methylglyoxal. The fact that the pentoses have the same activating power as methylglyoxal and that the activation sets in only when the compds. are heated with certain nitrogenous substances (found in great abundance in yeast ext.) leads to the view that the activating substances must be similar in nature to cozymase. The main result of this work is that by sterilization of the nutrient matters used in bacteriol. technic not only are undesired fermentations impeded, but also under certain conditions desired fermentations can be promoted.

F. L. Dunlap

**The action of nitrates on the fermentation of glucose by *Es. coli*.** J. Tikka. *Acta Chem. Fennica* B6, 317(1933) (In German).—The action of  $KNO_3$  in preventing the swelling in cheese formation, etc., has been shown to be due to its effect on changing the course of the fermentation. It acts as an acceptor of H, inhibits the growth of gas-forming bacteria, and is reduced to the nitrite state, which also inhibits the growth of gas-forming bacteria.

S. A. Karjala

**The influence of oxygen tension on the respiration of**

**Rhizobia.** C. E. Georgi and P. W. Wilson. *Arch. Mikrobiol.* 4, 543-64(1933).

## D-BOTANY

THOMAS G. PHILLIPS

**Preliminary experiments on bluing and chlorosis of *Hydrangea opuloides*.** P. Chouard. *Bull. mens. soc. natl. hort. France* 6, 289-91(1933).—Fe, Cr and Al can be bluing agents but Fe alone can prevent chlorosis. Ferric Fe was employed and did not seem to lack efficacy although it is considered that ferrous Fe is absorbed better by plants.

J. R. Adams

**The formation of citric acid in lemons.** A. Ricevuto. *Ann. chim. applicata* 23, 411-13(1933).—The wt., acidity, reducing sugars, pentosans, fibrin and essential oils were detd. every 15 days on lemons from the same tree. The citric acid is formed during the warm months at the expense of the reducing sugars and pentosans, while in the colder months, from the pentosans only. Thus the change is due to enzymic action which is most active during the warmer weather. The enzymes are probably derived from *Aspergillus* which abound in the soil.

A. W. C.

**Distribution of saponins in the plant kingdom.** Th. Solacolu and Ecaterina Welles. *Arch. Pharm.* 271, 470-7(1933).—The authors have undertaken anew the examination of species belonging to the phanerogams for saponins by means of the biol. method, thereby locating these products in species never before reported as contg. saponins. In the seed of the Gramineae saponin was found only in the ripened product; in the Rhamnaceae, however, (*Frangula* and *Cathartica*) saponins occur in the unripe, not in the ripe, fruit. These facts justify the assumption that possibly the saponins play a role in the life of plants akin to that of all other glucosides. Their formation and disappearance may be due to various causes, among others perhaps enzymic action. Characteristic for this assumption is the fact that as a rule saponins occur for the most part at those points where growth is pronounced, as with the glucosides, localized in the seed. A compilation is given of all plants in which saponins have been detected, together with their hemolytic activities.

W. O. F.

**Some physicochemical properties of seed extracts.** Charles A. Shull and John W. Mitchell. *Bot. Gaz.* 95, 258-78(1933).—There are appreciable amts. of both ash elements and carbohydrates in the substance of seeds, and these substances are capable of going into soln. quickly when the finely divided substance is immersed in water. The depression of f. pt., and the osmotic concn. shown by finely powd. seed substance when frozen with water are caused by the salts and the sugars. The proteins can be neglected.

Benjamin Harrow

**Chlorophyll content of grain sorghums.** J. C. Ireland and Parks A. Yeats. *Bot. Gaz.* 95, 300-15(1933). A photoelec. colorimeter was used to make a comparative est. of the cl. of the ext. The chlorophyll content in Kalir increases generally to the stage of seed maturity in the plant. It begins to decrease as the grain hardens.

Benjamin Harrow

**Notes on the Ascobolaceae.** H. C. I. Gwynne-Vaughan and H. S. Williamson. *Trans. Brit. Mycol. Soc.* 18, 127-34(1933).—When *Ascobolus viridulus* was grown on sheep-dung agar contg. 0.2%  $NH_4Cl$  or  $(NH_4)_2SO_4$  the spores were smooth and colorless until approx. 1 month after inoculation, but with  $NH_4$  phosphate, nitrate, molybdate or tartrate normal striated, purple spores were formed. On sheep-dung agar with 0.2%  $NH_4$  sulfate, chloride, nitrate or tartrate the spores of *A. levellii* were colorless and smooth, lacking a mucilage halo, but with 0.2%  $NH_4$  phosphate or molybdate a few spores were faintly colored and showed the verrucose markings and the characteristic halo. On dung agar with 0.2%  $(NH_4)_2SO_4$ , *A. furfuraceus* formed fruits which did not reach maturity, while in the presence of other  $NH_4$  compds. the mycelium gave rise only to oidia. On dung agar contg. 0.2%  $NH_4$  sulfate, chloride, nitrate, molybdate or tartrate *Dasybolus immersus* formed mostly colorless spores; in the presence of 0.2%  $NH_4$  phosphate most of

the spores were colored. Urea was harmful to all 4 species. In the presence of  $\text{KNO}_3$ , *A. furfuraceus* produced oidia only, but the other species fruited normally.

K. D. Jacob

The stimulation by dilute antiseptics of "sectoring" in mold colonies. L. D. Galloway. *Trans. Brit. Mycol. Soc.* 18, 161-2 (1933).—A concn. of 0.003-0.005% of the Na salt of salicylanilide did not appreciably affect the rate of growth of *Aspergillus terreus* on flour agar (2% wheat flour, 1.5% agar) but caused the development of sectors of a lighter color in the majority of colonies. The "sectoring" persisted through 4 subcultures on wort agar slopes, and both types showed approx. the same resistance to salicylanilide when transferred back to a medium contg. this antiseptic.

K. D. Jacob

The chemistry of Australian timbers. III. Chemical composition of four pale-colored woods of the genus *Eucalyptus*. W. E. Cohen, A. G. Charles and A. B. Jamieson. *Australia Council Sci. Ind. Research Pamphlet No. 44*, 22 pp. (1933); cf. *C. A.* 27, 753.—Analyses of 49 samples of the following species of *Eucalyptus* are given: *E. gigantea*, *E. obliqua*, *E. regnans* and *E. sieberiana*. Many differences and few resemblances between these woods and the hardwoods of N. America are revealed. Regular chem. differences between the eucalypts examd. may be used as an aid in identification. The results with respect to cellulose, lignin and NaOH solv. are of interest in connection with the proposed Australian wood-pulping industry.

A. I. K.

Carbohydrates in the bulbs of *Narcissus tazetta*. III. Comparison with carbohydrates in the bulbs of *Lycoris radiata*. Yoshijiro Kihara. *J. Agr. Chem. Soc. Japan* 9, 1005-7 (1933). Carbohydrates in the bulbs of *Lycoris radiata* were sepd. and analyzed. Total sol. carbohydrates, 57% (air-dried), sugar sol. in hot alc. 3.74%, reducing sugar 0.27%, carbohydrates sol. in cold water 18.28%, carbohydrates sol. in hot water 21.95%, carbohydrates sol. in superheated water 18.65%. The content of the lower sugars was less than that in *Narcissus tazetta*. The cold- $\text{H}_2\text{O}$  ext. contained fructan with 6% of glucan. It was sol. in  $\text{H}_2\text{O}$  but not hygroscopic. It is different from nulin or scorodose. Mauman could not be found. The carbohydrates consist chiefly of starch, which was extd. with hot and superheated  $\text{H}_2\text{O}$ . The starch granule is oval and slightly smaller than that of the potato.

Y. Kihara

Biochemistry of molds. III. A metabolic product of *Aspergillus melleus* Yukawa. (2). Fijiro Nishikawa. *J. Agr. Chem. Soc. Japan* 9, 1050-3 (1933). Mellein has no methoxy group. Monoacetylmellein, hexagonal plates, m. 126°, does not give the  $\text{FeCl}_3$  reaction. Dinitromellein, light yellow prisms, m. 160°,  $[\alpha]_D^{20} = +508.68^\circ$ , was prepd. by treating mellein with hot concd.  $\text{HNO}_3$ . When mellein was fused with KOH at 200°, melleic acid,  $\text{C}_{10}\text{H}_{10}\text{O}_4$ , m. 170°, was obtained, monobasic acid, optically inactive, Ac deriv., m. 110°, dihydro deriv., m. 116°, and monomethyl ester, m. 59°. When mellein was heated with KOH at 300°, 6-hydroxy-2-methylbenzoic acid, needles, m. 170°, was obtained. It was previously found as a metabolic product of *Penicillium griseofulvum* Dierckx by Anslow and Raistrick. These facts indicate that melleic acid is 2,6- $\text{C}_6\text{H}_4(\text{HO})\text{C}_2\text{H}_4\text{CO}_2\text{H}$ , and, hence, mellein is the lactone of 6-[ $\alpha$ (or  $\beta$ )-hydroxypropyl]- $\alpha$ -cyclic acid.

Y. Kihara

The content of pectic acid and methanol in tobacco leaves produced in Japan. III. Saichi Machida. *J. Agr. Chem. Soc. Japan* 9, 1140-2 (1933); cf. *C. A.* 27, 5150. Tobacco leaves of various varieties cultivated under the same condition were taken. The contents of pectic acid and MeOH were, resp., 10-15% and 0.3-0.64%.

Y. Kihara

The vegetable auxins and their influence on monocellular organisms. Methodi Popov. *Biol. Zentr.* 53, 661 (1933).—Exts. from cornseed sprouts have, in high concn., an inhibiting effect on the development of cysts of *Euglena gracilis* Khrb. The dil. exts. have a growth-stimulating effect, those from the top being the most active, less from

the stem and the weakest from the root. The active principle is undiminished in the dried plants.

A. F. Meyer

The action of cyanide salts on the development of yeasts. M. N. Meissel. *Zentr. Bakt. Parasitenk.* II, Abt. 88, 449-50 (1933).—The following salts were toxic to yeasts in the order given:  $\text{Hg}(\text{CN})_2 > \text{NaCN} < \text{KCN} > (\text{NH})_4\text{CNS}$ . Long exposure to a weak cyanide soln. causes a loss of fat in yeast cells, but brief exposure to stronger solns., did not have this effect. John T. Myers

The products of fermentation by *Mucor* groups. II. The products of fermentation in the presence of calcium carbonate. Teizo Takahashi and Toshinobu Asai. *Zentr. Bakt. Parasitenk.*, II Abt. 89, 81-4 (1933); cf. *C. A.* 27, 5376.—The following products were identified:  $\text{AcH}$ ,  $\text{C}_2\text{H}_5\text{OH}$ , pyruvic acid, succinic acid. John T. Myers

The relationship between infection types and the course and products of metabolism in the presence of different mineral salts in the plant food. Karl Böning and Elizabeth Böning-Seubert. *Zentr. Bakt. Parasitenk.*, II Abt. 89, 85-106 (1933).—The reaction of plants to a parasitic invasion is related to metabolism, and depends on the amt. and kind of ions in the food and their special properties. The effect of an ion will vary with the characteristics of the parasite and the plant host. John T. Myers

Effect of excess carbon dioxide on growing mushrooms. Edmund B. Lambert. *J. Agr. Research* 47, 599 (1933).—An accumulation of 5% or more of  $\text{CO}_2$  in the air causes abnormal growth, stunting and even death of mushrooms. This harmful effect is due principally to the  $\text{CO}_2$  surrounding the sporophores rather than to that in the interstices of the compost of the bed. Approx. 1% of  $\text{CO}_2$  is the lowest concn. that is noticeably injurious. This concn. was not encountered in com. mushroom houses or caves except where they had been closed up tightly for 24 hrs. or more. An abnormally high concn. of  $\text{O}_2$  seems to produce more compact and heavier mushrooms.

W. H. Ross

Factors influencing resin concentration in loblolly and slash pine. G. Norman Bishop and Gordon D. Marckworth. *J. Forestry* 31, 953-60 (1933). H. K. Salzberg

Improvements of the pollen-analysis technic. Lenneart v. Post. *Geol. Foreh. Forh.* 55, 523-7 (1933). P. discusses the quant. refinements proposed by G. and H. Erdtman (*C. A.* 27, 1657) in relation to certain uncontrolled natural conditions which exert a greater difference in the pollen count than the errors pointed out by E. and F.

Wilhelm Segerblom

A new example of exudation and volatilization of alkaloids in plants. J. Chaze. *Compt. rend.* 197, 1148-50 (1933). Young stems, leaves and flowers of *Conium maculatum* exude, principally through the stomata, quantities of conine which can be detected microchemically. Smaller amts. are present in the surrounding cells. After exposure to bright sunlight very little conine can be observed, the alkaloid having largely volatilized. The exudation continues after application of  $\text{KI}$ , and other reagents.

K. V. Thimann

Occurrence of rotenone in species of *Derris* and *Lonchocarpus*. Howard A. Jones. *J. Wash. Acad. Sci.* 23, 493-6 (1933).—Rotenone (I) was present only in very small amts. in the roots of *Derris* spp., but in *Lonchocarpus nuou* (S. American culm) the fine roots contained up to 8% and the coarser roots 2-3%, the cortex contg. about twice as much as the remainder. A sample root of Brazilian timbo contained 16% of I. In no case were appreciable amts. of I found in stems or leaves of *Derris* or *Lonchocarpus* spp.

K. V. Thimann

Physiologically balanced culture solutions with stable hydrogen-ion concentration. Sam F. Trelease and Helen M. Trelease. *Science* 78, 438-9 (1933).—Wheat plants grown in a salt soln. cause an increase of acidity when the ratio  $\text{NO}_3^-/\text{NH}_4^+$  is low, and a decrease when the ratio is high. This change in  $\text{pH}$  cannot be easily prevented by increasing the phosphate buffering of the soln., but may be stabilized by suitable ratios of  $\text{NO}_3^-/\text{NH}_4^+$ . Thus, ratios of 1, 5.7 and 19 maintain the  $\text{pH}$  at 4.3, 5.1 and

6.0, resp. Such soils change by about 0.2  $pH$  unit in 8 days of growth of wheat plants. K. V. Thimann

Acidity and alkalinity produced by changes in the nitrogen, sulfur and carbon cycles. John P. Conrad. *Plant Physiol.* 8, 509-24(1933).—A theoretical inquiry based on simple chem. reactions. Transformations from one form of N to another within the group  $N_2$ , urea,  $NH_4NO_3$ ,  $NH_4NO_2$  and proteins cause very little or no change in titratable acidity or alk. Transformations from any one or all of this group to  $NH_3$  produce about one equiv. of titratable alk. for each g.-atom of N changed and transformations from this same group to  $HNO_3$  or nitrates result in 1 equiv. of titratable acidity for each g.-atom of N changed. When weak acids and bases are formed the  $pH$  of the medium is important in detg. the titratable acidity and alk. produced. Exptl. data will be given in a subsequent paper. Walter Thomas

Photodynamically induced tropisms in plant roots. H. F. Blum and K. G. Scott. *Plant Physiol.* 8, 525-36 (1933); cf. C. A. 26, 2523.—The roots were suspended in a nutrient soln. at  $pH$  4.5 with a W-filament lamp as the light source. The presence of 1 part in 500,000 of tetraiodo-fluorescein brought about a definite bending of the roots toward the light within a few hrs. This orientation occurs only in the region of the root tip. The phenomenon is the resultant of 2 reactions, the dark reaction and the photo-reaction. The wave lengths active in producing phototropic bending, namely, 400 and 507  $m\mu$ , correspond to the absorption spectrum of the dye, indicating that the dye acts as a photo-sensitizer. W. T.

Spike disease of sandal (*Santalum album*). XIII. Hexone bases. Y. V. S. Rao. *J. Indian Inst. Sci.* 16A, 91-3(1933); cf. C. A. 27, 3771.—Basic amino acids in general, and histidine especially, are higher in the diseased leaves than in the normal. XIV. Mosaics associated with spiked areas. *Ibid.* 94-5. In many areas of spiked sandals the weeds show a mosaic disease. Analysis of healthy and normal leaves of *Ageratum* and *Gyssetia* spp. showed lower  $P_2O_5$  and much higher  $NH_4$  in the latter, while there was no difference in the basic amino acids and  $CaO$ . J. J. Willaman

Occurrence of growth substance in marine algae. H. G. van der Weij. *Proc. Acad. Sci. Amsterdam* 36, 759-60(1933).—By means of the test on coleoptiles of oats, the growth-promoting substance, auxin, was demonstrated in both sap and cell walls of *Valonia macrophylla*. J. J. Willaman

Growth substance in *Elaeagnus angustifolia*. H. G. van der Weij. *Proc. Acad. Sci. Amsterdam* 36, 760-1 (1933).—By means of the test on coleoptiles of oats, it was shown that young leaves contained the substance; young sprouts did not. The substance is transferred from the leaves through the stems downward only. J. J. Willaman

Growth vitamin. V. Cryptoxanthin (Kuhn, Grunemann) 10. Reductions with Zn dust in pyridine. III. Reversible hydrogenation and dehydrogenation of chlorophylls (Kuhn, Winterstein) 10.

## F. NUTRITION

PHILIP B. HAWK

Use and misuse of carbohydrates. J. Hunter P. Paton. *Edinburgh Med. J.* 40 (1933); *Trans. Medico-Chirurgical Soc. Edinburgh Session* 112, 177-90(1932-33).—P. suggests that improvement in the quality and reduction in the quantity of carbohydrate intake would produce beneficial effects in public health and that this could be effected in reform in methods of milling cereals and by restriction in the use of sugar. John Paton. *Edinburgh Med. J.* 40 (1933); *Trans. Medico-Chirurgical Soc. Edinburgh Session* 112, 191-208(1932-33).—A review dealing with carbohydrate foods, disease and pathol. conditions. Rachel Brown

Ascorbic acid from iris and other plants by a simplified method. Emil J. Baumann and Nanette Metzger. *Proc. Soc. Exptl. Biol. Med.* 30, 1268-72(1933).—Specific instructions are given for the extn. of 5-20 g. of ascorbic

acid from 5-10 kg. of German iris leaves (*Iris germanica*) or skunk cabbage (*Symplocarpus foetidus*). C. V. B.

Preparation of vitamin C from lemon juice. W. A. Waugh, O. A. Bessey and C. G. King. *Proc. Soc. Exptl. Biol. Med.* 30, 1281-3(1933).—A detailed description of a procedure which yields 100-150 mg. of cryst. vitamin C per l. of lemon juice. C. V. Bailey

The influence of vitamin C on the gas metabolism of normal and scorbutic guinea pigs. J. Mosonyi and L. Rigo. *Z. physiol. Chem.* 222, 100-4(1933).—The gas exchange of scorbutic guinea pigs is greater than that of normal animals. It falls after administration of vitamin C (ascorbic acid) and the R. Q. then rises. In normal animals the administration of vitamin C causes an increase in gas exchange and a slight rise in the respiration quotient. A. W. Dox

The question of the antiscorbutic activity of compounds similar to ascorbic acid. O. Dalmer and Th. Moll. *Z. physiol. Chem.* 222, 116-20(1933).—The acid  $HO_2C:C(OH)CH(OH)CHOCH_2OH$ , described by Maurer

and Schiedt (C. A. 27, 4777) and having the same empirical formula as ascorbic acid, was tested on guinea pigs for vitamin C action. Orally it was about  $1/40$  and subcutaneously about  $1/30$  as effective as ascorbic acid. The hydroxytetronic acid  $OCC(OH):C(OH)CH_2O$ , prepd.

by Michael (C. A. 27, 5723) by condensation of 2 mols of glycolic acid, represents the lactone ring of ascorbic acid without the attached glycol. This was wholly devoid of antiscorbutic activity. A. W. Dox

Distribution of irradiated ergosterol (vitamin D) in the animal organism after administration by mouth. Ph. A. Coppens and G. A. Metz. *Arch. n'erland. physiol.* 18, 407-15(1933).—Ten hrs. after dogs were fed irradiated ergosterol (vitamin D) the most important organs were extd. with  $Et_2O$ . These exts., after sepn. of the phosphatides, were fed to young rachitic rats to test for the presence of irradiated ergosterol. The vitamin was detected in the liver, suprarenal capsule, lungs, blood, spleen, mesentery and in 2 out of 4 cases also in the kidneys. The exts. of the heart, brain, skin and pancreas showed no vitamin D. F. L. Dunlap

Vitamin B and resorption in the intestine. H. G. K. Westenbrink and G. A. Overbeek. *Arch. n'erland. physiol.* 18, 416-28(1933).—In the absence of the thermolabile and thermostable B vitamins, the resorption of glucose is lessened. F. L. Dunlap

B vitamins and liver glycogen. H. G. K. Westenbrink. *Arch. n'erland. physiol.* 18, 429-45(1933).—In the different B avitaminoses, the liver is capable of forming glycogen in a normal manner. F. L. Dunlap

Comparative studies of the nutritive value of raw and pasteurized milks. J. C. Drummond. *J. Soc. Chem. Ind.* 52, 400-3T(1933).—No exptl. evidence was obtained which showed that pasteurization adversely affected the nutritive value of milk. Raw milk supplemented with biscuit prep'd. from white flour was found insufficient to enable a young female rat to produce and rear a normal litter of young. The expts. suggest that addnl. vitamin B may adjust the balance of this diet so that satisfactory reproduction can occur and D. thinks that amts. of Cu and Fe above those required to maintain a normal blood picture may influence reproduction beneficially. F. L. Dunlap

Comparison of the nutritive value of raw and pasteurized milks for mice. G. S. Wilson and M. P. Cowell. *J. Soc. Chem. Ind.* 52, 403-6T(1933).—A basal diet of either raw or pasteurized milk, together with white-flour biscuit, was quite inadequate to promote normal growth. The addn. of a Cu and Fe mixt. to this basal diet improved growth and development and prevented the occurrence of anemia, but was not sufficient as a rule to enable the females to rear their litters. The addn. of Yeastrel (a source of vitamin B) to the basal diet, together with the mineral mixt., brought about growth, reproduction and rearing of litters almost as well as a normal stock diet. There is little difference between the nutritive value of raw and

pasteurized milks in influencing general development, survival time, production of litters or successful rearing of the young. With mice brought up from birth, however, on the milk and biscuit diet, the av. wt. of the mice at time of weaning was significantly heavier in the raw than in the pasteurized milk groups. F. L. Dunlap

**Value of yeast bread.** J. Vargas Ryre. *J. Soc. Chem. Ind.* 52, 406-9T(1933).—A discussion of the inadequacies of white bread, especially with respect to the vitamin B complex. It is suggested that the vitamin B complex in white bread be increased by the addn. of dry yeast.

**Nutritive value of bread.** Wm. Jago. *J. Soc. Chem. Ind.* 52, 412-14T(1933).—A brief historical discussion, especially with respect to the nutritional factors involved. F. L. Dunlap

**The dehydrating effect of a carbohydrate-poor diet and its practical utility.** D. Adlersberg and O. Porges. *Klin. Wochschr.* 12, 1446-50(1933).—A carbohydrate diet causes a retention of water in the tissues, primarily the skin. Conversely, a carbohydrate-poor diet causes dehydration and is of therapeutic value in edemas, inflammatory exudation and bronchiectasis with profuse sputum. There is an extensive bibliography. Harry Eagle

**The effect of the nutrition upon the hydrogen-ion concentration of the bile. Clinical observations.** H. Bronner. *Klin. Wochschr.* 12, 1502 3(1933).—In normal individuals, a vegetable diet causes the  $p_H$  of the bile to rise to approx. 7.5; a meat diet causes it to fall to 6.5. Infection, stones and medication also affect the  $p_H$  of the bile. Harry Eagle

**Hypervitaminosis A. I. The symptomatology of the hypervitaminosis caused by feeding pure vitamin A to young rats.** J. A. Collazo and J. Sánchez Rodríguez. *Klin. Wochschr.* 12, 1732 4(1933).—Trophic skin changes, cessation of growth, inflammatory conditions of the eyes, spastic contractures of the extremities and death were caused by feeding an excess of pure vitamin A to young rats. If one stops at the right time, the eye condition improves, and the animals resume growth. Harry Eagle

**Specific dynamic effect of foodstuffs in anemias and leucemias. I. Protein.** Saburo Kunura. *Tōhoku J. Exptl. Med.* 21, 613 28(1933).—The basal metabolism is increased, or at the upper limits of normal in chronic anemia and is definitely increased in myeloid leucemias. In both diseases the specific dynamic action of protein is somewhat less than in normal. In chlorosis both the sp. dynamic action and the basal metabolism are within normal limits. II. The specific dynamic effect of carbohydrates. *Ibid.* 22, 18 28. —The sp. dynamic effect of carbohydrate (peroral glucose) and its effect upon the P:Q are normal in cases of chlorosis, but are decreased in chronic leucemia and anemia. The basal metabolism in the latter is increased. III. The specific dynamic effect of amino acids in experimental anemia. *Ibid.* 29-40. —In rabbits rendered anemic by hemorrhage or by phenylhydrazine, the sp. dynamic effect of glycine introduced into the duodenum with a sound is significantly decreased. IV. The specific dynamic effect of liver substance in experimental anemia. *Ibid.* 41 52. —The sp. dynamic effect of liver is decreased in exptl. anemia. Harry Eagle

**The role of salt in poultry nutrition. I. Salt in the nutrition of the chick.** J. H. Prentice. *J. Ministry Agr. Northern Ireland* 4, 72 90(1933).—Expts. were carried out with White Wyandotte chicks. Birds receiving rations contg. no NaCl or other Na salt made poor growth, utilized food inefficiently and were susceptible to disease and the pullets showed retarded sexual maturity. Steamed bone flour, KCl,  $Fe_2O_3$ , S and KI, when used to supplement a normally constituted mash, had no apparent effect on the birds, either in the presence or absence of NaCl. The beneficial effects which accompany the use of NaCl appear to be a function of the Na rather than of the Cl. In the absence of a supplement of NaCl there was no response of any kind from the addn. of protein to a cereal mash, even when a chloride was supplied also. There was striking evidence that grass plays an important part in helping to balance a ration which is deficient in Na.

Chick mash should contain 0.5% NaCl. II. Salt in the nutrition of the laying hen. *Ibid.* 92-104. —In the absence of NaCl from the laying mash the rate of egg production and the size of eggs decreased, and the birds lost wt. and were prone to cannibalism, particularly when they were deprived of access to grass; these conditions were overcome by addn. of 0.5% NaCl to the rations. Omission of KCl,  $Fe_2O_3$ , S and KI from the mash had no effect on the health of the birds or on egg production; the effect of steamed bone flour was doubtful.

**A deficiency disorder induced in suckling young rats bred on a purified synthetic diet with "glaxo casein" (caseinogen) as a sole source of protein.** Leslie Wm. Mapson. *Biochem. J.* 27, 1061-8(1933); cf. C. A. 27, 122. —The deficiency is marked by failure of growth, loss of fur and eventual death. "Physin," the growth-promoting factor in liver, and the Coward factor (C. A. 24, 402) cure the deficiency. Benjamin Harrow

**The role of carotene in human health.** Albert F. O. Germann. *J. Chem. Education* 11, 13-16(1934). E. H.

**A statistical analysis of some experiments on slipped tendon.** T. T. Milby. *Poultry Sci.* 12, 352-5(1933). —An analysis of the results reported by different investigators indicated that the correlations between the percentage of slipped tendons in chickens and the amts. of protein, ash and Ca in the feed were not significant in the data studied. The amt. of P in the ration is positively correlated with the percentage of slipped tendon, the value of the correlation being 0.6303. The amt. of P in the ration gives practically as good an est. of the amt. of slipped tendon as do protein, ash, Ca and P combined. The results do not justify the conclusion that P is the chief causative factor of slipped tendon, but merely indicate that high percentages of slipped tendon are associated with high P in the ration. K. D. Jacob

**Mineral content of tibiae from chicks with slipped tendon.** Arthur D. Holmes, Madeleine G. Pigott and Wm. B. Moore. *Poultry Sci.* 12, 356-61(1933). —There was no significant difference between the size and mineral content of tibiae from slipped-tendon chicks and those of normal chicks. K. D. Jacob

**Oat hulls as a source of vitamins B and G.** N. B. Guarrant and R. Adams Dutcher. *Poultry Sci.* 12, 373-7(1933). —Oat hulls contain an appreciable quantity of vitamins B and G. Addn. of 5% of oat hulls to a basal diet greatly extended the life of rats; a 10% addn. resulted in slow but consistent growth and a 20% addn. resulted in a 5-g. gain in wt. per week during the 8 weeks of the expt. Vitamin B and G concentrates were about equally effective in stimulating addnl. growth. Addn. of 20% of alc.-extd. hulls to the basal diet was not sufficient to stimulate growth but there was some evidence that it did prolong life. K. D. Jacob

**Effect of fluorine in the nutrition of the chick.** C. H. Kick, R. M. Bethke and P. R. Record. *Poultry Sci.* 12, 382-7(1933). —Chicks can tolerate more F in their ration in the form of  $CaF_2$  than as rock phosphate or NaF; the last 2 materials exert similar effects on growth and feed consumption. When the rations of chicks contained more than 0.036% F, as NaF or rock phosphate, growth and feed consumption were decreased in direct proportion to the F content of the ration; the clotting time of the blood decreased with increase in the amt. of F in the ration. F ingestion did not significantly affect the percentage of bone ash in the tibiae at 8 weeks. K. D. Jacob

**The nutritive protein value of five varieties of rice.** A. J. Icarmano. *Philippine J. Sci.* 51, 567-72(1933). —The nutritive value of rice as detd. by rat growth is not correlated with the protein content. The Mancaser variety contains less protein than others but it excels in promoting growth in rats. Amy LeVesconte

**Effect of fatty acids on nutrition. II. Experiments with diets composed of rice, oil and lipid containing linoleic or linolenic acid.** Ume Tange. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 22, 1-14(1933); cf. C. A. 27, 1664. —Rice starch was inferior to potato starch for rat growth. Linoleic acid or alc. yeast ext. could not cure

rats that had been fed on rice starch but whole dried yeast did. Lecithin, soy-bean oil and chrysalis oil promoted growth, while rice bran oil did not. Fatty acids from cod-liver oil did not maintain growth and large doses caused gastro-intestinal disturbance. Linoleic acid did not spare vitamin B<sub>1</sub> or B<sub>2</sub>. A. LeVesconte

**Sodium chloride requirement and its relationship to mineral metabolism.** Hans Glatzel. *Z. ges. expil. Med.* 90, 59-77(1933). Bunge (Z. Biol. 10, 275(1874)) believed that the dietary use of NaCl served to balance high K intake on vegetable diets. On analyzed diets of potatoes or rice G. finds that high K in the diet did not increase the urinary Na. The potato diets which are customarily used with added salt produce alk. urines whereas rice diets, for which salt is not used, produce acid urines. The NaCl is supposed to prevent excessive urine alk. Milton Levy

**The dietary production of fatty livers in rats.** N. R. Blatherwick, E. M. Medlar, Phoebe J. Bradshaw, Anna L. Post and Susan D. Sawyer. *J. Biol. Chem.* 103, 93-106(1933). Cholesterol in ingested liver is one substance capable of producing the fatty condition found in young rats fed diets contg. whole liver. Fat is not deposited on diets contg. a residue from the aq. extn. of liver or a 70% alc. ppt. of the aq. ext. Deposition of fat and cholesterol in the liver also occurs on diets contg. egg but the results are less striking than those with liver on account of the relatively poor nutritive condition of the animals on the egg diet. Any role of lecithin in opposing the laying down of liver fat is not apparent with the liver diets. The lecithin content of the fatty livers tends to decrease with increasing amts. of fat. The fat of the fatty livers appears to be that normally present and the lipides of the blood and kidney are not significantly altered.

A. P. Lothrop

**Diet of tuberculous and nontuberculous children. Effect of increased supply of vitamin B concentrate and minerals.** Paul D. Crimm, Isador J. Raphael and Louise F. Schulte. *Am. J. Diseases Children* 46, 751-6(1933).--A group of children with latent or suspected tuberculosis, receiving daily a special cereal mixt. (cf. C. A. 25, 2174) which supplied liberal amts. of Ca, P, Fe, Cu and vitamins B<sub>1</sub>, B<sub>2</sub> and C, showed greater increases in wt. and in the hemoglobin content of the blood than control groups receiving regular diets or diets contg. added quantities of vitamin B or minerals. Increases in the Ca and P contents of the serum were also observed. The vitamin B complex appeared to be responsible for the gains in wt. and the minerals for the increase in hemoglobin. The addn. of vitamin B or of minerals to the diet did not appear to be as effective as the feeding of the combination of the 2 in the form of the special mixt. which contained in addn. vitamins A and E. E. R. Main

**The interrelation of a gonotropic hormone and vitamin A.** S. B. D. Aberle. *Am. J. Physiol.* 106, 267-72(1933).--A placental ext., capable of producing nucoid vaginal cells in normal female rats, was incapable of producing any effect on the vaginal cells of rats suffering from vitamin A deficiency disease. J. F. Lyman

**Fluorine in the nutrition of the rat. I. Its influence upon growth.** A. R. Lamb, P. H. Phillips, E. B. Hart and G. Hohstedt. *Am. J. Physiol.* 106, 350-5(1933).--Growth in rats is inhibited when F is added to their rations to the extent of 18-20 mg. F per 100 g. body wt. per day in the form of NaF or 36-40 mg. F per day in the form of rock phosphate or as CaF<sub>2</sub>. II. Its effect upon reproduction. P. H. Phillips, A. R. Lamb, E. B. Hart and G. Hohstedt. *Ibid.* 356-64. --Chronic F poisoning does not inhibit reproduction in the rat. Lactation is suppressed when F is fed above the upper limit of safety. J. F. Lyman

**The nutritional anemia of the rat. IX. The anemia of pregnancy.** H. H. Beard and V. C. Myers. *Am. J. Physiol.* 106, 449-53(1933); cf. C. A. 27, 3988. --An anemia develops in the rat during pregnancy, the hemoglobin being reduced about 20% and the red cells about 40%. The addn. of Fe salts to the diet retards the drop

in hemoglobin; while neither liver ext. nor yeast has any anemia-preventing effect. J. F. Lyman

**Factors which determine renal weight. XV. The relation between vitamin B (complex) and protein intake.** E. M. MacKay. *Am. J. Physiol.* 106, 571-3(1933), cf. C. A. 27, 4562. --The increase in the wt. of the kidneys of the white rat produced by a high-protein diet is greatly lessened, but not entirely prevented, by maintaining the same vitamin B: protein ratio in the high- and low-protein diets. J. F. Lyman

**Disturbances of reproduction and ovarian changes in the guinea pig in relation to vitamin C deficiency.** M. M. Kramer, Mary T. Harman and Alice K. Brill. *Am. J. Physiol.* 106, 611-22(1933). --Diets free from vitamin C were supplemented with varying amts. of orange juice. Quantities of orange juice about 100% in excess of the scurvy-protecting dose, and sufficient to give nearly normal growth, did not permit the birth of living young. J. F. Lyman

**The energy metabolism of phosphorus-deficient dairy cattle.** W. H. Riddell, J. S. Hughes and J. B. Fitch. *Am. J. Physiol.* 106, 676-81(1933). --Lactating dairy cows, fed a ration contg. 0.18% of P with a slight surplus of digestible nutrients, produced 3135 cal. per sq. m. per 24 hrs. After adding 100 g. NaH<sub>2</sub>PO<sub>4</sub> daily, heat production fell to 2701. J. F. Lyman

**Effect of lactose on rickets in rats.** Gertrude Sunderlin. *Am. J. Diseases Children* 46, 786-93(1933). --The administration of lactose to rats receiving rachitic diet produces a definite prophylactic effect, assoc. with a decrease in the  $p_{H}$  of the intestinal tract. Since the effect is much less marked than that resulting from the administration of cod-liver oil, which also reduces the intestinal  $p_{H}$ , other factors than this must be concerned in the etiology of rickets. The administration of lactose causes little or no healing of active rickets. E. R. Main

**The value of cod-liver oil in the treatment of anemia.** Arthur D. Holmes, Madeleine G. Pigott and Lawrence P. Bowser. *New Engl. J. Med.* 209, 839-42(1933). The administration of cod-liver oil alone does not appear to promote blood regeneration in anemic rats. Rats maintained on daily rations contg. 0.5 mg. of Fe and 0.05 mg. of Cu in addn. to cod-liver oil supplements show a somewhat more rapid rate of blood regeneration than rats receiving Fe and Cu without cod-liver oil. However, when the quantity of Fe administered is increased to 1.5, 2.5 or 3.0 mg., the rate of hemoglobin increase does not differ from that of the controls. Similar results are obtained when peanut oil free from vitamin A is substituted for cod-liver oil. E. R. Main

**The factor E (vitamin of reproduction).** V. Zagani. *Arch. Physiol.* 32, 301-40(1933). --A review. Zu and Chu have a favorable influence in E deficiency. A. E. Meyer

**Destruction of the antirachitic power of irradiated ergosterol (Vitamin D) by lung tissue.** Ph. A. Coppin and C. A. Metz. *Biochem. Z.* 266, 169-74(1933). Vitamin D is destroyed, or at any rate inactivated, *in vitro* by lung tissue, but not by liver tissue. Blood also attacks the vitamin *in vitro*. This inactivating action of the lung is thought to account for the difference in vitamin D content of mammalian and fish livers. S. Morgulis

**Substances affecting the non-protein nitrogen increase in cats brought about by vitasterol.** Siegwart Hermann and Margot Zentner. *Biochem. Z.* 266, 418-21(1933). Vigantol fed to cats causes a 100% increase in the blood non-protein N, but this can be prevented completely by feeding Kombuchal at the same time. The latter is a prepn. obtained by the fermentation of sugar in a tea infusion by certain molds, the chief product of which is gluconic acid. Gluconic acid, itself prevents the non-protein N rise only in about 40% of the cases, and such substances as citric acid and tea infusion have no effect at all. S. Morgulis

**Vitamin A content of barley.** E. H. Hughes. *J. Agr. Research* 47, 487-94(1933). --Barley as the only source of vitamin A in the diet does not produce normal growth in rats. In the sexually immature rat the addn. of vitamin A to a diet in which barley is the only source of this

vitamin results in a decided increase in growth and a normal estrous cycle. Barley contains more vitamin A than white corn but less than  $\frac{1}{10}$  as much as yellow corn.

W. H. Ross

**Losses of vitamin A in drying fresh raw carrots and sweet potatoes and canned spinach.** G. S. Fraps and Ray Treichler. *J. Agr. Research* 47, 539-41 (1933).—A study of the effect of drying on the vitamin A content of certain vegetables showed that raw carrots lose approx. 50% of their vitamin A during drying in a vacuum oven, sweet potatoes about 29% and canned spinach about 65%. The results do not show whether or not loss of vitamin A occurs on storing the fresh material, but they indicate that fresh green vegetables may contain much higher amts. of this vitamin than might be expected from tests of the dried material.

W. H. Ross

**The vitamin C content of commercially canned sauerkraut produced under known conditions.** Helen T. Parsons and Carolyn Horn. *J. Agr. Research* 47, 627-34 (1933).—A study of 4 brands of com. sauerkraut manufd. under known and fairly comparable conditions showed that 2 of these brands practically duplicated their previous antiscorbutic content (Clow, Parsons and Stevenson, *C. A.* 24, 5350) when observed under routine conditions in the factory. The other 2 brands did not show any antiscorbutic potency when fed to guinea pigs at a 10-g. level. This record is inferior to previous results on the same brands although one of these brands showed a low vitamin C content in the previous tests. No satisfactory correlation can be traced between the comparative vitamin C content in the 4 individual brands on the one hand and variations in processes of manuf. on the other.

W. H. Ross

**Comparative nutritional value of diets containing rancid fat, neutral fat and no fat.** Dorothy V. Whipple. *Oil and Soap* 10, 228-9 (1933).—Feeding tests with rats showed that slightly oxidized fat does not have the same nutritional value as neutral fat.

E. Scherubel

**Role of B vitamins in the utilization of sugars by the pigeon. Comparative influence of some hexoses and disaccharides (holosides) incorporated to the extent of 66% in the diet.** Raoul Lecoq. *Compt. rend.* 197, 1155-7 (1933); cf. *C. A.* 27, 2714. —The curative action of dried yeast on pigeons with avitaminosis-B whose diet contains 66% of sugars is not the same as previously found for diets contg. 35% of sugars. With 66% dextrose or maltose, 0.5 g. of dried yeast daily is curative, while with galactose even 4 g. yeast is without effect. Levulose is somewhat less effective than dextrose, sucrose being intermediate. Lactose is only slightly more effective than galactose. The disaccharides thus possess essentially the properties of their constituent monosaccharides, but to a less degree.

K. V. Thimann

**Arginine metabolism. II. The relation of the arginine content of the diet to the creatine-creatinine production during growth.** Curtis E. Meyer and Wm. C. Rose. *J. Biol. Chem.* 102, 461-71 (1933).—The formation of creatine and creatinine by rats on a diet low in arginine is much greater than can be accounted for by the arginine ingested, and is therefore probably a true endogenous reaction.

K. V. Thimann

**Mineral supplement to farm foods.** Frank E. Corrie. *Chemist and Druggist* 119, 444-5 (1933); cf. *C. A.* 27, 3200. —The metabolisms of Ca, Fe, P and I in farm foods as studied by E. B. Hart (*C. A.* 26, 2221), Halnan (*C. A.* 25, 5447; 26, 4656), Musschl (*C. A.* 26, 2221; 27, 1032), Weiser (*C. A.* 26, 5650; 27, 135), etc., are discussed; recipes for mineral foods with KI are given.

S. Waldbott

**Biological relation between carotene and vitamin A.** Jack C. Drummond and Roy J. MacWalter. *Biochem. J.* 27, 1342-7 (1933).—Injection of carotene into the portal circulation of rabbits gives no increase in the vitamin A in the liver until after 8 days. Attempts to convert carotene into vitamin A *in vitro* by incubation of liver tissues were unsuccessful. Benjamin Harrow

**Growth vitamin (Kuhn, Grundmann) 10.** *Biochemistry of cacao* (Heim de Balsac) 12.

**Phillips': Vitamin Charts. No. 1. Vitamin Values of Foods. No. 2. Diseases Resulting from a Lack of Vitamins.** London: Geo. Philip and Son, Ltd. 8s. 6d. each. Reviewed in *Nature* 132, 300 (1933).

**Antirachitic preparation.** I. G. Farhenind. A.-G. Ger. 583,791, Sept. 9, 1933. A prepn. of the above type is prepd. by irradiating lumisterol with ultra-violet light. The product is preferably converted to the crystd. dinitrobenzoate.

## F—PHYSIOLOGY

HOMER W. SMITH

**Reaction of anterior hypophysis of immature rat to placental hormones.** J. M. Wolfe, Doris Phelps and Rucker Cleveland. *Proc. Soc. Exptl. Biol. Med.* 30, 1092-4 (1933).—Immature female rats were given 2 subcutaneous injections of a relatively crude estrin-free ext. of placenta daily for 6-8 days. The ovaries were markedly increased in size. The hypophyses were swollen and hyperemic; the anterior lobes had a definite decrease in eosinophilic cells, the basophilic cells were enlarged and had lost all or a greater part of their granular material. Castration 2-3 days before the beginning of the injection period prevented the loss of basophilic granules.

C. V. Bailey

**Saliva and coagulation of blood.** Carroll J. Bellis and F. H. Scott. *Proc. Soc. Exptl. Biol. Med.* 30, 1373-5 (1933).—Human saliva, collected from the mouth, hastened the coagulation of dog, bovine and human blood; similar results were obtained with dog saliva collected by cannula and with fluid obtained by abdominal or intrathecal paracentesis.

C. V. Bailey

**Comparison of inorganic phosphate contents of serum, fluoride plasma and native plasma.** H. L. White and Betty Monaghan. *Proc. Soc. Exptl. Biol. Med.* 31, 1-5 (1933).—The presence of NaF in concns. up to 0.9% did not inhibit the production of color when the Benedict-Thies method (cf. *C. A.* 18, 3398) was applied to standard solns. of inorg. phosphates. When 0.3% NaF was used as an anticoagulant in blood the plasma inorg. P was lower than that of native plasma obtained by immediately centrifuging the blood and lower than the amt. found in hirudin plasma; NaF, by its osmotic effect, dild. the plasma. The inorg. P. content of serum was the same as that of native plasma.

C. V. Bailey

**Proportion of cystine yielded by hemoglobins of the horse, dog and sheep.** Hubert B. Vickery and Abraham White. *Proc. Soc. Exptl. Biol. Med.* 31, 6-7 (1933).—By use of the cuprous mercaptide method (cf. *C. A.* 27, 2170) hydrolyzed hemoglobin of the horse, sheep and dog yielded 0.41%, 0.6% and 1.16% of cystine, resp.

C. B. Bailey

**Periodicity of carbohydrate metabolism and rhythmic functioning of the liver.** Jakob Mollerström. *Arch. Internal Med.* 52, 649-63 (1933). See *C. A.* 27, 4564.

J. V. Brown

**Iron in the liver of the calf fetus.** G. Roussel and Mme. Z. Gruzewska. *Compt. rend.* 197, 943-4 (1933).—The quantity of Fe in the liver of the calf fetus is min. at 6-7 months, 0.0035-0.027 parts per 100, and max. at 8.5-9 months, 0.128-0.179 parts per 100.

Rachel Brown

**The pathophysiology of acute inflammatory dermatoses. III. The regularity of the different distributions of ions between skin and blood. The Donnan membrane equilibrium law.** Alfred Perutz and Andreas E. Klein. *Arch. Dermatol. u. Syphilis.* 168, 161-72 (1933).—The application of the concept of the Donnan membrane equilibrium affords an explanation of the differences in distribution of the electrolytes in the blood and skin. The content of protein,  $\text{CO}_3$  and  $\text{Na}^+$ , and osmotic pressure due to colloids, in skin blister fluid is lower than in serum; with respect to  $\text{Cl}^-$  and  $\text{OH}^-$  the reverse is true. The differences are considerable in the cases of  $\text{Cl}^-$  and  $\text{CO}_3$ , slight in the case of  $\text{Na}^+$ , and more pronounced with respect to  $\text{OH}^-$ .

B. C. Brunstetter

**The anterior pituitary sexual hormone from gravid urine.** Felix Haurowitz, Max Reiss and Josef Balint.

*Z. physiol. Chem.* 222, 44-9 (1933).—New observations are reported on the activation, chem. properties and individuality of the hormone. Adsorption of the EtOH ppt. on BzOH gave regularly an unexpected increase in activity to 100-300 times the initial value, e. g., from 500 to 150,000 mouse units. A less striking activation was also obtained by warming the aq. soln. 24 hrs. at 38°. It is suspected that the activation consists in the severance of a loose linkage between hormone and inhibitor, or the removal or destruction of the latter. The active prepn. contains 7% sugar but no P and S, and gives several of the protein reactions. It causes both follicle ripening and luteinization. This twofold activity is attributed to a single hormone, since the ratio cannot be altered by adsorption, activation and inactivation. The hormone obtained from urine is not identical with that obtained from the pituitary but is probably a transformation product of the latter contg. the specifically active grouping. For manifestation of full activity it requires complementation by non-specific substances of the hypophysis.

A. W. Dox

**The sulfhydryl and ascorbic acid contents of eye lenses.** Hans v. Buler and Carl Martius. *Z. physiol. Chem.* 222, 65-9 (1933).—Direct colorimetric detn. of glutathione in beef eye lenses by Na nitroprusside gives values considerably lower than those obtained by subtracting the I no. from the indophenol indicator value. About 20% of the total reducing power is due to vitamin C. Both glutathione and vitamin C are greatly decreased in cases of human cataract as compared to normal.

A. W. Dox

**Ammonia and nitrogen metabolism.** Michel Polonovski, Gaston Bizard and Paul Boulanger. *Ann. physiol. physicochim. biol.* 9, 759 (1933); cf. *C. A.* 27, 125. The kidney and pancreas both liberate  $\text{NH}_3$  into the blood, the  $\text{NH}_3$  content of the blood leaving the organ being higher than that of the arterial supply, even when the latter has been artificially increased by the injection of  $\text{NH}_4$  salts. Resting muscles, on the other hand, take up  $\text{NH}_3$  from the circulating blood.

Harry Eagle

**The adrenal gland and the sulfhydryl compounds.** Léon Binet. *Ann. physiol. physicochim. biol.* 9, 803 (1933).—The adrenal gland contains more reduced glutathione (500-600 mg. % in dogs) than any other organ, including the liver. The cortex contains more than the medulla. If adrenal glands are perfused with citrated blood contg. cystine and glutamic acid, the reduced glutathione in both the perfusion fluid and the gland are definitely increased (approx. 40%). A kidney similarly perfused causes no change. The glutathione content of the adrenal glands is increased in pregnancy (dogs), is decreased after removal of the ovaries and is slightly decreased by pancreatectomy or by dinitrophenol.

Harry Eagle

**Nitrogen reserves in animals.** Andrée Roche. *Ann. physiol. physicochim. biol.* 9, 933 (1933). If the protein ingested is insufficient, the body catabolizes a labile muscle protein.

Harry Eagle

**The spleen and glucide metabolism.** F. Rathery and R. Cosmulesco. *Ann. physiol. physicochim. biol.* 9, 939-42 (1933).—Splenectomy in dogs usually causes hyperglucemia, and appears to accentuate the artificial hyperglucemia caused by the injection of glucose. Hepatic glycogen and glycogen formation are decreased. None of these effects is invariable.

Harry Eagle

**The biologic effect of intermediary products of tissue decomposition. I. The effect of pancreatolyzate upon the blood-sugar level.** S. G. Genes and S. Ph. Epstein. *Arch. expl. Path. Pharmacol.* 171, 733-43 (1933).—The protein-free products of pancreatic autolysis cause hypoglycemia when administered to rabbits perorally or intravenously.

Harry Eagle

**The excretion of citric acid by rabbit kidneys.** Hedwig Langecker. *Arch. expl. Path. Pharmacol.* 171, 744-55 (1933).—Fasting rabbits excrete 2-3.5 mg. citric acid daily in the urine, increased to as high as 50 mg. by a green vegetable diet. It comprises 0.5-2% of the total org. acids excreted. The ingestion of citric acid or Na citrate does not affect the quantity excreted in the urine; nor

is any demonstrable in the feces. The normal urinary citric acid is therefore endogenous.

Harry Eagle

**Changes in the serum calcium level in rabbits throughout the year.** Siegwart Hermann and Margot Zentner. *Arch. expl. Path. Pharmacol.* 172, 5-9 (1933).—The total serum Ca and the ratio of total/free Ca are max. during the winter and min. in the spring.

H. E.

**A ferric compound of globulin appearing in the intermediary iron metabolism.** E. Starkenstein and Z. Harvalik. *Arch. expl. Path. Pharmacol.* 172, 75-92 (1933); cf. following abstr. Approx. 500 mg.  $\text{FeCl}_2$  can be oxidized by 100 cc. fresh defibrinated blood. Red cells washed and resuspended in physiol. salt soln. are only  $1/10$  as active in this respect as whole blood; and the slight activity of serum is due to traces of hemoglobin. The complete oxidizing activity is restored by mixing the washed cells and serum. The active substance is the hemoglobin Fe, 1 mol. of which can convert 4 mols. of  $\text{FeCl}_2$ , and can be then reactivated by oxidation. Serum globulin is an adequate substitute for serum in furthering the reducing activity of the blood cells; serum albumin or egg albumin is inactive. The ferric globulin complex is pptd. upon  $1/2$  satn. with  $(\text{NH}_4)_2\text{SO}_4$  or dialysis. The latter ppt. is insol. in water, but readily swells and dissolves in serum. In contrast, the ferric albuminate pptd. from serum by the addn. of  $\text{FeCl}_2$  is sol. in water, but only slowly in serum. The ratio of Fe to N in the ferriglobulin increases with the amt. of  $\text{FeCl}_2$  used, up to about 500 mg.  $\text{FeCl}_2$  per 100 cc. blood, when it attains a limiting value of 1:4.

Harry Eagle

**The oxidation and reduction of iron in the organs.** Emil Starkenstein and Franz John. *Arch. expl. Path. Pharmacol.* 172, 93-103 (1933); cf. preceding abstr. The Fe of the liver is water insol. but can be extd. in hot 5N HCl. Na ferriurate added to macerated liver is immediately reduced to a partially water sol. form. The reducing activity is greatly impaired by heating the liver, or by the addn. of 2 N HCl, and is increased in a  $\text{CO}$  atm. Ferriurate added to blood is only partially reduced, and only in the presence of considerable  $\text{CO}$ .  $\text{FeCl}_2$  is not affected by liver, but is oxidized by the blood. Part of the ferric salt so formed is gradually converted to a water-insol. basic salt.  $\text{K}_4\text{Fe}(\text{CN})_6$  is reduced to  $\text{K}_4\text{Fe}(\text{CN})_6$  by both liver and blood; the ferri cyanide remains free as such.

Harry Eagle

**The appearance of an acetylcholine like substance in the coronary venous blood of warm-blooded animals upon stimulation of the vagus nerves.** W. Feldberg and G. Kraver. *Arch. expl. Path. Pharmacol.* 172, 170-9 (1933). After dec. vagal stimulation, the substance can be demonstrated in the blood of the coronary vein in dogs and cats, provided that the acetylcholine-destr. activity of normal blood is previously inhibited by the intravenous injection of physostigmine. The acetylcholine activity disappears within a few min. after the stimulation, and is believed due to acetylcholine as such.

Harry Eagle

**Plasma phosphate and lactic acid in normal and adrenalectomized animals during changes in the carbohydrate metabolism.** Carl F. Cori and Gerty T. Cori. *Arch. expl. Path. Pharmacol.* 172, 219-60 (1933).—The intravenous injection of non-convulsive doses of crystd. insulin into rabbits causes a fall of approx. 1.5 mg. % in the inorg. plasma P within a hr. In adrenalectomized animals the fall averages only 0.27 mg. %. The subcutaneous injection of adrenalectomized animals causes a decrease in both normal and adrenalectomized animals. The effect of insulin upon the inorg. P and lactic acid levels in normal rabbits is ascribed to the secretion of adrenalectomized animals. The intravenous injection of glucose has no significant effect upon the inorg. plasma P.

Harry Eagle

**The effect of human urine upon the muscular activity of the surviving uterus.** Erich Ringelhart. *Arch. expl. Path. Pharmacol.* 172, 267-71 (1933); cf. *C. A.* 27, 5389.—Human urine contains a thermostable org. substance insol. in EtOH or ether, diffusing through Cellophane and adsorbed by animal charcoal, which stimulates the contractions of rat, guinea pig and rabbit uteri

vitro. The active substance is not adrenaline, pituitrin, adenosinephosphoric acid or padutin. Harry Eagle

The autonomic innervation of the [pancreatic] islet system. I. The role of the vagi in the production of warmth hypoglycemia. F. Geiger. *Arch. expl. Path. Pharmacol.* 172, 295-301(1933). Warming the carotid vessels in dogs under chloralose anesthesia causes an increased blood insulin content, prevented by sectioning of the vagi. The islet stimulating impulses are carried by the right vagus. Harry Eagle

The effect of vaginectomy upon the blood sugar. F. Hogler. *Arch. expl. Path. Pharmacol.* 172, 325-42(1933).—Neither unilateral nor bilateral vaginectomy affects the blood-sugar level in rabbits. The inhibition of the alimentary hyperglucemia by ergotamine is also unaffected. Harry Eagle

The effect and site of action of isolated posterior pituitary hormone upon the carbohydrate metabolism. S. Thudicum and A. Waly. *Arch. expl. Path. Pharmacol.* 172, 535-50(1933). Unlike orasthin, tonephin causes hyperglucemia in rabbits because of a mobilization of hepatic glycogen. This hyperglucemia is decreased in hyperthyroid animals, and is not observed after exptl. liver damage. In the latter animals tonephin does not antagonize insulin hypoglycemia. Harry Eagle

The functional significance of the structural elements of the thyroid glands. Werner Grab. *Arch. expl. Path. Pharmacol.* 172, 586-629(1933); cf. *C. A.* 27, 5389.—From  $\frac{2}{3}$  to  $\frac{1}{4}$  of the fresh or dry weight of normal resting sheep thyroid gland consists of colloid. Fresh colloid contains 0.065-0.074% I, of which  $\frac{2}{3}$  is thyroxine I, the remainder being acid-sol. I compds., probably diiodotyrosine. In the acetone-soluble and metabolized expt. colloid is at least as active as the corresponding quantity of thyroxine. Fresh epithelial tissue contains only 0.0072-0.0094% I, of which  $\frac{1}{3}$  is thyroxine I. Here also, the tissue is at least as active as the quantity of purified thyroxine corresponding to it: thyroxine I content. Colloid must therefore be considered the storage form of the active thyroid hormone. The ratio of thyroxine to diiodotyrosine in colloid and epithelium is approx. the same, indicating that colloid represents a mobilization of substances performed in the epithelium in the proper proportions. Of the active I compds. in dried thyroid prepns., 95% is in the colloid. Colloid contains 20% solids; its isoelectric point (opt. pptn.) is at pH 4; and its compn. when dried *in vacuo* is C 45, H 6 $\frac{1}{2}$ , N 13, S 3, P 0.2, 10.3%, 0.26.6%. Upon stimulation of the thyroid gland, as by the injection of thyrotropic anterior pituitary hormone into cats, the I content of the colloid decreases and its H.O. content increases. Colloid as such is an *inert protein carrier of the effective thyroid substances, thyroxine and diiodotyrosine.* Harry Eagle

Histamine-like substances and late toxins in blood. K. Zipl and P. Hulsmeier. *Arch. expl. Path. Pharmacol.* 173, 1-14(1933). Aq. and aq.-alc. exts. of fresh or old blood contain adrenaline-like substances, but no demonstrable histamine. They do contain an oxytocic principle with no effect upon blood pressure, the "late" toxin of Freund. Harry Eagle

The occurrence of melanophore hormone in human organs. A. Jores and W. Velde. *Arch. expl. Path. Pharmacol.* 173, 26-30(1933), cf. *C. A.* 27, 2992. Only the eye and midbrain of mammals contain melanophore hormone, other organs give neg. results. Harry Eagle

The occurrence of melanophore hormone in human body fluids. Arthur Jores. *Arch. expl. Path. Pharmacol.* 173, 31-5(1933); cf. *C. A.* 27, 2992.—Human blood contains melanophore hormone. The urine contains a substance causing melanophore expansion, but which differs in its chem. properties from the true hormone. Rabbit spinal fluid obtained by occipital puncture contains the hormone; human spinal fluid, whether occipital or lumbar, contains none. The aqueous humor of rabbits kept in the dark contains the hormone. Harry Eagle

Anterior pituitary lobe and thyroid glands. The effect of the thyrotropic substance of the anterior pituitary lobe

upon the adrenal glands. Arnold Loeser. *Arch. expl. Path. Pharmacol.* 173, 62-71(1933).—Injected intraperitoneally into guinea pigs, the thyrotropic substance also causes a 150-200% increase in the vol. and weight of the adrenal glands. This increase presupposes the presence of functionally active thyroid gland, and is not observed after thyroidectomy. Harry Eagle

Relationship between the thyrotropic substance of the anterior pituitary gland and the adrenal glands. Arnold Loeser. *Klin. Wochschr.* 12, 1614(1933).—The hormone causes an increased vol. of the adrenal glands in guinea pigs. A preliminary report. Cf. preceding abstr. Harry Eagle

The mechanism of the action of the diuretic liver hormone. J. Mosonyi and L. Voith. *Arch. expl. Path. Pharmacol.* 173, 72-7(1933).—Fluid perfused through the liver and thence to the kidneys in frogs causes increased diuresis. If both the tubules and glomeruli are perfused, the urine contains more Cl than if the tubules only are perfused. Harry Eagle

Anterior pituitary lobe and the thyroid glands. The effect of thyrotropic substance upon liver glycogen and blood ketone bodies. H. Eitel, G. Lohr and A. Loeser. *Arch. expl. Path. Pharmacol.* 173, 205-20(1933).—Intraperitoneal injection of the pituitary thyrotropic substance into rats causes a decreased liver glycogen and increased blood acetone bodies, returning to normal 24 hrs. after the injection. The effect can be prolonged by daily injections, presupposes the presence of the thyroid glands and is not observed after thyroidectomy. H. E.

The effect of experimental mitral insufficiency upon the metabolism. Dietrich Jahn. *Arch. expl. Path. Pharmacol.* 173, 221-41(1933).—The circulation slows, the concn. of blood lactic acid increases because of insufficient O<sub>2</sub> supply, the respiratory quotient increases; with increasing cardiac decompensation, the basal metabolism increases and the alimentary hyperglucemia becomes more pronounced. Harry Eagle

The mineral economy after the administration of posterior pituitary substance. Rudolf Engel, Irvine McQuarrie and Mildred Ziegler. *Arch. expl. Path. Pharmacol.* 173, 248-59(1933).—Posterior pituitary substance causes an increased excretion of K, Na and Cl, even during the inhibition of diuresis. The excretion of Ca, Mg, P, S and N is not affected. Harry Eagle

The dependence of the structure of tissue proteins upon the metabolism of the organism. II. Hormones, metabolic products and agents which injure the protoplasm. E. G. Schenck and H. Wollschitt. *Arch. expl. Path. Pharmacol.* 173, 260-8(1933); cf. *C. A.* 27, 4569.—Agents which injure the protoplasm (Röntgen rays, toxins, As, quinine, monobromoacetic acid, Witte peptone), hormones (adrenaline, insulin and thyroxine), metabolic products (urea, lactic acid) and nerve toxins (atropine, choline) all cause chem. changes in the protoplasm and tissue proteins of rats, as judged by the tryptophan per unit tissue, the tryptophan per unit protein, and the amino acids per unit tissue in the liver, kidney, heart and muscles. III. The behavior of cystine and tyrosine. *Ibid.* 269-77.—The administration of cystine, tyrosine or tryptophan causes them to replace other amino acids in the tissue proteins, to a varying extent in the various organs. The concns. of cystine and tyrosine in the tissue proteins under the influence of the various factors listed in the preceding paper usually change in opposite directions. IV. Changes with age; avitaminoses. *Ibid.* 278-82.—The relative weights of the various organs of rats and their protein structure change with age. Significant changes in the organ protein compn. are observed in avitaminosis-A. Harry Eagle

The central effect of pituitary circulatory hormone (vasopressin) upon blood pressure. Hans Heller and G. Kusunoki. *Arch. expl. Path. Pharmacol.* 173, 301-13(1933).—Urethan anesthesia decreases the susceptibility of dogs to the pressor action of intracisternal pituitrin or pitressin. The latent period is also prolonged. Atropine has no effect. The cardiac and coronary complications of intravenous injections of pituitrin are not observed after intracisternal injection, and the latent period is not

significantly different. The blood-spinal fluid barrier is impermeable for pituitrin; the pressor action of intracisternal injections is due to a direct central action. Intracisternal histamine, acetylcholine and "Padutin" do not affect the blood pressure.

**Gastric studies.** Chlorine in the gastric juice. I. Gelman and D. Sheveluchin. *Arch. Verdauungskrankh.* 54, 183-90(1933).—The total Cl in the gastric juice varies from 0.05 to 0.6%. There is a definite but not necessary parallelism between the Cl and HCl excretion.

**The chemistry of the oxytocic hormone of the pituitary gland.** I. B. C. Culha and P. N. Chakravorty. *Indian J. Med. Research* 21, 429-30(1933).—The oxytocic principle is most stable (1 hr. autoclaving at 1 atm.) at  $pH$  3-5. It is not adsorbed by fuller's earth ( $pH$  1.5 or 4.5) or by kieselguhr ( $pH$  4.5). The effects of  $HNO_3$ ,  $HNO_2$ ,  $H_2O_2$ ,  $SO_2$ , benzoyl chloride, acetyl chloride, picrolonic acid and phosphotungstic acid were also studied.

**The effect upon the ovarian action of prolactin of a simultaneous injection of folliculin.** M. A. Magath and R. M. Rosenfeld. *Klin. Wochschr.* 12, 1288(1933). A preliminary report. The injection of horse urine folliculin accentuates the luteinizing action of prolactin B upon the infantile ovaries of rats and mice.

**Which fraction of pituitrin affects the velocity of [water] absorption from the skin?** D. Adlersberg, and B. Paul. *Klin. Wochschr.* 12, 1320-9(1933).—Pituitrin accelerates the absorption of the intradermal saline wheal. Its vasopressor constituent acts similarly, but is less effective; the oxytocic fraction is practically inactive. Anterior pituitary ext. has no effect.

**Investigations in the melanophore hormone.** III. F. G. Dietel. *Klin. Wochschr.* 12, 1354-64(1933); cf. C. A. 27, 4569.—The melanophore hormone of the pituitary gland is an independent hormone, not related to the other components of the ext. (1) It differs from these in sol., being less sol. in BuOH and more sol. in EtOH; (2) it is pptd. by acetone; (3) it is not destroyed by alkali; (4) it is not strongly adsorbed; (5) it diffuses through collodion more slowly than the other active principles in pituitary exts.

**Coefficients of the thyroxine effect in biological experiments.** H. Buefinger and J. Gottlieb. *Klin. Wochschr.* 12, 1307-402(1933).—Normal blood antagonizes the effect of thyroxine in accelerating the metamorphosis of tadpoles, the inhibiting factor being assoc. with the serum proteins. Vitamin A is also antithyroidal in this respect. The antithyroidal action of the blood is decreased in the pregnancy toxicoes, possibly because of a disturbance in the hepatic formation of vitamin A. The peroral administration of vitamin A to such cases restores the normal antithyroidal activity of the blood. Guanidine accentuates the metamorphosis-accelerating action of thyroxine; choline, carbamylcholine and acetylcholine increase its growth-inhibiting action.

**The bromine content of the blood.** Comments on the papers by H. Zondek, A. Bier and co-workers. F. Holtz and Chr. Roggenbau. *Klin. Wochschr.* 12, 1410-11(1933).—The methods developed by Pincussen (C. A. 27, 744) and by Zondek and Bier (C. A. 27, 2201) are wholly inadequate, as shown by the failure of these workers to analyze correctly samples with known Br content. Reply. Hermann Zondek *Ibid.* 1411-12. L. Pincussen. *Ibid.* 1412.

**The non-saponifiable components of pig liver.** Godo Lohr and Ernst Fränkel. *Klin. Wochschr.* 12, 1413(1933).—A preliminary report.

**The pancreatotropic substance from the anterior pituitary lobe.** I. The preparation and properties of the pancreatotropic substance. K. J. Anselmino and Fr. Hoffmann. *Klin. Wochschr.* 12, 1435-6(1933).—II. The metabolic effects of the pancreatotropic substance. Fr. Hoffmann and K. J. Anselmino. *Ibid.* 1436-8.—The physiol. effects of the substance, obtained by ultrafiltration of the entire aq. pituitary ext. at weakly acid ( $pH$

5.2) reaction, suggest that it causes an increased secretion of insulin.

**The physiological decomposition of the blood pigment.** III. The derivation of the urine pigment from hemoglobin. R. Nothhaas. *Klin. Wochschr.* 12, 1438-41(1933).

**A new rapid pregnancy test with urine.** ("Thirty hour reaction.") Woldemar Reiprich. *Klin. Wochschr.* 12, 1441-4(1933).—Infantile rats (40-50 g.) are used instead of mice as test animals. From 10 to 14 cc. of urine is injected subcutaneously over a period of 6-9 hrs., and the animal killed 30 hrs. after the first injection. In pos. results (pregnancy) the ovaries are hyperemic and 3-4 times as large as in the control animal.

**The synthesis of uric acid in birds.** II. Werner Schuler and Wilhelm Reindel. *Klin. Wochschr.* 12, 1470-80(1933), cf. C. A. 27, 4570; 28, 512<sup>2</sup>.—The liver cells of doves and geese form a precursor of uric acid from amino acids by way of  $NH_3$ . This reaction is enzymic, with a temp. opt. at 41° and a  $pH$  opt. at 7.6. This precursor substance can be extd. from muscle, but is not formed there. This precursor is converted to uric acid in the kidney by living cells, the opt.  $pH$  being 7.1.

**The appearance of the gastric juice upon drying.** N. Henning and L. Norpoth. *Klin. Wochschr.* 12, 1531-2(1933).—If a drop of gastric juice is allowed to dry, it forms a grayish center contg. salt crystals, surrounded by a raised ring. Frequently this is in turn surrounded by a glassy transparent layer. This ring phenomenon is apparently caused by protein, and its size is a measure of the protein content of the juice.

**Melanophore hormone and the eye.** Arthur Jouts. *Klin. Wochschr.* 12, 1599-601(1933); cf. C. A. 27, 2892.—Melanophore hormone dropped into the conjunctival sac of human beings shortens the adaptation time to darkness. Rabbits kept in the dark, or whose eyes were closed surgically, have an increased melanophore hormone content in the blood, eyes and aqueous humor. The hormone content of the pituitary gland of chickens, human beings, guinea pigs and cats is in the ratio 0.05; 0.2; 0.8; 3.0, resp., that is, directly proportional to the visual acuity in the dark.

**Adrenal cortical hormone and circulation.** G. Nohm and C. R. Skoglund. *Klin. Wochschr.* 12, 1614-15(1933).—Cortical adrenal ext. ("Eschatin") had no demonstrable circulatory action in 2 human beings when injected in doses of 2-5 cc.

**The collaboration of the cells and the colloid in the endocrine activity of the thyroid glands.** Werner Grab. *Klin. Wochschr.* 12, 1637-40(1933).—The colloid of the thyroid gland is a storage form of the active hormone bound to an inert protein in a readily dissolved adsorption complex. The presence of significant quantities of acid-sol. I compds. in the colloid and its excretion into the blood along with thyroxine during functional activity of the thyroid indicates that such acid-sol. compds. are physiologically important. The function of the epithelial cells is to take up I-contg. substances from the blood, transform them into active compds. and secrete them into the colloid, 500,000 times as concd. as they are in the blood. These are the relationships in the normal gland. In colloid goiter, the massive amt. of colloid contains *in toto* the same amt. of active hormone as the normal gland, but in a much lower concn.

**Substances in the serum of pregnant women combining with posterior pituitary hormone.** F. G. Dietel. *Klin. Wochschr.* 12, 1683-6(1933).—The serum of pregnant women contains a substance which adsorbs the melanophore-expanding component of the posterior pituitary ext. There is a 2nd substance which inactivates the anti-diuretic component of the ext. This inactivating agent is present in highest concn. in the last few months of pregnancy, and begins to disappear on the 5th or 6th day *post partum*. Normal serum to which a small quantity of pregnant serum has been added also inactivates the anti-diuretic component of pituitary ext.

**The intermediary iron metabolism in childhood.** F. Thoenes. *Klin. Wochschr.* 12, 1686-8(1933).—The serum

Fe is highest in the newborn (av. 0.17 mg. %), falling to approx 0.08 mg. % during the nursing period and rising to 0.12 mg. % in later childhood. These are av. values, individual children varying widely. It is to be noted that in general the serum Fe parallels the hemoglobin content of the blood. In anemias the serum Fe content generally falls, as it does also in the early stages of acute infections (diphtheria, scarlet fever). Just as in animals, complete elimination of iron from the food does not cause a fall in the serum Fe; conversely, the ingestion of iron preps. for therapeutic purposes does not cause more than a transitory and insignificant increase. Blockade of the reticuloendothelial system by the injection of metallic colloids (thorotrast, collargol) and splenectomy both cause a decreased serum Fe, not due to an impaired intestinal absorption of alimentary Fe. T. concludes that most of the acid-sol. serum Fe arises from the breakdown of hemoglobin to bilirubin and Fe. The decreased serum Fe caused by infection or by the injection of bacterial toxins is unexplained.

**The excretion of prolan in the urine during the involution period or in senility.** Haakon Saether. *Klin. Wochschr.* 12, 1727 9(1933).—In 137 of 139 women at or after the climacterium there was an increased urinary excretion of prolan without an increased blood prolan concn. Both exceptions were less than 5 years after the beginning of the menopause. In the pre-puberty and puberty periods, before the beginning of menstruation, there is no demonstrable urinary prolan.

**The role of prothrombin and heparin in the proliferation and differentiation of tissues. II. Studies in vitro.** Z. Zakrzewski. *Klin. Wochschr.* 12, 1658 9(1933); cf. C. A. 26, 3837.—A preliminary report. Tissue cultures grow as slowly in serum rendered prothrombin-free as they do in heparinized plasma. Heparin preps. and other antiprothrombic factors inhibit the growth of tissue cultures in proportion to their anticoagulating activity. Tissue cells have an affinity for prothrombin, which promotes their multiplication; and the removal of prothrombin, by inhibiting multiplication, makes the culture viable for a much longer period of time.

**Mechanism of the transformation of pyruvic acid into lactic acid in the liver.** E. Aubel, Y. Khouvine and G. Attagon. *Bull. soc. chim. biol.* 15, 1070 82(1933); cf. C. A. 26, 3569.—Hashed dog liver in Ringer soln. at  $pH$  3 reduced Na pyruvate to Na lactate. An excess of lactic acid was found, the source of which could not be detd. More  $CO_2$  was also produced than could be accounted for by the reactions believed to occur. Attempts to identify the H donor involved in the reduction also failed. Fourteen references.

**Action of red corpuscles on acetoacetic acid.** P. E. Grégoire. *Bull. soc. chim. biol.* 15, 1094-1106(1933).—Washed red corpuscles from dog blood, suspended in a NaCl-phosphate buffer mixt., slowly converted  $MeCOCH_2CO_2H$  into acetone and  $CO_2$ . The addn. of glucose and methylene blue (which enables the corpuscles to oxidize glucose) did not affect the rate of reaction. The corpuscles equiv. to 50 cc. blood decompd. 12-13 mg. of the acid per hr. It is calculated that the blood of a 70 kg. man could decompose 1.25 g. per hr. or about 28% of the  $MeCOCH_2CO_2H$  produced in a severe case of diabetes. Twenty references.

**Maximum concentration of urinary urea in rabbits.** J. J. Bouniol. *Compt. rend. soc. biol.* 114, 700 2(1933).—Urea was fed to rabbits in conjunction with a limited food and water intake. The max. concn. of urea found in the urine was 70 g. per l. for adult and 65 g. for young rabbits.

**The uric acid of human saliva and its relation to that of the blood serum.** J. Maupetit. *Compt. rend. soc. biol.* 114, 707-8(1933).—The uric acid content of normal saliva is 15-45 mg. per l. In cases of N retention it may be 80-120 mg. The ratio of the uric acid content of the saliva to that of the serum is usually 0.6-0.7 but is sometimes as low as 0.4 or as high as 1.0. The detn. of salivary uric acid may be useful clinically provided proper precautions

are used to prevent bacterial action before analysis of the sample.

**The lipid contents of the parathyroids of several animal species.** C. I. Parhon and I. Ornstein. *Compt. rend. soc. biol.* 114, 753 4(1933).—The total wt. of the fresh parathyroid glands was for dogs 9 36 mg., cats 2 10 mg., and rabbits 6 16 mg. The lipid contents of the fresh glands were, for dogs 5-57%, av. 32.3; cats 41 71%, av. 57.9; rabbits 38 82%, av. 61.

**Hyperglucemic action of extract of the posterior hypophysis.** B. A. Housay and Elena Di Benedetto. *Compt. rend. soc. biol.* 114, 793 5(1933).—Blood-sugar curves for dogs treated with the ext. are shown. A transient hyperglucemia was produced. Roles of various organs and the nervous system in the production of hyperglucemia by extract of the posterior hypophysis. *Ibid.* 795 7.

**Causes of the determinism of childbirth.** Joaquim Fontes. *Compt. rend. soc. biol.* 114, 855 8(1933); cf. C. A. 25, 1566.—A strongly ocytoca ext. was prepd. from placental tissue.

**Copper balance of normal rats after ingestion of variable quantities of copper [sulfate].** R. Guillemet. *Compt. rend. soc. biol.* 114, 1038 40(1933); cf. C. A. 27, 1037.

**Regulation of blood sugar after alimentation with carbohydrates.** J. Mella. *Z. ges. expil. Med.* 90, 22 7(1933).—Gargling of a glucose soln. reduces glucemia and a subsequent dose of glucose produces less rise than in a control. The effect is absent if the oral membranes are anesthetized. The effect is due to a reflex stimulating insulin secretion.

**Contra-insulin hormone of the anterior pituitary and pancreatic diabetes.** H. Lucke, E. R. Heydemann and O. Berger. *Z. ges. expil. Med.* 90, 120-9(1933); cf. C. A. 27, 3510.—Depancreatized dogs respond with a much more marked rise of blood sugar than normal dogs to the anti-insulin hormone of the pituitary. The hypoglucemic action of insulin is antagonized in the depancreatized dogs. An animal rendered sugar free by insulin treatment after depancreatization and with a normal glucemia became diabetic after a few days of injection with the hormone. After withdrawal of the hormone the animal came back to the previous metabolic equil. in a few days.

**Relationships between serum and plasma nitrogen.** A. A. Schmidt and Klara Tulichinska. *Z. ges. expil. Med.* 90, 150-8(1933).—Serum contains more N than plasma from the same blood. The increase is in the albumin fraction, the globulins being slightly lower because of fibrin removal. The source of the extra albumin is perhaps the autolyzing blood cells.

**The effects of various preparations of the anterior pituitary on the depancreatized dog.** H. Lucke, E. R. Heydemann and O. Berger. *Z. ges. expil. Med.* 90, 102-72(1933).—Two com. anterior pituitary exts. are shown to contain anti-insulin. Prolan and the thyreotropic hormone do not have an antagonistic effect to insulin.

**The resorptive power of the skin for iodine.** Alexander Sturm and Helmut Schultze. *Z. ges. expil. Med.* 90, 173 207(1933).—The amt. of I absorbed through the skin and found in the urine depends on the prepn. used.

**The lactic acid metabolism of the isolated dog heart.** H. Rolshoven. *Z. ges. expil. Med.* 90, 225 36(1933).—The isolated, denervated dog heart removes lactic acid from the coronary blood. This effect is independent of artificially produced insufficiency but cyanide and pitressin cause the venous lactic acid to be higher than the arterial.

**The serous fluid of the pleural cavity of normal men.** S. Yamada. *Z. ges. expil. Med.* 90, 342-8(1933).—A small amt. of serous fluid is present in the pleural cavity of normal men. Analysis shows protein 1.77%,  $pH$  7.64, Ca 7.2, Na 324, K 22.5 mg./100 cc. Lipase and antitypsin are present.

**Spectrographic investigations on tissue sections of**

human organs with the high-frequency spark. Walter Benoit. *Z. ges. exper. Med.* 90, 421-64 (1933).—Reproductions of spark spectra from tissue sections and detailed data are given. Lines of Zn and Cd as well as P, Mg, Na, Fe, K, Ca and Cu were found. Milton Levy

The blood phosphate during work. Hans Günther. *Z. ges. exper. Med.* 90, 479-88 (1933).—The increase in total acid-sol. P of blood during exercise is mostly an expression of the increased blood cell content. Milton Levy

The source of urinary ammonia. H. Rasold. *Z. ges. exper. Med.* 90, 502-7 (1933).—Whereas in rats surviving strips of kidney deaminate alanine 5 times as rapidly as do liver strips, in rabbits and young goats the difference is not nearly as marked. Milton Levy

Fermentable sugar in heart and skeletal muscle. Gerty T. Cory, John O. Closs and Carl F. Cori. *J. Biol. Chem.* 103, 13-24 (1933).—"Fermentable sugar in skeletal muscle of rats amounted to 10-12 mg. % at plasma sugar levels of 80-120 and to 13-53 at plasma sugar levels of 140-380 mg. %. Adrenaline injections caused a larger increase in fermentable sugar of muscle than could be accounted for by the rise in plasma sugar. Apparently breakdown of muscle glycogen is associated with the formation of small amounts of fermentable sugar. Moderate insulin hypoglycemia was accompanied by a decrease in fermentable sugar of muscle. When the plasma sugar level had fallen below 30 mg. %, there occurred a marked rise in muscle sugar, so that it equaled or even surpassed the plasma sugar concn. In adrenalectomized animals this rise in muscle sugar was absent and hence its occurrence in intact animals was attributed to adrenaline secretion elicited by the hypoglycemia. Adrenaline, by causing an increase in fermentable sugar in muscle, may abolish gradients of diffusion between blood and muscle and thus prevent a further drop in blood sugar. Heart muscle of rabbits at plasma sugar levels of 130-180 contained 46-59% of fermentable sugar. During insulin hypoglycemia fermentable sugar was reduced to 14-24 mg. %, while glucose injections caused it to rise to very high values. The large no. of open capillaries in active muscle may account for the observation that heart muscle is more permeable to injected glucose than resting skeletal muscle. The diaphragm contained more fermentable sugar than resting skeletal muscle at comparable blood-sugar levels. Short tetanic stimulation of rat muscle *in situ* and of isolated frog muscle was invariably accompanied by an increase in fermentable sugar." A. P. Lothrop

The regulation of gastric acidity. I. The influence of acid on the secretion of hydrochloric acid by fundic pouches and by the whole stomach. C. M. Wilhelmj, Irwin Neigum and F. C. Hill. *Am. J. Physiol.* 106, 381-97 (1933).—The secretion from the fundic pouch of the dog stomach contains about 578 mg. Cl per 100 cc. of secretion and has the same Cl concn. when collected under these 4 conditions: (1) pure secretion, (2) from a pouch filled with H<sub>2</sub>O, (3) from a pouch filled with 0.101 N HCl and (4) from a pouch filled with 0.173 N HCl. The Cl concn. of the combined secretions found in the intact stomach is definitely lower than that of pure fundic secretion and the lowering is proportional to the amt. of bile present in the gastric sample. J. F. Lyman

Carbohydrate metabolism, respiration and circulation in animals with basal metabolism heightened by dinitrophenol. V. E. Hall, J. Field, 2nd, M. Sahyun, W. C. Cutting and M. L. Tainter. *Am. J. Physiol.* 106, 432-40 (1933).—1,2,4-Dinitrophenol given intramuscularly to dogs in doses of 3-15 mg. per kg. body wt. may increase O consumption to over 10 times the resting rate. Liver and muscle glycogen decreases; while blood sugar and lactates rise. The decreases in carbohydrate account for less than 0.5 of the O consumed; therefore, the principal fuel of the accelerated metabolism must be other than carbohydrate. J. F. Lyman

Simultaneous study of the constituents of the sweat, urine and blood; also gastric acidity and other manifestations resulting from sweating. XI. Phosphorus and sulfur. G. A. Talbert, F. Stinchfield and H. Staff. *Am. J. Physiol.* 106, 488-90 (1933); cf. *C. A.* 27, 4288.—P in

the sweat varies from a trace to 4.8 mg. per 100 cc. and S from a trace to 7.37 mg. per 100 cc. P in the sweat is increased as a result of a high P diet and it is higher in work sweat than in heat sweat. J. F. Lyman

The effects upon the hydrogen-ion concentration of dog serum and urine of the  $\alpha$ - and  $\beta$ -fractions of posterior-lobe pituitary extract. A. R. McIntyre. *Am. J. Physiol.* 106, 505-8 (1933).—Pitressin injected subcutaneously into dogs causes a slight shift in the blood serum toward alk.; while pitocin causes a slight shift toward acidity. Both fractions cause a definite increase in the alk. of the urine. J. F. Lyman

Respiratory metabolism of active and inactive rats. E. A. Rundquist and C. J. Bellis. *Am. J. Physiol.* 106, 670-5 (1933).—Two strains of white rats, one relatively inactive, the other active, differed in basal metabolism; the active animals have decidedly higher rates of metabolism. J. F. Lyman

The possible mechanism of contracting and paying the oxygen debt and the role of lactic acid in muscular contraction. R. Margaria, H. T. Edwards and D. B. Doll. *Am. J. Physiol.* 106, 689-715 (1933).—Tests on man show that no extra lactic acid appears in the blood up to a rate of work corresponding to about 66% of the max., after which it increases rapidly, with an increment of 7.0 c.c. per 1 l. of O debt. The removal of the lactic acid is very slow, 50% being removed in 15 min. Such a speed seems limited by the slowness of the process of oxidation of a fraction of the lactic acid itself. Therefore, the lactic acid mechanism does not play an important part in muscular contraction except in very strenuous exercise, probably involving an anaerobic condition in the muscles. That portion of the O debt (1) other than the lactic acid debt is approx. a linear function of time and is probably related to the oxidation of substances furnishing the energy for the re-synthesis of phosphagen. The reaction by which (A) is repaid is 30 times as fast as the mechanism for removal of lactic acid. J. F. Lyman

Hyperguanidinemia associated with dehydration in parathyroidectomized dogs. W. R. Bryan, A. S. Minor and L. I. Chastain. *Am. J. Physiol.* 106, 738-44 (1933). The variabilities in the guanidine content of the blood of dogs in the early stages of parathyroid tetany can be explained largely on the basis of differing degrees of dehydration. The removal of the parathyroid glands has in itself no influence on the concn. of guanidine bases in the blood. J. F. Lyman

The rate of oxygen utilization by rat kidneys at different rates of urea excretion. Wm. Dock. *Am. J. Physiol.* 106, 745-9 (1933).—The increase in work done by the rat kidney, due to a 50-fold increase in osmotic work done in urea elimination, was 22.6%. The extra heat formed in the kidney excreting large amts. of urea is 5 times as great as the caloric equiv. of the extra osmotic work of urea elimination. J. F. Lyman

Carbohydrate metabolism and the effect of decapitation and decerebration under nitrous oxide anesthesia. J. S. L. Browne and C. L. Evans. *J. Physiol.* 80, 1-19 (1933).—Anesthesia is easily induced in a large majority of cats by means of N<sub>2</sub>O contg. 5-12% O. It can be maintained for long periods; recovery is rapid and complete. Its effects on blood sugar, blood lactic acid and liver glycogen are discussed. After inactivation of the adrenal glands, the depletion of liver glycogen caused by anesthesia with N<sub>2</sub>O, decapitation or decerebration, was less than with the suprarenals intact. J. F. Lyman

The utilization of blood sugar and lactate by the heart lung preparation. C. L. Evans, A. C. DeGraff, T. Kosaka, K. Mackenzie, G. E. Murphy, T. Vacek, D. H. Williams and F. G. Young. *J. Physiol.* 80, 21-40 (1933).—When the heart lung prepn. is ventilated with air, the heart (90 to 100 g.) removes from the blood about 7 mg. glucose and 234 mg. lactic acid per hr. No appreciable amt. of lactic acid is removed by the lungs. The normal resting blood lactic acid arises by glycolysis, and is not produced by muscle as often supposed. J. F. Lyman

The formation of liver glycogen in the cat, under various conditions, following infusion of ammonium lactate.

Rhoda Grant. *J. Physiol.* 80, 41-7(1933).—The infusion of  $\text{NH}_4$  lactate into the superior mesenteric vein of cats resulted in formation of liver glycogen. Removal of the spleen reduced or abolished this conversion. The simultaneous infusion of acetylcholine restored the ability of the liver to convert lactate to glycogen in splenectomized animals. J. F. Lyman

The influence of the autonomic nerves on alimentary hyperglucemia and on the absorption of glucose. E. A. Horne, E. J. McDougall and H. E. Magee. *J. Physiol.* 80, 48-64(1933).—The effects of ergotoxine, atropine, vagotomy and splanchnotomy upon the absorption of glucose from the digestive system and upon blood sugar indicate that alimentary hyperglucemia is due to overflow of absorbed glucose through the liver. J. F. Lyman

The effect of parathyroid hormone and of irradiated ergosterol upon the calcium content of the parotid saliva of the dog. L. Andreyev and L. I. Pugsley. *J. Physiol.* 80, 96-100(1933).—An increased serum Ca brought about by parathyroid hormone or irradiated ergosterol was accompanied by an increase in the saliva Ca which exceeded the rise in serum Ca. J. F. Lyman

Histological changes in the thyroid and testicles after treatment with anterior pituitary, and thyroxine plus synthetic diiodotyrosine. Nora Andreis. *Boll. soc. ital. biol. sper.* 8, 1157-62(1933). Peter Masucci

Changes in the blood  $p_{\text{H}}$  after muscle activity of different types. Rodolfo Margaria and Cesare Talenti. *Arch. fistol.* 32, 165-75(1933).—See C. A. 27, 1041. A. E. Meyer

The influence of the liver on the heart function. Bruno Bassani. *Arch. fistol.* 32, 223-31(1933).—Hepatic blood has a stimulating effect on the heart. This is due to a substance, which is not glucose or a bile ingredient. A. E. Meyer

Liver metabolism. I. B. Bassani. *Arch. fistol.* 32, 341-60(1933).—Hepatic perfusion expts. are described and criticized. A. E. Meyer

Intermediate metabolism in endocrine glands. A. Utevskii and S. Epstein. *Biochem. Z.* 265, 320-8(1933).—Both the thyroid and thymus gland contain small amts. of glycogen but in Basedow or goiterous persons this glycogen may be greater. The thymus gland (beef) contains more lactic acid than the thyroid, and in Basedow or goiterous patients the lactic acid content is much greater than normal. The lactic acid is formed from glucose but not from glycogen, and the lactic acid formation is considerably greater in the diseased than in the normal glands. Alanine, which causes an increased lactic acid formation in the thymus but not in the thyroid gland, causes a small rise in lactic acid formation in the Basedow gland. Pyruvic acid has but a slight stimulating action on the production of lactic acid. The formation of  $\text{CH}_3\text{COH}$  occurs in both thymus and thyroid glands but is very slight, indicating a low carboxylase content, but the amt. of  $\text{CH}_3\text{COH}$  is increased in the presence of glucose or glycogen. The thymus and thyroid are able to metabolize glucose both aerobically and anaerobically, but the former glycolyzes more actively and contains more lactic acid. The young gland likewise glycolyzes more actively than the old gland, and the diseased gland has a higher glycolytic power than the normal. S. Morgulis

The conditions for the formation of a colloidal calcium phosphate complex in serum. M. Laskowski. *Biochem. Z.* 265, 401-12(1933).—Since increasing the Ca concn. of serum causes a lowering of the concn. of the ultrafilterable P, the  $\text{Ca} \times \text{P}$  product of the ultrafiltrate has a const. value. On the contrary, increasing the serum P concn. leads to a lowering of the ultrafilterable Ca concn. only to about 3.5-4 mg. % so that the  $\text{Ca} \times \text{P}$  product of the ultrafiltrate increases with the P concn. On increasing the serum Ca and P simultaneously, provided the  $\text{Ca/P}$  is not over 1, the concn. of the ultrafilterable Ca is sometimes left unaffected, but this depends upon a variety of conditions, the initial Ca concn. being not without significance. The supersatd. state of the serum water is only stable in the presence of the serum colloids. S. Morgulis

Studies on the ability of carbon dioxide to permeate living tissues. J. Wehrli-Hegnner and Oscar A. M. Wyss. *Biochem. Z.* 266, 46-67(1933).—The permeability of the living venous wall to  $\text{CO}_2$  and other acids ( $\text{HCl}$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{H}_3\text{PO}_4$ ) was investigated; the change in the  $\text{H}$ -ion concn. of the venous blood was used as an indicator. The change was followed by means of a galvanometer registering every 6 sec., an Sb electrode being inserted directly into the lumen of a closed-off segment of the vein.  $\text{CO}_2$  permeates the vessel wall with remarkable ease and rapidly while the mineral acids fail to pass. S. Morgulis

Mechanism of deamination in skeletal muscles. T. Mann. *Biochem. Z.* 266, 162-8(1933).—The deamination of adenosine triphosphate or of adenylic acid, as well as the  $\text{NH}_3$  formation in muscle pulp, is inhibited by Mg salts. The  $\text{NH}_3$  formation from adenylic acid by the Meyerhof muscle ext. does not vary with the quantity. Addn. of Mg ions inhibits the deamination; it varies with the quantity of Mg, but is the same in dialyzed or undialyzed muscle ext. The deamination of adenylic acid decreases with the age of the ext. The effect of the Mg is apparently upon the substrate and not the enzyme, and its inhibition of deamination is not assocd. with its activation of the glycolytic coenzyme. S. Morgulis

The isoelectric point of hemoglobin at high altitudes. M. Rubowitz. *Biochem. Z.* 266, 190-6(1933).—The isoelec. point of oxyhemoglobin, reduced hemoglobin and CO-hemoglobin of man or animals is at high altitudes shifted to the alk. side as compared with that at low levels. The isoelec. point of the oxyhemoglobin is at  $p_{\text{H}}$  7.0 to 7.2; of reduced hemoglobin at 6.9 to 7.1; of CO-hemoglobin at 7.2. S. Morgulis

New biochemical properties of the bile pigments. II. Influence of calcium cations on the hemagglutinating and hemolytic capacity of the bilirubin. A. Clementi and F. Condorelli. *Biochem. Z.* 266, 221-5(1933); cf. C. A. 25, 5706.—The characteristic agglutinating effect of bilirubin upon red blood cells suspended in Ringer soln. proceeds very slowly if the cells are suspended in a 0.9% soln. of purest  $\text{NaCl}$ , because the  $\text{Ca}^{++}$  exerts a strongly stimulating action upon this agglutination.  $\text{Ba}^{++}$  and  $\text{Sr}^{++}$  act in a similar manner. S. Morgulis

Studies on muscle autolysis. II. Changes in the total amount of reducing substances, of lactic and phosphoric acids. I. A. Smorodintzev, N. V. Shirokov and L. A. Philipova. *Biochem. Z.* 266, 274-80(1933); cf. C. A. 27, 4840.—The reducing substances in meat increase with time. At 24 hrs. this increase is on the av. 50% and after 72 hrs. it is more than 100%. This increase is greatly affected by temp., being 50% in 3 days at 4-8°, and reaching 200% at 17-25°. The lactic acid content is tripled, reaching the max. in about 24 hrs. This also depends upon the temp. at which the meat is kept, being 185% at 4-8° and 238% at 17-25° as compared to the value at the end of the first hr. Changes in the org. and inorg.  $\text{H}_3\text{PO}_4$  vary within the narrow limits of 20-25% of the first-hr. value. S. Morgulis

A blood-sugar-raising substance from the pancreas. II. Tangl and F. Than. *Biochem. Z.* 266, 448-51(1933).—A substance can be extd. from the pancreas with acidified  $\text{CCl}_4$ , which is removed from the latter by shaking with  $\text{H}_2\text{O}$ ; on injection it causes the blood-sugar level to increase 100-200%. The aq. soln. is evapd. at 40°, leaving a residue easily sol. in alc. or  $\text{CHCl}_3$ . From 0.1 to 0.8 g. of the substance is obtained from 3 kg. pancreas. S. Morgulis

The chemical nature of thrombin. Fr. Kraus and H. J. Fuchs. *Biochem. Z.* 266, 458(1933).—Comment on Fischer's paper in C. A. 27, 5351. S. Morgulis

Absorption and elimination of folliculin in man. Tage Kemp and Kaj Pedersen-Bjergaard. *Endokrinol.* 13, 156-67(1933).—Folliculin is absorbed from the intestinal tract and evenly distributed between the corpuscles and plasma of the blood. A large part of the absorbed folliculin is destroyed in the organism and a small, but const. percentage is eliminated in the urine. In normal adult males less than 10 mouse units of folliculin is recovered per l. of urine, while in the feces 30-70 mouse units is elimi-

nated per day. In 2 pregnant women as much as 3000 and 7000 mouse units were found in the daily feces. After the oral administration of a large dose of folliculin to men about 6% is eliminated in the urine, while after subcutaneous injection only 3%, with traces appearing in the feces. In pregnant women toward the end of their period the blood contains 5.6-7.6% of the folliculin eliminated in a similar vol. of urine.

**Artificial sectioning of the sperm ducts and its effect on sexually mature and senile rat testes.** Rulo Welker. *Endokrinol.* 13, 167-80(1933).—Principally a histological study. No evidence of a rejuvenating effect has been found.

**Effect of adrenal cortex extract on cholesterolemia.** J. A. Collazo, G. Marañón, E. Roda and Isabel Torres. *Endokrinol.* 13, 186-96(1933).—A repetition of the expts. with a freshly prepd. adrenal cortex ext. (according to Swingle-Pfiffner's method (cf. C. A. 26, 489)) shows that in animals (dogs, rabbits), in normal persons or in patients with Addison's disease injection of the cortigen prepn. produces hypercholesterolemia.

**The role of bile acids in carbohydrate metabolism. XXIX. Effect of bile acids on tissue oxidation and carbohydrate oxidation.** Ziro Uraki. *J. Biochem.* (Japan) 18, 207-25(1933); cf. C. A. 27, 5383.—Cholic acid inhibits the dehydrogenase activity of rabbit or frog muscle and of rabbit liver; this increases with the quantity of acid added. Cholic acid also inhibits, in proportion to its concn., the decolorization of methylene blue by tissue exts. Cholic acid inhibits the oxidation of glucose by frog muscle tissue, also the oxidation of fructose, glycogen, glycerophosphoric, lactic or succinic acid by rabbit liver or muscle. The decolorization of methylene blue in the presence of hexosediphosphate or hexosemonophosphate is not affected by the addn. of cholic acid.

**Occurrence of taurocholic acid in chicken bile.** Kazumi Yamasaki. *J. Biochem.* (Japan) 18, 323-4(1933).—Taurocholic acid is present only in very min. amts. in chicken bile.

**Clinical and experimental studies on bromine metabolism. II. The relation between bromine content and internal secretion.** Teikichi Kuranami. *J. Biochem.* (Japan) 18, 417-43(1933); cf. C. A. 26, 5637.—The Br content of the blood increases during pregnancy, reaching a max. value shortly before parturition. In one woman this value was 1.57 mg.%, and 3 days after parturition it was 1.24 mg.%, dropping to 0.62 mg.% after 3 weeks. The blood of the umbilical cord contains on the av. 0.75 mg.% Br and is fairly const. This is considerably above the level for adult human blood. The Br blood content varies much in pathol. states. In diabetes it is increased; it is higher than normal in Basedow's and below normal in simple struma. In dogs the blood Br content is very const., but is increased by subcutaneous injection of thyroxine and adrenaline, but is lowered by insulin or posterior pituitary hormone. Castration causes a temporary rise in the blood Br, but subcutaneous administration of ovarian hormone lowers the Br level. Injection of the anterior pituitary hormone increases the Br content markedly, and is even greater and more enduring in castrated dogs, so that the sex hormones of the gonads and of the anterior lobe of the pituitary have a definite antagonistic effect. The rise in blood Br level during pregnancy is attributed to the increased hypophyseal activity. Pilocarpine lowers and atropine or adrenaline raises the Br blood content, so that the vagus or sympathetic stimulation also exerts an antagonistic effect. Physiol. saline by itself does not affect the Br level in a manner to account for these results. It is suggested that, although the Br level is the resultant of the interplay of various factors and of a coordination of org. functions, the anterior hypophysis is the center of the control mechanism.

**Influence of the spleen on bile and bile acid excretion.** Toshiyuki Tanaka. *J. Biochem.* (Japan) 18, 369-77(1933).—The spleen apparently exerts a hormonal influence on the bile and bile acid production by the liver. After splenectomy the secretion of bile acids and generally

also of bile is increased, but this increase disappears if spleen ext. or atropine is also administered.

**Influence of glutathione and monolodoacetic acid on the production of lactic acid from hexosediphosphoric acid by animal tissues.** Samuro Yamazoye. *J. Biochem.* (Japan) 18, 445-56(1933).—It is shown that in the conversion of hexosediphosphoric acid to lactic acid by the enzyme system contained in a liver dialyzate, glutathione exerts an accelerating action only upon the glyoxalase, where the inhibitory effect of  $\text{CH}_3\text{ICO}_2\text{H}$  was likewise exerted upon this enzyme by combining with its coenzyme, the glutathione.

**The toxicity of urine and serum proteic acid fraction.** Yoshio Gamo. *J. Biochem.* (Japan) 18, 457-78(1933).—After bilateral nephrectomy in rabbits, their urine and serum have a toxic effect when injected. This is only slightly due to urea, creatine or creatinine; a substance which gives a water-sol. but alc.-insol. Ba salt, and is dialyzable through collodion, is toxic. Its toxic action lost on hydrolysis by acid. This substance, oxyproteic acid, has a min. lethal dose per kg. of nephrectomized rabbit corresponding to 0.27-0.30 mg. N, while alloxypoteic acid contains 3.28-3.30 mg. N in the lethal dose. About the time of appearance of uremic symptoms in nephrectomized rabbits, which is 72 hrs. after the operation, the blood contains 0.8-1.2 mg. % oxyproteic acid.

**Calcium and phosphorus metabolism. I. Influence of carotene and bile sterols.** Inao Ishida. *J. Biochem.* (Japan) 18, 479-93(1933).—Subcutaneous administration of  $\beta$ -carotene increases the assimilation of Ca and P in rabbits so that even a neg. balance becomes pos. under its influence. But whereas the Ca balance can only be maintained while the carotene is administered and becomes neg. upon the cessation of the treatment, the P continues to show a pos. balance, even an increasing pos. balance, several days after the carotene administration had been stopped. The Ca and P balance is increased or becomes pos. also upon treatment with vitamin A + choleic acid. However, the effect is different from that exerted by carotene in that the behavior of the Ca and P balance upon cessation of the treatment is just the opposite. The effect of the vitamin A + choleic acid on raising the Ca balance is greater than that of the bile acids.

**Studies on the character and cause of physiological changes occurring in the tubal epithelium.** Jenő Baumann and Lajos de Thanhofer. *Magyar Orvosi Arch.* 34, 431-7(1933).—Physiol. changes identical with those in pregnancy can be produced in the tubal epithelium of rats by injection of urine of pregnant women.

**The fate of mannitol and mannitan in the animal body.** C. Jelleff Carr, Ruth Musser, Jacob E. Schmidt and John C. Krantz, Jr. *J. Biol. Chem.* 102, 721-32(1933).—The feeding of mannitol to rats results in an increase of liver glycogen and of blood sugar, but causes no change in the fasting R. Q. Mannitan, on the other hand, is not stored as glycogen, does not increase the blood-sugar level, and increases the fasting R. Q. from 0.718 to 0.766. Anhydride formation thus greatly changes the metabolism of these compds.

**Studies of phosphorus of blood. I. The partition of phosphorus in whole blood and serum, the serum calcium and plasma phosphatase from birth to maturity.** Genevieve Stearns and Edna Warweg. *J. Biol. Chem.* 102, 749-65(1933).—The inorg., lipid and ester P contents of whole blood and serum all reach a max. in early childhood but all at different times. The plasma phosphatase shows the same behavior, but maintains a value close to the max. from the first to about the 20th month. The vol. of the corpuscles varies parallel with the total P of whole blood, both reaching a marked max. at about 5 days after birth. Fifty-four references.

**The relation of thyroid to the conversion of cyanides to thiocyanate.** Emil J. Baumann, David B. Sprinson and Nannette Metzger. *J. Biol. Chem.* 102, 773-82(1933); cf. Marine, et al., C. A. 26, 6004.—After injection of KSCN into rabbits about 90% of it was recovered in the

urine within 5 days. Similarly, after injection of KCN or PhCN, 80% was recovered as KSCN in the urine, and thyroidectomy did not reduce the KSCN excretion. However, injection of MeCN was followed by partial excretion as KSCN by normal rabbits and no excretion by thyroidectomized animals. Hence the thyroid has no effect on cyanide metabolism but does control demethylation of MeCN, a reaction similar to that observed by Stuber, *et al.* (*C. A.* 18, 2199).

**Methods and effects of increasing the urinary constituents in the body.** F. W. Hartman. *J. Exptl. Med.* 58, 649-62(1933).—Five methods are presented for the slow continued reabsorption of urine in the exptl. animal. The most striking changes noted in the blood chemistry in the expts. of long duration are the elevation in non-protein N and the reduction of the CO<sub>2</sub>-combining power of the plasma; however, the acidosis was not severe until late in the process. Large and rapid increase of urinary constituents in the body is definitely destructive to the kidney.

**The supposed new formation of fibrinogen caused by Congo red.** Boris Belonoschkin and Edgar Wöhlisch. *Klin. Wochschr.* 12, 1371-2(1933).—The finding of Wedekind that Congo red causes an increase in the blood fibrinogen content both *in vivo* and *in vitro* was not confirmed. With a gravimetric method, no significant changes were observed. Wedekind was not justified in using the refractive index as a criterion of protein concn.

Harry Eagle

## G—PATHOLOGY

H. GIDRON WELLS

**Phosphatase in tuberculosis.** Ison Horii. *Arb. dritt. 1bt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No. 4, 49-51(1933).—Phosphatase is present in exts. from tuberculous human lungs.

**The incidence of pulmonary disease following exposure to vesicant and asphyxiating gases.** W. N. Abbott. *Brit. Med. J.* 1933, 11, 862-5.

**The mechanism of Henry's reaction in malaria.** V. Chorine and R. Gillier. *Compt. rend.* 197, 950-2(1933).—A disequil. between the proportions of the substances which are dissolved in the serum and are insol. in formalized H<sub>2</sub>O and the mol. concn. of the blood control Henry's reaction in the course of malaria.

**Sex hormones in psychopathic patients.** Huakon Saethre. *Klin. Wochschr.* 12, 1409-10(1933).

**Hypophysis and blood glutathione.** Helena Maveroff de Lissner. *Compt. rend. soc. biol.* 114, 726(1933).—In dogs, removal of the hypophysis causes a 10% decrease in blood glutathione; on the other hand treatment with ext. of the anterior hypophysis causes an increase above normal, even in the absence of the hypophysis or thyroid.

**Relation of the glucose, nitrogen and cholesterol contents of the blood to each other.** M. R. Castex and M. Scheingart. *Compt. rend. soc. biol.* 114, 745-6(1933).—From a study of 900 pathol. cases it is concluded that the 3 vary independently of each other.

**The lactic acid of the blood of dogs after thyroparathyroidectomy.** C. I. Parhon and C. Urzica. *Compt. rend. soc. biol.* 114, 751-2(1933).—The operation usually caused tetany and a 35-40% decrease in blood lactic acid. In one case, where no tetany occurred the decrease in lactic acid was very slight.

**A new form of bilirubin, extractable by ether, in icteric serum.** B. Varela and C. Viana. *Compt. rend. soc. biol.* 114, 786-8(1933); cf. *C. A.* 27, 5390.—Ordinarily no bilirubin can be extd. from serum by Et<sub>2</sub>O. In 3 cases of icterus with cancer of Vater's ampulla, part of the serum bilirubin was in a new form, readily extd. by Et<sub>2</sub>O but not by CHCl<sub>3</sub>. Nature of the ether-extractable bilirubin in certain icteric serums.

**Metabolism of normal and tumor tissue.** IX. Ammonia and urea formation. Frank Dickens and Guy D. Greville. *Biochem. J.* 27, 1123-33(1933); cf. *C. A.* 28,

208<sup>a</sup>.—Little NH<sub>3</sub> or urea is formed by rat liver or yolk-sac either in presence or absence of sugar. With kidney, spleen, Jensen rat sarcoma and embryo (chick and rat), the aerobic NH<sub>3</sub> formation was large in the absence of sugar, but was arrested by glucose. In all cases where glucose reduced the NH<sub>3</sub> production, fructose acted similarly. Anaerobic NH<sub>3</sub> elimination under the same conditions as the aerobic expts. are usually small compared to the latter. Urea formation by 5-day chick embryo and by Jensen rat sarcoma is very small. The assumption is confirmed that in a glucose medium the protein oxidation is so small as to have no material influence on the R. Q. X. Effects of lactate, pyruvate and deprivation of substrate. *Ibid.* 1134-40.—The inhibitory effect of lactates on the anaerobic glucolysis of brain, testis and tumor is very variable. In tissues and under conditions in which spontaneous activation is observed, an equal activation is achieved on addn. of pyruvate. After 20 min. preliminary anaerobic substrate deprivation the glucolysis of the brain recovers to 12% of its normal value, while with other tissues tested the recovery is almost complete.

**The evaluation of galactose in physiological and pathological conditions.** V. The use of galactemia and glucemia after galactose ingestion for the diagnosis of liver function. H. Kosterlitz. *Z. ges. exptl. Med.* 90, 465-78(1933); cf. *C. A.* 27, 2986i.—Galactemia and glucemia were followed in 74 patients after 40 g. of galactose by mouth. The galactemia is high and prolonged in icterus simplex where the glucemia is normal. In diabetes mellitus the galactemia is normal but the glucemia is high and prolonged. The conversion of galactose to glucose is a function of the liver not dependent on insulin. Data are given for other pathol. states.

**The output of adrenaline from the adrenal glands during anaphylactic shock.** M. B. Cohen, J. A. Rudolph, P. Wasserman and J. M. Rogoff. *Am. J. Physiol.* 106, 414-15(1933).—Anaphylactic shock in dogs sensitized with horse serum does not cause any change in the rate of adrenaline secretion.

**Eye reactions in pancreatic diabetes.** M. E. M. Sawyer. *Am. J. Physiol.* 106, 491-504(1933).—The sensitization of both the nictitating membrane and iris to adrenaline which occurs in cats after removal of the pancreas results from secondary factors accompanying diabetic acidosis that affects the permeability of the eye tissues to adrenaline.

**Lactation in diabetes.** I. L. Chaikoff and W. R. Lyons. *Am. J. Physiol.* 106, 716-20(1933).—Six dogs whose pancreatic glands had been completely removed and which were kept alive with insulin and a special diet were given the lactation hormone of the anterior pituitary. In only one case could lactation be induced. All the controls produced milk.

**The contents of glucose and lactic acid, the  $n_D$  and  $p_H$  in blood and the fluid of blisters produced by various methods.** R. D. Policaro. *Arch. fisiol.* 32, 566-90(1933).—Sugar and lactic acid are of equal concn. in the blood and in fresh heat blisters in guinea pigs; both increase in older blisters. Lactic acid is higher than in blood in human blisters produced by various methods. The  $p_H$  is higher in fresh heat blisters, identical with blood in old heat and cantharidine blisters. The  $n_D$  is slightly lower in the fresh heat blisters; in older and in cantharidine blisters it is considerably lower than in blood. The results are discussed.

**Noorden, C. v.: Neuzzeitliche Diabetesfragen.** Vienna: Urban & Schwarzenberg. 55 pp. Reviewed in *Nutrition Abstracts & Reviews* 3, 643(1933).

## H—PHARMACOLOGY

A. N. RICHARDS

**Chronaxie in morphine-addicted rats on high and low calicum diets.** L. E. Detrick and J. M. D. Olmsted. *Proc. Soc. Exptl. Biol. Med.* 30, 1102-4(1933).—In the normal rat and in the rat subjected to morphine addiction

and withdrawal, a diet rich in Ca and injections of "parathormone" did not change the chronaxie of a typical motor nerve nor that of the flexion reflex. C. V. B.

**Purgative effect of some aliphatic alcohols.** David I. Macht. *Proc. Soc. Exptl. Biol. Med.* 30, 1272-3 (1933).—An emulsion of finely divided animal charcoal contg. 1% of the test alc. was introduced into the stomach of the rat; the distance travelled by the emulsion in 1 hr. was recorded in percentage of the total length of the intestine and compared with that of controls (cf. C. A. 25, 5955). All the primary alcs. contg. 13-18 C atoms exhibited more or less laxative action. Hexadecyl or cetyl alc. was the most effective, but not as powerful as that of the ester, cetyl acetate. Mineral oils studied by this method showed no special laxative action. C. V. Bailey

**Local anesthetic properties of some aliphatic alcohols.** David I. Macht and Mary E. Davis. *Proc. Soc. Exptl. Biol. Med.* 30, 1294-5 (1933).—Concs. of alcs. of 1 : 1000 in 9.5% ethanol were used in tests on the conjunctival and corneal reactions of rabbits and on living frogskin by the standard methods. Local anesthetic properties were exerted by octyl, heptyl, nonyl, decyl, undecyl, dodecyl and hexyl alcs. (arranged in descending order of potency). Local anesthesia was not induced by Pr, Bu or Am alcs. of the primary, secondary or tertiary varieties, or by alcs. contg. 13-18 C atoms. C. V. Bailey

**Effect of adenylic acid on gastric secretion.** John Vandolah. *Proc. Soc. Exptl. Biol. Med.* 31, 28-9 (1933).—Extn. of the blood obtained after the ingestion of meat gave a vasodepressor substance with a pos. Pauly reaction; the subcutaneous injection of the substance did not produce a gastric response in the dog. Adenylic acid, a vasodepressor substance found in the blood (cf. C. A. 26, 504), likewise produced no gastric response. C. V. Bailey

**Action of digitalis on the kidney.** A. Howard Shanberg, Robert Hemmer and Louis N. Katz. *Proc. Soc. Exptl. Biol. Med.* 31, 39-43 (1933).—The immediate effects of digalen, digitalone and ouabain were studied in anesthetized dogs by comparing the urine flow of the kidney, into whose renal artery the drug was injected, with the urine flow of the opposite kidney. No diuresis occurred; in most of the expts. urinary secretion was inhibited. C. V. Bailey

**Comparative effects of dinitrophenol and thyroxine on tadpole metamorphosis.** C. C. Cutting and M. L. Tainter. *Proc. Soc. Exptl. Biol. Med.* 31, 97-100 (1933).—Dinitrophenol in up to lethal concns. had no effect on the metamorphoses of tadpoles of *Bufo halophilus*; thyroxine 1 : 500,000 caused complete metamorphosis in 30 days. The substances are comparable in their stimulating effect on metabolism; dinitrophenol lacks the power of thyroxine to accelerate developmental processes; it should not be used therapeutically to replace thyroxine in true thyroid deficiencies. C. V. Bailey

**Skin changes after subcutaneous injection of adrenaline.** M. Caroline Hrubetz. *Proc. Soc. Exptl. Biol. Med.* 31, 103-5 (1933).—Rats were given subcutaneous injections of 0.1 mg. of adrenaline-HCl in 0.25 cc. of isotonic NaCl soln. per 250 g. of body wt.; 54% of the animals developed localized loss of hair, 13% had local necrosis and 34% were not injured. The injection of solns. of HCl of equal pH caused no skin changes. C. V. Bailey

**Yatoconin therapy in iridocyclitis serosa tuberculosa.** Konin Okamoto. *Arb. drith. Abt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No. 4, 15 (1933); cf. C. A. 27, 1941.—One case was treated with good results. M. L. C. Bernheim

**The influence of phosphoric acid esters on the blood sugar of rabbits.** Kuniaki Shibuya. *Arb. drith. Abt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No. 4, 54-60 (1933).—A comparison of the effects on the blood sugar of injected glucose, fructose and galactose with those of their resp. monophosphoric acid esters. The esters produce a more prolonged but less marked effect. M. L. C. Bernheim

**The treatment of tuberculous lung lesions with yatoconin.** Isamu Nagai. *Arb. drith. Abt. Anat. Inst. Kaiser.*

*Univ. Kyoto Ser. C*, No. 4, 61-100 (1933).—One hundred and thirty-three cases are reported of which 77 cases improved or recovered after yatoconin injections. M. L. C. Bernheim

**Yatoconin therapy in tuberculous lesions.** Seigo Funaoka. *Arb. drith. Abt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No. 4, 101-7 (1933).—The healing of tuberculous wounds and abscesses is aided by injection of yatoconin. M. L. C. Bernheim

**The biological properties of some alkaloid salts of phosphoric acid ester.** I. Yoshiki Imagawa. *Arb. drith. Abt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No. 4, 108-22 (1933).—The toxicity of strychnine, brucine and quinine fructose monophosphates is less than that of the free alkaloids. II. *Ibid.* 123-9.—The toxicity of strychnine brucine and quinine diethyl phosphates is less than that of the free alkaloids. M. L. C. Bernheim

**Yatoconin therapy in trachoma.** Konin Okamoto. *Arb. drith. Abt. Anat. Inst. Kaiser. Univ. Kyoto Ser. C*, No. 4, 145-9 (1933).—Five cases yielded to treatment. M. L. C. Bernheim

**Toxic cirrhosis caused by cinchophen.** James F. Weir and Mandred W. Comfort. *Arch. Internal Med.* 52, 685-724 (1933).—Many cases of toxic cirrhosis are described after the use of cinchophen. The universal presence of the quinoline radical in different preps. suggests that this is the offending part of the compd. J. B. Brown

**Effect of alkali on the absorption of thyroxine from the gastro-intestinal tract.** Willard O. Thompson, Phoebe K. Thompson, Lois F. N. Dickie and Joseph M. Alper. *Arch. Internal Med.* 52, 809-20 (1933).—In 3 patients with myxedema oral doses of thyroxine in alk. soln. or equiv. doses of Na thyroxine were less effective on the basal metabolism than when administered intravenously. Synthetic and natural thyroxine were equally effective intravenously. J. B. Brown

**How do drugs act?** W. Langdon Brown. *Brit. Med. J.* 1933, 11, 1007-10. J. B. Brown

**The action of morphine on the small intestine and its clinical application in the treatment of peritonitis and intestinal obstruction.** Thomas G. Orr. *Ann. Surgery* 98, 835-40 (1933).—Morphine and related opium derivs. when given hypodermically stimulate the tone, rhythmic contraction, and in some degree peristaltic waves of the small intestine for at least 6 hrs. To prevent over-distention of the small intestine morphine is indicated in acute peritonitis, intestinal obstruction and so-called paralytic ileus. Rachel Brown

**Nicotine sulfate as a vermifuge for the removal of ascarids from poultry.** Wm. L. Bleecker and R. M. Smith. *J. Am. Vet. Med. Assoc.* 36, 645-55 (1933).—Nicotine-contg. vermifuges are effective in removing *Ascaris lineata* from fowls harboring this parasite and combined with kamala are effective against tape worms. Rachel Brown

**Pulmonary embolism from arsenicals injected intravenously.** Geo. C. Shivers. *Arch. Dermatol. Syphilol.* 27, 901-22 (1933).—A large part of the deaths due to injection of arsenicals are caused by pulmonary embolism resulting from a combination of the drugs with the plasma proteins. An acid reaction of the drug appears to be the cause of the pptn. of the drug in the blood. It is suggested that bromothymol blue be combined with the arsenical in ampoules to check on the acidity at the time of injection. B. C. Brunstetter

**The sensitivity of the intestine of various animals to adrenaline.** M. N. Achutin. *Arch. exptl. Path. Pharmacol.* 171, 668-71 (1933).—The sensitivity of guinea pig, cat and rabbit intestine to adrenaline decreases in the order named. The concns. necessary to cause inhibition of contraction are  $10^{-3}$ ,  $8 \times 10^{-3}$  and  $1.5 \times 10^{-3}$ , resp. Harry Eagle

**A case of exceptional tolerance to "Vigantol" given in large doses over a long period of time to a cat.** Siegwart Hermann. *Arch. exptl. Path. Pharmacol.* 171, 756-8 (1933). Harry Eagle

**Pharmacological and chemical studies on the effective constituents of *Urtica dioica* and *Urtica urens*.** E.

Starkenstein and Th. Wasserstrom. *Arch. expl. Path. Pharmacol.* 172, 137-48(1933).

Report on tsetse investigations. H. M. O. Lester. *Nigeria Rept. of Med. & Health Dept.* 1931, 89-98; *U. S. Pub. Health Eng. Abstracts* 13, Ma, 15(July 22, 1933).—Of some 5000 cases of African sleeping sickness treated with a full course of 20-30 g. of trypanamide, 83% were apparently cured.

C. R. Fellers  
Assimilation of sugars by dogs with an Eck fistula. Glucemia after intravenous injection of sugars. S. Livierato, M. Vagliano and A. Dervenaga. *Compt. rend. soc. biol.* 114, 462-4(1933); cf. *C. A.* 27, 5819.—Glucose produced a much greater hyperglucemia in operative dogs than in the controls. Similar, but slight, differences were observed with lactose and levulose.

L. E. Gilson  
The proteins and reduced glutathione of the blood after injection of sulfurized oil.—M. Michaux, P. Mollaret and J. Tonnet. *Compt. rend. soc. biol.* 114, 516-18(1933).—Hyperthermia was produced in paralytic, tabetic and dementia precox cases by injection of 5-25 mg. S in oil. In general the reduced glutathione of the blood was somewhat increased. The changes in the blood proteins were irregular.

L. E. Gilson  
Cancerigenic power of 1,2,5,6-dibenzanthracene. J. Maisin and P. Liégeois. *Compt. rend. soc. biol.* 114, 536-8(1933).—One drop of a satd. soln. of 1,2,5,6-dibenzanthracene in  $\text{CaH}_2$  was applied to the skin of mice 3 times a week until 50 drops had been applied. Numerous cases of apapilloma, cancer and mediastinal neoplasm were produced.

L. E. Gilson  
Production of cancer in rabbits by 1,2,5,6-dibenzanthracene. A. Lacassagne. *Compt. rend. soc. biol.* 114, 660-2(1933).—Injected into the mammae the compd. caused some proliferation of the epithelium of the ducts. Intravenously, it produced hyperplastic patches in the broncho-alveolar epithelium. In 1 of 6 rabbits injected in the testicle epithelioma was produced.

L. E. Gilson  
Influence of various barium salts on the metabolism of normal and cancerous cells. J. Maisin and Y. Pourbaix. *Compt. rend. soc. biol.* 114, 538-42(1933); cf. *C. A.* 27, 5107.— $\text{BaCl}_2$ , 0.00018 M, inhibited the respiration of liver sections *in vitro*, but the gluconate or saccharate in the same concn. had no effect. The results with various tumor sections were irregular but in general respiration was accelerated.

L. E. Gilson  
Absence of anti-tumoral properties toward experimental epithelioma in mice treated with injections of adrenaline or some of its quinonic oxidation derivatives. F. Arloing, A. Morel, A. Jossier and A. Badinand. *Compt. rend. soc. biol.* 114, 631-3(1933); cf. *C. A.* 27, 1938.—In mice, adrenaline and the colored compds. formed by its spontaneous oxidation in air or by treatment with  $\text{FeCl}_3$  and  $\text{NH}_4\text{OH}$  had no anti-tumoral action whatever.

L. E. Gilson  
Sulfur and temperature. J. Sivadjan. *Compt. rend. soc. biol.* 114, 686-7(1933).—Intramuscular injections of "sulfosine" or sulfurized oil produce little or no hyperthermia in rabbits or guinea pigs; hence they are of no value in the study of antipyretics.

L. E. Gilson  
Influence of some vital stains on the asphyxia of certain marine animals. B. S. Levin. *Compt. rend. soc. biol.* 114, 689-91(1933).—Very small quantities of various dyes considerably prolonged the survival period of shrimps and ascidians in un-aerated water. Influence of some vital stains on the resistance of marine animals to arsenious acid. *Ibid.* 909-12.—In well-aerated sea water the dyes increased the resistance of *Ascidia* and *Actinia* to As poisoning. Under conditions of asphyxia the action of vital stains promotes poisoning by arsenious acid. *Ibid.* 1053-6.—Expts. with shrimps and young turbot are described.

L. E. Gilson  
Use of sodium nitrite and thiosulfate together in the treatment of hydrocyanic acid poisoning in dogs. E. Hug. *Compt. rend. soc. biol.* 114, 711-14(1933); cf. *C. A.* 28, 526<sup>9</sup>.—The expts. previously reported for rabbits were repeated with dogs; the same results were obtained.

L. E. Gilson  
Effect of lipid extract of the adrenals on the chemical

composition of the blood and various organs. C. I. Parhon and G. Werner. *Compt. rend. soc. biol.* 114, 749-51(1933).—Dogs were given 6 daily injections of 50 mg. of lipid extd. from adrenal cortex. Some dehydration was produced. The K of the brain and muscles was somewhat increased. Other changes were slight or uncertain.

L. E. Gilson  
Pharmacodynamic action of extract of *Trichocereus candicans* Br. and Rose. F. P. Luduena. *Compt. rend. soc. biol.* 114, 809-11(1933).—In dogs the ext. causes an increase in respiration and heart beat, hypertension, exophthalmia, mydriasis and muscular incoordination. In toads it produces a syndrome like nicotine intoxication. These effects are characteristic of *p*-hydroxyphenylethyl-trimethylammonium salts, which are present in the ext. Action of extract of *T. candicans* and its active principles, hordenine (anhaline) and salts of *p*-hydroxyphenylethyl-trimethylammonium, on adrenaline secretion. J. T. Lewis and F. P. Luduena. *Ibid.* 814-16.—The ext. acts directly upon the adrenals and provokes adrenalinic secretion even though the glands are enervated. Effects of cocaine on the action of extract of *T. candicans* and its active principles on the splanchnic nerve. F. P. Luduena. *Ibid.* 950-1.—Effect of sparteine sulfate on the action of extract of *T. candicans* on the splanchnic nerve. *Ibid.* 951-3.—Effect of yohimbine on the action of extract of *T. candicans* on the splanchnic nerve. *Ibid.* 953-4.

L. E. Gilson  
Chloral hydrate narcosis in thyroidectomized and hyperthyroidized animals. C. Kucera. *Compt. rend. soc. biol.* 114, 822-5(1933).—Expts. with rats, dogs, goats and sheep are reported. Hypothyroidism makes the animals more sensitive, and hyperthyroidism less sensitive, to the narcotic action of chloral hydrate. Suckling lambs tolerate larger doses, in proportion to their wt., than adult sheep. For operations on sheep a profound narcosis lasting 30-60 min. is produced by 0.2-0.25 g./kg. intraperitoneally. Overdoses can be combated by injections of thyroxine and caffeine.

L. E. Gilson  
Hypercalcemic action of intravenous injections of potassium chloride in thyroparathyroidectomized animals. J. Toscano Rico. *Compt. rend. soc. biol.* 114, 847-8(1933); cf. *C. A.* 26, 5658.—The effect is but slightly weaker than in normal animals.

L. E. Gilson  
Action of some respiratory excitants on respiratory paralysis caused by magnesium. J. Toscano Rico. *Compt. rend. soc. biol.* 114, 849-50(1933).—Camphor, cardiazole, lobeline, etc., combat respiratory paralysis produced by  $\text{MgCl}_2$  without affecting the curariform paralysis also produced.

L. E. Gilson  
Calcium-magnesium and potassium-magnesium antagonisms studied on the isolated small intestine of a mammal. J. Toscano Rico. *Compt. rend. soc. biol.* 114, 851-3(1933).—Isolated rabbit intestine is paralyzed by  $\text{MgCl}_2$ , but not by  $\text{MgCl}_2$ - $\text{CaCl}_2$  and  $\text{MgCl}_2$ -KCl mixts.

L. E. Gilson  
Insulin hypoglycemia tests with epileptics. A. Baudouin, E. Azérad and J. Lewin. *Compt. rend. soc. biol.* 114, 902-3(1933).—The blood glucose of epileptics (17 cases) and the effects of insulin were practically the same as in normal persons.

L. E. Gilson  
Influence of anesthetics on the excitability of the vasodilator nerves. A. Chauchard and B. Chauchard. *Compt. rend. soc. biol.* 114, 907-9(1933).

L. E. Gilson  
Methemoglobin-forming action of sodium nitrite and methylene blue *in vivo*. E. Hug. *Compt. rend. soc. biol.* 114, 947-50(1933); cf. *C. A.* 28, 526<sup>9</sup>.—In dogs, after the injection of  $\text{NaNO}_2$  or methylene blue methemoglobin reaches a max. in about 15 min. and gradually disappears during the following 5 hrs. The action of methylene blue is weak compared to that of  $\text{NaNO}_2$ .

L. E. Gilson  
Histochemical investigation of polyphenols injected into guinea pigs and rats. R. Jonnard. *Compt. rend. soc. biol.* 114, 1000-1(1933).—Pyrocatechol, resorcinol, hydroquinol or phloroglucinol, 0.6 g./kg. disappeared from the blood within a few min. after injection. None could be detected in any of the tissues.

L. E. Gilson  
Antagonistic action on the tone of isolated intestine of

two theoretically synergic compounds, arecoline and pilocarpine. H. Busquet. *Compt. rend. soc. biol.* 114, 1083-4(1933).

**Research on trypanosomiasis.** H. R. Hornby and H. W. Bailey. Tanganyika Territory Dept. Vet. Sci., *Ann. Rept.* 1931, 10 25(1932).—A 1:250,000 concn. of tartar emetic in a nutrient medium composed of equal parts of fresh sheep serum and saline glucose (0.2% glucose in normal saline) killed trypanosomes of *T. congolense* in 2 hrs.; 1:500,000 and 1:1,000,000 concns. were effective in 4 and 7 hrs., resp. Tartar emetic was slightly more effective than an equiv. amt. of total Sb in the form of Antimosan; this is in accordance with the expectation that the more complex compd. has a lower dissociation const. and yields a smaller concn. of therapeutically active ions than does tartar emetic in equiv. concn. A 1:500,000 concn. of tartar emetic, or Antimosan soln. of the same Sb content, killed trypanosomes of *T. brucei* in less than 3 hrs. *in vitro*. Evidence is presented which indicates that antimonials contg. trivalent Sb act directly on trypanosomes and that the success of the treatment depends on the extent to which the Sb ions come in direct contact with the parasites. Certain protein substances (not necessarily cellular) in the blood seem to have a pronounced affinity for Sb ions and correspondingly reduce the effectiveness of the Sb treatment. **Notes on trypanosomiasis research.** H. E. Hornby. *Ibid.* 1932, 24 8(1933). Intravenous injection of either Antimosan or peptone induced a no. of the trypanosomes of *T. congolense* present in the open capillaries of oxen to let go their hold and be swept into the general circulation, as indicated by an increase in the concn. of trypanosomes in the unit amt. of blood represented by 100 fields of a smear. Trypanosomes do not become Sb-fast unless first rendered fast to an arsenical, like atoxyl. K. D. Jacob

**Antispasmodics of the papaverine type.** K. H. Slotta and G. Halerland. *Angew. Chem.* 46, 766 71(1933).—Three  $\beta$ -arylethylamines, 2 alkoxybenzoic acids and nine 1-phenylisoquinolines were prepd.; the latter were obtained by reaction of the first 2 kinds of compds. The pharmacol. tests of the 1-phenylisoquinolines showed that the size and no. of the alkoxy groups in the mol. are of great importance. If 5 methoxyl groups are present the compd. in nontoxic quantities has a paralyzing action upon smooth muscle tissue. Introduction of 2 ethoxyl and 3 methoxyl groups greatly increases the action, but a decrease occurs when 5 ethoxyl groups are present and the action disappears with 6 methoxyl groups. The most effective compd. prepd. so far is the 1-(3', 4', 5'-trimethoxyphenyl)-6,7-diethoxyisoquinoline which was examd. and compared with papaverine and atropine. The lethal dose and the action upon the stomach and the small and large intestine were detd. for these substances. Exptl. data are presented for all substances which were prepd. Thirty-one references. Karl Kammelmeyer

**Methylene blue in the treatment of hydrocyanic acid gas poisoning.** J. A. Trautman. *U. S. Pub. Health Repts.* 48, 1443-7(1933).—It is apparent from expts. on rabbits, white rats and guinea pigs that injections of 1% methylene blue soln. were of no value in the treatment of HCN gas poisoning when the animals had absorbed, by breathing, lethal or near-lethal doses of gas in a short period of time. J. A. Kennedy

**The effect of menthol on the metabolism in phosphorus poisoning.** M. Kojima. *Z. ges. expil. Med.* 90, 1 12 (1933).—The C:N ratio in the urine of rats is increased by peroral menthol, more so after P poisoning. The "vacat" O:N (see Kanitz, *C. A.* 26, 4622) is not affected in a regular way. Milton Levy

**The effect of natural carbonic acid thermal baths on diuresis and the hydrogen-ion concentration of urine.** Vladimir Bojuklysky and Claus Buchholz. *Z. ges. expil. Med.* 90, 13 21(1933). The Bad Nauheimer CO<sub>2</sub> waters are diuretic and the urine pH diminishes after bathing in it. Milton Levy

**The influence of saponins on the cardiac action of strophanthin.** R. A. Holkstra and A. Schleusing. *Z. ges. expil. Med.* 90, 36 44(1933).—Non-toxic doses of saponin

increased the toxicity of strophanthin by 20% in cats. Milton Levy

**Enzyme and carbohydrate investigations of the aqueous humor. II. Pharmacological effects.** Hans Popper and Josef Böck. *Z. ges. expil. Med.* 90, 596-603(1933); cf. *C. A.* 28, 1064<sup>1</sup>.—Eserin increases the permeability of the aqueous humor membrane to diastase. Pilocarpine and pituitrin are without effect. Adrenaline decreases the permeability. Milton Levy

**The physiology of sleep. X. The effect of alcohol and caffeine on motility and body temperature during sleep.** F. J. Mullin, N. Kleitman and N. R. Cooperman. *Am. J. Physiol.* 106, 478-87(1933).—In human male subjects 300-375 cc. of 19% alc., taken 1 hr. before retiring, causes a lowering of motility and body temp. during the first half of the night, with an increase in both during the last half of the night's sleep. Large doses of caffeine (4-6 grains) produce a marked increase in motility and body temp. during sleep. J. F. Lyman

**The emetic action of two secondary alkaloids of Lobelia, lobelanine and lobelanidine.** A. Clementi. *Boll. soc. ital. biol. sper.* 8, 1132-4(1933).—The emetic action of fluidext. of *Lobelia inflata* must not be attributed to lobeline; although the latter strongly excites the respiratory centers, it has no emetic action. The emetic action is due to 2 secondary alkaloids of *L. inflata*, namely, to lobelanine which simultaneously exerts a slight respiratory action and a slight emetic action, and to lobelanidine which is not endowed with any respiratory action but has a marked emetic action. These divergent results are explained by the fact that C. worked with pure lobelanine-HCl while previous investigators used a mixt. of alkaloids extd. from *L. inflata*. Peter Masucci

**The action of sympathetic and parasympathomimetic drugs on gaseous exchange. III. The associated action of adrenaline and pilocarpine.** G. Orestano. *Boll. soc. ital. biol. sper.* 8, 1145-6(1933); cf. *C. A.* 27, 5822. —The simultaneous introduction of large doses of adrenaline and pilocarpine in animals (cats, dogs) does not modify in any way the action of each drug injected alone. If the 2 drugs are injected in smaller doses, the action is one of summation, incomplete for doses which alone would give an increase greater than 50% of the basal metabolism, complete for smaller doses. Large doses of both drugs injected into rabbits produce only a slight increase in the intensity of the gaseous exchange. **IV. The influence of atropine on the excitometabolic action of adrenaline.** *Ibid.* 1146-8. —Atropine injected into rats before the administration of adrenaline or simultaneously with adrenaline does not change noticeably the excitometabolic action of the latter regardless of the dose introduced. **V. The influence of ergotamine on the excitometabolic action of adrenaline.** *Ibid.* 1148-50. —Ergotamine tartrate injected subcutaneously into albino rats in large doses produces a lowering of the basal metabolism. Injected simultaneously with adrenaline, ergotamine inhibits partially the excitometabolic action of the former. The min. active dose of ergotamine tartrate on normal metabolism is 0.003 g. per kg. of rat; that against the exciting action of adrenaline is 0.0011 g. per kg. Doses between 0.003 g. and 0.0011 g. while exerting no influence on the normal metabolism are capable, however, of hindering partially the action of adrenaline. **VI. The influence of ergotamine on the excitometabolic action of pilocarpine.** *Ibid.* 1150-1. —Ergotamine in proper doses completely impedes the excitometabolic action of pilocarpine. The min. active dose of ergotamine tartrate against pilocarpine is 0.0003 g. per kg. of rat. The min. active dose for normal metabolism is 0.003 g. per kg. The ability of ergotamine to suppress gaseous exchange is manifested in a decreasing manner from a metabolism under the action of pilocarpine to a metabolism under the action of adrenaline and from this to a normal metabolism. Peter Masucci

**The pharmacologic action of platinum chloride.** G. Orestano. *Boll. soc. ital. biol. sper.* 8, 1152-4(1933).—The immediate M. L. D. of H<sub>2</sub>PtCl<sub>6</sub> (soln. previously neutralized with NaOH) is 0.1801 g. per kg. of rabbit when the velocity of injection is 0.0045 g. per kg. per min. When

the velocity is 0.0023 g. the immediate M. L. D. is 0.125 per kg. The delayed M. L. D. is 0.0229 g. per kg. (period of survival 3 days). The salt does not destroy red blood corpuscles *in vivo* although it does hemolyze them *in vitro*. Detn. of Pt in the organs 3 days after injection of the salt shows that the kidneys contain the most, followed by the spleen, liver, lungs and muscle tissue. The kidneys eliminate 30% of the Pt introduced during the first 72 hrs. after injection. Peter Masucci

The pharmacologic action of palladium chloride. G. Orestano. *Boll. soc. ital. biol. sper.* 8, 1154-6 (1933).—In the organism  $\text{PdCl}_2$  is transformed into metallic Pd directly and after conversion to  $\text{PdCO}_3$  and  $\text{Pd}_3(\text{PO}_4)_2$ . The Pd cation acts intensely and immediately on the heart and on the red corpuscles, less quickly on the kidneys. Death is rapid through cardiac lesions, gradual through renal lesions. The immediate M. L. D. is 0.05 g. per kg.; the delayed M. L. D. is 0.0186 g. per kg. of rabbit (period of survival 12 days). In proportion to the wt. of organ, the fixation of Pd is as follows: spleen > bone marrow > kidneys > liver > lungs > muscle tissue. P. M.

The physiologic action of methylglyoxal. Emilio Martini. *Boll. soc. ital. biol. sper.* 8, 1200-1 (1933).—Methylglyoxal was prepd. by oxidizing  $\text{Me}_2\text{CO}$  with  $\text{SeO}_2$ . The substance had a marked action on the vagus center but without any action on the peripheral vagal endings; it had an inhibiting effect on the peristaltic action of the guinea pig isolated intestine and diminished the height of the contractions of the isolated heart of the frog or rabbit without noticeable change of rhythm. P. M.

Benzoic acid intoxication. I. Benzoic acid and sodium glycolate. Marco Stassi. *Boll. soc. ital. biol. sper.* 8, 1224-6 (1933).—Na glycolate impeded the development of marasmus produced by Na benzoate when the latter was administered to guinea pigs in a daily dose of 1 g per kg. and also checked the decrease in wt. The urea-N ratio in animals receiving both substances fell within normal limits. The beneficial action of Na glycolate does not seem to be due to the formation of glycocon; the hippuric acid in the urine of the animals so treated showed only a small fraction of the total N. II. Benzoic acid and ammonium glycolate. Cataldo Zunino. *Ibid.* 1226-8. —The administration of  $\text{NH}_4$  glycolate to guinea pigs subjected to the action of Na benzoate did not arrest or diminish the endogenous destruction observed in such animals. The animal organism is incapable of utilizing  $\text{NH}_4$  salts. III. Benzoic acid and sodium citrate. Ugo Lombroso. *Ibid.* 1228-9. —Guinea pigs which received Na benzoate and Na citrate not only maintained but showed a tendency to increase their wt. The beneficial action of Na glycolate is, therefore, not due to the glycolate radical which is supposedly transformed to glycocon and subsequently synthesized into hippuric acid, but like Na citrate, it is due to the common radical Na. Org. salts in which the alkali metal is linked to an easily combustible org. acid and capable of maintaining and increasing the alk. reserve have this beneficial property. P. M.

The absorption of nitrogenous substances. II. The absorption of a casein suspension introduced into a Vella loop. Gaetano Sarzana. *Boll. soc. ital. biol. sper.* 8, 1230-2 (1933); cf. *C. A.* 27, 5800. —A casein suspension introduced into an intestinal segment was absorbed 25-30% within  $\frac{1}{2}$  hr. The non-absorbed fraction when mixed with intestinal secretion *in vitro* would require 24 hrs. to give by formal titration a N figure equal to that absorbed by the intestinal segment. If casein and pancreatic juice were introduced into the loop, the absorption in  $\frac{1}{2}$  hr. was very rapid (60%), approaching that of peptone. Formal titration *in vitro* of the non-absorbed portion showed that after 24 hrs the N figure did not reach that absorbed by the loop. These results do not favor the hypothesis that absorption takes place only after digestion in the intestine has proceeded to the amino acid stage.

III. Absorption of serum proteins introduced into a Vella loop. *Ibid.* 1232-4. —Serum proteins were not absorbed in any noticeable amts. by the intestinal epithelium within the period of 1 hr. The addn. of pancreatic juice to the serum proteins did not influence the absorption. IV.

Absorption of amino acid solutions introduced into a Vella loop. *Ibid.* 1235-7. —Solns. of amino acids (glycocon, alanine, glutamic acid, aspartic acid) introduced into a Vella loop were absorbed to a lesser degree than peptone. While peptone was absorbed about 60%, the amino acids, excluding alanine, were absorbed about 30%. Alanine was absorbed 50%. Peter Masucci

Studies on the metabolism of water. III. The influence of acids and alkalies, administered intravenously, on diuresis. Mario Saviano. *Boll. soc. ital. biol. sper.* 8, 1237-42 (1933).—Physiol. salt soln., 0.01N HCl or 0.01N NaOH were introduced into the jugular vein of a dog, at a rate of 3 cc. per min. and in a dose of 10 cc. per kg. body wt. The vol. of urine collected during the injection and  $3\frac{1}{2}$  hrs. after was noted. The results show: The amt. of urine eliminated during the injection and  $3\frac{1}{2}$  hrs. later is almost double after the administration of HCl, while the urine eliminated after the administration of NaOH is slightly less than that eliminated after the administration of NaCl. The amt. of urine eliminated  $3\frac{1}{2}$  hrs. after the administration of HCl is greater than the amt. of liquid introduced in circulation. The diuresis produced by HCl is ascribed to the passage of water from the tissues to the plasma. This hypothesis is supported by the facts that the protein content of the blood is reduced from 9% before to 7.2% after the HCl injection, and by a marked hypotonicity of the urine. P. M.

Alkalosis and excitability of the cortical sensory-motor centers. G. Martino and L. De'Palmis. *Arch. fisiol.* 32, 361-78 (1933). —Oral doses of 2-10 g. of  $\text{CaCl}_2$  or  $\text{NH}_4\text{Cl}$  have no influence on the excitability of the cortical centers of the dog. Pulmonary hyperventilation after doses of these salts does not cause changes, whereas it increases the excitability in non-treated dogs. The latter effect is probably caused by alkalosis. A. E. Meyer

The action of quinine, picrotoxin and atropine on the neuromuscular reflex activity. R. De Marco. *Arch. fisiol.* 32, 405-13 (1933). —Quinine and picrotoxin increase the reflex activity, the duration depending on the dose. Atropine has no influence. The action of caffeine, cocaine, strychnine and morphine on the neuromuscular reflex activity. *Ibid.* 414-20. Caffeine causes an increase even in small doses, cocaine also, but the effect is more accentuated in larger doses; its effect is less prompt but longer lasting than that of caffeine. Strychnine causes an increase in proportion with the dose. Small doses of morphine do not cause much change; large doses cause a very slight increase. A. E. Meyer

Pharmacodynamics and toxicology of tryptaflavine, rivanol and some other acridine derivatives. Marcel Levrat and François Morelon. *Bull. sci. pharmacol.* 40, 582-92 (1933); cf. *C. A.* 28, 2108, 5283. —The bactericidal action on *Staphylococcus*, *Es. coli* and *Fl. typhi* of the following substances was investigated: (1) Tryptaflavine, (2) Gonarine (3,6-diamino-10-methylacridinium chloride), (3) Rivanol, (4) 2,7-dimethyl-3,6-bis(methylamino)-10-methylacridinium chloride, (5) 3,6-diamino-2,7-dimethylacridinium chloride, (6) Rheonine, (7) Flavicide, (8) 3,6-bis(methylamino)acridine-HCl, (9) 2,7-dimethyl-3,6-diaminoacridinium chloride, (10) acridine-HCl. Nos. 1-3 are of highest antiseptic power; 10 is almost ineffective. The immediate lethal dose of (1) is 40 mg. per kg. in the rabbit, but 5 mg. is sufficient to produce lasting and often fatal lesions in the kidneys. The injurious effect on the kidneys does not permit the use of larger therapeutic doses than 0.1 g., which is frequently not sufficient in the treatment of gonorrhea. No. 2 shows the same characteristics as No. 1. The lethal dose of No. 3 is 60 mg. Doses of 40 mg. cause eventually some kidney irritation, which, however, is of short duration and never causes death. The other products tested have a toxicity at least equal to that of tryptaflavine. A. E. Meyer

The parenteral administration of magnesium sulfate in hypertension. Hurton L. Zohman and Bernard Sternberg. *Ann. Internal Med.* 7, 643-52 (1933). —It had a beneficial effect. John T. Myers

Experimental and clinical studies of ergotamine. V.

The action of ergotamine on the sympathetic nervous system stimulated by adrenaline. Studies of the metabolic rate, pulse rate, blood pressure, blood sugar and the total leucocyte count. John B. Youmans, Charles Trabue, Ralph S. Buvinger and Helen Frank. *Ann. Internal Med.* 7, 653-63(1933); cf. C. A. 25, 5929.—Ergotamine in 0.5 cc. subcutaneous doses partially inhibited the increase in the metabolic rate and the hyperglucemia induced by 1 mg. of adrenaline. It had no effect on 0.5 cc. doses of adrenaline. The injection of both substances gave a greater increase in blood pressure than adrenaline alone.

John T. Myers

Iodized oil in bronchiectasis, including a study of two cases following lobectomy. Joseph A. Weinberg. *Arch. Surgery* 27, 545-54(1933).

John T. Myers

Combination avertin-ether rectal anesthesia. Experiments on animals. Geo. H. Hunt. *Arch. Surgery* 27, 960 9(1933).—The combination is useful.

Radiothorium in myelogenous leucemia. II. Small doses. I. Zadek. *Folia Hematol.* 51, 1-31(1933); cf. C. A. 27, 5425.

John T. Myers

The relation of iron and copper to reticulocyte response in anemic rats. M. O. Schultz and C. A. Elvehjem. *J. Biol. Chem.* 102, 357-71(1933).—In severely anemic rats the administration of 0.3 mg. Fe with 0.01 mg. Cu causes a very rapid increase in the no. of reticular red blood cells to a max. of  $1.5 \cdot 10^6$  per cu. mm. in 4 to 5 days. The nos. then decrease rapidly while the hemoglobin and erythrocytes increase. The response to Cu alone is only about half as great as that to Cu + Fe, while Fe alone has no effect. This indicates that Cu can be supplemented by Fe stored in the body. Intraperitoneal injection of 0.08 g. hemoglobin has an effect similar to that of Cu with Fe. The feeding of liver fractions, active in pernicious anemia, but low in Cu and Fe, was without effect. The reticulocyte response from Fe alone obtained by Beard, Baker and Myers (C. A. 26, 759) is ascribed to the presence of sufficient Cu in the diet.

K. V. Thimann

Glycogen formation in the white rat after oral administration of propionic, butyric, valeric and caproic acids. H. C. Eckstein. *J. Biol. Chem.* 102, 591-4(1933).—The administration to rats by stomach tube of 0.2-1.0 g. of  $\text{EtCO}_2\text{H}$  led to an increase of 0-1% only in the liver glycogen. However, butyric, valeric and caproic acids, though absorbed, did not lead to the formation of any glycogen.

K. V. Thimann

Permeability of the placenta for barbituric derivatives. R. Faltre. *J. pharm. chim.* 18, 417 18(1933).—See C. A. 27, 5418.

S. Waldbott

Habituation and cumulation phenomena. III. The antagonism of some barbituric acid derivatives. M. R. Bohnemann. *Arch. expl. Path. Pharmacol.* 172, 645 56(1933); cf. C. A. 27, 5816.—The administration of phanodorn to dogs prevents the antidiuretic action of phanodorn, phenobarbital or prominal given later the same day. The antidiuretic action of tonephin cannot be so prevented. The efficacy of hypnotics in preventing antidiuresis varies inversely with the ease of detoxication *in vivo*.

The hydrogen-ion concentration in the intestinal canal of some blood-sucking arthropods. P. P. Popov and R. D. Golzova. *Arch. Schiffs-Tropen Hyg.* 37, 465-6(1933).—The values ranged from pH 6.2 to 7.8.

Harry Eagle

Utilization of proteins and iron of vegetable origin in the maturation of eggs of *Culex pipiens*. P. de Boissezon. *Compt. rend. soc. biol.* 114, 487-9(1933).

L. E. Gilson

Inhibition of chorda formation of Triton embryos by chemical means. F. E. Lehmann. *Naturwissenschaften* 21, 737 8(1933).—The influence of chemicals (chlorotone) on the lens formation of *Rana fusca* has recently been described (*Rev. suisse Zool.* 40(1933)). The chorda formation of *Triton* can be influenced likewise while the development of other organs remains normal. Treatment of sprouts of *T. alpestris* during the first half of the gastrulation phase with LiCl soln. of increasing strength during 24 hrs. at const. temp. followed by growth in an indifferent medium resulted in larvae with typically changed organs, all deprived of the trunk chorda. The effect of Li is attributed to a change in carbohydrate metabolism which in turn influences the chorda formation. Cf. Woordeman (C. A. 27, 4312); Fischer and Wehner (C. A. 27, 5379); Lindahl, *Arch. Entwicklungsmech. Organ.* (Abt. D., Z. Wiss. Biol.) 128, 663(1933).

B. J. C. van der Hoeven

Protozoa. IV. Lethal effects of x-radiation of a sterile culture medium for *Colpidium campylum*. C. V. Taylor, J. O. Thomas and M. G. Brown. *Physiol. Zool.* 6, 467-92(1933); cf. C. A. 27, 3234.—The protozoan was killed by x-rays whether these were applied directly to the organism, to the sterile media or to the tap water used in prep. the medium. The toxicity was due to  $\text{H}_2\text{O}_2$ , the presence of which was demonstrated by the use of  $\text{TiCl}_4$ . If the water was carefully freed from  $\text{O}$  before radiation no peroxide or toxicity appeared. Org. materials added to the water before or after radiation nullified the toxicity.

Milton Levy

The action of hormone extracts injected into anura tadpoles. Giorgio Schreiber. *Boll. soc. ital. biol. sper.* 8, 1181 4(1933).

Peter Masucci

Reduction of the wings in *Selepia bilunaria* Esp. after feeding with leaves impregnated with manganese. H. Lemche. *Biol. Zentr.* 53, 591-600(1933).—The leaves were treated with a 1.3% soln. of  $\text{MnSO}_4$ . Twelve out of 735 individuals had reduced wings; in 2 they were missing. No reduction was found in 1185 controls.

A. E. Meyer

Protein digestion in gastropods. Sven Hörstadius. *Biol. Zentr.* 53, 645-50(1933).—Colloidal Au imbedded into fibrin was used for the investigation. Some species show a protein assimilation by phagocytosis. Generally a true extracellular digestion is observed.

A. E. Meyer

Mineral content of muscle tissue of fresh water fish under the influence of increasing mineral salt content of the water. S. Kaplauskil and N. Boldireva. *Biochem. Z.* 265, 422-5(1933).—Increasing the NaCl and  $\text{CaCl}_2$  content of the water to 1.5-2% causes a corresponding rise in the cation content of the muscles but has no effect upon the compn. of the blood. On the contrary, the Cl content of the blood increases markedly while in the muscle substance it is unchanged.

S. Morgulis

The purine content of fish and amphibians. Emil Stransky. *Biochem. Z.* 266, 287-300(1933).—The end products of protein metabolism in fishes and amphibians are urea and  $(\text{CH}_3)_2\text{NH}_2\text{O}$ , and of purine, urea and  $\text{NH}_3$ ;

in reptiles and birds the corresponding end products are uric acid; in mammals, urea and allantoin, while in man and anthropoid apes, urea and uric acid, *ssp.* Neither uric acid nor allantoin can be detected in fish or amphibian urines. The livers of these animals change allantoin and uric acid to urea which was definitely identified as the xanthidrol compd. Oxalic acid is not obtained in the enzymic decompn. of purine bodies. The application of Ehrlich's aldehyde reaction is not applicable since it is given by both allantoin and allantoic acid. It is also pointed out that the Fosse glyoxylic acid reaction for allantoic acid is not characteristic. S. Morgulis

**Chemotactic response of *Rhabditis filiformis* B. Ryoseki Taniguchi.** *Proc. Imp. Acad.* (Tokyo) 9, 432-5(1933).—*Rhabditis filiformis* B., a soil nematode, is generally attracted to acids, to inorg. more than org. acids and less to alkalis. It acts independently for most salts except  $\text{KMnO}_4$ ,  $\text{AgNO}_3$ ,  $\text{HgCl}_2$ , alum,  $\text{CuSO}_4$  for which it has no attraction. The nematode displays a slight attraction for MeOH and EtOH, but not for  $\text{CHCl}_3$ . It is not attracted by acid or basic dyes. E. W. Scott

**Analyses of eggs in relation to the adaptation of fish to environments of different salt contents.** Th. Busniti and N. Gavrilescu. *Bull. sect. sci. acad. roumaine* 15,

208-14(1932).—Analyses of the eggs of *Cyprinus carpio* and *Alosa pontica* (Danube herrings) are given. With the latter, those obtained from fresh water tend to have a higher ash content (mean 6.5%) than those living in salt water (mean 5.7%). The differences in fat content, 13.2 and 14.6%, and I no., 59 and 82, resp., are in the opposite sense. Figures are calcd. on the dry wt.

K. V. Thimann

**Studies on the constituents of the leaves of *Solanum tuberosum* determining the nutrition of larvae of *Leptotarsa decemlineata*.** M. Raucourt and B. Trouvelot. *Compt. rend.* 197, 1153-4(1933).—The larvae of *Leptotarsa decemlineata* will not eat the aq. ext. of potato leaves, but will eat the residue. The edible material is completely extd. with alc., the ext. being eaten and the residue not. On recombination, the mixt. is eaten as readily as the original leaves. On fractionating the alc. ext. the edible material remains in the unsaponifiable fraction; it is not extd. with benzene,  $\text{Et}_2\text{O}$ ,  $\text{CHCl}_3$ ,  $\text{Me}_2\text{CO}$  or petr. ether; it is not destroyed by drying for 8 hrs. at  $105^\circ$  and is non-volatile. It is destroyed when the leaf ext. is allowed to ferment, but if fermentation is prevented by  $\text{CHCl}_3$  it keeps for some weeks.

K. V. Thimann

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

**Air conditioning reduces loss in stored raw materials.** Harry Stiner. *Food Ind.* 5, 498-500, 528(1933).—Controlled humidity prevents loss in quality of nuts, flour, cereal grains, corn meal and dried fruits through the action of microorganisms at increased moisture contents. Refrigeration is often a necessary adjunct to controlled humidification. C. R. Fellers

**Preservative action of benzoic acid.** G. Biermann. *Z. Fleisch-Milchhyg.* 43, 21-29, 41-45(1933).—A study of the preservative action of Na benzoate and the effect on color of blood and meat. George R. Greenbank

**The determination and significance of the gluten content of flour.** I. K. Greisenegger and V. Hafner. *Mühlenlab.* 3, 217-24(1933).—The principal errors involved in the washing of gluten are evaluated, and an improved method is proposed. Clinton L. Brooke

**The influence of  $p_H$  on the baking quality of wheat flour.** Holger Jørgensen. *Mühlenlab.* 3, 193-200(1933); cf. *C. A.* 27, 5830.—Expts. on 4 flours of like extn. and varying N contents (1.66-2.60), milled from soft Danish winter wheat and baked at different  $p_H$  levels with sufficient sugar always present to preclude yeast starvation, indicate that at least within a given varietal class, response to acid, like response to bromate ( $\text{KBrO}_3$ ), is closely correlated with N content. The literature on  $p_H$  and baking quality is reviewed and 13 references are given. Clinton L. Brooke

**The importance of soy-bean flour as a baking improver for wheat flours.** R. Dietz. *Mühlenlab.* 3, 209-14(1933); cf. *C. A.* 27, 5835.—The importance of soy-bean flour as a baking improver, especially for flour from German wheats, has been overstd. Although the addn. of soy-bean flour results in higher dough yield, accelerated fermentation, and improved crust color, the disadvantages as lowered vol., lowered fermentation tolerance in the proof, poor oven spring, coarse grain and texture, and undesirable crumb color are so great that its use is profitable neither for the miller nor for the baker. When used to increase the protein content of bread and other baked goods, soy-bean flour should be added in the final stage of fermentation. Since the flour has high water absorption, it may prove useful in tightening up weak and slack doughs. Baking expts. are reported showing the superior action of malt and chemicals as improvers. C. L. B.

**Determination of the grade of flour in bread.** K. Eble and R. Bretschneider. *Z. Untersuch. Lebensm.* 66, 314-17(1933).—The  $\text{P}_2\text{O}_5$  contents of 34 rye flours are given and mean values obtained. A method for the detn. of

$\text{P}_2\text{O}_5$  in bread is described and its use in estg. the flour grade used for bread production is discussed.

F. L. Dunlap

**The biuret reaction, the Trommer sugar test, and a simple new colorimetric sugar determination.** Ernst Berliner and E. Schmidt. *Mühlenlab.* 3, 187-92(1933).—The "hot biuret reaction" of Köhl (*C. A.* 27, 2734) is misleading when applied to flour suspensions, since the reducing sugars present give the yellow color of the Trommer reaction, which masks the blue-violet to violet-pink color of the true biuret reaction. In cold soln. the Trommer reaction is absent and the biuret reaction is more reliable. Colorimetric sugar detn.: Digest a 25% aq. flour suspension 30 min. at  $27^\circ$ , filter, add 5 cc. N NaOH to a 15 cc. aliquot, heat 5 min. in a boiling water bath, and compare the yellow to orange color with standards made with pure maltose in steps of 0.1%. The results check closely with the Lane and Eynon method. Köhl's hot biuret reaction is found useful for detecting rye flour in bread by means of foamy to red-brown turbidity characteristic of fructose.

Clinton L. Brooke

**The biuret reaction.** Hugo Köhl. *Mühlenlab.* 3, 205-8(1933).—Polemical with Berliner (preceding abstr.).

Clinton L. Brooke

**The use of refrigeration in the dairy industry.** Ch. Porcher. *Lait* 13, 1126-40(1933).—The use of refrigeration as a means of controlling chem. and bacteriol. changes in milk, cheese and butter is discussed.

A. H. Johnson

**Advantages of grading market milk.** James A. Tobey. *Milk Plant Monthly* 22, No. 12, 28(1933).

A. H. Johnson

**Pasteurizing milk.** F. Kieferle and L. Eisenreich. *Milchwirtschaft. Forsch.* 15, 348-66(1933).—A study of the effect of different temps. in various types of pasteurizers on total N, casein N, albumin N, albumose N, peptone N, residual N and acidity. The quantity of albumin coagulated indicated by loss of albumin N at  $74^\circ$  varies from 2.5 to 11%. The same pasteurizers at  $84^\circ$  coagulate 20-23%. The holding method which is most common in this country coagulates 20% by holding at  $63^\circ$  for 30 min. George R. Greenbank

**Composition of milk as affected by the amount of protein feed.** A. E. Perkins. Ohio Agr. Expt. Sta., *Bull.* 516(51st Annual Rept.), 69(1933); cf. *C. A.* 27, 4563.—None of the major constituents of milk such as fat, lactose, casein and ash, was perceptibly affected by even the most radical change in the protein content of the ration.

Approx. twice as much non-protein N was present in the milk of cows receiving very high protein rations as compared with cows receiving low-protein rations.

C. R. Fellers

**Bacteriological analysis of milk.** Irene Lipska. *Lait* 13, 1090-8(1933).

A. H. Johnson

**Effect of the addition of small quantities of iodine to milk on the rate of bacterial growth.** T. S. Sutton and W. E. Krauss. Ohio Agr. Expt. Sta., *Bull.* 516(51st Annual Rept.), 69-70(1933).—The presence of a small amt. of I in milk increases the rate of bacterial growth, probably through an increase of the rate of metabolic processes. Approx. 0.0001 g. of I per 100 cc. of milk seemed most favorable for bacterial growth. Bacterial growth was retarded in milk contg. 0.004 g. of I per 100 cc.

C. R. Fellers

**The freezing point and electrical conductivity of milk.** J. Krenn. *Milchwirtschaft. Forsch.* 14, 513-37(1933).—The av. f. p. for milk from individual cows and herds is  $-0.545^{\circ}$ . A correction formula is given when sour milk is used instead of fresh. Cond. at  $18^{\circ}$  varies between  $38.0 \times 10^{-4}$  and  $68.4 \times 10^{-4}$  reciprocal ohms. No relationship was found between f. p. and cond.

George R. Greenbank

**The detection of the salting of milk by the determination of the phosphorus to chlorine ratio.** R. Vivario and C. Stainier. *Lait* 13, 1073-81(1933).—These investigators found that the detn. of the P to Cl ratio as a method of detecting whether a milk had been watered and salted was inexact except for milks of known origin. This was due to the fact that P and Cl did not vary in the same manner or degree throughout the lactation period. Total Cl, total P, mineral P and sol. P, were detd. for milks obtained throughout the lactation period.

A. H. J.

**Determination of iron. Adaptation of the mercaptoacetic acid colorimetric method to milk and blood.** Gladys Leavell and N. R. Ellis. *Ind. Eng. Chem., Anal. Ed.* 6, 46-7(1934).—Take 5 cc. of milk, 0.5 g. of dried milk or 0.01-0.02 ml. of blood. Digest with 1-3 ml. of concd.  $H_2SO_4$  and 1-2 ml. of concd.  $HClO_4$  to oxidize org. matter. When the oxidation is complete, transfer to a 150-ml. beaker, dil. and make neutral to litmus by adding  $NH_3$  soln. Then make acid with 5-10 drops of concd.  $H_2SO_4$ . Add 1 ml. of mercaptoacetic acid reagent (4 ml. of the acid and 8 ml. of concd.  $NH_3$  soln. in 50 ml. of water) and 1-2 ml. of concd.  $NH_3$  soln. Compare the color with that of standards.

W. T. II.

**Use of dry skim milk in the manufacture of cultured buttermilk.** E. E. Alldredge and A. D. Burke. Ala. Agr. Expt. Sta., *Bull.* 239, 3-39(1933).—The addn. of dry skim milk to normal skim milk in quantities sufficient to raise the total solids 1% prior to heating and fermentation improves the body, texture and flavor of the resulting buttermilk. The addn. of dry skim milk also increases the viscosity of normal skim milk buttermilk and produces a product the curd of which is easier to break and smoother than that prepd. solely from normal skim milk. The dry skim milk also is beneficial in preventing the sepn. of whey. At a storage temp. of  $35-38^{\circ}F$ . the desirable phys. properties of buttermilk may be satisfactorily maintained for a period of several days.

C. R. Fellers

**The special position of goat milk and the composition of goat blood.** F. E. Nottbohm and K. Philippi. *Z. Unters. Lebensm.* 66, 289-301(1933).—So far as most of the constituents are concerned, there is no tangible difference between cow and goat milk. The Cl content of the latter is twice as great as that of the former. An attempt is made to account for this high Cl content in goat milk in the compn. of the ash constituents of the goat blood and goat-blood serum. Goat blood differs from that of other ruminants by having a high K content. In this respect goats may be classified between sheep and swine. No tangible difference is found in the ash constituents of the blood serum of cattle, sheep and goats.

F. L. D.

**The composition of the casein of goat milk.** Siegfried Rauchning. *Milchwirtschaft. Forsch.* 15, 390-401(1933).—The amino acids from the acid hydrolysis of goat-milk

casein are compared with those of casein from cow and "globin." The presence of cystine, hydroxyproline and hydroxyglutamic acid is not able to be established at this time.

George R. Greenbank

**Casein.** J. Brigandó. *Lait* 13, 657-77, 843-66, 965-89, 1098-1115, 1230-49(1933).—Casein was considered to exist in milk as a colloidal complex with dicalcium phosphate. Acid-casein and rennet-casein are obtained by action on this complex. On theoretical grounds the production of acid-casein results in a conversion of dicalcium phosphate to monocalcium phosphate and a progressive decalcification of Ca caseinate. This is accomplished by the use of  $HCl$ ,  $H_2SO_4$ ,  $AcOH$  or spontaneously by lactic acid produced in fermentation. Theoretically pure casein should be salt-free. This, however, is rarely the case. Theoretically, rennet-casein is an assocn. of 2 salts: one, the Ca paracaseinate obtained by reaction from the original Ca caseinate of the milk, the other, dicalcium phosphate which is entrained by the Ca paracaseinate during pptn. Rennet-casein is high in ash, contg. about 7.5%. Rennet-casesins lower in ash are obtained when acid milks are used in the prepn., although neutralization of the acid operates to yield rennet-casein of the usual ash content. In order to prep. an acid-casein low in ash content, it is necessary to ppt. the casein at a low temp. (not above  $25^{\circ}$ ) and to wash the curd with distd. water, the last washing water preferably acidified with  $HCl$  to  $pH$  4.7. Excess of acid for pptn. of the casein and vigorous stirring above what is required to distribute the acid do not lower the ash content of the acid-casein. Alkali caseinates ( $K$ ,  $Na$ ,  $NH_4$ ) are subject to perfect coagulation with rennet on the addn. of sufficient  $CaCl_2$ . The paracaseinate is obtained by acidification of the alk. casein soln. to which the rennet has been added. Methods of detg. the acidity of acid and rennet casesins are discussed. A moisture and salt-free acid-casein had a titrable acidity equiv. to 8.10 g. of lactic acid per 100 g. of casein. A rennet-casein had a titrable acidity of 2.1 g. of lactic acid per 100 g. of the dry product.

A. H. Johnson

**Bacterial analysis of ice cream.** F. W. Fabian. *Milk Plant Monthly* 22, No. 12, 68-70; *Ice Cream Trade J.* 29, No. 12, 19-20(1933).

A. H. Johnson

**Eliminating stale, metallic flavor from strawberry ice cream.** P. H. Tracy, R. J. Ramsey and H. A. Ruche. *Ice Cream Trade J.* 29, No. 12, 40(1933).—Stale, metallic or tallowy flavor was found to be due to oxidation of the butter fat and was hastened by the presence of Cu salts and a certain min. quantity of strawberries. The defect could be controlled by reducing the Cu content of the ice cream mix, by using dairy products of high quality, and by homogenizing at a high pressure (3000 lb.). The strawberry juice contained the material responsible for increasing the rate of oxidation of the fat, while strawberry seeds and fiber contained the material which operated to retard oxidation. Other fruits such as oranges, lemons and pineapples had similar oxidizing effects on butter fat when used in ice cream.

A. H. Johnson

**Iron determination in cream, butter and curd with respect to the manufacture of butter from cream containing iron.** G. Schwarz and Edith Müller. *Milchwirtschaft. Forsch.* 15, 321-48(1933).—The authors employ a colorimetric method which detects both forms of Fe in dilns. of 1-10 million. The reagent used is dimethylglyoxime which produces a rosy red color in this diln. Ashing in crucibles of various materials showed that porcelain crucibles gave the least variation. The authors study the effect of small amts. of Fe on the keeping quality as indicated by the von Fellenberg reaction. The methods for various products are described.

George R. Greenbank

**Studies of the consistency of Swedish butter. II. Influence of different factors on the hardness of butter.** Gunnar Wode. *Medd. Centralanst. försöksväsendet jordbruks. Mejeriavdel.* No. 46, 34 pp.(1933); cf. C. A. 25, 1918.—Standard samples of butter, contg. 1%  $NaCl$ , were packed in paper cartoons, sealed in glass containers and stored in ice and water ( $2^{\circ}$ ) for different periods. Hardness measurements were then made at  $15.0^{\circ}$ ; averages

are reported for 24 tests on 4 portions of each sample. Factors tending toward harder butter are: chilling the cream before or after ripening; holding cream at a low temp.; rapidity of warming chilled cream for churning; low ripening temp. in cream chilled before ripening, but high ripening temp. and low chilling temp. quickly reached, in cream chilled after ripening; length of storage time, with max. effect at about the f. p.; cooling the butter before working, in butter with soft tendency. In butter tending to be hard, this last factor decreases hardness. Greasiness and crumbliness apparently depend on the amt. of free fat and its degree of crystn. While King's theory of butter structure and the crystn. properties of butter fat do not fully explain the influence of hardness factors, it seems probable that hardness is governed by distribution of butter fat between fat globules and free fat, by the lubricity of the free fat, and by the firmness of the fat globules.

Julian F. Smith

**A study of seasonal variation in butter fat. I. Seasonal variations in carotene, vitamin A and the antimony trichloride reaction.** Roland G. Booth, Stanislaw K. Kon, Wm. J. Dann and Thomas Moore. *Biochem. J.* 27, 1189-96 (1933).—Colorimetric methods were used. Detns. of the intensity of the yellow color (carotene) were carried out on the untreated butter fats.  $\text{SbCl}_3$  blue values (vitamin A) were detd. on the untreated fats and the non-saponifiable residues. Data obtained on yellow color and blue value as detd. on the non-saponifiable residue were in good agreement with the established variations of the carotene and vitamin A contents of the butter corresponding with the quantity of grass or of green fodder available in the diet of the cow. Blue values on untreated butter fat proved valueless. In the practical assay of the total vitamin A content (with colorimetric methods), it is necessary that both the vitamin A and carotene contents should be taken into account.

Benjamin Harrow

**Butter flavors.** B. W. Hammer. *Natl. Butter and Cheese J.* 24, No. 23, 28-30 (1933).—H. reviews research to det. the constituents responsible for the characteristic odor of butter. Methods are given by which high biacetyl and acetylmethylcarbinol contents can be obtained in butter cultures. The addn. of biacetyl, acetylmethylcarbinol and other flavoring materials to butter is discussed.

A. H. Johnson

**Methods for the investigation of eggs.** K. Braunsdorf and H. Brinckmeier. *Z. Unters. Lebensm.* 66, 301-14 (1933).—A satisfactory detn. of the freshness or age of eggs is assocd. with all sorts of difficulties. The most advantageous of the methods for use in lab. investigations are discussed and critically evaluated. F. L. Dunlap

**Conserving the goodness of eggs by sharp freezing.** Leo D. Ovson. *Food Ind.* 5, 502-4, 508 (1933).—The carefully graded eggs are broken, strained, churned and frozen in 30-lb. cans at  $-12$  to  $-15^\circ\text{F}$ . About 72 hrs. are allowed for the freezing process. Storage of the frozen eggs is at  $0^\circ$  to  $-5^\circ\text{F}$ . The use of 5% by wt. of glycerol in the frozen yolks prevents gummy, lumpy particles from forming in bakery products, and permits the yolk to thaw out smoothly. Yolks packed with glycerol give increased baking vol. because of the affinity of glycerol for water. If sucrose or invert sugar is added to the yolks, the concn. is usually 10%.

C. R. Fellers

**The distribution of chlorine in developing hen eggs.** Kichinosuke Yamada. *Japan. J. Med. Sci.* II. *Biochem.* 2, 71-9 (1933).—Eggs of white leghorns fed a const. diet were used as the study material. The fresh eggs contained 162.6-178.7 mg. % of Cl, nearly three-fifths of which was found in the white of the egg. The shell contained only a trace of Cl. With the progressive development of the embryo a redistribution of the Cl in the different parts of the egg occurs. The same is essentially true of the water content, which serves to control the osmotic pressure. Generally the changes in the osmotic pressure are parallel to those of the Cl content. Five tables of data are given.

B. S. Levine

**The colorimetric determination of hydrogen-ion concentration of meat extracts and the use of this method in**

**judging meat.** C. F. van Oyen. *Z. Fleisch- Milchhyg.* 43, 429-31, 449-53 (1933).—A study of a no. of kinds of meat. Ten g. of fat-free finely ground meat is extd.  $\frac{1}{4}$  hr. with 100 cc. boiled distd.  $\text{H}_2\text{O}$  and filtered clear. Indicators are then added to the ext. and it is compared with  $\text{pH}$  standards. Most meats which have a  $\text{pH}$  6.2 are considered of good quality; for pork  $\text{pH}$  6.4 is required.

George R. Greenbank

**Studies on the chemistry and nutritive value of Miongtāš (Alaska pollack, *Theragra chalcogramma*) and its products, and on the improvement of the methods employed in its drying process.** Z. Ogura, K. Fujikawa and Y. Okuda. *Bull. Fishery Expt. Sta. Govt.-Gen. Chosen Ser. B*, No. 2, 229 pp. (1929).

E. J. C.

**Studies of the vitamin A contents of Norwegian canned fish products and their raw materials.** Gulbrand Lundé, Hans Kringstad and Kristoffer Vestly. *Tids. Hermetikind.* 19, 305-13 (1933).—Vitamin A contents were detd. in various fish products in terms of the blue value (B. V.) in a 20% soln., as measured by a modified Carr-Price test. The normal vitamin A content of cod-liver oil is 6-10 B. V.; in this study the following B. V. nos. were found: fresh bristling sardines, in the total fat 0.30-1.97; bristling liver oil 13.2; herring-body oil 0.15; herring-liver oil 8; herring sardine fat 0.7-1.8; mackerel-body oil (autumn catch) 0.3-0.4; mackerel-liver oil 200+ (about 25 times as high as in cod-liver oil); small mackerel-body oil 0.14-0.25; small mackerel-liver oil 15-20. Canned bristling sardines showed practically no loss as compared with the fresh fish; after 2 years storage, either in tins or in Al cans, the B. V. was the same as when newly canned. In the tabulated data figures are given both for B. V. (in 20% soln.) and for blue units in 1 g. of the product.

Julian F. Smith

**Regeneration of the reducing properties of oxidized lemon juice.** Sydney W. Johnson. *Biochem. J.* 27, 1287-9 (1933).—J. confirms Tillmans' observation (C. A. 26, 5619) that lemon juice, oxidized with indophenol, I or  $\text{H}_2\text{O}_2$ , can regain its reducing capacity when treated with  $\text{H}_2\text{S}$  immediately after oxidation.

B. H.

**Vinegar and its use in canning, especially of marine products.** Erling Mathiesen. *Tids. Hermetikind.* 19, 319-22 (1933).—Production and uses of wine vinegar and vinegar essence are described. In canning sardines, mackerel, etc., the  $\text{HOAc}$  concn. of the vinegar should not be over 2%, giving about 0.5% in the product after storage; higher strengths detract from the flavor and are more corrosive. Tests were made with herring sardines, canned with 2.0, 2.5, 2.9, 3.8, 4.2 and 4.9% strengths of vinegar and stored 2 years at  $10-15^\circ$ . At 2% the sardines kept well and there were no swells; above 4% all the cans were swells. For a like  $\text{HOAc}$  concn. some cans were packed in strongly salted vinegar (15%  $\text{NaCl}$ ), others with only 0.3%  $\text{NaCl}$ . Corrosion was more severe in the cans with 15%  $\text{NaCl}$ .

Julian F. Smith

**How to calculate sirup strengths quickly.** Wm. F. Robertson. *Food Ind.* 5, 501, 508 (1933); cf. C. A. 23, 2223.—The desired sirup strengths are readily made by adding water or sugar according to a series of experimentally made curves.

C. R. Fellers

**Recent acquisitions regarding the biochemistry of cacao. Their importance to its production.** F. Heim de Balsac. *Compt. rend. acad. agr. France* 19, 862-71 (1933).—Kernels of the cacao contain vitamin A and 2 sterols which the authors have called theabromosterols. These sterols possess antirachitic properties and appear worthy of consideration in evaluating cacao. The shells of the cacao are a particularly rich source of these sterols. From preliminary tests on animals the use of large amts. of chocolate in the daily ration does not appear harmful. For the use of cacao in chocolate manuf. it is proposed that the biochem. processes in the bean immediately after harvesting be stopped by autoclaving in alc. vapor and that no fermentation be allowed to take place until it can be carried out under carefully controlled conditions in the industrial plant.

J. R. Adams

**Chemistry of coffee.** Mario Taveira and Francisco F.

Córtes. *Rev. soc. brasil. quim.* 4, 145-60(1933).—The types of coffees, methods of analysis and typical analyses of the coffees are given. John Ladino

**Determination of caffeine in coffee.** Francisco F. Córtes. *Rev. soc. brasil. quim.* 4, 105(1933).—Place 1 g. of finely pulverized coffee in a 200-cc. beaker, add 2 cc. concd.  $H_2SO_4$  and place on a water bath for 15 min. Add 50 cc. boiling water, allow to remain on the water bath 15 more min. and filter while hot through a plaited filter, washing many times with boiling water. Allow to cool and add strong NaOH soln. until alk. Add 60 cc. of  $CHCl_3$ , stir and decant through a filter paper moistened with  $CHCl_3$ , receiving the filtrate in a weighed dish. Wash 2 or 3 times with 25 cc.  $CHCl_3$ . Carefully evap. to dryness and place over  $H_2SO_4$  in a desiccator until const. J. Ladino

**Tea leaves. Tannin from fresh tea leaves.** Yasuyoshi Oshima and Teruo Goma. *J. Agr. Chem. Soc. Japan* 9, 948-52(1933).—The dry leaves were extd. with  $H_2O$ , and Pb acetate was added to the ext. The first brown ppt. was removed and then the yellowish white ppt., which occurred next, was collected and decompd. with  $H_2S$ . The filtrate was neutralized with  $Na_2CO_3$  and evapd. in  $CO_2$ . The concd. soln. was extd. with  $EtOAc$ .  $CHCl_3$  was added to the ext. The ppt. was dissolved in hot  $H_2O$  and kept in an ice box. Tannin crystd. out as a white needle, m. 227°. The yield for the fresh leaves was 0.2%. The residue of the  $EtOAc$  ext. was acidified with  $H_2SO_4$  and then extd. with ether. Quercetin, m. 296°, was obtained from the ext. The Ac deriv., m. 188°, and the Me deriv., m. 166°, were prepd. Five OH groups were proved in the mol. The formula  $C_{14}H_{14}O_7$  was detd. \*The chem. and phys. properties were somewhat different from Tsujimura's tea tannin. Cryst. tannin was oxidized with  $O_3$  in  $Me_2CO$ . A red needle,  $C_{12}H_{12}O_8$ ,  $[\alpha]_D^{25} = -70.22^\circ$ , was obtained. V. Kihara

**Analyses of live stock feed with respect to their albuminoidal substances.** Stan. Reynaert. *Agricultura* 36, 238-45(1933).—The albuminoidal substances are divided into 3 groups: crude, pure and indigestible, and from these is derived a fourth group of crude and pure digestible materials. The crude albuminoidal material is detd. by the Kjeldahl method, while the pure albuminoidal substance content is detd. by the Stutzer procedure. The indigestible material is detd. by treating a 2-g. sample with 200 cc. of distd.  $H_2O$ , 2 g. of pepsin, a little thymol and 0.2 cc. of HCl (sp. gr. 1.20-1.21°). This mixt. is held at 37° for 48 hrs., and every 2 hrs. 0.2 cc. of HCl are added until there is 2 cc. present in the mixt. The solid is filtered off, washed with distd.  $H_2O$  to a neutral reaction and the N is detd. by the Kjeldahl method. The results obtained by these methods give very satisfactory and comparable figures. J. R. Adams

**Studies of feed value of early hay.** Ford S. Prince, Paul T. Blood and G. P. Percival. *N. H. Agr. Expt. Sta., Circ.* 41, 6 pp.(1933).—Early-cut grass hay carries a greater percentage of protein and more protein per acre than later cuttings. In general, to be of greatest nutritive value, grass hay should be cut previous to the period of bloom. A difference of only 30 days in time of cutting hay means a difference of at least 50% in the digestible protein per acre in favor of the early-cut hay. Early-cut hay carries more moisture and is thus more difficult to make. C. R. Pellers

**A type of laboratory silo and its use with *Crotalaria*.** W. M. Neal and R. B. Becker. *J. Agr. Research* 47, 617-25(1933).—Typical silage was produced in lab. pit silos of 2000-2500 lb. capacity with *Crotalaria* forage. Chem. changes and losses of nutrients were of the same order as usually are encountered in large silos with other crops. Conditions more nearly comparable to those in large silos were secured than appear to have been obtained heretofore by others working with small exptl. silos of other kinds in the ensiling of legumes. *Crotalaria incana* and *C. intermedia* forages made palatable silage which was eaten readily by cattle. *C. spectabilis* silage was also eaten readily, but its possible toxicity requires further

investigation. *C. striata* does not seem to be adapted for use as a livestock feed. W. H. Ross

**Surface tension of edible oils (Canals, Ramahenina-Ranaivo)** 17. Buffer intensities of milk and milk constituents (Whittier) 11A. Biuret reaction as applied to food chemistry (Kühl) 17. Pb crystal glass and its investigation from a hygienic standpoint (Keim, Raeder) 9 19. Baking yeasts (Fr. pat. 751,602) 16.

**Concentrated food.** Schokoladenfabrik Mauxion m. b. H. Ger. 581,567, July 29, 1933. Cocoa powder is heated with an aq. soln. of sugar and an acid such as  $HCO_2H$  of concn. 0.05 to 0.15 N.

**Flour.** Tres Gyógyszer-Végyészeti Ipari És Kereskedelmi R. T. Fr. 751,265, Aug. 30, 1933. See Brit. 385,796 (C. A. 27, 3261).

**Soy-bean flour.** Wm. L. Shellabarger (to Shellabarger Grain Products Co.). Brit. 397,692, Aug. 31, 1933. See U. S. 1,867,541 (C. A. 26, 4657).

**Treating soy beans, etc.** Michele Bonotto. Brit. 397,482, Aug. 21, 1933. Soy beans and other leguminosae contg. acrid tasting and pigmented substances are immersed in an aq.  $SO_2$  soln. until the tissues are thoroughly penetrated and the material expanded, moderate heat being then applied to liberate the  $SO_2$  from the soln. in the tissues and expel excess  $SO_2$ . The treated beans may be ground to flour.

**Composition for use as an auxiliary ingredient in making yeast-leavened bread.** Charles H. McIntosh (to C. J. Patterson Corp.). U. S. 1,936,636, Nov. 28. A mixt. which may be formed of Ca acid phosphate 0.2,  $(NH_4)_2SO_4$  0.028,  $KBrO_3$  0.0005 and  $KIO_3$  0.0004 parts per 100 parts of flour used is employed in bread making.

**Baking powder.** Heinrich Schott. Ger. 583,779, Sept. 9, 1933. Baking powder is made up of basic K salt, especially carbonate, acid phosphates and a moisture-absorbent such as kieselguhr.

**Shortening composition for bakery products.** Stroud Jordan (to Ross and Rowe, Inc.). U. S. 1,936,718, Nov. 28. A fat is used with a preformed emulsion of lecithin in an aq. soln., the lecithin being present in small proportion as compared to the amt. of the fat.

**Sea water.** Abel Boulet. Fr. 752,895, Oct. 2, 1933. The nutritive and vital properties of sea water are rendered available by using it for breadmaking or in the cooking of other food.

**Margarine, etc.** Bruno Behrend. Fr. 751,123, Aug. 28, 1933. Malt wort or malt ext. and lipid substances, particularly lecithin, or substances resembling lipoids, such as sterols, e.g., cholesterol, are used in the manuf. of margarine or other edible fats.

**Cheese.** Felix M. Frederiksen (to Premier-Pabst Corp.). U. S. 1,936,872, Nov. 28. For improving the texture of emulsified, processed cheese to which a Na salt emulsifier such as  $Na_3PO_4$  has been added, the plastic emulsified product is thoroughly mixed with a small proportion (suitably about 1%) of a highly sol. edible alk. earth salt such as  $MgCl_2$ .

**Cheese.** Fernand Reignier. Fr. 752,990, Oct. 4, 1933. Melted cheese is subjected to a surface washing with pure or slightly salted water to refine it and form a crust.

**Desiccated milk product.** Herbert E. Otting (to M. & R. Dietetic Laboratories, Inc.). U. S. 1,937,527, Dec. 5. A product emulsifiable with water is prepd. by adding to a normal high-fat liquid milk product a portion of non-fat milk solids, desiccating the resulting mixt. and mixing it with a separately desiccated normal low-fat milk product. On standing, an emulsion of the product with water develops a cream line.

**Vegetable oil.** Enrique Delucchi. Fr. 752,876, Oct. 2, 1933. An oil for use as a food or lubricant is obtained from the seed of *Silybum marianum* (thistles) by any extn. method.

**Apparatus and method for preserving animal and vege-**

table materials during storage and transport by controlling the composition of the surrounding atmosphere by treatment with reversible physical or chemical absorbents for carbon dioxide. Franklin Kidd. Brit. 397,848, Aug. 29, 1933.

Use of glucose in preparing extracts from animal and vegetable substances. Francis C. Nicholas. U. S. 1,937,410, Nov. 28. Materials such as carrots, beets, onions, soy beans, lettuce, celery, liver, pancreas or "ordinary meat" are reduced to a pulpy state, the pulpy material is treated with glucose, and the pulp and fluid are subsequently sepd.

Amino acid salts from albuminous material. Karl Bromig. U. S. 1,938,512, Dec. 5. Albuminous material such as offals or malting barley is digested with  $H_2SO_4$  until the material is decompd. into amino acids of low mol. wt.; a Ca compd. such as lime is added to the resulting soln. to ppt. the  $H_2SO_4$  as  $CaSO_4$ , the latter is filtered out, the filtrate is neutralized (suitably with NaOH), and the resulting neutral filtrate is decolorized with decolorizing C and then evapd. to recover a dry pulverulent salt mixt. which may be used instead of NaCl for flavoring foods.

Apparatus for concentrating fruit juices. Mihan K.

Seraillan. Fr. 42,620, Aug. 23, 1933. Addn. to 644,180 (C. A. 23, 1699).

Deaerating freezing system for liquids such as citrus fruit juices. Ralph V. Grayson (50% to organizers of a corp. to be formed and known as Refrigeration Patents and Processes, Inc.). U. S. 1,938,522, Dec. 5. Various features of construction and operation of a vacuum freezing system are described.

Coffee preparations. Hanns Dyckerhoff. Fr. 753,692, Oct. 21, 1933. See Brit. 394,621 (C. A. 27, 5841).

Food for animals. Kenneth Cookson. Brit. 398,167, Aug. 28, 1933. A N-rich food, comprising products of animal origin and (or) vegetable products, which has not been heated, is triturated, and salts of Ca, K, Fe, P and Cl and (or) I are incorporated in amt. not less than 5% of the total wt., the mixt. being molded. Thus bean meal, bran,  $Ca_3(PO_4)_2$ , NaCl,  $CaCO_3$ ,  $Fe_2O_3$ , and KI are triturated, heated to reduce the moisture content, mixed with molasses and molded into tablets or cakes.

Preserving forage. I. G. Farbenind. A.-G. Fr. 754,001, Oct. 30, 1933. Green forage is preserved by mixts. or solid mol. compds. of  $H_2PO_4$  and primary alkali or Ca phosphate, e. g.,  $NaH_2PO_4 \cdot H_2PO_4$

### 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

Reform of teaching methods of chemical technology. A. W. Schmidt. *Angew. Chem.* 46, 791-2(1933).—A discussion of the problems of German chem. engineering institutions with regard to lab. training. K. K.

Modern solvent industry. E. W. Reid. *Ind. Eng. Chem.* 26, 21-3(1934). E. H.

Solving difficult solvent-recovery problems with silica gel. Adolf Koopmann. *Kunststoffe.* 23, 205-7(1933).—The advantages of silica gel in solvent-recovery systems are discussed and illustrated. J. W. Perry

A study of solvents for methane. V. A. Karzhavin and S. Yu. Gerchikova. *J. Chem. Ind. (Moscow)* 1933, No. 7, 26-32.—The soly. of  $CH_4$  in low-boiling benzene is sufficient to warrant its use in removing this gas from H-N mixts. Low temp. and high pressure should be used. Kerosene and heavier oils are not satisfactory.

H. M. Leicester  
Studies in agitation. III. The simple agitator as a classifier. A. McLaren White and S. D. Sumnerford. *Ind. Eng. Chem.* 26, 82-3(1934); cf. C. A. 27, 5842.—Further expts. on the distribution of sand suspended in water are reported. The coarse material was found to be coned. beneath the paddle agitator and the fine was distributed irregularly throughout the water. L. W. T. C.

Cooling condensing water. F. Johnstone Taylor. *Steam Engr.* 2, 545-7; 3, 25-7(1933). A. H. Emery

Problems of technical reactions. I. Decomposition of carbon compounds (cracking, sugar splitting). Otto Schmidt. *Z. Elektrochem.* 39, 969-81(1933); cf. C. A. 28, 233.—A review. E. H.

Air-raid protection by artificial fogs. Wilhelm Holzamer. *Kolloid-Z.* 65, 377-8(1933).—A review of ideal specifications and patents relating to the manuf. of artificial fogs. Arthur Fleischer

A systematic classification of chemical warfare agents. Albert Hloch. *Z. ges. Schiess-Sprengstoffes.* 28, 396-8(1933).—The chem. warfare agents are classified on the basis of their physiol. action into 2 main groups, irritant agents with secondary toxic action (Group I) and toxic agents with secondary irritant action (Group II). Each of these groups is subdivided into 2 subgroups. Several agents which do not comply strictly with the properties of any subgroup are classified separately under the subgroup to which they most nearly belong. German wartime code names and the markings on German wartime shell in which they were used are also indicated. Group I, subgroup 1 (eye irritants, secondary toxic action, high volatility (more than about 0.1 mg./l.)): xylyl bromide, benzyl bromide, benzyl iodide, bromobenzyl cyanide, bromoethyl acetate,

iodoethyl acetate, chloroacetone, bromoacetone, iodoacetone, bromoethyl methyl ketone, phenylcarbamylamine chloride, acrolein. Chloroacetophenone and bromoacetophenone are classified separately under this subgroup. Subgroup 2 (nose and throat irritants, secondary toxic action, low volatility (less than 0.005 mg./l. at 20°), smoke agents): diphenylchloroarsine, diphenylcyanoarsine, diphenylaminechlorarsine. Group II, subgroup 1 (respiratory poisons with little irritant action, high volatility (more than 20 mg./l. at 20°)): chlorine, phosgene, trichloromethyl chloroformate. Chloropicrin, ethyldichloroarsine and methyldichloroarsine are classified separately under this subgroup. Subgroup 2 (vesicants with lasting effect, low volatility (less than 0.6 mg./l. at 20°)): dichlorodiethyl sulfide, dibromodiethyl sulfide, chlorovinylidichloroarsine. A. L. Kibler

The gas mask in the service of the worker. (The gas mask in industry.) Erich Neitzel. *Gasmaske* 5, 158-65(1933).—Accidents are described which occurred in industrial plants in Germany during the year 1931 and which could have been prevented by the use of gas masks. Injuries from such causes amounted to 1408 of which 249 proved fatal. A. L. Kibler

The design and equipment of a gas-protected station for the care of war-gas casualties. Otto Muntsch. *Gasmaske* 5, 175-85(1933).—The Gas Station is designed for erection by large manufacturers of poison gases but is also intended to be used in the general scheme of protection against war gases in case of a war on German territory. A. L. Kibler

Gas war on the Vulcano Island (analysis of volcanic gases). F. Bernauer. *Gasmaske* 5, 166-73(1933).—Analyses were made of volcanic gases collected on the Vulcano Island in the Lipari group. Of 19 samples collected in shallow water off shore the analyses ranged as follows:  $H_2S$  10-25% (extreme values 4.5-52%),  $CO_2$  30-96%,  $O_2$  0-8%. Samples collected in the crater ranged as follows: acid gases ( $SO_2$  and  $CO_2$ ) 82-92%;  $H_2S$  6-11%; undetd. 1-12%. Temps. as high as 560° were measured where the gases emerged. A. L. Kibler

Heat transfer in mercury systems. W. T. Moore. *Mech. Eng.* 55, 748-50(1933).—Superheated Hg vapor was cooled and condensed inside an exptl. coil condenser. Water was heated, vaporized and superheated outside the coil to abstract the heat content of the Hg. Approx. overall heat-transfer coeffs. from condensing Hg to boiling water were estd. to be between 200 and 400. L. W. T. Cummings

The recent laws of heat flow by convection. Jean

Merlan. *Chaleur & ind.* 14, 467-77(1933).—A math. discussion of the more recent developments in heat flow by convection. Exptl. verifications are presented as far as available for gases and liquids. Karl Kammermeyer

Notes on the heat insulation of a vacuum still. Otto Krebs. *Chem.-Ztg.* 57, 861-3(1933).—Detailed calcs. for the insulation of a still, column, heat exchanger, and pipe lines are carried out with the latest available data. Karl Kammermeyer

Dammer, Otto: *Chemische Technologie der Neuzeit*. 2nd ed., enlarged. Revised and edited by Franz Peters and Herm. Grossmann. Bd. II. Tl. 2. Cooling gases. Siemens-Schuckertwerke A.-G. (Richard Heinrich, inventor). Ger. 581,865, Aug. 12, 1933. Hot gases, especially furnace gases, are cooled ready for elec. cleaning by intermixing with a current of supercooled gas supersatd. with a mist.

Separating gases by liquefaction. Mapag Maschinenfabrik Augsburg-Plattling A.-G. Fr. 753,726, Oct. 23, 1933. In sepg. gaseous mixts. of low b. p. into their constituents, with recovery in the liquid or gaseous state of the constituent of highest b. p., the vaporization of this constituent is effected only by the sensible heat of a part of the gaseous mixt. which is cooled not to satn. in an expansion machine. The washing liquid necessary for the rectification is produced independently of the vaporization of the above constituent in a particular liquefier by the sensible cold of the constituent. The process is applied to the sepn. of O from air.

Removing dust from gases by injecting steam and water. Joseph Jacquemotte. Fr. 754,264, Nov. 3, 1933.

Purifying liquefied gases. Lawrence J. Bowditch. Fr. 754,117, Nov. 2, 1933. Gases are passed through a heat exchanger to produce a change of heat such that several phases coexist in the heat exchanger, and a purified gaseous fraction is sepd. An app. is described.

Purifying liquefied gases. Walter F. Moeller. Fr. 754,118, Nov. 2, 1933. Liquefied gas is passed into a heat exchanger to vaporize a part of the liquid therein. A gaseous fraction is drawn off from the exchanger and cooled for recondensation. An app. is described.

Separating liquids. Compagnie des Fives-Lille. Fr. 752,960, Oct. 4, 1933. Mixed liquids obtained by the azeotropic method from distg. app. are sepd. by a decanter under pressure which allows the visible line of sepn. of the liquids to be brought to any level. The decanter is completed by the addn. of accumulator vats giving elasticity to the operation and allowing the various columns to be fed in a const. manner.

Separating colloidal mixtures. Gaston Laubier. Fr. 752,870, Oct. 2, 1933. The constituent elements of a colloidal gel are sepd. by a centrifuge, the speed of which is automatically regulated according to the nature of the gel to be treated, by a cam or other mech. or elec. arrangement.

Separating and recovering constituents of sea water. Alfred M. Thomsen. U. S. 1,937,995, Dec. 5. Suspended impurities are removed by the addn. of a sol. hydroxide such as lime. Lime and magnesia are jointly removed by adding an alk. carbonate such as  $\text{Na}_2\text{CO}_3$ . The residual sea water is partially concd. by evapn., Cl is then passed into it to recover Br, and the evapn. is continued until remaining salts are recovered.

Solvents. Fabrication française de produits du lait. Fr. 753,891, Oct. 26, 1933. A calcd. amt. of anhyd. Cl is caused to react directly with vapors of EtOH to convert it to AcOEt, passing through the stages of AcH and AcCl. Acetylacetone is prepd. by causing anhyd. Cl to react on a mixt. of vapors of EtOH and  $\text{C}_6\text{H}_6$  in the presence of anhyd.  $\text{AlCl}_3$ , then treating the resulting product with water to sep. acetylacetone. Cf. C. A. 27, 4670.

Coloring solvents, fats, etc. I. G. Farbenind. A.-G. (Hermann Rohrbach, inventor). Ger. 581,845, Aug. 3, 1933. Org. solvents, fats, waxes, etc., are colored by using azo dyes contg. no COOH or  $\text{HSO}_3$  groups and contg. 1 or more hydrogenated rings. Thus, the solvents, etc., are colored with the dyes, aminobenzene-azo  $\rightarrow$  tetrahydro-2-naphthol, or 1-aminonaphthalene-azo  $\rightarrow$  tetrahydro-1-naphthol.

Oil emulsions. Charles F. Pitts. Brit. 397,317, Aug. 24, 1933. A permanent colloidal suspension of oil in  $\text{H}_2\text{O}$ , suitable for removing oil, grease and dirt from locomotives, machinery, etc., is made by injecting minute amts. of oil into a high-pressure stream of  $\text{H}_2\text{O}$ , both being heated to approx. the same temp., e. g., 110-60° F. App. is described.

Deodorizing "industrial" carbon dioxide. Ralph H. McKee. U. S. 1,937,832, Dec. 5.  $\text{CO}_2$  is freed from odorous impurities by contacting it under pressure with about 0.01% of  $\text{O}_3$ . App. is described.

Apparatus for liquefying and storing gases such as carbon dioxide supplied in solid form. Thomas F. Lundy (to  $\text{CO}_2$  Appliance Co.). U. S. 1,938,034, Dec. 5. Various structural and operative details are described.

Solid carbon dioxide. I. G. Farbenind. A.-G. (Wilhelm Meiser, inventor). Ger. 579,624, July 1, 1933. A process is described for forming solid  $\text{CO}_2$  from precooled liquid  $\text{CO}_2$  by compression and cooling.

Apparatus for producing solid carbon dioxide. Maschinenfabrik Sürth Zweigniederlassung der Gesellschaft für Linde's Eismaschinen A.-G. Ger. 581,727, Aug. 1 1933.

Refrigerating system for separating gases such as in removing water vapor from air. Mathias Fränkl (to American Oxythermic Corp.). U. S. 1,936,622, Nov. 28. Various details of app. and operation are described.

Heat-exchange apparatus suitable for refrigerating systems. Alvin H. Baer (to Frick Co.). U. S. 1,937,802, Dec. 5. Structural features.

Refrigerating agents. Soc. anon. des ateliers de constructions mécaniques Escher Wyss. Fr. 753,946, Oct. 27, 1933.  $\text{BCl}_3$  is used as a refrigerating agent in cycles in which the agent is compressed.

Refrigerating liquid. Allgemeine Elektrizitäts-Ges. Ger. 583,683, Sept. 7, 1933. The working liquid of a refrigerator consists of  $\text{HCOOCH}_3$  and a 5-10% addn. of a low-boiling alc. such as  $\text{MeOH}$  or  $\text{EtOH}$ .

Respirators. Deutsche Gasglühlicht-Auer-G. m. b. H. Ger. 579,874, July 1, 1933. Catalytically acting water-sensitive filter layers of respirators contain a nitride of a metal of the 2nd group of the periodic table so that exhaustion of the air is indicated by development of  $\text{NH}_3$ .

Gas-proof masks. Maurice Baudou. Fr. 751,103, Aug. 28, 1933. One or more sheets of Cellophane are inserted between sheets of rubber or rubberized cloth, the Cellophane being perforated, if necessary, to adhere to the rubber, forming a mask impervious to yperite, etc.

Dielectric compositions. Frank M. Clark (to The British Thomson-Houston Co. Ltd.). Brit. 397,333, Aug. 24, 1933. A dielec. compn. comprises an aryl phosphate and a phenolic material, mixed or assoc. together without heat treatment, e. g., tritolyl or triphenyl phosphate and cresol or  $\text{PhOH}$ . Paper, e. g.,

kraft paper, is impregnated with the mixt. and used as the dielec. in condensers. Cf. C. A. 28, 52<sup>1</sup>.

**Dielectric materials.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 42,469, July 31, 1933. Addn. to 711,858. The material is composed of mixts. of neutral phosphoric esters, preferably arylphosphoric, with phenols or alcs. Cf. C. A. 28, 548<sup>2</sup>.

**Compound sheet material.** The British Thomson-Houston Co. Ltd., Geo. R. R. Bray and Reginald I. Martin. Brit. 397,243, Aug. 24, 1933. Fire-resistant, sound and heat-insulating compd. sheet material comprises surface layers of fibrous material, e. g., cotton or linen cloth, paper, asbestos, bonded by synthetic resin, and interior layers of felt, with or without layers of other

material, e. g., woven or sheet asbestos, the layers being united by synthetic resin or by intermediate layers of fabric or paper treated with synthetic resin.

**Cables, etc.** E. I. du Pont de Nemours & Co. Brit. 398,225, Sept. 11, 1933. A rubber insulated conductor is rendered oil-proof by a sheath of cotton, silk, asbestos or rayon fabric, impregnated with a (synthetic) resin soln., over which may be applied a cellulose lacquer or varnish coating. Modifiers, e. g., tritoly phosphate, triacetin, may be added to the resin to increase its flexibility.

**Electrical insulation.** Wm. B. Wiegand (to Binney & Smith Co.). U. S. 1,938,308, Dec. 5. Rubber insulation such as that used on wire contains dry raw carbon black 1.4-3% which serves to give increased resistivity.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**The water supplies of large and middle-sized German cities.** E. O. Stein. *Gesundh.-Ing.* 56, 583-5(1933).—Statistical data. M. G. Moore

**A comparison of hardness in the Dallas water before and after treatment in the city water plant.** W. D. Frazell and Henry Lewelling. *Field and Lab.* 2, 8-10(1933).—Data are given for total alky., and temporary and permanent hardness. M. G. Moore

**Water pretreatment works at Sacramento.** Don M. Hoffman. *Western Construction News* 8, No. 3, 75-8 (1933); *U. S. Pub. Health Eng. Abstracts* 13, W, 50(Apr. 29, 1933).—The treatment consists of coagulation, mech. filtration and chlorination. The new pretreatment works consists of a detritor with rotary traction agitator and sand-cleaning unit, aeration fields, mixing tanks, clarifiers and surfassetlers with sludge-removal units. From the surfassetlers the water goes to the filter beds. The pretreatment plant was built in 1924 and serves 100,000 people. C. R. Fellers

**Delicate floc formed in Ottawa water makes necessary a plant with unusual features.** A. D. Stalker. *Water Works Eng.* 86, 1143-6(1933).—The construction and operation of the plant are described. The raw water is dosed with alum, is very gently mixed so as not to break up the delicate floc by passing with spiral motion through the mixing basins, passes through settling basins without baffles (90% of the floc can be settled), and then to rapid sand filters. M. G. Moore

**Industrial water purification research.** Sheppard T. Powell. *J. Am. Water Works Assoc.* 25, 1577-88(1933).—Emphasis is given to embrittlement, boiler-scale and steam-purification research. D. K. French

**Progress in water purification.** George W. Fuller. *J. Am. Water Works Assoc.* 25, 1566-76(1933).—The survey covers the period 1869 to 1933. D. K. French

**The purification of water by activated charcoal.** Franz Krczil. *Kolloid-Z.* 65, 249-54(1933).—History of development and patent review covering methods of treating sewage, industrial waste waters, especially phenolic liquors, dechlorination, and special app. Arthur Fleischer

**Certification of water supplies used by common carriers.** R. E. Tarbett. *Trans. 30th Ann. Conf. State and Territorial Health Officers with U. S. Pub. Health Service*, 66-80; *U. S. Pub. Health Eng. Abstracts* 13, W, 32-3(Mar. 18, 1933).—Increased cooperation among states in the use of standard procedures has greatly improved certification. C. R. Fellers

**Mechanism of the sterilization of water by "verdunization."** P. Reiss and E. Téhoueyres. *Compt. rend. soc. biol.* 114, 1046-8(1933).—Hypochlorite equiv. to 0.1 mg. per l. added to well water having an oxidation-reduction potential of +387 mv. ( $r_H$  28.2,  $p_H$  7.4) raised the potential to +584 mv. ( $r_H$  34.5). This is high enough to kill *B. coli* and pathogenic bacteria. L. E. Gilson

**Successful experiments in use of prechlorination in the removal of manganese.** M. J. Davis. *Water Works Eng.* 86, 1192-3(1933).—The raw water of Wellsburg, W. Va. first passes over a coke aerator, then through a sedimentation basin, a pressure sand filter, and a clear well. Then

1/4 of the discharge flows through a zeolite softener of the pressure type, 3/4 being by-passed directly to the reservoir. It was found that the 1.0 p. p. m. of Mn in the raw water could be successfully removed by chlorination with 8.9 p. p. m. Cl<sub>2</sub> between the aerator and the sedimentation basin, all of the pptd. MnO<sub>2</sub> being removed in the latter or on the filter. The treated water showed no Mn. M. G. Moore

**Removal of aggressive carbon dioxide by contact beds of limestone or marble.** C. R. Cox. *J. Am. Water Works Assoc.* 25, 1505-22(1933).—Results at several exptl. plants are recorded. The softer limestones and marbles are preferable. For 1 m. g. d. beds 85 to 185 cu. yds. are considered ample. Size 1-a is recommended. The method provides automatic treatment for corrosion prevention for water of low alky. without aeration, and water of 50-100 p. p. m. alky. with aeration. D. K. F.

**Control of iron and manganese in filter sand.** Paul W. Frisk. *J. Am. Water Works Assoc.* 25, 1537-50(1933).—Fe and Mn oxides accumulated on filter sand can be removed by 6 to 12 hrs. soaking in a 10% NaOH soln. followed by washing. Apparently 0.1% Mn and 0.2% Fe in the sand bed have no effect on the quality of the effluent. Oxidation, coagulation and catalytic agents in the sand can completely remove Mn and Fe in a raw water. D. K. French

**Some aspects of trickling filter design.** H. G. Furphy. *Commonwealth Engr.* 21, 71-4(1933).—Such filters should be constructed so that (1) every particle of sewage comes in contact with O<sub>2</sub> and with the microorganisms which coat the filter medium; (2) air circulation is sufficient to supply enough O<sub>2</sub> and carry off CO<sub>2</sub> fast enough to prevent its concn. reaching more than 0.2%; and (3) vigorous growth of the organisms of the filter coating is maintained. A balance must be struck between small filter material which favors (1) and material of large size which favors (2). An organism continually bathed with sewage will not receive sufficient O<sub>2</sub>, so (3) requires intermittent flow, the length of interval between flow being unimportant. If no dry surface is available about the filter the breeding of the filter fly, *Psychoda alternata*, is retarded. M. G. Moore

**Proposed plan for ammonia-chlorine treatment in Chicago.** A. E. Gorman and H. H. Gerstein. *J. Am. Water Works Assoc.* 25, 1482-9(1933).—To meet the problem of increasing bacterial pollution, Chicago is prepg. to substitute the use of NH<sub>3</sub> and Cl for simple chlorination. Decreased velocity in action of NH<sub>3</sub>-Cl treatment has led to the idea of application at the intake cribs, rather than at the pumps. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> will be applied near the top of the intake shaft and Cl near the bottom, at the eye of the tunnel. There will be continuous control at the 68th St. Pumping Station. D. K. French

**Report of Committee on Control of Tastes and Odors in Public Water Supplies.** Martin E. Flentje, et al. *J. Am. Water Works Assoc.* 25, 1490-1504(1933).—A final report. A complete summary is given of the field covered, also the

detailed results of cooperative work with the "Spaulding threshold method of odor determination," in which increased confidence is placed. D. K. French

Sodium aluminate as an adjunct to lime-soda feed-water treatment. C. N. Ridley. *Steam Engr.* 3, 105-7(1933).—Suspended matter ( $Mg(OH)_2$ ) passing the filters after lime-soda treatment was removed satisfactorily by means of Na aluminate. Alden H. Emery

Automatic control instruments applied to the zeolite water-softening process. Eric Pick. *Instruments* 6, 215-18(1933). E. H.

Disposal of sludge at water-purification and softening works of the Mahoning Valley Sanitary District. W. H. Dittoe. *J. Am. Water Works Assoc.* 25, 1523-33(1933).—The wet sludge is pumped into artificial ponds, where further settling occurs. It is believed that when a pond is filled under favorable conditions the sludge will dry to about 50% moisture. The ultimate disposal is not settled. D. K. French

Should a water works treating river water return the sludge to the river? P. Timler. *Gesundh.-Ing.* 55, 66(1932); *U. S. Pub. Health Eng. Abstracts* 13, W, 34-5(Mar. 25, 1933).—In Glauchau there is insufficient flow in the River Mulde to prevent settling, putrefaction and nuisance. In general, the sludge should not be returned. C. R. Fellers

Water as a carrier of pathogenic bacteria. Hunziker. *Schweiz. Ver. Gas- Wasserfach. Monats-Bull.* 11, 301-10(1931); *U. S. Pub. Health Eng. Abstracts* 13, W, 34(Mar. 25, 1933).—According to the Swiss law pipes or tanks to hold drinking water must not be made of Pb, Pb-coated Fe or tin-coated Pb. After standing in the pipes water must not contain more than 1 mg. of Pb per l. Low pressure in pipes may lead to pollution from factory supplies. Swiss water supplies have improved greatly in sanitary quality by the installation of properly operated filters and chlorination plants. C. R. Fellers

Current research in water bacteriology. John F. Norton. *J. Am. Water Works Assoc.* 25, 1473-81(1933). Special reference is made to Brilliant Green Bile and the Dominick-Lauter Medium and the various methods for differentiation within the coli-aerogenes group. The present "standard" methods are far from perfect, and the more newly developed methods should be used with caution. D. K. French

Sanitary survey of artificial-ice plants. Warren J. Scott. *Conn. Health Bull.* 47, 11-15(1933); *U. S. Pub. Health Eng. Abstracts* 13, W, 32(Mar. 18, 1933).—Forty-one of the 50 plants obtained water from pure public supplies. All but 3 plants were equipped with pressure filters and used alum as a coagulant. Only 2 plants were rated "poor." C. R. Fellers

Ayr and its municipal works. J. Young. *J. Munic. County Eng.* 58, 1533(1932); *U. S. Pub. Health Eng. Abstracts* 13, W, 48(Apr. 29, 1933).—Sewage is screened and discharged at selected spots in the Firth of Clyde. The 2 sources of water supply are spring water and impounded moorland water. The latter is acid and must be neutralized to prevent Pb soln. The spring water has a hardness of 12° and is mixed with the moorland water and stored in a reservoir holding 2 days' supply. After settling, the water is filtered. C. R. Fellers

Industrial sewage in city sewage systems. H. Möhle. *Tech. Gemeindeblatt* 36, 205-9(1933).—Troubles in the mains due to industrial wastes include attacks upon the pipes by acids, production of poisonous or explosive gases or gas mixts., and clogging of the pipes by heavy sediment, particularly when fibers, as from paper mills, are also present. M. G. Moore

The chief line of development in sewage technic. K. Imhoff. *Gesundh.-Ing.* 56, 585-6(1933). M. G. M

Extending the settling basins at the sewage-treatment plant at Halle. Heilmann and Müller. *Gesundh.-Ing.* 56, 571-3(1933).—As ample digestion space was already available, the 4 adanl. 2-story units added had only 1 cu. m. of digestion space to 9.5 cu. m. of settling space, the settled sludge being transferred to the old plant for digestion. M. G. Moore

Apple wastes create operating difficulties in sewage plant. P. P. Pilcher. *Munic. Sanit.* 3, 485(1931); *U. S. Pub. Health Eng. Abstracts* 13, S, 22(Apr. 1, 1933).—Acid apple-plant wastes discharged into sewers cause heavy foaming and objectionable odors in Imhoff-tank sprinkling-filter plants. Remedies applied consist of spraying foam with liquor taken from just above the sludge line by pump, and use of chloride of lime. C. R. Fellers

Sanitation works in small towns. Tuckfield. *Gas- u. Wasserfach* 75, 30(1932); *U. S. Pub. Health Eng. Abstracts* 13, W, 34(Mar. 25, 1933).—The water and sewage works in Luben, 8000 population, are described. The ground water supply from 5 wells corroded Fe and Zn piping so badly that Cu and asphalt coating was applied. After this treatment the  $CO_2$  content increased from a trace to 18 mg. per l. Treatment by aeration, by spraying for Fe removal and rapid filtration was then supplemented by de-acidification by lime water at the rate of 900 l. per hr. for an hourly water demand of 64 cu. m. This gave the water an Fe content 0.15 mg. per l., no aggressive  $CO_2$  and a total hardness (German) of 3.36°. C. R. F.

Sterilization of water by silver. Sarrot du Bellay. *La Nature* No. 2887, 149-50(1932); *U. S. Pub. Health Eng. Abstracts* 13, W, 33(Mar. 18, 1933).—The catadyn process makes use of very finely divided Ag as a filtering medium. About 0.00006 g. of Ag per l. goes into soln. as Ag ion in combination with dissolved  $O_2$  of the water, and creates an elec. field fatal to bacteria and to some molds and enzymes. This small quantity of Ag is of no health significance. Water sterilized by the catadyn method possesses to a limited degree, the power of sterilizing adanl. raw water. The process is thus useful in maintaining the sanitary quality of the water in swimming pools. No preliminary treatment is required, and the cheapness of the equipment adapts the process to use on small supplies. C. R. Fellers

Some factors involved in the use of chloramines for the disinfection of swimming pools. A. H. Fletcher and E. C. Link. *Am. J. Pub. Health* 23, 1255-61(1933).—The use of chloramines instead of  $Cl_2$  alone requires certain extra tests and control to guard against its limitations. Some of these are (1) higher residuals—0.7 to 1 p. p. m., (2) control of the ratio of  $NH_3$  to  $Cl_2$  and of the free  $NH_3$  content of the water, (3) routine control of  $pH$  and (4) collection of all samples in  $Na_2S_2O_5$ -treated bottles. The duplicate series of tests run on ordinarily collected samples and dechlorinated collected samples showed a lag in the killing power of chloramines over the  $Cl_2$  on *Es. coli*. A moderate excess of  $Na_2S_2O_5$  when used as an antichlor was found to have no disinfecting effect.  $CuSO_4$  definitely and completely controlled algae or slime growth if added every second night at a dosage of 5 lb. to each 100,000 gal. of water. J. A. Kennedy

Recent progress made in plants for the purification and re-utilization of the water for swimming baths. W. A. Hoveman. *J. Inst. Sanit. Eng.* 36, 87(1932); *U. S. Pub. Health Eng. Abstracts* 13, Sw,5(Apr. 29, 1933).—The development of the present continuous purification systems is described. The best modern practice is to draw the water from the deepest part of the pool through a strainer. It may or may not be aerated before passing to the filters. Alum and soda are normally added as needed before filtering at the recommended rate of 200 gal. per sq. ft. per hour. After filtration, the water is aerated, heated and chlorinated so that a  $Cl$  residue of 0.2-0.5 p. p. m. is maintained in the bath. Ammonia- $Cl$  treatment is optional. C. R. Fellers

Bacterial pollution of swimming baths. III. Presence of bacteriophage in fresh, sea and sea-bath waters. B. L. Davis. *J. Roy. Army Med. Corps* 61, 18-25(1933); *U. S. Pub. Health Eng. Abstracts* 13, Sw,9(July 22, 1933).—Fresh sea water has a low bacterial count, but the count increases when the water is stored in sea-baths. After a short period the bacteria again decrease irrespectively of the no. of bathers. No demonstrable bacteriophage against staphylococci, pneumococci, dysentery types, *Es. typhi* or *Salmonella schottmülleri*, could be demonstrated i

the sea-bath water. Hence the decreased nos. of bacteria are not due to a bacteriophage. C. R. Fellers

**Experimental studies of natural purification in polluted waters. VIII. Dissolved oxygen in the presence of organic matter, hypochlorites and sulfite wastes.** Emery J. Theriault and Paul D. McNamee. *U. S. Pub. Health Repts.* 48, 1363-77 (1933).—Expts. were undertaken to test the extent of interference with the Winkler method by various forms of org. matter. The apparent loss of dissolved oxygen is progressively greater with increasing amts. of glucose, irrespective of the procedure used. The reaction between  $\text{MnSO}_4$  and the alk. iodide reagent is practically complete in 15 sec. at ordinary temp. when intimate contact between the dissolved O and the  $\text{Mn}(\text{OH})_2$  is maintained through the soln. Reasonably accurate results for dissolved O can be obtained even in the presence of 5000 pts. per million of glucose, provided the period of alkalization does not exceed 15-25 sec. Abbreviation of the period of alkalization is also effective in reducing interference due to peptone. Interference by sulfite wastes could not be overcome by use of the various modifications of the Winkler method. For these wastes add enough alk. hypochlorite reagent (1 M NaOCl in 0.1 M NaOH) to oxidize the sample, avoiding a great excess, mix well by inverting rapidly a few times, acidify the sample by adding 1 ml. of 10%  $\text{H}_2\text{SO}_4$  and add 1 ml. of 1 M KI or NaI to release  $\text{I}_2$ , shake, neutralize the liberated  $\text{I}_2$  with 0.1 or 0.025 M  $\text{Na}_2\text{SO}_3$ , with 0.2 ml. of starch soln. as indicator. Relatively low results will be obtained when more than 3 ml. of 0.05 M sulfite is required for the neutralization of the  $\text{I}_2$ . If only about 0.1 ml. of 0.05 M sulfite is required, insufficient alk. hypochlorite has been used. Add 1 ml. of the usual  $\text{MnSO}_4$  soln. and 1.3 ml. of alk.  $\text{I}_2$  soln. The period of contact with the  $\text{MnSO}_4$  should not exceed 40-50 sec. Titrate without delay, as a measurable loss of  $\text{I}_2$  occurs on standing. J. A. Kennedy

**Charcoal as a diluent for Paris green in the destruction of Anopheles larvae.** Paul F. Russell and Augustus P. West. *Philippine J. Sci.* 48, 291-7 (1932); *U. S. Pub. Health Eng. Abstracts* 13, Ma, 5 (Mar. 25, 1933); cf. C. A. 27, 800.—A dust spray of wood charcoal with 1% Paris green kills over 80% of *Anopheles* larvae in 4 hrs., and 100% of the larvae in 24 hrs. The particles of Paris green must be small enough to be ingested by the larvae, must be distributed to all parts of the breeding area, must float long enough for the larvae to devour them, and must not be dangerous to other living creatures. Charcoal floats much longer than Paris green, is inexpensive and easily distributed.

C. R. Fellers  
**Further observations on Chara fragilis in relation to mosquito breeding in Queensland.** R. Hamlyn-Harris. *Ann. Trop. Med.* 26, 519-24 (1932); *U. S. Pub. Health Eng. Abstracts* 13, Ma, 6 (Mar. 25, 1933).—*Chara fragilis* in its full-growing, fruiting or decomp. states has no deterrent value whatever on the breeding of *Stegomyia fasciata*, *Culex fatigans* or *Aedes notoscriptus*. C. R. F.

**Behavior of Cu and Zn and their alloys toward tap water (Haase) 9.** Should Cu [pipes] be coated with Sn? (Haase) 9.

**Purifying water.** Permutit A.-G. Ger. 584,696, Oct. 12, 1933. Water is aerated and deacidified by atomization in an air current. The treated water is then filtered.

**Purifying water.** Gustav Rittler. Fr. 751,543, Sept. 5, 1933. Water is purified by adding  $\text{H}_3\text{PO}_4$  and a sol. Ba salt (proportional to the amt. of sulfate in the water) and then adding a hydroxide of Ca, Mg or  $\text{NH}_4$ .

**Water purification.** Maufice Fontaine, François Sen-

tenac and Robert Cambier. Fr. 753,402, Oct. 16, 1933. Waste waters are purified by mixing them with activated muds at the origin, the purification taking place by simple contact during the flow.

**Apparatus for treating water with chlorine.** Filtration & Water Softening Proprietary Ltd. (Michael J. Martin and Walter R. Terry, inventors). Australia 7969/32, July 27, 1933.

**Means for preventing water containing chlorine from reaching apparatus for controlling the supply of chlorine for the treatment of water.** John C. Baker. Brit. 398,124, Sept. 7, 1933.

**Base-exchange water-softening apparatus.** Eric Pick (to Permutit Co.). U. S. 1,937,324-5, Nov. 28. Structural and operative details.

**Base-exchange water-softening apparatus.** Norman E. Brice (to Permutit Co.). U. S. 1,937,330, Nov. 28. Structural, mech. and operative details.

**Base-exchange water-softening apparatus.** United Water Softeners Ltd. Brit. 398,130, Sept. 7, 1933.

**Apparatus for regenerating zeolites.** Ward S. Calvert (to Refinite Co.). U. S. 1,937,034, Nov. 28. Various structural and operative details are described.

**Degassing water for boilers.** Rudolf Oertel. Ger. 583,526, Sept. 5, 1933. The gas is removed by active C and heating.

**Apparatus for controlling the concentration of boiler waters.** Gustav H. Karlsteen (to Dunlop Tire and Rubber Corp.). U. S. 1,938,072, Dec. 5. The flow of water is controlled in accord with the d. of a test portion of the boiler water cooled to a predtd. temp. for testing.

**Apparatus for regulating supply of anti-corrosive liquids to boiler feed water.** Frank O. Hutton. U. S. 1,937,893, Dec. 5. Various structural and operative details are described.

**Removing boiler scale.** David W. Haering. U. S. 1,936,714, Nov. 28. Fermented cactus juice is used as a scale-removing agent. Various details of prepn. are given.

**Destruction of microorganisms in water or sewage.** Georg Ornstein. U. S. 1,937,780, Dec. 5. Algae, bacteria, etc., are destroyed by the joint action of a Cu-contg. substance such as Cu chloride and dissolved Cl. App. is described.

**Method and means for supplying air or gas in finely divided form to sewage or other liquid in a tank.** Activated Sludge Ltd., Ernest R. Jones, Arthur B. Denton and James A. Coombs. Brit. 397,841, Aug. 22, 1933.

**Device for separating light liquids from sewage water.** Elise Reichwaldt née Schulze. Ger. 580,643, July 14, 1933.

**Sewage filtration and disposal.** Wm. Raisch and Arthur Wright (to Underpinning & Foundation Co.). U. S. 1,937,481, Nov. 28. Cellulose pulp is added to a stream of sewage passing to a vacuum filter having a rotary filter member under low vacuum to form continuously a relatively wet cake that can be easily repulped; the cake is continuously removed from the rotary filter member, and is repulped with the sewage in the stream passing to the filter. App. is described.

**Tank for treatment of sewage by the activated-sludge method.** Wm. M. Piatt. U. S. 1,937,434, Nov. 28. Various detail of a circulating system are described.

**Bacterial filters for septic effluents.** Bureau technique d'hygiène (Établissements Hygea-Simplex). Fr. 751,483, Sept. 4, 1933.

**Circulating system for purifying the water of swimming pools, comprising a heater, means for treatment with ozonized air and means for sterilization by ultra-violet light.** Waldo M. Bailey. Brit. 398,312, Sept. 14, 1933.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

**A soil survey of the Hundreds of Laffer and Willalooka, South Australia.** J. K. Taylor. *Australia Council Sci. Ind. Research Bull.* 76, 41 pp. (1933).—The Hundreds of

Laffer and Willalooka are typical of considerable areas in South Australia and Victoria covered by mallee and heath vegetation, under a 15-20 in. rainfall. Seven groups of

soil types have been distinguished. All are mature soils. The  $pH$  values of the surface soils and subsoils range from 6.2 to 9.3. An examn. for replaceable bases shows that none of the total base figures is low, and some are moderately high. All the soils are very poor in plant nutrients with the exception of  $K_2O$ , and require material building up particularly by legumes and the const. use of superphosphate. The total sol. salt concn. in all surface and sub-surface sands is low.

J. R. Adams

An index for rating the agricultural value of soils. R. Earl Storie. Calif. Agr. Expt. Sta., *Bull.* 556, 3-44 (1933).—Soils are rated by means of the various profile characteristics, texture and such modifying conditions as acidity, alky., drainage, etc. The relative productive capacity can be well estd. by means of the proposed index for rating soils. The wts. to be given to the several factors are given in detail.

C. R. Fellers

The various forms of organic matter in the soil. F. Yu. Gel'tzer, Yu. A. Rubinchik and T. P. Lasukova. *Chemisation Socialistic Agr.* 1933, No. 5, 37-43.—The authors studied the org. matter content of gray soils of the cotton belt in Turkestan. The org. matter of podzols and chernozems was compared. It is shown that the cellulose and hemicellulose contents vary. Thus the podzols contain 60, the gray soils 52 and the chernozems only 30% of these constituents. On the other hand, the chernozem contains more lignin, up to 70%.

J. S. Joffe

Measurement of size-frequency distribution in soils. Richard Bradfield, G. W. Conrey, J. G. Steele, T. C. Green and F. G. Loughry. Ohio Agr. Expt. Sta., *Bull.* 516 (51st Annual Rept.), 32-3 (1933); cf. *C. A.* 27, 1435.—The study of the efficiency of the methods of dispersion recommended by the Intern. Soc. Soil Sci. and of the modification suggested by the U. S. Bureau of Soils shows that the destruction of org. matter by  $H_2O_2$  is unnecessary in most soils, if they are treated with any of the more efficient deflocculating agents. The methods which gave satisfactory deflocculation are (1) removal of exchangeable bivalent bases by leaching with dil. acids or electro-dialysis, followed by the addn. of sufficient  $Na_2CO_3$  or  $NaOH$  to sat. the sample completely with Na, and (2) the addn. of a liberal excess, 100-400%, of  $Na_2CO_3$  or  $Na_2C_2O_4$  over that required to sat. the sample completely with Na.

C. R. Fellers

The iodine content of soil solution as related to the hydrological history. W. F. J. M. Krul. *Ingenieur* 48A, 216-19 (1933).—The I distribution in the soil of the Netherlands is given on a map, based on numerous borings and analyses. In the north and west, I content of the soil soln. is high as a result of "marine transgression"; only in old dune land the I content is lower. High I was found in the subsoil, little leached out, of polders (100  $\gamma$  per l.). In the east and south, diluvial soil, the I content is low except for a few special cases of unleached marine soil in which high I (up to 200  $\gamma$  per l.) is usually accompanied by high Cl and alkali.

B. J. C. van der Hoeven

The acidity of raw humus in relation to natural covers. W. B. Haines and K. S. Pillay. *J. Rubber Research Inst. Malaya* 5, No. 1, 14-21 (1933).—Nine different fresh plant materials were allowed to decompose in the shade under optimum conditions of moisture and aeration. Highly nitrogenous plants as *Cassia hirsuta* and rubber debris decompd. in 1-2 months while stagmoss and bracken were not fully decompd. at the end of 9 months. Decayed timber and leaves of mixed forest plants had  $pH$  values of 3.29 and 3.84, resp., about 2 units lower than the humus from the material studied.

K. C. Beeson

The acidity of the soils of our (Vercellese) regions. F. De Rege. *Giorn. risicoltura* 23, 173-7 (1933).—Detns. of the  $pH$  of 14 clay, loam and sandy soils, cultivated to clover, grass, tomato, rice and maize, show them to be slightly acid except those submerged (rice culture), which are neutral. The  $pH$  of the irrigation water is 7.2-7.8.

A. R. Merz

A comparison of the methods for the determination of hydrolytic acidity. O. K. Kedrov-Zikhman and A. A. Osina. *Chemisation Socialistic Agr.* 1933, No. 4, 71-8.—

The authors tested the methods of Kappen, Vagel and Waltersdorf for the detn. of hydrolytic acidity and found them inadequate. The Calky method gives slightly better results, but it is not adequate. The method of washing the soil on a funnel, with a 25 g. sample, is considered most reliable although time-consuming.

J. S. Joffe

The influence of soil reaction on the germination of corn and millet. Valentine Schaffer-Kircher. *Arch. Pflanzbau* 10, 324-48 (1933).—Good growths of various corns and millet were obtained within a  $pH$  range of 4.15-8.00 with a max. growth at about  $pH$  7.00. At a  $pH$  of 8.50 a noticeable reduction of yield was found in all cases. Better germination of seeds in cane-sugar soln. at osmotic pressures of 2 and 4 atm. was obtained than at 6 atm.

K. C. Beeson

The influence of acidifying ordinary chernozem on the yield of rye and wheat. I. P. Zaev. *Chemisation Socialistic Agr.* 1933, No. 5, 44-9.—If  $NaHSO_4$  (3-8 tons per hectare) was added to a chernozem soil the yield of rye increased by 2.85 and that of wheat by 3.71 centners per hectare. The  $pH$  of an aq. ext. decreased from 6.61 to 6.0. The water-sol.  $P_2O_5$  increased, but the nitrate content decreased upon the addn. of  $NaHSO_4$ . The yield increase is attributed to the release of  $P_2O_5$ .

J. S. Joffe

The cultivation of grasses and the change in the quantity of available nutrients in the soil. A. V. Vladimirov. *Chemisation Socialistic Agr.* 1933, No. 5, 49-55.—Pot and field expts. with the 3 essential elements usually deficient (N, K and P) on a podzolic soil with grass in the rotation show that K is highly important. The crops following the grasses responded most to K fertilization, next to  $P_2O_5$  and least to N.

J. S. Joffe

Manganese in Malayan soils. C. G. Akhurst. *J. Rubber Research Inst. Malaya* 5, No. 1, 29-34 (1933).—Examn. of a no. of Malayan soils indicated that only 3 had Mn contents that would class them as manganiferous. These were of limestone origin and had a  $pH$  range of 7.7-8.4. Most of the soils showing only a trace up to 0.04% of Mn ranged in  $pH$  from 3.9 to 7.0. Five p. p. m. of Mn were tolerated by rubber plant seedlings, but 10 p. p. m. proved toxic. Seedlings grown in Mn soln. show abnormal quantities of Mn in the root of the rubber plant.

K. C. Beeson

Views on irrigation and water supply. H. T. Burgers. *J. S. African Inst. Engrs.* 32, 3-13 (1933).—A general examn. is made of the phys. and chem. processes relating to conditions within the soil, and of biol. activities and their effect upon microscopic plant life.

A. W. F.

Fixation and penetration of phosphates in Vermont soils. V. L. Weiser. Vt. Agr. Expt. Sta., *Bull.* 356, 3 31 (1933).—Superphosphate penetrates slowly in soils, penetration may be enhanced by various salts of Na, K,  $NH_4$ , and Mg. Na,  $NH_4$  and certain org. phosphates penetrate more quickly in soils than does superphosphate. Exposure of a phosphate to relatively large amts. of soil results in enhanced fixation. Vt. soils have comparatively high fixing power for P. This is explained by the presence of much of the B horizon in the surface soil, due to the loss of a considerable portion of the A horizon through cultivation and erosion. Phosphate fixation in such soils is thought to be brought about chiefly by Fe and Al compds. Certain hydrated oxides and pptd. salts of Fe and Al fix large amts. of P. Certain silicates and minerals, when applied to soils, reduce their fixing power. Org. matter (e. g., specially prepd. humus) also reduces fixation. Liming increases the ability of a crop to recover P. However, chem. studies indicate that liming may sometimes increase fixation. The influence of frequency of application on phosphate recovery varies with the form of phosphatic fertilizer used. Recovery from  $Na_2PO_4$  was greater when small and frequent applications were made, but recovery from superphosphate and Ammophos was greater when large and less frequent applications were made.

C. R. Fellers

The influence of anions on the fixation and mobilization of the phosphoric acid in the soils. A. Demolon and E.

**Bastisse.** *Compt. rend* 197, 1247-9(1933).—The presence of an active anion, one which is fixed by clay, in a soln. of phosphate in contact with the soil lowers the amt. of  $P_2O_5$  fixed by the soil. Inversely the presence of an inactive anion, one not retained by clay, increases the  $P_2O_5$  fixation. An increase in the anion concn. accentuates these phenomena. The presence of active anions gives a higher mobilization of the fixed  $P_2O_5$  in the soil than the presence of inactive anions. Among the active anions are phosphate, silicate, citrate, oxalate and humate; the inactive anions include chloride, nitrate, sulfate and acetate.

J. R. Adams

**Behavior of the Jones lime-requirement determination with progressive decrease in soil acidity.** W. H. Metzger. *J. Am. Soc. Agron.* 25, 789-96(1933); cf. *C. A.* 27, 4009.—Two series of acid soils treated with increasing increments of  $Ca(OH)_2$  were examd. by a modified Jones  $CaO$ -requirement detn. The decrease in  $CaO$  requirement corresponding to a given treatment with  $CaO$  was in all cases below the theoretical value. The agreement was fairly close to theoretical if the change in Jones  $CaO$  requirement was corrected by adding the calcd. amt. of  $CaO$  which would be needed to change the soil alone from the  $pH$  value of the untreated soil in equil. with the  $Ca(C_2H_3O_2)_2$  soln. to the similar  $pH$  value for the treated soil. A zero  $CaO$  requirement value was not obtained until enough  $CaO$  had been added to a soil to raise its reaction considerably above  $pH$  7.0.

J. R. Adams

**The "Lion d'Angers" experiment field.** J. Valentin. *Engrais* 48, 689-91(1933).— $K_2O$  is indispensable for the production of grain, not only in increasing the wt. but more particularly in improving the quality of the crop. Relatively large amts. (400 kg. of  $KCl$  per hectare) of  $K_2O$  are advisable and it is necessary from the beginning of vegetation.  $K_2O$  also has a very favorable effect on the production of the straw, not only in increasing the quantity, but when used in sufficient amt. in increasing its rigidity and resistance to beating down.

J. R. Adams

**Microbiological methods in determining the fertilizer requirements of soils.** V. S. Butkevich and O. G. Naidina. *Chemisation Socialistic Agr.* 1933, No. 4, 62-70.—The authors report a series of expts. with *A. niger* and *A. oryzae* as indices of the fertilizer requirements of the soil. The expts. cover tests with various sources of P, sterilized and unsterilized cultures, and effects of  $pH$  and antiseptics on the reliability of the tests. Comparisons of this method with those of Arrhenius, Mitscherlich, Neubauer and Lemmerman show that the last method gives similar results.

J. S. Joffe

**Microbiological methods in determining the fertilizer requirements of soils.** V. S. Butkevich and O. G. Naidina. *Chemisation Socialistic Agr.* 1933, No. 5, 56-68.—The authors describe in detail the method of detg.  $P_2O_5$  and deficiencies in soils; *Aspergillus oryzae* was used as an index. It has some advantages over *A. niger*. The K deficiency in soils is more easily detected by this method than the deficiency of  $P_2O_5$ , and in general this method compares very favorably with other methods in use.

J. S. Joffe

**Determining fertilizer needs by test.** S. F. Thornton. *Canning Age* 14, 483-4, 503(1933); cf. *C. A.* 27, 4336.—Simple and rapid tests for N, P and K in plant materials are outlined (cf. *C. A.* 26, 5372). Single plants often fail to give reliable data and 6-8 plants should be used for a sample. The results of the tests indicate the relative nutrient level as compared with other possible limiting factors and are of most value when all the tests are made together and compared with observable conditions of growth in the field.

C. R. Fellers

**The influence of mineral fertilizers on the botanical composition of meadow vegetation.** B. D. Onoshko. *Chemisation Socialistic Agr.* 1933, No. 4, 46-51.—Exptl. evidence is presented showing that nitrates stimulate the grain type of grasses and crowd out the legumes. A mixed K-P fertilizer favors the legumes. It appears that of the 2 ingredients K is more important for the legumes. With a complete fertilizer the grain-bearing grasses are

more favored. The response of various types of meadows to different fertilizer units has also been tested and the results are discussed.

J. S. Joffe

**Apatite as a fertilizer.** L. J. Vuitchikov. *Chemisation Socialistic Agr.* 1933, No. 4, 60-2.—The effects of apatite alone and in combination with  $(NH_4)_2SO_4$  and manure on several crops were tested for 2 years on a podzolic soil. The results indicate the feasibility of utilizing apatite directly as a source of P, especially on acid soils, and of having the rock ground to a fine powder. The residual effects of apatite are sometimes more marked than the effects of the initial application. Winter rye and vetch-oats mixt. respond to apatite; oats alone do not respond so well.

J. S. Joffe

**Recent developments in nitrogen fertilizers.** C. L. Burdick. *Chem. & Met. Eng.* 40, 638-41(1933).—See *C. A.* 28, 556<sup>4</sup>.

G. G.

**A statistical determination from field tests of nitrogen balances.** Hans Sandhoff. *Arch. Pflanzenbau* 10, 297-323(1933).—A N balance detd. on various soils over a period of years showed that an unfertilized, cultivated soil lost the least or gained the most in soil N, while the application of only a N fertilizer caused the greatest loss of N. Both K and P exerted a favorable action on the N balance. The presence of appreciable amts. of N in the soil on unfertilized plots is due to the fixation of atm. N by soil microorganisms.

K. C. Beeson

**Assimilation of fixed nitrogen by grasses and clovers.** A. B. Beaumont, W. S. Eisenmenger and W. J. Moore, Jr. *J. Agr. Research* 47, 495-503(1933).—In a study of the assimilability of different chem. forms of fertilizer N, 5 grasses and 3 clovers were grown in nutrient solns. contg.  $NaNO_3$ ,  $(NH_4)_2SO_4$  and  $CO(NH_2)_2$ , resp. The order of assimilability of the N in these salts is:  $NaNO_3$ ,  $CO(NH_2)_2$  and  $(NH_4)_2SO_4$  for the grasses; and  $CO(NH_2)_2$ ,  $NaNO_3$  and  $(NH_4)_2SO_4$  for the clovers. The addn. of  $CaCO_3$  to the soln. contg.  $(NH_4)_2SO_4$  for the purpose of buffering it against physiol. change in reaction did not change the order. The results obtained are not meant to be applied to field conditions under which nitrification and other salutary soil processes may considerably alter the condition of applied N.

W. H. Ross

**The source of nitrogen and the active acidity of the medium as factors in the growth of meadow grasses.** V. V. Tzerling. *Chemisation Socialistic Agr.* 1933, No. 4, 52-7.—Expts. are recorded showing that the active acidity of the soil is influenced by the type of N source in the fertilizer. With  $NH_4$  fertilizers and an optimum  $pH$  the plants are enriched with N and mineral substances and also give a high yield. Timothy responds to nitrates in a more acid medium and to  $NH_4$  salts in a more alk. medium. A no. of other grasses and their behaviors are enumerated.

J. S. Joffe

**The influence of nitrogen fertilizers on the activity of phosphates.** A. V. Sokolov. *Chemisation Socialistic Agr.* 1933, No. 4, 33-9.—Expts. are recorded showing that the physiologically acid nitrogenous fertilizers, like  $(NH_4)_2SO_4$ , in combination with raw phosphates do not make the  $P_2O_5$  available unless they are mixed together and placed in the hill. By broadcasting or otherwise mixing the fertilizers with the soil the acidity produced by the acid fertilizer is neutralized by the large bulk of the soil.

J. S. Joffe

**The effects of potassium on the nitrogen availability from ammonia and nitrate for plants.** L. S. Lyubarskaya. *Chemisation Socialistic Agr.* 1933, No. 4, 40-6.—Soln. culture expts. with combinations of  $KCl$  and  $NH_4$  salts have shown that  $KCl$  increased the  $NH_4$  intake by beet seedlings. It is suggested that the Cl and not the K ion is responsible for the increased  $NH_4$  intake. The percentage of org. N also increased. With increased utilization of N there is a corresponding increase in carbohydrate utilization. The combination of  $KCl$  and nitrate increased the nitrate intake. It appears that the K increases the utilization of N by plants.

J. S. Joffe

**Determination of potash in fertilizers.** F. B. Carpenter and R. O. Powell. *Ind. Eng. Chem., Anal. Ed.* 6, 62

(1934).—It is recommended to det. available rather than water-sol.  $K_2O$ . W. T. H.

Potash fertilization of the sugar beet. M. Zehentner. *Zuckerrübenbau* 15, 22-30, 51-3(1933).—An av. crop of sugar beets withdraws about 0.6% of its weight of  $K_2O$  from the soil; an excess of  $K_2O$  in the soil raises the sugar content in somewhat larger proportion than the tonnage of roots. There is evidence that a liberal supply of K salts decreases damage from dry weather; K also appears to give more vitality to young beets; an excess of K hastens ripening. O. W. Willcox

Absorption, utilization and recovery of nitrogen, phosphorus and potassium by apple trees grown in cylinders and subjected to differential treatment with nutrient salts. Walter Thomas. *J. Agr. Research* 47, 565-81(1933).—A study with the pure salts  $NaNO_3$ ,  $Ca(H_2PO_4)_2$  and  $K_2SO_4$  showed that the omission of any one of the nutrient elements from the complete fertilizer is followed by a decreased absorption of the remaining elements. This decreased absorption results in a nutritional lack of balance as exhibited in reduced growth and flowering. The percentage recovery by the trees of added N, P and K is relatively low under all treatments. There appears to exist a sp. ratio in which N, P and K are absorbed by the trees having optimum growth and reproduction. This ratio is approx. 6:1:4. The wide discrepancy shown between the ratio in which these principal nutrient elements are absorbed by the trees and the ratio in which the nutrient salts were applied is indicative of soil effects, viz., leaching of nitrates, and of high fixing capacities of P and K. W. H. Ross

Nutrient elements used by leaves and growth of apple trees. Edmund Burke and H. E. Morris. *Plant Physiol.* 8, 537-44(1933).—Analytical data are given on the amts. of N, P, K, Ca and Mg absorbed by 2 apple trees each 20 years old of equal vigor, growing in a soil low in available nutrients. One (D) was removed and analyzed at the end of the dormant period (April 9) and the other (A) when the leaves had attained max. growth. 66.9% of the N, 66.1% of the Mg, 97.9% of the P, 100% of the K and 83.2% of the Ca of (A) were removed from the roots and soil and utilized for the growth of leaves and season's branch growth. Walter Thomas

Influence of Bordeaux mixture and oil sprays on some of the water relations of plants. J. D. Wilson and H. A. Runnels. Ohio Agr. Expt. Sta., *Bull.* 516(51st Annual Rept.), 44-5(1933).—Transpiration is accelerated by Bordeaux mixt. more during the night than during the day period. A no. of other Cu sprays tested did not cause increased transpiration in tomato leaves. If the Cu is kept const. each addnl. increment of lime added to Bordeaux mixt. increases the influence of the mixt. on the transpiration rate until the quantity of lime becomes about  $1\frac{1}{2}$  times as great as that of the Cu. High-Mg limes are fully as effective as Ca limes. However,  $Ca(OH)_2$  is less effective in increasing transpiration rate than the equiv. amt. of lime. Certain sulfates, other than  $CuSO_4$ , likewise increase transpiration rate. C. R. F.

Injury to apple by petroleum-oil sprays. Paul A. Young and H. E. Morris. *J. Agr. Research* 47, 505-22(1933).—The effects of petroleum-oil emulsions on apple were tested by spraying 25 kinds of oils on the leaves of 2566 apple limbs during 7 yrs. Oils for applications to Hibernial apple leaves and apple buds should not be more than 15 and 45% sulfonatable, resp. The different sulfonatable chemicals in the oils appear to differ in their effects on apple leaves; this explains why low concns. of some oils are more injurious than higher concns. of some other oils. Cresoap emulsions of 1-8% oils are more easily diluted, more uniformly applied and less injurious to leaves than the corresponding Ca caseinate-oil emulsions. The speed with which an oil kills cells or causes plesionecrotic symptoms is an important index of its toxicity as a spray oil. W. H. Ross

The method of action of copper mixtures—role of drying. J. Branas and J. Dulac. *Compt. rend.* 197, 1245-7(1933); cf. *C. A.* 28, 849<sup>a</sup>.—The Cu compds., sol. at the moment of prepn. of the mixt., are rendered totally or

partially insol. depending on the type of mixt. and the method of drying. After drying, the mixts. can be classed in 2 categories: those whose deposits contain enough sol. Cu to render an aq. soln. toxic and those no longer having Cu sol. in pure  $H_2O$  but which require a certain solvent action from impurities of the rain water. J. R. Adams

Chloropicrin and its use for the disinfection of stored materials. L. Mesnil. *Bull. mens. soc. natl. hort. France* 6, 234-7(1933).—A crit. review of the use of chloropicrin as an insecticide shows that it is of unquestionable value although its use is limited by its action on the insect-carrying materials. This action is dependent on the temp., the humidity of the substances to be treated and the length of treatment. J. R. Adams

Sterilization of narcissus bulbs by immersion in silver nitrate-potassium cyanide solution in vacuo. W. Newton, R. J. Hastings and J. E. Boshier. *Can. J. Research* 9, 31-6(1933); *Sci. Agr.* 14, 51(1933).—A mixt. of  $AgNO_3$  0.05% and KCN 0.15%, combined in the ratio of 1 to 3, proved most effective. C. R. Fellers

Rotenone. Its insecticidal value. Joseph M. Ginsburg. N. J. Agr. Expt. Sta., *Circ.* 273, 1-2(1933).—Rotenone dust or ext. is an effective poison for both sucking and chewing insects, particularly aphids, and is non-toxic to plants. Rotenone readily decomposes in sunlight and loses its toxic properties in a few days; hence frequent sprays are needed. One qt. of acetone ext. contg. 5% rotenone and 20% extractives is used in 100 gal. of water for a spray. Rotenone dusts are preferably prepd. by grinding very fine derris roots contg. approx. 3% rotenone with 4-5 parts of inert material. C. R. Fellers

Pyrethrum: its value in exterminating insects. Joseph M. Ginsburg. N. J. Agr. Expt. Sta., *Circ.* 272, 4 pp. (1933).—Formulas for household, greenhouse and garden, and cattle sprays, as well as a mosquito larvicide, are given. Pyrethrum insecticides are affected by sunlight and lose their toxicity in 2-3 days out-of-doors. Pyrethrum vapors are not toxic to insects and are only mildly repellent to flies and mosquitoes. C. R. Fellers

The fungicidal and insecticidal action of Tabacol. Nicola A. Barbieri. *Bull. mens. soc. natl. hort. France* 6, 237-44(1933).—See *C. A.* 27, 4868. J. R. Adams

Acetic ether and carbon tetrachloride with rubber as a killing agent for insects. H. M. Pendlebury. *J. Rubber Research Inst. Malaya* 5, No. 1, 75-7(1933).—Insects placed in tubes contg. a mixt. of crepe rubber, 15% of  $CCl_4$  and 85% of  $EtOAc$  remain in a flaccid state for a considerable time after death. The possibility of the use of such mixts. as insecticides is suggested. K. C. B.

Fumigation of cane grubs. E. Jarvis. *Rept. Bur. Sugar Expt. Stas. Queensland* 33, 62-3(1933).—The economic value of  $CS_2$  and *p*-dichlorobenzene as soil fumigants against cane grubs (larvae of scarabacids) has been proved by several years of farm experience. The kill ranges from 87 to 100%. O. W. Willcox

The control of foot rot of grains. E. W. Schmidt and W. Feistritzer. *Arch. Pflanzenbau* 10, 391-421(1933).—Fertilization with N, P or K alone or in combinations did not materially affect the loss of wheat due to foot rot. Treatment of the stubble before plowing under with 2000 kg. of  $H_2SO_4$  per hectare suppressed the disease somewhat, but a special bleaching powder prepn., "Caporit," and kaolin failed to give any satisfactory results. K. C. B.

Hygroscopicity and caking of  $NH_4NO_3$  and mixts. of  $NH_4NO_3$  and  $(NH_4)_2SO_4$  (Gorshtein) 18. Decreasing the degree of hygroscopicity and caking of  $NH_4NO_3$  (Krichevskii, et al.) 18. Qual. method for Se [in soil] (Horn) 7. Bactericides (Fr. pat. 753,802) 17.

McRae, W., and Shaw, F. J. F.: Influence of Manures on the Wilt Disease of *Cajanus Indicus* Spreng and the Isolation of Types Resistant to the Disease. Scientific Monograph of the Imperial Council of Agricultural Research No. 7. Delhi: Manager of Publications, Civil Lines. 60 pp. Reviewed in *Current Science* 2, 72(1933).

**Soil treatment.** I. G. Farbenind. A.-G. (Albrecht Schmidt, Adolf Steindorff and Wilhelm Staudermann, inventors). Ger. 579,597, June 28, 1933. Plants are protected against rust fungus by treating the soil with a mixt. of thiourea or salts of thio- or dithiocarbamic acid and fertilizer.

**Fertilizers.** Mathurin J. Oliviero. Fr. 751,355, Sept. 2, 1933. A fertilizer is prepd. by adsorption of alkali silicates or phosphates by substances contg. humic acid, as dried pulverized peat. Other fertilizers may be added.

**Fertilizer.** I. G. Farbenind. A.-G. Fr. 754,095, Oct. 31, 1933. A mixed fertilizer is made by treating materials contg. KCl and NaCl with  $\text{NH}_4\text{NO}_3$  so as to obtain  $\text{KNO}_3$ ,  $\text{NaNO}_3$  and  $\text{NH}_4\text{Cl}$ . The  $\text{NH}_4\text{Cl}$  is removed by mech. means.

**Fertilizer.** Hubert Kappen. Ger. 579,551, June 28, 1933. Crude phosphates are treated with the HCl developed by treating KCl with steam, and the product is used as a fertilizer.

**Fertilizer.** Gustav Pfarrius. Ger. 579,573, June 28, 1933. See Fr. 741,374 (C. A. 27, 2753).

**Fertilizer.** Heinrich Koppers A.-G. and Christian J. Hansen. Ger. 580,915, July 18, 1933. A mixt. contg.  $(\text{NH}_4)_2\text{SO}_4$  and  $(\text{NH}_4)_3\text{PO}_4$  is made by treating  $\text{NH}_4$  salts of  $\text{H}_2\text{SO}_4$ ,  $\text{H}_2\text{S}_2\text{O}_8$  or polythionic acids with com.  $\text{H}_3\text{PO}_4$  in presence or absence of  $\text{NH}_4\text{CNS}$ . The reaction takes place at temps. above the m. p. of S. The solns. are mixed outside the app. so that the pptd. S and other impurities can be removed before the clear solns. are subjected to heat and pressure. Examples are given.

**Fertilizer.** Carl Ehrenberg. Ger. 581,558, July 29, 1933. A humus fertilizer rich in N is prepd. by treating peat, lignite, coal, etc., with  $\text{CO}_2$  and  $\text{NH}_3$  or gases or liquids contg. these, at high temp. and pressure. Water may be added during the process. Examples are given.

**Superphosphate.** Chemische Werke Rombach G. m. b. H. Fr. 753,914, Oct. 27, 1933. A dry pulverulent superphosphate is obtained in a single operation in a furnace provided with agitating mechanism and directly heated. The temp. is maintained between  $110^\circ$  and  $250^\circ$  according to the nature of the crude phosphate. The mass is moistened before or after its introduction into the furnace and before or during the introduction of acid.

**Insecticides.** I. G. Farbenind. A.-G. Fr. 42,512, Aug. 4, 1933. Addn. to 723,510 (C. A. 26, 4128). Oils having an insecticidal or fungicidal action are used as solvents for the esters of Fr. 723,510. The solns. may be mixed or emulsified with water in any proportion. Suitable oils are light oil, white oil, lubricating oil, lighting oil, paraffin oil and gasoline.

**Insecticide.** Albert C. Malzac. Fr. 750,708, Aug. 17, 1933. An insecticide is composed of a viscous soln. contg. HCN which is liberated progressively, e. g., glycerol contg. water 20 and HCN 4%.

**Insecticides, etc.** Peter Speece & Sons Ltd. Fr. 754,128, Nov. 2, 1933. An active insecticide, bactericide or fungicide ( $\text{S}$  or  $\text{C}_{10}\text{H}_8$ ) is fused and dispersed in or on pptd., dry, light and finely divided absorbent  $\text{SiO}_2$ .

**Insecticides, etc.** Hercules Glue Co. Fr. 751,239, Aug. 29, 1933. A spreading agent for powd. insecticides, etc., contains a protein and lime, e. g., casein 4-8, lime (calc.) as  $\text{Ca}(\text{OH})_2$  90-96 and a deflocculator such as skin glue 1-2%. Cf. C. A. 27, 2754.

**Insecticide, etc.** I. G. Farbenind. A.-G. (Walther Speer and Walter Flemming, inventors). Ger. 580,678, July 14, 1933. A preventive for plant pests consists of the products formed by treating aliphatic ketones with  $\text{HCOONH}_4$  or  $\text{HCONH}_2$ .

**Oil emulsifier and insecticide.** Hugh Knight (to Emulsoids, Inc.). U. S. 1,937,969, Dec. 5. Esters such as butyl acetylricinoleate are used in prepg. insecticides contg. oil emulsified with water. Cf. C. A. 27, 159.

**Emulsifying oils.** Gérard Lafarge and Roger Chanut. Fr. 751,045, Aug. 25, 1933. A homogeneous oily mixt. of d. above 1 is added to oil of d. below 1 to form a stable suspension in water. Thus, the emulsifying agent may contain a vegetable oil, trichloroethylene and  $\text{NH}_3$  soln. The oils are used as insecticides and complementary insecticides may be added.

**Copper compounds.** Daniel W. Marsh and Benjamin H. Marsh. U. S. 1,937,524, Dec. 5. A voluminous light green insol. Cu compd. which may be used as an insecticide or fungicide is obtained by treating metallic Cu while immersed in a heated bath of a sol. Cu salt capable of forming a basic Cu salt, such as  $\text{CuSO}_4$ , by forcing O or air through the soln. and collecting the resulting ppt.

**Fungicide, etc.** I. G. Farbenind. A.-G. (Karl Marx and Karl Brodersen, inventors). Ger. 579,701, June 30, 1933. Fungicides contain sulfonates of mineral-oil hydrocarbons or their mixts. with aromatic or hydroaromatic hydrocarbons or derivs. and colloidal or dispersed S.

**Parasiticides, etc.** Jean Maurin. Fr. 752,602, Sept. 27, 1933. Sulfides of As or arsenides which are not toxic when used but become toxic by oxidation in contact with atm. agents are used to combat parasites and for treatment of vegetable diseases.

**Anticryptogamic powder.** Lelio Ferri. Fr. 751,277, Aug. 30, 1933. A powder having a basis of Cu oxychlorides is made by causing  $\text{NH}_4\text{Cl}$  in ammoniacal soln. to act on Cu in the presence of air at ordinary temp. The mother liquors are removed and the product is treated with quicklime, whereby water and  $\text{NH}_3$  are removed. An app. is described.

**Cauterizing seeds.** Chemische Fabrik Marktedwitz A.-G. (Rolf Tropitzsch, inventor). Ger. 580,504, July 12, 1933. A fungicide especially effective against diseases of barley and rye contains Cd compds. mixed with inert substances or other fungicides.

**Cauterizing seed.** Emil Molz. Ger. 583,605, Sept. 6, 1933. Seeds are cauterized by treatment with a small amt. of highly concd. HCl in a drum.

**Plant preservation.** I. G. Farbenind. A.-G. (Kaspar Pfaff and Michael Erlenbach, inventors). Ger. 579,598, June 28, 1933. A spray or dusting powder for preserving plants from the attacks of fungi or insects is prepd. by mixing fungicide or insecticide with reversible colloidal metal hydroxides obtained by treating aq. solns. of salts of heavy or alk. earth metals with alkylene oxides. Thus, a 25% aq. soln. of  $\text{AlCl}_3$  is treated with an aq. soln. of  $\text{C}_2\text{H}_4\text{O}$ . The mixt. is evapd. to dryness and the product mixed with  $\text{CuSO}_4$  and a little  $\text{CaO}$ . Other examples are given. Cf. C. A. 28, 852<sup>1</sup>.

**Plant preservation.** Emil Molz. Ger. 581,603, July 31, 1933. A dusting powder for preventing diseases of conifers contains  $\text{CH}_2\text{O}$  polymers, e. g., kaolin and paraformaldehyde.

**Sulfurizing plants, etc.** Georg Rupprecht. Ger. 579,514, June 27, 1933. Addn. to 523,965 (C. A. 25, 3764). In treating plants, trees, etc., with a S mist to kill insects by the method of 523,965, substances or mixts. b. or vaporizing above  $50^\circ$  are used to load the S particles. Examples mention naphthalene and  $p\text{-C}_6\text{H}_4\text{Cl}_2$ .

**Herbicides.** Compagnie de produits chimiques et électrométallurgiques Alais, Frogès et Camargue. Fr. 753,684, Oct. 21, 1933. Chlorates are used alone or with salts of K, Mg or  $\text{NH}_4$  in such high diln. that a selective herbicidal action is obtained.

**Chlorates.** I. G. Farbenind. A.-G. Ger. 583,106, Aug. 29, 1933. Addn. to 549,645 (C. A. 26, 4920). The method of 549,645 for prepg.  $\text{Ca}(\text{ClO}_3)_2$  by treating a boiling soln. of  $\text{NaClO}_3$  with  $\text{CaCl}_2$  is improved by adding a mol. equiv. amt. of  $\text{CaCl}_2$ . As the soln. is evapd.  $\text{NaCl}$  seps. out and is removed by centrifuge. On evapn. to dryness, a mixt. of  $\text{Ca}(\text{ClO}_3)_2$  and  $\text{NaClO}_3$  is left. This may be used as weed killer.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

The use of shredded asbestos in methane fermentations. C. R. Breden and A. M. Buswell. *J. Bact.* 26, 379-83(1933); cf. *C. A.* 27, 1980.—It furnishes a support for the methane producers. John T. Myers

Qualitative evaluation of starch and protein in barleys from different sources. N. N. Ivanov and V. A. Kirsanova. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 35-52(1933).—The common belief that high-protein barleys are more resistant than low-protein barleys to malting is erroneous; in fact, the diastatic effect is often superior, with better germination and higher starch conversion, in the high-protein grain. Hence barleys which have hitherto been considered fit only for feed, because of high protein content, are actually well suited for use in brewing.

Chemical stimulation of sprouting in barley. E. S. Tzetkova. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 3-34(1933).—Germination of barley is accelerated by  $H_2O_2$  (optimum concn. of soln. 0.5%), so that malting is hastened and molding is prevented; but  $H_2O_2$  is too expensive for large-scale use. Treatment with  $C_2H_2$  did not improve germination or diastatic power. Trials with  $H_3PO_4$ , formalin, Br water, tannin and salts of Na, Mg, Mn and Fe showed stimulation only with Mn salts and  $FeCl_3$ . Use of  $PcCl_3$  blackens the barley; but the possibility of using Mn salts to accelerate malting should be investigated. It is possible that cheap electrolytic  $H_2O_2$  may lower the future cost of chem. stimulation sufficiently for com. utilization.

Distilling beverages from grain. Gustave T. Reich. *Chem. & Met. Eng.* 40, 618-24(1933). E. H.

Chemistry of strongly alcoholic drinks. Mario Taveira, José Eduardo Alves Filho and Jorge Bandeira de Mello. *Rev. soc. brasil. quim.* 4, 106-44(1933).—Classifications of alcs., methods of analysis and related tables are given.

John Ladino

Condensation products from  $C_2H_2$  and  $NH_3$  [for denaturing alc.]. (U. S. pat. 1,936,995) 10.

Alcohol. Usines de Melle and Henri M. Guinot. *Fr.* 752,666, Sept. 28, 1933. Alc. of high degree is obtained by treating low wines in a column having a concg. zone and an exhausting zone. The vapors from the concg. zone are directed wholly or almost wholly into a 3rd zone in which an entraining substance works, so as to ensure free heating of this 3rd zone, the concn. of the alc. being assured by a retrogradation of alc. from the entraining zone. Alc. of high degree is available in a region intermediate between the concg. zone and the entraining zone. Cf. *C. A.* 27, 4022.

Absolute alcohol. Eloi Ricard and Henri M. Guinot (to U. S. Industrial Alc. Co.). U. S. 1,937,786, Dec. 5. In a continuous process, mashers are exhausted in one zone and, after concg. the vapors thus produced in another zone, the alc. is dehydrated in a third zone (the liquid in the dehydrating zone being heated by alc. vapors issuing from the exhausting zone). App. is described.

Production of citric acid, etc., by fermentation. Cecil H. Lilly (to Imperial Chemical Industries Ltd.). U. S. 1,936,983, Nov. 28. An app. is described, in which a regulated stream of sterilized nutrient liquor contg. fermentable carbohydrate is passed by gravity flow through the inside of a flat porous-walled tube the outer surface of which is aerated and inoculated with felt-forming organisms. The tubes used may be formed of earthenware, canvas, etc.

Propionic acid production by fermentation. James M. Sherman (to Wilbur White Chemical Co.). U. S. 1,937,672, Dec. 5. In fermentations such as that of molasses soln. contg. meat scrap by the action of organisms of the type of *Bacterium acidipropionici*, a mass of the organ-

isms is propagated on the surfaces of finely divided particles of inert solid absorptive material such as "Filter-Cel" and the medium is fermented in the presence of such mass of organisms; fermented medium is withdrawn from and fermentable medium is supplied to the organisms during that period of their growth cycle which follows the dormancy phase but precedes the period during which the death rate is more rapid than the reproduction rate, and before the fermentation has proceeded to completion.

Biacetyl. Thomas H. Verhave, Sr. *Ger.* 579,743, June 30, 1933. See U. S. 1,899,094 (*C. A.* 27, 2757).

Apparatus for purifying carbon dioxide obtained from fermentation processes. Hansena A.-G. *Ger.* 583,681, Sept. 7, 1933.

Malting grain. Brauerei "Zur Eiche" vorm. Schwensen & Fehrs. *Ger.* 583,971, Sept. 13, 1933. The germinating grain is arranged in layers of 5-8 cm. depth in chambers in which the temp., amt. of air and moisture can be regulated.

Foam separators for fermentation plants, etc. Ernst Jantzen. *Brit.* 398,046, Sept. 7, 1933.

Device for suppressing frothing in fermentation vats, etc. The Distillers Co. Ltd. and Alexander V. Montgomery. *Brit.* 397,722, Aug. 31, 1933.

Apparatus for fermenting or storing liquids at controlled temperature. Rudolf Horch. U. S. 1,937,226, Nov. 28. An app. suitable for use in breweries, etc., comprises a metal vessel electrically insulated from the earth and surrounded by a jacket adapted to contain a gas such as air, the temp. of which may be controlled by a fluid circulated through a pipe coil in the jacket. Various modified forms of app. are described.

Beverages. Chemische Werke Marienfelde A.-G. *Fr.* 42,513, Aug. 4, 1933. Addn. to 735,639 (*C. A.* 27, 1086). The clarifying agent is composed of pitch or pitch and another substance and is added at the top in such a form that it descends slowly.

Spirits. Anton J. H. Philipsky. *Ger.* 584,855, Sept. 25, 1933. The age of spirits, especially brandy and whisky, is estimated by adding standard test yeast and observing the degree of fermentation.

Beer. Hilde Krönig. *Ger.* 581,143, July 21, 1933. Addn. to 561,725 (*C. A.* 27, 1086). In prepg. beer contg. vitamins, yeast physically disintegrated by passage through a colloid mill is introduced into the liquor before the end of the fermentation.

Yeast. Ejnar A. Meyer (to Standard Brands Inc.). U. S. 1,938,081, Dec. 5. Yeast is propagated in a nutrient liquid in a fermenter to which is continuously added one or more solns. contg. yeast nutrient materials and from which is continuously withdrawn yeast-contg. liquid (at least one of the added solns. contg. a substance such as Cl which, in the fermenter, maintains a condition inhibiting the growth of undesirable organisms).

Yeast. Erste Hessische Presshefefabrik und Dampfbrennerei Inhaber Josef Pleser Söhne (H. Rössler, I. Schmitt and Joseph Pleser, inventors). *Ger.* 579,909, July 3, 1933. The Mg content of yeast is raised by adding Mg compds. to a nutritive medium contg. yeast cultures. Examples are given.

Yeast. Georges Collette. *Fr.* 750,998, Aug. 24, 1933. Beet juice is concd. to preserve it and dild. when required for the manuf. of yeast.

Yeast. Pfeifer & Langen A.-G. *Fr.* 751,268, Aug. 30, 1933. In producing yeast, inorg. N salts are not used. Unless a salt is present which will react with the inorg. N salt to give an org. N salt. N compds. which are easily assimilable by the yeast and which in the yeast are transformed with the sugar to albumin are present from the start of the fermentation, whereas the aminoacids, which are assimilated more slowly and which are transformed to albumins without cooperation with the sugar are added over a period of 5-6 hrs. A too high content of the yeast produced in albuminous materials, caused by the amino-

acids, is lowered by a short complementary fermentation using a sugar soln. contg. ammoniacal N.

**Baking yeasts.** Pfeifer & Langen A.-G. Fr. 751,602, Sept. 7, 1933. Pressed yeasts are enriched in enzymes by a secondary fermentation in a sugar liquor prep'd. from

molasses, a part (at least 5%) of the sucrose of the molasses being replaced by maltose in the form of sweet malt, after which the liquor, dild. to 12-15°Bé. and with a  $p_H$  value of 4.8-5.1, is subjected to a rapid fermentation without aeration at 20-27°.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. RMERY

**Petrolatum as salve base.** E. Rupp. *Apoth. Ztg.* 48, 1408-9(1933).—The advantageous use of high-grade (official) petrolatum, in preference to lard, is emphasized in the prepn. of many salves carrying resorbent drugs.

W. O. E.

**Scientific contributions to practical pharmacy.** XXIV. Reddening of talcum D. A.-B. 6 and salves or pastes admixed therewith and "fined" oleum vaselini flavum. Hermann Kunz-Krause. *Apoth. Ztg.* 48, 1441-2(1933); cf. C. A. 27, 3287.—White petrolatum should not be used in salves and pastes contg. talc fined with tropeolin, which causes reddening in such combinations. The various types of steatite are discussed, notably their chem. compn.

W. O. E.

**Areca nuts and aloes.** H. Oettel. *Apoth. Ztg.* 48, 1457-9(1933).—The use of areca nuts and aloes in human medication and their pharmacol. effects are discussed.

W. O. E.

**Pharmacopeia Helvetica V.** Hans Dietmann. *Pharm. Presse, Wiss.-Prakt. Heft.* 1933, 152.—A commentary.

W. O. E.

**Linimentum ammoniatum.** Wolfgang Brandrup. *Pharm. Zentralhalle* 74, 749-51(1933).—This prepn. is discussed (with illustrations of the oil dispersion) mainly from the standpoint of the D. A.-B. VI.

W. O. E.

**Biuret reaction as applied to medicinal and food chemistry.** Hugo Köhl. *Pharm. Zentralhalle* 74, 51-4(1933).

W. O. E.

**Reaction mechanism in the purification by the sodium method of anesthetic ether decomposed by autoxidation.** O. Tonn. *Pharm. Zentralhalle* 74, 765-9(1933).—An address in which T. classifies the contaminants of anesthetic ether into 4 groups: peroxides, alcs., aldehydes and org. acids, emphasizing the fact (by expt.) that purification by the Na method is really due to the action of the caustic and not of the metal. NaOH (KOH even more so) converts the aldehydes by the Cannizzaro reaction into alcs. and acids, which on distn. are thus eliminated.

W. O. E.

**Estimation of extract in alcoholic liquors.** Curt Luckow. *Pharm. Zentralhalle* 74, 709-71(1933).—In the estn. of ext. a distinction must be made between spirituous liquors low and high in ext. In the former preps. it suffices to det. the d. of the alc.-freed soln. with an aerometer (15°) or the Mohr-Westphal balance (15°), and to refer the resulting values to the table (Windisch) for aq. sugar soln. For preps. high in ext. recourse is had to liquor-ext., saccharometers having 0.5% divisions.

W. O. E.

**Simple method for the estimation of alkaloids in tincture and fluid extract of hydrastis, as also in certain other homeopathic original tinctures.** H. Neugebauer. *Pharm. Ztg.* 78, 1077(1933).—The method is essentially applicable to homeopathic preps. and involves after suitable isolation of the alkaloidal material titration with standard alkali and acid. In addn. to tincture of hydrastis and its fl. ext., details are outlined for the examn. of tinctures of aconitum napellus, gelsemium, nux vomica and ignatia.

W. O. E.

**Changes in acid solutions of adrenaline.** L. A. Had-dock. *Quart. J. Pharm. Pharmacol.* 6, 496-501(1933).—The racemization of l-adrenaline is comparatively rapid in HCl solns. at approx.  $p_H$  0.1, but at  $p_H$  values of 1.4-3.7 it becomes negligibly small. The changes produced by light are also small from a quant. standpoint, consisting mainly in slight oxidation, racemization being negligible. The total visible spectrum is more effective than

either the ultra-violet spectrum alone, or pure red light, and the presence of substances such as chloretone assists the action of the light. Ultra-violet light, however, produces true racemization in dil. solns. such as Liq. adrenalinæ-HCl, but not in stronger solns. Sterilization at 80° for 1 hr. causes slight destruction of adrenaline, but the amt. of racemization seems negligibly small in both weak and strong solns.

W. O. E.

**Tinctura ephedrae and tinctura ephedrae benzoica.** Walter Meyer. *Süddeut. Apoth.-Ztg.* 73, 386-7(1933).

J. D. S.

**Tinctura ephedrae benzoica.** F. Gstirner. *Apoth. Ztg.* 48; *Deut. Apotheker* 2, 321-2(1933); cf. preceding abstr.

W. O. E.

**Antiseptic and sterilizing power of oil of cinnamon and some derivatives of cinnamic acid.** A. Morel, A. Rochaix and P. Genton. *Compt. rend. soc. biol.* 114, 645-7(1933). Antiseptic power of some phenols and phenol ethers with allyl, propenyl or aldehyde groups [found in volatile oils]. A. Morel, A. Rochaix and L. Perrot. *Ibid.* 1118-20.

L. E. Gilson

**Chemical examination of trichloroethylene.** Herman L. Tschentke. *Ind. Eng. Chem., Anal. Ed.* 6, 21-2(1934).—A series of chemical and 2 physical tests are described which enable one to det. whether a commercial product is suitable for producing local anesthesia. The product used for dry cleaning is not suitable for medicinal work.

W. T. H.

**Can sodium nipasol be used as a disinfecting material in body fluids?** G. Northof. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 138-43(1933).—It is not satisfactory in the animal body.

John T. Myers

**The determination of the phenol coefficient of disinfectants by the cover glass method.** Vilh. Jensen and Elsa Jensen. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 144-57(1933).—See C. A. 27, 5367.

John T. Myers

**Synthesis of acridine derivatives for treatment of malaria.** O. Yu. Magidson and A. M. Grigorovskii. *Khim. Farm. Prom.* 1933, 187-8.—The synthesis is effected by condensation of 9-phenoxy or 9-chloroacridines with diamines. The activity on *Plasmodium praecox* was detd. on: 2-ethoxy-6-nitro-9-diethylaminoethylaminoacridine; 2-ethoxy-7-nitro-9-diethylaminoethylaminoacridine; 2-ethoxy-6-(and 7)-nitro-9-diethylaminopropylaminoacridine; 2-methoxy-7-nitro-9-diethylaminohydroxypropylaminoacridine; 2-methoxy-6-chloro-9-diethylaminopropylaminoacridine; 2-methoxy-6-chloro-9-diethylaminobutylaminoacridine; 2-methoxy-6-chloro-9-diethylaminoisopentylaminoacridine; 2-methoxy-9-diethylaminopropylaminoacridine. The compds. with 7-nitro groups are more powerful than 6-nitro and increasing the C chain to C<sub>4</sub> also increases the activity.  $\beta$ -Hydroxypropyl derivs. approach atebriin in efficiency.

L. Nasarevich

**Russian creolin.** P. I. Chebotarev. *Khim. Farm. Prom.* 1933, 221-4.—A tabular study of creolin constituents, suggesting the necessity of better information regarding their germicidal and toxic properties.

L. Nasarevich

**Increasing the activity of heparin and pneumin (anti-thrombine) preparations.** N. P. Kretchetova and V. D. Yankovskii. *Khim. Farm. Prom.* 1933, 225.—Benzidine, quinidine-HCl and quinine sulfate are used as precipitants. The complex salt is washed with alc., decomposed with weak acid and pptd. with aq. acetone and acetone-ether. The increase in activity is as high as 230%.

L. Nasarevich

**Substitution of cherry-tree gum for gum tragacanth.**

- M. B. Shvartzman and E. B. Sklyutovska. *Farm. Zhur.* 3, 113-14(1933).—In the methods of German Pharm. IV for detn. of alkaloids 1 g. of powd. cherry-tree gum is effectively substituted for gum tragacanth. Comparative tables are given. L. Nasarevich
- Oil of Bordeaux pine needles. J. de Fayard. *Bull. inst. pin* 1933, 215.—The compn. of the oil varies with the season. Percentage yield, d.,  $[\alpha]_D$  and esters (%) (as bornyl acetate) for Nov.-Dec. were 0.68, 0.870, +31.5°, 3.76; for Jan.-Feb.-March 0.75, 0.875, 34.2, 3.68; for April-May 0.79, —, 33.6°, —.
- A. Papineau-Couture
- Surface tension of medicinal and edible oils. E. Canals and Ramahenina-Ranaivo. *J. pharm. chim.* 18, 438-43(1933); cf. *C. A.* 27, 2593, 5204-5.—Results on 26 samples of oils in the detn. of surface tension by the formation of drops in air, in  $H_2O$ , in 0.0005 *N* NaOH and by Lecomte du Nouy's method, together with data on  $d_{20}^{20}$ ,  $n_D^{20}$ , oleorefractometer and viscosity readings are tabulated and discussed. S. Waldbott
- The glucosides of digitalis. E. Léger. *J. pharm. chim.* 18, 482-502(1933).—A succinct review is given of the chemistry of digitalis glucosides, with 41 references and a summary showing the close chem. relations of the different aglucons. S. Waldbott
- Assay of kamala. J. Stamm and K. Killinen. *Pharmacia* 13, 109(1933); *Schweiz.-Apoth. Ztg.* 71, 513-14(1933).—The vermifuge properties of kamala reside in phloroglucinol derivs. The assay method is analogous to that for male fern. Ext. the drug with  $Et_2O$ ; from this soln. remove the phenols with  $Ba(OH)_2$  soln., re-ppt. with HCl, take up with  $Et_2O$ , distil off the  $Et_2O$ , dry the residue at 100° and weigh. Drugs contg. not more than 6% ash yielded 30-34% crude kamalin. A kamalin content of about 39-40% should be required. S. Waldbott
- Standardization of drugs and detection of adulterations especially with the aid of capillary analysis and the analytical quartz lamp. Paul Kämpf. *Pharm. Acta. Helv.* 8, 170-8, 214-21(1933).—The materials studied were *Datura stramonium* L., *Hyoscyamus niger* L. and their possible substitutes. Twenty-three references. S. W.
- John Thurlbeck Humphrey, pharmacist-editor. 1862-1933. Anon. *Pharm. J.* 131, 705-6, 724-5, 751, 774; *Chemist and Druggist*, 119, 728-30, 749, 751(1933).—Obituary, with portraits and memorial letters. S. W.
- The (British) Pharmacopeia Commission laboratory. Anon. *Pharm. J.* 131, 718-19; *Chemist and Druggist*, 119, 725-6(1933).—A description, with photographs. S. Waldbott
- The alcoholic strength of ext. senegae liquid., Brit. Pharm. T. Tusting Cocking. *Pharm. J.* 131, 766(1933).—From the percentage of  $H_2O$  in air-dry senega and the quantities of solids and fluids used in the official prepn. of the liquid ext., it is shown by calcn. that the min. official figure for the alc. content is too high; the max. figure is unattainable. New limits suggested are: max. 44-54%, min. 38-44% by vol. As the tincture of senega, Brit. Pharm., is made by dila. of the liquid ext. with 60% alc., the corresponding limits for the tincture should be: max. 57-60%, min. 55-58% alc. S. W.
- Fluorescence analysis of pharmaceutical products. J. A. Radley. *Chemist and Druggist* 119, 295, 340(1933); cf. Ernst and Jentschitsch, *C. A.* 23, 3304.—An address. Typical examples of results on the examn. of 140 drugs in ultra-violet light are given. S. Waldbott
- Derivs. of  $\alpha$ -bromoisovaleric acid (Covello) 10. *Toddalia aculeata* Pers. 1. 2 new alkaloids and a neutral crystalline substance from the root bark (Dey, Pillay) 10. Industrial prepn. of redistd. water for biol. purposes (Cliquet, et al.) 11B. Addn. products of the pyridine series (U. S. pat. 1,938,253) 10. Naphthol derivs. [products are intermediates for therapeutic products] (Fr. pat. 751,237) 25.
- Bentley and Driver's Text-Book of Pharmaceutical Chemistry. 2nd ed., revised by John E. Driver. New York: Oxford Univ. Press. 538 pp. \$7.00. Reviewed in *Analyst* 58, 724; *J. Am. Pharm. Assoc.* 22, 1205(1933).
- Therapeutic product from stomach tissue. Elwood A. Sharp, Cyrus C. Sturgis and Raphael Isaacs (to the Regents of the Univ. of Mich.). U. S. 1,937,133, Nov. 28. A product which stimulates the growth of red blood cells and may be used for combating pernicious anemia comprises powd. desiccated defatted hog stomach (various details of prepn. are given).
- Arsenic compounds. Baptist Reuter. Fr. 752,688, Sept. 28, 1933. A soln. ready for use and keeping for a long time, of the mono-Na salt of 3,3'-diamino-4,4'-dihydroxyarsenobenzenemonomethylenculfonic acid is prepd. by adding to crude diaminodihydroxyarsenobenzene (by reduction of 3-nitro-4-hydroxybenzenearsonic acid) used in the moist state while observing the known precautions such as working in the absence of air, a sterilized air-free soln. of glucose and afterward adding an amt. corresponding to 1 mol. or less of a concd. soln. of  $CH_3O$ -sulfoxylate, heating to about 70°, then sepg. the deposited impurities after a prolonged rest, and bringing the soln. to the desired content by the addn. of a sterilized soln. of glucose.
- Bismuth carboxylates. Boot's Pure Drug Co. Ltd., Frank L. Pyman and Alexander P. T. Easson. Brit. 397,249, Aug. 24, 1933. The basic Bi salts of  $\alpha$ -carbalkoxycyclohexylacetic acids, 1-acyloxyhexahydrobenzoic acids or malonic acid esters of formula  $RCH \begin{matrix} \swarrow COOR' \\ \searrow COOH \end{matrix}$ , where R contains at least 7 C atoms and has 1 or more branch chains and R' is alkyl, are prepd. in oil solns. by double decompn. between an inorg. basic Bi salt, e. g., the nitrate, and an alkali salt of the acid in the presence of a vegetable oil, e. g., olive. The oil soln. is extd. from the aq. mixt. by  $Et_2O$ , the  $Et_2O$  soln. filtered and dried and the  $Et_2O$  distd. off. The oil soln. may be used medicinally for injection purposes. Cf. *C. A.* 27, 3950.
- Gold compounds. Soc. des usines chimiques Rhône-Poulenc. Fr. 753,401, Oct. 16, 1933. Compds. of Au sol. in oils are made by causing phosphorous ethers, e. g., triethyl or tributyl phosphite to act on compds. of Au, e. g., halides, sulfides,  $NCSAu$ , mercaptides, xanthates, thiosulfocarbamates, auromercapto-benzoxazoles, -benzothiazoles and -benzimidazoles.
- Magnesium hydroxide. Jan Becka. Ger. 579,843, July 1, 1933.  $Mg(OH)_2$  is obtained in finely divided, almost colloidal form for therapeutic purposes by digesting  $MgO$  with an aq. soln. of  $MgCl_2$  or  $MgSO_4$  in water of at least 10 degrees of hardness. Cf. *C. A.* 27, 4031.
- Metallic mercapto compounds. Schering-Kahlbaum A.-G. Brit. 398,020, Sept. 7, 1933. See Ger. 575,598 (*C. A.* 27, 4890).
- Barbituric acids. F. Hoffmann-La Roche & Co. A.-G. Brit. 398,132, Sept. 7, 1933. 5,5-Phenylethyl-N-propylbarbituric acid is prepd. by the catalytic hydrogenation of 5,5-phenylethyl-N-propylbarbituric acid. The product has therapeutic properties. Examples are given of hydrogenation in (1) MeOH soln. at ordinary temp. and pressure in presence of  $PdCl_2$  and (2) EtOH soln. by using a Ni catalyst and heating in an autoclave.
- Reduction products of keratins. Firma Johann A. Wülfing. Ger. 582,000, Aug. 5, 1933. Keratins obtained by the alk. or acid hydrolysis of keratin are reduced by treatment with Na-amalgam or  $Na_2SO_3$ . The reduction may be arrested when the SH group has been formed in the keratinate. Examples are given. The products are used in therapy.
- Plants containing alkaloids. I. G. Farbenind. A.-G. Fr. 750,870, Aug. 21, 1933. Plants contg. alkaloids, particularly tobacco plants, are improved by treatment with exciting agents used for forcing, interrupting germinatory rest or accelerating the coloration of fruits. Examples are given of the use of  $C_2H_4$ , the content of alkaloids in the plants being thereby reduced, whereas aroma, etc., are improved.
- Vitamin concentrates. Atherton Seidell. U. S.

1,937,671, Dec. 5. In eliminating non-vitaminic nitrogenous and other substances from aq. vitamin solns. such as those derived from brewers' yeast, substances contained in the soln. are subjected to benzylation of such character as to effect an increase in the differential solubilities of vitaminic and non-vitaminic substances thus facilitating their sepn. by use of acetone as a selective precipitant. By repeated pptn., a cryst. vitaminic product of high antineuritic potency is obtained.

**Hormones, etc.** Siegfried Loewe. Fr. 750,730, Aug. 17, 1933. See Brit. 353,635 (C. A. 27, 375).

**Hormones.** Bernhard Zondek and Carl van Eweyk. Ger. 583,910, Sept. 12, 1933. Female sexual hormones are pptd. by treating the weakly acidified urine of pregnant females with water-sol. heavy metal salts of org. acids such as (AcO)<sub>2</sub>Pb.

**Hormone preparations.** Bernhard Zondek and Carl van Eweyk. Ger. 584,966, Sept. 27, 1933. Addn. to 583,910 (preceding abstr.). The method of 583,910 for obtaining hormone preps. by treating the urine of pregnant females with heavy metal salts of org. acids is modified by using salts insol. instead of sol. in water, e. g., Fe stearate and (AcO)<sub>2</sub>Fe.

**Hormone preparations.** Soc. pour l'ind. chim. à Bâle. Ger. 579,820, July 1, 1933. Female sexual hormones are obtained in cryst. form by treating hormone exts from human or animal urine with aq. solns. of hydroxides of the second group of the periodic table and filtering off the ppt. The latter is thoroughly washed with water; the washings are acidified and extd. with a solvent non-miscible with water. The ext. is then washed with alkali carbonate soln. and the hormones crystd. out. Examples are given. Cf. C. A. 27, 2763.

**Hormone preparations.** Schering-Kahlbaum A.-G. Ger. 583,854, Sept. 11, 1933. Derivs. of sexual hormones sol. in water are prepd. by treating the hormones with acylating agents which also form salts. Thus, the oil obtained by extg. male urine is treated with phthalic anhydride at 120–40°. On neutralizing with soda, extg.

with ether, and evapg. off the latter, a sol. prepn. is obtained. Other examples are given. Cf. C. A. 28, 262.

**Hormone solutions.** Schering-Kahlbaum A.-G. Ger. 581,528, July 29, 1933. Hormone solns. are rendered stable for some time and given a strong subcutaneous action by addn. of alc. bases such as triethanolamine.

**Mentholated talcum powder.** Alfred J. Lautmann. U. S. 1,936,845, Nov. 28. A talc base powder is mixed with about 4% or less of diatomaceous earth impregnated with menthol, etc.

**Dentifrice.** John S. R. Heath. Australia 6785/32. Apr. 27, 1933. A dye or stain, such as a small amt. of crystal violet and brilliant green in alc., is added to a dentifrice to make visible any film on the teeth.

**Disinfectant.** F. Raschig G. m. b. H. Ger. 579,897, July 4, 1933. A disinfectant sol. in water consists of a mixt. of chlorothymol, m. 62–4°, and soap.

**Disinfectant.** F. Raschig G. m. b. H. Ger. 580,880, July 17, 1933. Addn. to 579,897 (preceding abstr.). The method of 579,897 for producing a disinfectant sol. in water by mixing chlorothymol with soap is improved by using a resin soap.

**Disinfecting with iodine.** Johann P. Schönthan. Brit. 397,238, Aug. 24, 1933. See Fr. 734,494 (C. A. 27, 1007).

**Bactericides, etc.** Louis Genevois and Eugène Delauney. Fr. 753,862, Oct. 26, 1933. Esters of mono-haloacetic acids, particularly bromo- and iodo-acetic acids of higher fatty alcs., polyalcs., or aromatic alcs. are used as antimycotic and anticryptogamic agents, non-toxic to animals.

**Coloring hair.** Wm. B. Stoddard, Jr. and Willard F. Greenwald (to Victor J. Thill). U. S. 1,937,365, Nov. 28. Two solns. are used, one contg. a Bi compd. such as Bi nitrate and an anti-hydrolytic agent such as glycerol in an amount sufficient to prevent substantial hydrolysis, the other comprising a S-contg. compd. such as Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> to form a coloring compd. on hair capable of reacting with the Bi compd. (the 2 solns. being mixed before application to the hair).

## 18--ACIDS, ALKALIES, SALTS AND SUNDRIES

R. M. SYMMES

Modern methods of preparing phosphoric acid, especially by the wet process. H. Lehrcke. *Chem. Fabrik* 1933, 505–7.—The conditions of temp. and concn. for the formation of CaSO<sub>4</sub> that settles and filters well in concd. H<sub>2</sub>PO<sub>4</sub> solns. are discussed, and a new filter is shown (cf. C. A. 27, 5899; Tiedemann and Gundelach, C. A. 28, 580°).

J. H. Moore

The problem of theoretical interpretation of the intensification of the production of sulfuric acid. Ya. Delch. *Khimstrof* 5, 2371–3(1933).—Lab. expts. and factory observations showed that the modern methods of processing H<sub>2</sub>SO<sub>4</sub> are inconsistent with the latest scientific conceptions and the physicochem. nature of the process. The process constitutes a series of chem. reactions, each of which takes place in a corresponding phase, and is interpreted by 2 schemes in the light of the electron-ionic theory. The gaseous N oxides do not act as catalysts in the process, but enter into the formation of the intermediate product of nitrosyl of sulfuric acid, [O<sub>2</sub>S(OH)]<sub>2</sub>.NO (not to be confused with nitrosylsulfuric acid), which is a factor of intensification in the production of H<sub>2</sub>SO<sub>4</sub>. Theoretically the process proceeds without any loss of N oxides (i. e., HNO<sub>3</sub>). The common losses of N oxides in the production of H<sub>2</sub>SO<sub>4</sub> can be averted by improvements in the installation and careful control of the factors of intensification of the process. Chas. Blanc

Coke-oven gas as one of the basic sources for production of hydrogen for synthetic ammonia. V. I. Borodkin. *Khimstrof* 5, 2417–22(1933).—Economic advantages of the use of H<sub>2</sub> derived from coke-oven gas are discussed. Chas. Blanc

A study of poisoning of ammonia catalysts by hydrogen sulfide and phosphine. V. P. Kamzolkin and A. V.

Avdeeva. *J. Chem. Ind. (Moscow)* 1933, No. 7, 32–5.—Concns. of 0.001% of H<sub>2</sub>S and PH<sub>3</sub> in the gas for the synthesis of NH<sub>3</sub> suffice to poison the catalyst. This effect is less above 500° and increases rapidly at lower temps. and higher pressures. H. M. Leicester

**Decreasing the degree of hygroscopicity and caking of ammonium nitrate.** I. Krichevskii, L. Kantorovich and M. Bergauz. *J. Chem. Ind. (Moscow)* 1933, No. 7, 41–7.—NH<sub>4</sub>NO<sub>3</sub> is treated with 0.05% of its wt. of paraffin dissolved in CCl<sub>4</sub>. The thin film formed when the CCl<sub>4</sub> evaps. practically prevents absorption of moisture by the salt. The paraffin can also be added in the fused state without the use of solvents. Coating NH<sub>4</sub>NO<sub>3</sub> with compds. contg. polar groups does not decrease the rate of absorption of H<sub>2</sub>O. The treated salt is non-explosive and its fertilizing properties are unchanged. H. M. L.

**The hygroscopicity and caking of ammonium nitrate and mixtures of ammonium nitrate and ammonium sulfate.** G. I. Gorshtein. *J. Chem. Ind. (Moscow)* 1933, No. 7, 47–56.—NH<sub>4</sub>NO<sub>3</sub> is usually as hygroscopic as a mixt. of NH<sub>4</sub>NO<sub>3</sub> and (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, but with increasing temp. and decreasing humidity, the mixt. becomes less hygroscopic. For a moisture content in the NH<sub>4</sub>NO<sub>3</sub> varying between 0.5 and 30–40% there is no difference in further absorption of H<sub>2</sub>O. Thick layers of NH<sub>4</sub>NO<sub>3</sub> absorb little moisture, and if they are covered with a thin layer of sand, the H<sub>2</sub>O absorption is still further decreased. The size of the lumps is almost without effect. At 32° NH<sub>4</sub>NO<sub>3</sub> changes from one modification to another. If more than 0.1% H<sub>2</sub>O is present in the salt, this change causes severe caking. Drying the moist salt has the same effect, but dry NH<sub>4</sub>NO<sub>3</sub> will not cake. Although methods of mixing and small variations in the relative amts. of NH<sub>4</sub>NO<sub>3</sub> and

( $\text{NH}_4$ ) $_2$  $\text{SO}_4$  in a mixt. of these compds. do not affect their absorption of  $\text{H}_2\text{O}$ , increase in the relative amt. of ( $\text{NH}_4$ ) $_2$  $\text{SO}_4$  decreases the caking tendency. If a double salt has formed, the mixt. cakes about as much as  $\text{NH}_4\text{NO}_3$  alone, but if there is only a mech. mixt., caking is less.

H. M. Leicester

The preparation of lime-ammonium nitrate and its hygroscopic properties. A. Guyer and H. Schütze. *Angew. Chem.* 46, 763-6(1933).—The method of prepn. has a definite influence upon the degree of conversion of  $\text{CaCO}_3$  and  $\text{NH}_4\text{NO}_3$ . Loose mixing in the cold results in a lower conversion, because of the less intimate contact of the components. Subsequent pressing increases the conversion. Addn. of ( $\text{NH}_4$ ) $_2$  $\text{SO}_4$  improved slightly the hygroscopic properties of the product and simultaneously gives rise to the reaction  $\text{CaCO}_3 + \text{NH}_4\text{NO}_3 \cdot \text{aq.}$  to a small extent. The content of sol. lime is increased likewise by the reaction between  $\text{CaCO}_3$  and ( $\text{NH}_4$ ) $_2$  $\text{SO}_4$ . Addn. of  $\text{Ca}(\text{NO}_3)_2$  slows up the reaction, reduces the N losses during the reaction and scarcely changes the hygroscopic properties. Exptl. data and figures of the app. are given. Twelve references.

Karl Kammermeyer

Recrystallization of potassium chloride for the production of potassium chlorate. Ya. V. Pupko and S. S. Shraibman. *Khimstrof* 5, 2427-31(1933).—Tech. KCl is freed from impurities of  $\text{K}_2\text{SO}_4$  and  $\text{K}_2\text{CO}_3$  by double decompn. with  $\text{CaCl}_2$ ; mother liquor from the previous crystn. is used as the solvent.

Chas. Blanc

Sodium sulfate. Oscar Peña i Lillo. *Bol. minero soc. nacl. mineria* (Chile) 45, 73-6(1933).—Several processes for extn. are described briefly and some com. applications outlined. The chem. and phys. properties of the deposits in Chile are described.

A. W. Furbank

Formation of hydrogen peroxide in catalytic dehydrogenation. Thomas F. Macrae. *Biochem. J.* 27, 1248-52(1933).—The test is based upon the fact that when a suspension of  $\text{Ce}(\text{OH})_3$  is treated with  $\text{H}_2\text{O}_2$  the suspension changes from a white to a deep yellow-orange, because of the formation of the sparingly sol. ceric hydroperoxide (I):  $2\text{Ce}(\text{OH})_3 + 3\text{H}_2\text{O}_2 \rightarrow 2\text{Ce}(\text{OH})_4\text{OOH} + 2\text{H}_2\text{O}$ . I can be detd. iodometrically or colorimetrically.  $\text{H}_2\text{O}_2$  is an intermediate product in the catalytic combination of  $\text{H}_2$  and  $\text{O}_2$ .  $\text{H}_2\text{O}_2$  can also be detected in the catalytic aerobic dehydrogenation of  $\text{CH}_3\text{OH}$  and  $\text{C}_2\text{H}_5\text{OH}$ . This substantiates the Wieland theory of dehydrogenation.

Benjamin Harrow

The preparation of sulfur dioxide and portland cement from gypsum. S. Royak, M. Gershman, K. Miloslavskii and E. Nagerova. *J. Chem. Ind. (Moscow)* 1933, No. 7, 35-41.—A mixt. of  $\text{CaSO}_4$ , clay and coke burned in  $\text{N}_2$  contg. 1-2%  $\text{O}_2$  yields portland cement and  $\text{SO}_2$ . The C reduces  $\text{CaSO}_4$  to  $\text{CaS}$ , which reacts with the remaining  $\text{CaSO}_4$  to give  $\text{CaO}$  and  $\text{SO}_2$ .  $\text{Fe}_2\text{O}_3$  helps the process. Burning of the mixt. should be slow. H. M. Leicester

The modernization of lime plants. Development of the plant "Bousquet et de la Vernhe. Chaux de Rantell-Albi." L. Puech. *Rev. matériaux construction trav. publics* 1933, 362-9.—Modernization of the equipment and mfg. process and the resulting improvements are discussed. K. K.

The bleaching clays. P. G. Nutting. *U. S. Geol. Survey Circ.* 3, 51 pp.(1933); cf. C. A. 27, 2793.—A discussion of the source, prepn. and theory of the bleaching action of various clays. Wt.-humidity curves, dehydration curves and miscellaneous tabular data are given.

W. A. Moore

Some comments on the practical use of casein. Erich Kunze. *Forbe u. Lack* 1933, 581-2. G. G. Sward

Inefficiency of calking compounds a challenge to industry. C. R. Shaffer. *Paint, Oil & Chem. Rev.* 95, No. 26, 18-19(1933).—The principal requirements of calking compds. are adhesion, elasticity, freedom from sagging and ease of application. As a rule, only a very small percentage of the compds. on the market are satisfactory.

G. G. Sward

Chemical investigation of bamboo. XII. The adsorption of acetic acid from aqueous solution by charcoal. 2. Sutezō Oguri and Jirō Kashima. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 630-2(1933); cf. C. A. 27,

5986.—Exptl. results are reported on absorption tests with 8 bamboo and 4 wood charcoals on solns. of  $\text{AcOH}$  varying in concn. from 0.00125 to 0.4 N. K. Kammermeyer

The new detergents. R. A. Duncan. *Ind. Eng. Chem.* 26, 24-6(1934).

Carboxide gas: a new insecticidal fumigant for bedbugs and cockroaches. E. W. Brown. *U. S. Naval Med. Bull.* 31, 253-68(1933).—Carboxide (a liquid mixt. of 1 part ethylene oxide to 9 parts of  $\text{CO}_2$ ) was tested in a 2000 cu. ft. room on deeply buried insects. The following min. lethal concns. per 1000 cu. ft. are recommended for both bedbugs and cockroaches: 5 lbs. for 3 hrs.; 3 lbs. for 6 hrs.; 3 lbs. for 12 hrs.; 2 lbs. for 18 hrs.; and 2 lbs. for 24 hrs.

B. C. Brunstetter

Solvents for  $\text{CH}_4$  [for sepn. from H-N mixts.] (Karzhavin, Gerchikova) 13.

Saufrignon, R.: Le graphite. Pt. II. Étude technique. 51 pp. Paris: Mines carrières. F. 10.

Borates. 2nd Ed. (1920-1932). London: H. M. Stationery Office. 44 pp. 9d. (by post 10d.). Reviewed in *J. Soc. Glass Tech.* 17, 128-9A(1933).

Hydrocyanic acid. I. G. Farbenind. A.-G. Fr. 42,-610, Aug. 23, 1933. Addn. to 715,052 (C. A. 26, 1719). Derivs. of hydrocarbons, particularly those contg. O or halogens, e. g.,  $\text{MeOH}$ ,  $\text{EtOH}$ ,  $\text{C}_2\text{H}_5\text{Cl}$  or  $\text{C}_2\text{H}_4\text{Cl}_2$ , are used instead of hydrocarbons in the process of Fr. 715,052. Cf. C. A. 27, 4034.

Hydrocyanic acid from heavy metal cyanides. Henry L. Sulman and Hugh F. K. Picard (to General Engineering Co.). U. S. 1,938,469, Dec. 5. A heavy metal cyanide such as that of residual liquors from cyanide plants is heated in a reducing H-contg. atm. and in the presence of an added metallic sulfide such as ground pyrites to a temp. sufficient to set free HCN and to cause the heavy metal to combine with the S set free from the metallic sulfide. An arrangement of app. is described. Cf. C. A. 27, 5902.

Hydrofluoric acid. I. G. Farbenind. A.-G. (Julius Söhl, inventor). Ger. 580,633, July 14, 1933. HF technically free from  $\text{SiO}_2$  is prepd. by distg. the impure HF till  $\text{SiF}_4$  appears in the distillate. Cf. C. A. 27, 4884.

Hydrofluoric acid. I. G. Farbenind. A.-G. (Julius Söhl, inventor). Ger. 581,714, Aug. 1, 1933. HF contg. very little  $\text{SiO}_2$  is prepd. by treating fluorspar contg.  $\text{SiO}_2$  with  $\text{H}_2\text{SO}_4$ , the paste of fluorspar and  $\text{H}_2\text{SO}_4$  being stirred for some time with a slight rise of temp. prior to driving off the HF to ensure removal of nearly all the  $\text{SiO}_2$  as  $\text{SiF}_4$ .

Fluosilicic acid. Walker Penfield (to Pennsylvania Salt Mfg. Co.). U. S. 1,938,533, Dec. 5. In the manuf. of  $\text{H}_2\text{SiF}_6$  solns. of about 20-30% strength from a gas contg.  $\text{SiF}_4$  and water vapor, the gas is cooled to a temp. (suitably about  $50^\circ$ ) at which the formation and condensation of  $\text{H}_2\text{SiF}_6$  takes place by immediately contacting it, without the introduction of addnl. water, with a soln. of  $\text{H}_2\text{SiF}_6$  of 20-30% concn. maintained at such temp., the water necessary for the reaction and prepn. of the concd. acid from the gas being thus obtained. App. is described.

Tungstic acid. Fritz Best. Ger. 579,509, July 1, 1933. Addn. to 567,571 (C. A. 27, 2662). The method of 567,571 for producing  $\text{WO}_3$  by treating finely crushed W ores with  $\text{HCl}$  or  $\text{HBr}$  is modified by using  $\text{HCl}$  of 1.195 sp. gr., at  $38-40^\circ$  and at a pressure of 40 cm. of water, or  $\text{HBr}$  of 1.502 sp. gr. at  $55-6^\circ$  and at the same pressure.

Ammonia synthesis. Patentwertungs A.-G. "Alpina." Ger. 583,559, Sept. 5, 1933. A mixt. of N and H for the synthesis of  $\text{NH}_3$  is purified by passing the mixt. over a catalyst comprising various alkali and alk. earth metals at  $2-500^\circ$ .

High-pressure-resisting joint suitable for synthetic ammonia apparatus. Sydney R. Boyce and Frank S. Lundy (to Imperial Chemical Industries Ltd.). U. S. 1,937,329, Nov. 28.

Recovering alkali metal compounds from waste lyes. George H. Tomlinson. Brit. 397,787, Aug. 31, 1933.

Waste liquors from cellulosic pulp, especially sulfate pulp, manuf. are spray-dried in the upper region of a recovery chamber, combustion of the dried product being substantially confined to a combustion and reducing zone below the drying zone. App. is described.

**Alkali cyanides.** Stickstoffwerke G. m. b. H. (H. Heinrich Franck and Carl Freitag, inventors). Ger. 579,886, July 3, 1933. Alkali carbonates are heated to redness in a current of HCN and H or  $\text{NH}_3$ , CO and H. Thus, soda is heated to 770–875° in a current of HCN and H to give a 99.6% yield of NaCN.

**Alkali metal nitrates.** Marius Fauvart and Gérard Mulliez. Fr. 750,945, Aug. 22, 1933. Vapors of oxides of N from the catalytic oxidation of  $\text{NH}_3$  are passed into a soln. of KCl or NaCl to form nitrates. An app. is described.

**Alkali metal phosphates.** Conway Freiherr von Girschwald and Hans Weidmann (to American Lurgi Corp.). U. S. 1,938,057, Dec. 5. A metal-P compd. such as ferro-P is heated with a basic alkali metal compd. such as  $\text{Na}_2\text{CO}_3$  to a reaction temp. below the fusion temp. of the reaction mixt. while the mixt. is moved in contact with a current of O-contg. gas in such an amt. that the issuing gas still contains at least 5% O.

**Alkali phosphates.** Metallgesellschaft A.-G. (Conway Freiherr von Girschwald and Hans Weidmann, inventors). Ger. 580,138, July 6, 1933. Addn. to 576,503 (C. A. 27, 5903). See U. S. 1,938,057 (preceding abstr.).

**Alkali sulfite solutions.** Patentaktiebolaget Gröndal-Ramén (Gustav Haglund, inventor). Ger. 583,850, Sept. 11, 1933. Alkali mono- and bisulfite solns. practically free from Ca salts and for use in obtaining cellulose are prepd. from the waste lye of cellulose processes. The waste lye is first burned to remove org. impurities, sulfides and thiosulfates. The residue is then dissolved in water and treated with  $\text{SO}_2$  and finely divided  $\text{CaCO}_3$ , or other Ca salts which form  $\text{Ca}(\text{HSO}_3)_2$  with  $\text{SO}_2$ , till the alkali salts present are all converted to bisulfite. The soln. is then treated with sufficient finely powd.  $\text{CaCO}_3$ , CaO or  $\text{Ca}(\text{OH})_2$  to ppt. the  $\text{Ca}(\text{HSO}_3)_2$  as  $\text{CaSO}_3$ , this causing some of the alkali bisulfite to be converted into the monosulfite. The pptd.  $\text{CaSO}_3$  is filtered off, this leaving a soln. of alkali mono- and bisulfite.

**Kiln for burning alkaline earth carbonates.** Dwight and Lloyd Metallurgical Co. Ger. 581,575, July 31, 1933.

**Caustic lyes.** I. G. Farbenind. A.-G. Fr. 751,312, Aug. 31, 1933. Alk. caustic lyes are made by decomposing amalgams by a countercurrent of water, e. g., in a tower filled with coke, charcoal, Fe, Fe-Ni or Cr in small pieces.

**Aluminum salts.** Zschimmer & Schwarz chemische Fabrik Dörlau. Fr. 752,805, Sept. 30, 1933. See Ger. 575,597 (C. A. 27, 4817).

**Ammonium salts.** Harry Pauling. Fr. 751,128, Aug. 28, 1933. In the formation of  $\text{NH}_4$  salts by neutralization of  $\text{NH}_3$  gas by acids in countercurrent, the gas is divided into several partial currents which are introduced in different horizontal planes. Larger quantities of gas can thereby be treated in the same space than previously.

**Ammonium double salt.** I. G. Farbenind. A.-G. Ger. 581,867, Aug. 4, 1933. The double salt  $(\text{NH}_4)_2\text{SO}_4 \cdot 2\text{NH}_4\text{NO}_3$  is prepd. by adding  $\text{NH}_3$  and  $\text{H}_2\text{SO}_4$  to  $\text{NH}_4\text{NO}_3$  lye, or by adding  $\text{NH}_3$  and  $\text{HNO}_3$  to  $(\text{NH}_4)_2\text{SO}_4$  lye in quantities sufficient to cause evapn. of the water by the heat of neutralization.

**Bismuth salts.** Soc. des usines chimiques Rhône-Poulenc. Fr. 752,768, Sept. 30, 1933. Stable solns. of Bi salts in vegetable oils are obtained by treating Bi with an org. acid having in the  $\alpha$ -position an alkoxy, phenoxy, phenylalkoxy, alkylmercapto, phenylmercapto or phenylalkylmercapto group. Examples are given of the prepn. of solns. of  $\alpha$ -phenoxycaproate,  $\alpha$ -phenoxisobutyrate,  $\alpha$ -butoxyphenylacetate, and  $\alpha$ -ethoxy-, mono- and tri- $\alpha$ -butoxy-, mono- and tri- $\alpha$ -phenoxy-,  $\alpha$ -benzylmercapto-,  $\alpha$ -phenylmercapto- and  $\alpha$ -butylmercapto-laurate of Bi.

**Calcium compounds.** Chemische Fabrik vorm. Sandoz. Fr. 750,940, Aug. 22, 1933. New Ca compds. are made

by causing  $\text{CaBr}_2$  to react on Ca salts of polyhydroxy-monocarboxylic acids obtained by oxidation of polyaldoses. Examples are given of the prepn. of compds. from  $\text{CaBr}_2$  and the maltobionate and lactobionate. The oxidation of the polyaldose and the combination may be carried out in one step.

**Lead salts.** René J. Daloze. Fr. 752,674, Sept. 28, 1933. Pure Pb salts are obtained from impure  $\text{PbSO}_4$  by a double decompn. in aq. soln. between  $\text{PbSO}_4$  and a large excess of  $\text{AcONa}$ , sepn. of insol. substances, and pptn. of Pb from the  $\text{Pb}(\text{OAc})_2$  by adding a Na salt corresponding to the insol. Pb salt desired.

**Working up crude potassium salts.** Chemieverfahren G. m. b. H. Ger. 579,925, July 1, 1933. Crude sulfate-free K salts such as sylvine, carnallite, etc., are treated with  $\text{NH}_4\text{Cl}$  lye and a current of  $\text{NH}_3$ . The pptd. KCl is sepd. The mother liquor is then treated to obtain by-products. In the case of sylvine, the lye is treated by the Solvay process. In the case of carnallite,  $\text{CO}_2$  is passed into the lye to ppt. the double salt  $\text{MgCO}_3 \cdot (\text{NH}_4)_2\text{CO}_3$ . Cf. C. A. 28, 8667.

**Soluble salts from silicates.** Società italiana potassa. Fr. 752,374, Sept. 21, 1933. Silicates, which may be mixed with other substances to effect the reaction, are placed in the upper part of a closed vessel and an aq. soln. of acid is placed in the lower part and heated to form steam. The steam condenses and carries down sol. substances, forming a cyclic process.

**Working up silicates.** Hans L. Lehmann. Ger. 580,712, July 14, 1933. Crude silicates are crushed, suspended in strong  $\text{NH}_4\text{Cl}$  soln. and heated with HCl. The product is an 82% yield of good quality fuller's earth.

**Metal silicates.** Philip Nathan Engel. Ger. 583,974, Sept. 13, 1933. A soln. of an alkali silicate is mixed with an acid and a soln. of a salt of a metal forming an amphoteric hydroxide. The latter may be mixed with the acid before addn. to the silicate. Thus,  $\text{Al}_2(\text{SO}_4)_3$  is added to concd.  $\text{H}_2\text{SO}_4$ . On cooling, the mixt. is added to a soln. of  $\text{Na}_2\text{SiO}_3$  to give a gelatinous mass contg.  $\text{Al}_2(\text{SiO}_3)_3$ . Other examples are given. The dried products are used as adsorption agents.

**Complex compounds of fluorine and aluminum.** I. G. Farbenind. A.-G. Ger. 584,964, Sept. 27, 1933. Solns. of complex F and Al compds. are obtained by the action of aq. mineral acid on a mixt. of crude  $\text{Al}_2\text{O}_3$  material such as clay, bauxite, etc., and difficultly sol. F compds., such as fluorspar,  $\text{AlF}_3$ , etc.

**Metal carbamates.** The Mathieson Alkali Works. Fr. 751,346, Aug. 31, 1933. Metal carbamates sol. in water, e. g.,  $\text{NH}_2\text{COONa}$  or  $(\text{NH}_2\text{COO})_2\text{Ca}$ , are made by causing  $\text{NH}_2\text{COONH}_4$  to react with a salt of the metal in aq. soln. at a temp. below 10°.

**Carbides.** N. V. Philips' Gloeilampenfabrieken. Brit. 397,372, Aug. 24, 1933. Refractory carbides are obtained by heating a body consisting at least partly of C in an atm. consisting of 1 or more volatile compds. of the element(s) whose carbides are to be produced. The atm. may also contain reducing gases, e. g., H. The carbides of Si, Zr, Hf, Ti, Ta, V, etc., may thus be obtained from their volatile halogen compds. In an example a C filament is heated by an elec. current to 2400° in vaporous  $\text{ZrCl}_4$  until the resistance of the filament remains const., the resulting tubular  $\text{ZrC}$  filament being washed with  $\text{H}_2\text{O}$  and alc.

**Carbides.** Mathias Fränkl (to Société Oxythermique). Brit. 397,744, Aug. 31, 1933. Addn. to 396,698 (C. A. 28, 4544). The process of 396,698, in which a self-sustaining column of material is formed in the enlarged lower end of a shaft furnace by sintering the charge, is modified for the manuf. of Ca and Si carbides from materials that do not sinter by heating. The raw materials, in correct proportions for the final product, are finely ground, intimately mixed and formed into briquets or long bars which are arranged in a rectangular section shaft in layers, the bars or briquets in adjacent layers being at right angles.

**Cyanamides.** Bayerische Stickstoffwerke A.-G. Ger. 583,533, Sept. 5, 1933. Carbide is rapidly azotized by employing several vertical chambers charged with carbide,

the heat being applied at the bottom. The N is applied under pressure.

**Nitrates.** Norsk Hydro-Elektrisk Kvaestofaktieselskab. (Henry Johnsen, inventor). Fr. 42,410, July 19, 1933. Addn. to 738,253 (C. A. 27, 1720). The base-exchange substances are flushed out with pure water between the passage of the NaCl and the  $\text{Ca}(\text{NO}_3)_2$  solns., so that the nitrate soln. is not contaminated by the chloride soln.

**Phosphates.** Chemische Fabrik Budenheim A.-G. (Guido Hedrich, inventor). Ger. 581,655, July 31, 1933. Crude phosphates, especially  $\text{Ca}_3(\text{PO}_4)_2$  contg. compds. of Fe and Al and org. substances as impurities, are refined by treatment with gaseous Cl and HCl at high temps. Small amts. of alkali chloride and steam may be added during the process.

**Phosphates.** Camille Matignon and Pierre Kachkaroff. Fr. 753,638, Oct. 20, 1933.  $(\text{NH}_4)_2\text{PO}_4$  and a Ca salt, e. g., the nitrate, are obtained from natural phosphates or bones,  $\text{NH}_3$  and an acid such as  $\text{HNO}_3$ , by dissolving the phosphate in the min. amt. of acid, pptg. the  $\text{Ca}(\text{H}_2\text{PO}_4)_2$  as  $\text{CaHPO}_4$  by the action of  $\text{CaCO}_3$ . The pptd.  $\text{CaHPO}_4$  is treated with an excess of a concd. soln. of  $(\text{NH}_4)_2\text{CO}_3$  or  $\text{NH}_4\text{HCO}_3$ , with or without  $\text{NH}_3$ , to form  $(\text{NH}_4)_2\text{PO}_4$  and  $\text{CaCO}_3$ , the latter being used to ppt.  $\text{Ca}(\text{H}_2\text{PO}_4)_2$ .

**Phosphates.** Victor Chemical Works. Fr. 754,104, Nov. 2, 1933. See U. S. 1,926,747 (C. A. 27, 5903). Fr. 754,105. A caustic alkali is added to the lixiviating liquid in amt. such that the final liquor has an alk. above 1.06, preferably above 1.08.

**Phosphates.** Rozel-Malétra (Soc. industrielle de produits chimiques). Fr. 754,294, Nov. 3, 1933. See U. S. 1,935,474 (C. A. 28, 5857).

**Pyrophosphates.** Chemische Fabrik Joh. A. Benckiser G. m. b. H. and Albert Reimann. Fr. 751,131, Aug. 28, 1933. See Brit. 395,642 (C. A. 28, 5879).

**Thiocyanates.** Emil Hene. Ger. 551,776, July 24, 1933. Addn. to 517,759 (C. A. 25, 2818). The method of 517,759 for forming thiocyanates is modified by using with thiourea oxides or hydroxides, instead of anhyd. hydrosulfides of alkali or alk. earth metals. Thus,  $\text{CaO}$  is mixed with  $\text{CS}(\text{NH}_2)_2$  and heated to 150–80° to give  $\text{Ca}(\text{CNS})_2$  and  $\text{NH}_3$ .

**Purifying alumina.** John G. Stein & Co. Ltd., Joseph F. Hyslop and Ralph Mackenzie. Brit. 397,288, Aug. 24, 1933. Fe oxide is sepd. from  $\text{Al}_2\text{O}_3$  by heating in a reducing atm., e. g., H, CO, at (over) 1000°, cooling to at least 800° in said atm. and then to ordinary temp. in air or other oxidizing atm., e. g., O.  $\text{Fe}_2\text{O}_3$  formed is dissolved from the mixt. by acid, e. g., HCl. The  $\text{Al}_2\text{O}_3$  is suitable for refractories.

**Alumina extraction from aluminous materials such as bauxite or clay.** John J. Crawford. U. S. 1,938,173, Dec. 5. A soln. contg. Al and Fe chlorides is formed by treating aluminous material with HCl; this soln. is treated with  $\text{NaHCO}_3$ ; the resulting mixt. of  $\text{NaHCO}_3$ ,  $\text{Al}(\text{OH})_3$  and Fe oxide is heated, residual Na aluminate and Fe oxide are treated to dissolve the Na aluminate, the latter is combined with  $\text{CO}_2$  and alumina is pptd. An arrangement of app. is described.

**Leaded ammonium chloride.** Charles P. Weise (to Grasselli Chemical Co.). U. S. 1,936,811, Nov. 28.  $\text{NH}_4\text{Cl}$  is crystd. from an alk. soln. contg. Pb and the lead  $\text{NH}_4\text{Cl}$  is treated with an acidified  $\text{NH}_4\text{Cl}$  soln., in order to obtain a light-colored product.

**Ammonium sulfate.** Appareils et Évaporateurs Kestner. Brit. 397,271, Aug. 24, 1933. See Fr. 733,594 (C. A. 27, 1105).

**Ammonium sulfate.** Emil Baerwald and Henry Goldmann. Ger. 585,502, Oct. 4, 1933.  $(\text{NH}_4)_2\text{SO}_4$  is prepd. by oxidizing  $\text{SO}_2$  (e. g., in gases from roasting pyrites, etc.) by means of oxides of N obtained by passing a high-tension current through air, and admitting  $\text{NH}_3$  and steam. The  $(\text{NH}_4)_2\text{SO}_4$  is collected by an electrofilter as a fine white powder.

**High-speed centrifugal drier and associated apparatus for drying ammonium sulfate.** Joseph van Ackeren (to

Koppers Co. of Del.). U. S. 1,936,866, Nov. 28. Various structural, mech. and operative details are described. **Ammonium sulfate nitrate.** Gewerkschaft Victor. Brit. 397,532, Aug. 28, 1933.  $\text{NH}_4$  sulfate nitrate is produced by introducing  $\text{NH}_3$  into a mixt. of  $\text{HNO}_3$  and  $\text{H}_2\text{SO}_4$  with utilization of the heat of reaction for evapn. of  $\text{H}_2\text{O}$ , the neutralization being effected under pressure so that evapn. cannot occur and said evapn. being conducted in a sep. part of the app. under a pressure less than that in the neutralization space.

**Barium hydrosulfide, etc.** Albert T. Mertes (to Krebs Pigment & Color Corp.). U. S. 1,936,849, Nov. 28. An aq. soln. of Ba sulfide is treated with  $\text{CaCl}_2$  in an amount substantially less than that equiv. to the Ba sulfide, and the  $\text{Ca}(\text{OH})_2$  is sepd. from the remaining soln. of Ba salts, which may be used for  $\text{BaCl}_2$  production, etc.

**Cadmium sulfate.** Harry P. Corson (to Grasselli Chemical Co.). U. S. 1,936,830, Nov. 28. Cd is dissolved in hot dil.  $\text{H}_2\text{SO}_4$ , and compressed air is introduced into the reaction mixt. while it is maintained at superatm. pressure.

**Chloride of lime.** Società elettrica ed elettrochimica del Caffaro, Achille Carughi and Carlo Paoloni. Fr. 42,505, Aug. 4, 1933. Addn. to 715,229 (C. A. 26, 1724). The interruption of the chlorination takes place after 9/10 of the operation is complete instead of 2/3 as in Fr. 715,229. The 1st phase of the reaction is carried out at 33–7°, the 2nd at 31–3° and the last at 27–31°.

**Shaft kiln for burning lime, etc.** Josef Rohm. Ger. 579,881, July 1, 1933.

**Calcium hypochlorite.** Francis N. Kitchen (to Imperial Chemical Industries Ltd.). U. S. 1,937,230, Nov. 28. A suspension of lime in water is chlorinated to produce basic Ca hypochlorite, the latter is sepd. from mother liquor, suspended in water and further chlorinated to produce normal  $\text{Ca}(\text{OCl})_2$ .

**Calcium hypochlorite.** Matthew Weber, Jr. (to Mathieson Alkali Works). U. S. 1,937,613, Dec. 5. Basic Ca hypochlorite is pptd. from an aq. soln. contg. Ca, chloride, OH and OCl ions, and after sepn. the chlorinated intermediate is caused to react with a NaOCl compd. and is dried.

**Copper chloride and sodium sulfate.** Giovanni Mosselli. Fr. 754,184, Nov. 2, 1933.  $\text{CuCl}_2$  and  $\text{Na}_2\text{SO}_4$  are made and sepd. from an aq. soln. of NaCl and  $\text{CuSO}_4$ , preferably in equimol. proportions, by cooling the soln. to between –10° and –20° and sepg. the crystd.  $\text{Na}_2\text{SO}_4$  by centrifuging or filtering.

**Cyanogen chloride.** Paul Dieterle (to National Aniline & Chemical Co.). U. S. 1,938,324, Dec. 5. Reaction is effected between Cl and an alkali metal cyanide in the presence of a halogenated aliphatic hydrocarbon such as  $\text{CCl}_4$  and of an org. monocarboxylic acid such as glacial HOAc which is sol. in the halogenated hydrocarbon used, in the substantial absence of water. By the use of Br instead of Cl, a similar reaction may be effected.

**Ferrous chloride.** Carl F. Prutton (to Dow Chemical Co.). U. S. 1,938,461, Dec. 5. A  $\text{FeCl}_2$  soln. is evapd. to ppt.  $\text{FeCl}_2 \cdot 2\text{H}_2\text{O}$  crystals, and the latter are sepd. from their mother liquor at a temp. above 90° (in order to avoid formation of tetrahydrate) and may be completely dehydrated by heating to about 230°.

**Ferric oxide.** Vereinigte Stahlwerke A.-G. (Leopold Brandt, inventor). Ger. 581,657, July 31, 1933. Pure  $\text{Fe}_2\text{O}_3$  is prepd. by reducing  $\text{Fe}(\text{CO})_5$  by heating to obtain pure Fe, treating the latter with  $\text{HNO}_3$  or  $(\text{CO}_2\text{H})_2$  and finally converting the resulting salt to  $\text{Fe}_2\text{O}_3$  by heating.

**Ferric oxide.** I. G. Farbenind. A.-G. (Hans Dohse, inventor). Ger. 584,646, Sept. 22, 1933.  $\text{Fe}_2\text{O}_3$  is obtained in a very finely divided condition by treating  $\text{FeCl}_3$  with alc. and  $\text{NH}_3$  in the presence of a small amt. of water. The alc. is distd. off and the  $\text{Fe}_2\text{O}_3$  freed from  $\text{NH}_4\text{Cl}$  and dried. In practice, anhyd.  $\text{FeCl}_3$  is treated with anhyd.  $\text{NH}_3$  and high-percentage alc.

**Ferric sulfate.** Titan G. m. b. H. Ger. 580,851, July 17, 1933. App. for treating solid powd.  $\text{Fe}_2(\text{SO}_4)_3$  with gaseous  $\text{NH}_3$  to produce  $\text{Fe}_2\text{O}_3$  and  $(\text{NH}_4)_2\text{SO}_4$  is described.

**Iron carbonyl.** Compagnie de produits chimiques et électrometallurgiques Alais, Froges et Camargue and James Basset. Fr. 753,683, Oct. 21, 1933. Fe carbonyl is made by causing CO to react under a pressure of 800 kg. per sq. cm. or more on compact Fe, divided simply by mech. means, *e. g.*, Fe turnings or filings.

**Purifying anhydrous magnesium chloride.** Société de produits chimiques des terres rares (to Johnson Matthey & Co. Ltd.). Brit. 397,481, Aug. 22, 1933. Divided on 397,479 (C. A. 28, 717<sup>a</sup>). See Fr. 736,416 (C. A. 27, 1285).

**Manganese dioxide.** Leslie G. Jenness (to Intermetal Corp.). U. S. 1,937,488, Nov. 28. Catalytic MnO<sub>2</sub> suitable for use in oxidizing CO at low temps. is prep'd. by heating a Mn ore such as pyrolusite ore contg. Mn of a valence greater than 2 in a stream of MeOH vapors to reduce the ore to compds. contg. both bivalent and quadrivalent Mn; the bivalent Mn is dissolved out with HNO<sub>3</sub>, and the resulting foraminite product is subjected to filtration, washing, pressing, crushing, sizing and drying.

**Nickel sulfate.** Harry P. Corson (to Grasselli Chemical Co.). U. S. 1,936,829, Nov. 28. A Ni-Cu-Fe alloy is treated with hot dil. H<sub>2</sub>SO<sub>4</sub>, and a gas contg. free O is introduced into the reaction mixt., as by use of air with steam, to give a suitable partial pressure of O greater than that in air alone, while a superatm. pressure and a temp. above 100° is maintained.

**Potassium aluminum fluoride.** Arthur H. Henninger (to General Chemical Co.). U. S. 1,937,956, Dec. 5. Al<sub>2</sub>O<sub>3</sub> is dissolved in a soln. of KOH, and HF is added. Various details of procedure are described.

**Potassium carbonate and sodium sulfate.** Kali Chemie A.-G. Fr. 752,507, Sept. 25, 1933. K<sub>2</sub>SO<sub>4</sub> is transformed to K<sub>2</sub>CO<sub>3</sub> by means of BaCO<sub>3</sub>, and the BaSO<sub>4</sub> is retransformed to BaCO<sub>3</sub> by means of Na<sub>2</sub>CO<sub>3</sub> in aq. suspension, preferably under pressure and heat. The mother liquor from the BaCO<sub>3</sub> is treated with CO<sub>2</sub> to sep. NaHCO<sub>3</sub>, and the mother liquor from the NaHCO<sub>3</sub> is cooled to sep. Na<sub>2</sub>SO<sub>4</sub>. The NaHCO<sub>3</sub> is heated in the presence of water to form Na<sub>2</sub>CO<sub>3</sub> and CO<sub>2</sub>.

**Potassium nitrate.** Kali-Forschungs-Anstalt G. m. b. H. (Oskar F. Kaselitz and Walter Katz, inventors). Ger. 581,656, July 31, 1933. KCl is treated with gaseous oxides of N obtained by heating Ca(NO<sub>3</sub>)<sub>2</sub> with KCl.

**Potassium phosphate.** Kali-Forschungs-Anstalt G. m. b. H. (Oskar F. Kaselitz and Walther Schuppe, inventors). Ger. 580,422, July 10, 1933. Addn. to 575,747 (C. A. 27, 4888). In prep'g. KH<sub>2</sub>PO<sub>4</sub> by the method of 575,747 from KCl and H<sub>3</sub>PO<sub>4</sub>, a sat'd. soln. of KH<sub>2</sub>PO<sub>4</sub> and the double salt KH<sub>2</sub>PO<sub>4</sub>·H<sub>3</sub>PO<sub>4</sub> is obtained. KCl and H<sub>3</sub>PO<sub>4</sub> are introduced into this soln. in equimol. proportions. The mixt. is heated till the Cl is driven off. The liquid is then cooled and the deposited KH<sub>2</sub>PO<sub>4</sub> sep'd.

**Silicon carbide.** Otis Hutchins (to Carborundum Co.). U. S. 1,937,060, Nov. 28. SiC in the form of allotropic crystal units joined to form a massive substantially continuous solid mass is prep'd. by a special described furnace operation and is of high purity and has a high elec. resistance.

**Sodium carbonate monohydrate.** Wm. H. Allen and Charles F. Ritchie (to American Potash & Chemical Corp.). U. S. 1,937,937, Dec. 5. In producing Na<sub>2</sub>CO<sub>3</sub>·H<sub>2</sub>O from complexes of Na<sub>2</sub>CO<sub>3</sub> and Na<sub>2</sub>SO<sub>4</sub>, a major part of the Na<sub>2</sub>SO<sub>4</sub> is first ppt'd. from the soln. while it is being replaced with NaCl, and NH<sub>3</sub> is then added to the soln. to ppt. Na<sub>2</sub>CO<sub>3</sub>·H<sub>2</sub>O. App. is described.

**Soda and ammonia.** Alfred Mentzel. Ger. 583,396, Sept. 2, 1933. Addn. to 582,504 (C. A. 28, 865<sup>1</sup>). The process of 582,504 for producing K<sub>2</sub>CO<sub>3</sub> and NH<sub>3</sub> from K<sub>2</sub>SO<sub>4</sub> is applied to Na<sub>2</sub>SO<sub>4</sub>. Thus Na<sub>2</sub>SO<sub>4</sub> is heated with C, steam and N to give NaCN. This is then treated with steam to give Na<sub>2</sub>CO<sub>3</sub>, NH<sub>3</sub> and NaOH.

**Sodium bicarbonate.** Henri Lawarree. Fr. 42,546, Aug. 4, 1933. Addn. to 730,997 (C. A. 27, 3787). NaHCO<sub>3</sub> is made by adding NaCl to a soln. circulating in a cycle contg. nitrates of amines and of NH<sub>4</sub>, (1/4) of the nitrate N being combined with the amines), then adding (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub> or NH<sub>3</sub> and CO<sub>2</sub> until pptn. of an amt. of

<sup>1</sup> NH<sub>4</sub>Cl corresponding to the NaCl added, removing the NH<sub>4</sub>Cl and treating by CO<sub>2</sub> to ppt. NaHCO<sub>3</sub>. The NaCl may be replaced by other sol. Na salt, and instead of NH<sub>4</sub>NO<sub>3</sub> in the starting soln. NaNO<sub>3</sub> may be used. Cf. C. A. 27, 4358.

**Sodium cyanide.** Gesellschaft für Kohlentechnik m. b. H. Fr. 751,191, Aug. 28, 1933. Na<sub>2</sub>CO<sub>3</sub> contg. water of crystn. is subjected to dehydration under a temp. such that there is no solution, fusion or fritting of the salt, and HCN is afterward directed at a higher temp. onto the dehydrated salt. In a modification NaHCO<sub>3</sub> is heated under vacuum to a temp. not above 102° and HCN is directed onto the calcined salt at a higher temp.

**Sodium nitrate.** George H. Gleason (to Compania Salitrera Anglo-Chilena). U. S. 1,937,757, Dec. 5. "Commercial" NaNO<sub>3</sub> is heated to liquefy its actual NaNO<sub>3</sub> without liquefaction of assoc'd. impurities, and the molten NaNO<sub>3</sub> is sep'd.

**Sodium nitrate and ammonium chloride.** Wilhelm Steudemann. Brit. 397,290, Aug. 24, 1933. See Fr. 741,213 (C. A. 27, 2768).

**Sodium nitrite.** Synthesia chemické tovarny akc. spol. and Bedrich Batik. Fr. 750,886, Aug. 21, 1933. See Ger. 568,942 (C. A. 27, 2768).

**Stannic chloride.** Jacques Wolf and Georges A. Favre. U. S. 1,937,419, Nov. 28. In treating molten Sn with Cl, about 5% or more of Sb is added to the Sn as a catalyst. App. is described.

**Strontium carbonate.** Otho L. Thomas (to Grasselli Chemical Co.). U. S. 1,936,806, Nov. 28. Crushed celestite ore is subjected to ball milling in a Na<sub>2</sub>CO<sub>3</sub> soln. at a temp. above about 65°, the solid product is sep'd. from Na<sub>2</sub>SO<sub>4</sub> soln. formed, reground as a slurry in water in a ball mill at a temp. above about 65°, and the resulting SrCO<sub>3</sub> is sep'd. from the reaction liquor.

**Zinc oxide.** Metallgesellschaft A.-G. Fr. 753,330, Oct. 13, 1933. ZnO is made by the combustion in powd. coal burners of a mixt. of fuel and a material contg. ZnSO<sub>4</sub>, *e. g.*, smoke dust from the roasting of Zn ores, without an excess of combustion air and at a temp. above the decomposition temp. of ZnSO<sub>4</sub>. The gases are cooled by pulverized water to ppt. ZnO and to oxidize the Zn formed.

**Active carbon.** N. V. Algemeene Norit Maatschappij. Ger. 583,053, Aug. 28, 1933. Addn. to 547,516 (C. A. 26, 3632). In prep'g. active C by the method of 547,516, *i. e.*, by heating coal and inorg. binding agent, the activating heating is carried out in a rotary-drum furnace. A small amt. of H may be introduced into the furnace.

**Colloidal carbon.** George Antonoff and Jean Freedland. Ger. 580,962, July 19, 1933. Colloidal C free from ash is prep'd. by carbonizing vegetable materials with H<sub>2</sub>SO<sub>4</sub>, and subjecting the product to an alk. peptization. The vegetable material may be subjected to a treatment with alkali before carbonization. Cf. C. A. 27, 5906.

**Carbon and hydrogen.** Adolf Köpke. Ger. 584,538, Sept. 21, 1933. App. for the simultaneous production of C and H by heating hydrocarbons, especially CH<sub>4</sub>, is described.

**Solutions of chlorine.** Electrochlore (Soc. anon.). Fr. 752,897, Oct. 2, 1933. Solns. of Cl in water are obtained by the use of a blast pump in which water under pressure acts to draw in the Cl and then dissolves it. The solns. are particularly for *delignification of cellulose*.

**Fluorine compounds of aluminum.** Walter H. Gitzen and Glenn H. Wagner (to Aluminum Co. of America). U. S. 1,937,885, Dec. 5. See Brit. 383,780 (C. A. 27, 4355).

**Hydrogen production.** Roger Williams (to E. I. du Pont de Nemours & Co.). U. S. 1,938,202, Dec. 5. A mixt. of steam and CH<sub>4</sub> under pressure and at a temp. of 300–550° is subjected to the combined action of a Ni catalyst and a preponderating proportion of an alk. earth oxide such as lime. When oxides of C begin to appear in the H, the catalyst is regenerated by heating.

**Hydrogen.** Hans Harter. Ger. 581,986, Aug. 5, 1933. H or a mixt. of H and N for the synthesis of NH<sub>3</sub> is obtained from CH<sub>4</sub> in two parallel processes. In one process, the CH<sub>4</sub> is treated with excess of steam in the presence of

fused Fe and a catalyst, to produce H and CO<sub>2</sub>. In the other, the CH<sub>4</sub> is treated with O or air to produce a mixt. of H and CO or N, H and CO, the H and CO being used to regenerate the catalyst used in the CH<sub>4</sub>-Fe-steam process. App. is indicated.

**Hydrogen or hydrogen-nitrogen mixture.** Hans Harter. Ger. 583,205, Aug. 31, 1933. Addn. to 581,986 (preceding abstr.). The method of 581,986 for producing H or H and N from CH<sub>4</sub> and steam, or CH<sub>4</sub>, steam and air, is modified by carrying out the two parallel processes described in 581,986 in one app., the waste gases, H and CO from one process being used to reduce the catalyst used in the other process.

**Hydrogen.** L'oxyhydrique française. Fr. 751,384, Sept. 2, 1933. H is made by charging Fe-Si in pieces, NaOH in pieces and then water into an autoclave, so that the rise in temp. due to the reaction assures progressive attack of the Fe-Si, without boiling.

**Oxygen.** I. G. Farbenind. A.-G. (Kurt Fischer, inventor). Ger. 583,788, Sept. 12, 1933. O is removed from gas mixts. contg. O by absorption with a complex Co compd., and is then recovered from the latter by treatment with NH<sub>3</sub>. Thus, crystd. Co(NO<sub>3</sub>)<sub>2</sub> and NH<sub>4</sub>NO<sub>3</sub> are dissolved in water and treated with an aq. soln. of NH<sub>3</sub>. Air is bubbled in to cause absorption of the O by the complex Co NH<sub>3</sub> compd. present. The O causes pptn. of the oxidized complex compd. This is filtered off and treated with gaseous NH<sub>3</sub>, causing evolution of O.

**Masses giving off oxygen.** Käte Wurster née Bode (Albert Hloch, inventor). Ger. 580,634, July 14, 1933. Masses giving off O on heating consist of a mixt. of O-yielding agents such as alkali or alk. earth oxides or peroxides and asbestos fiber.

**Phosphorus from phosphates.** Stapleton D. Gooch and Friedrich P. Kerschbaum (to Pembroke Chemical Corp.). U. S. 1,938,557, Dec. 5. A shaft furnace is supplied with a charge comprising a silica-contg. phosphate material in the form of lumps which will not disintegrate in passing through the shaft of the furnace and lumps of coke, the proportion of the coke being about one-third to two-thirds the quantity of the phosphate material; the charge is blasted with air preheated to at least 700°, and the throughput of the furnace based on coke consumption is maintained at from 200 kg. to 800 kg. per hr. per sq. m. of hearth. Cf. C. A. 27, 816.

**Phosphorous and phosphoric acid esters.** Wilhelm Lommel and Rudolf Engelhardt (to I. G. Farbenind. A.-G.). U. S. 1,936,985, Nov. 28. Phosphorous or phosphoric esters contg. Cl or Br are obtained by reaction of compds. such as ethylene or propylene oxides or epichlorohydrin with PCl<sub>3</sub>, POCl<sub>3</sub> or PBr<sub>3</sub> (suitably at about the b. p. of the alkylene oxide used). Oily products may be thus obtained such as tri(dichloropropyl) phosphate b<sub>p</sub> 67°, which hydrolyze when boiled with water and which may be used as impregnating and softening agents capable of reducing the inflammability of org. materials.

**Pure sulfur from crude material.** Koloman von Szombathy. U. S. 1,936,959, Nov. 28. In a continuous operation, the crude material is treated to produce H<sub>2</sub>S and SO<sub>2</sub> which are then simultaneously conducted into a polythionate soln. (using an excess of H<sub>2</sub>S and maintaining the temp. of the soln. at 45-65°). An arrangement of app. is described.

**Sulfur.** I. G. Farbenind. A.-G. (Paul Herold and Hans Dorsch, inventors). Ger. 581,147, July 21, 1933. Addn. to 565,538 (C. A. 27, 2541). See Fr. 726,380 (C. A. 27, 4361).

**Sulfur.** I. G. Farbenind. A.-G. (Fritz Winkler, Fritz Giller and Hans Dorsch, inventors). Ger. 581,654, July 31, 1933. See Fr. 747,250 (C. A. 27, 4889).

**Sulfur from sulfur dioxide.** Daniel Tyrer (to Imperial Chemical Industries Ltd.). U. S. 1,936,809, Nov. 28. A carbonaceous fuel such as coal is carbonized by heating it in contact with a preheated SO<sub>2</sub> gas contg. insufficient O to maintain the fuel at carbonizing temp., the carbonization being started at a temp. of about 400-500°; an O-contg. gas is added to the resulting reaction gases, and the gas mixt. is passed through a bed of highly heated carbo-

naceous fuel maintained at a temp. above 1000° by reactions between the fuel and the gas mixt.; reaction gases are withdrawn and elemental S is recovered from them. Cf. C. A. 27, 3788.

**Sulfur and arsenic.** Patentaktiebolaget Gröndal-Ramén. Ger. 581,557, July 29, 1933. See U. S. 1,917,725 (C. A. 27, 4637).

**Freeing sulfate solutions from iron.** Arthur Fleischer (to Kalumite Co.). Brit. 397,412, Aug. 24, 1933. Solns. of Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> or alum are freed from ferric Fe by treating the neutral or basic soln. with dehydrated alunite, base exchange being effected between the Fe<sub>2</sub>O<sub>3</sub> and the Al<sub>2</sub>O<sub>3</sub> of the alunite.

**Aluminum sulfate.** Katherine Steuart (to Kalumite Co.). Brit. 397,407, Aug. 24, 1933. A finely divided basic NH<sub>4</sub> alum is heated to 400-620° to expel its (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and obtain a basic Al sulfate which may be treated with H<sub>2</sub>SO<sub>4</sub> to reduce its basicity and increase its soly. Thus aluminiferous material, e. g., burnt clay, may be treated with H<sub>2</sub>SO<sub>4</sub> and (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> to obtain an NH<sub>4</sub> alum soln., BaS added to reduce the Fe therein, the soln. filtered and crystd., a soln. of the alum heated as in Brit. 397,408 or 397,410 (following abstr.) to ppt. the basic NH<sub>4</sub> alum and obtain a mother liquor contg. H<sub>2</sub>SO<sub>4</sub>, (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and residual normal alum, the basic alum treated as above and the ammoniacal vapors recovered in soln. and used with the mother liquor to attack fresh burnt clay. Cf. C. A. 27, 4356.

**Basic alums.** Katherine Steuart (to Kalumite Co.). Brit. 397,408 and 397,410, Aug. 24, 1933. See U. S. 1,914,175 (C. A. 27, 4355).

**Alumina.** Louise D. Sanders (to Kalumite Co.). Brit. 397,409, Aug. 24, 1933. A basic Na or K alum, obtained as in Brit. 397,408 or 397,410 (preceding abstr.), is calcined at 750-1000° and the undecompd. alkali sulfate-leached out. Residual SO<sub>3</sub> may be removed from the Al<sub>2</sub>O<sub>3</sub> by leaching with aq. Na, K or NH<sub>4</sub> hydroxide or carbonate. The alum is preferably first dehydrated at 500-600° and the SO<sub>3</sub> and SO<sub>2</sub> driven off at the higher temps. converted into H<sub>2</sub>SO<sub>4</sub>. In 397,411, Aug. 24, 1933, basic NH<sub>4</sub> alum, similarly obtained, is dehydrated at 500-600° and calcined at 700-1000°.

**Carbon monoxide.** Jean Mauclet. Fr. 753,658, Oct. 21, 1933. Carbonates are decomposed in a closed vessel, and the CO<sub>2</sub> is transformed to CO by contact at a high temp. with a material contg. C, e. g., an Fe-C alloy.

**Hydrogen peroxide.** Friedrich Boedecker and Jon Seemann (one-half each to E. I. du Pont de Nemours & Co. and to Buffalo Electro-Chemical Co.). U. S. 1,937,682, Dec. 5. Superheated steam is injected upwardly through a body of acid persulfate soln. in a continuous process, and the atomized soln. and H<sub>2</sub>O<sub>2</sub> vapor are drawn through a heated zone (of a described app.) by the action of a vacuum.

**Hydrogen peroxide.** Alfred Rieche. Ger. 580,710, July 14, 1933. A stable H<sub>2</sub>O<sub>2</sub> prepn. is obtained by treating urea derivs. of sugar with H<sub>2</sub>O<sub>2</sub> in the presence of water or stabilizers. Thus, glucose uride is treated with H<sub>2</sub>O<sub>2</sub> to give a stable product contg. 1.5-2% H<sub>2</sub>O<sub>2</sub>.

**Hydrogen peroxide.** Soc. d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine. Fr. 42,600, Aug. 23, 1933. Addn. to 733,201 (C. A. 27, 816). Steam is introduced at one or more points into the circulating soln. which is in process of being distd.

**Sulfur dioxide from acid sludges.** Ingenieur Hechenbleikner (to Chemical Construction Corp.). Brit. 398,023, Sept. 7, 1933. See U. S. 1,900,239 (C. A. 27, 3069).

**Catalysts.** "S. I. R. I." (Società italiana ricerche industriali). Brit. 397,309, Aug. 24, 1933. See Fr. 738,880 (C. A. 27, 1996).

**Catalysts.** Alexander Wacker Ges. für elektrochemische Industrie m. b. H. (Hans Anselm and Eugen Galitzenstein, inventors). Ger. 579,566, June 29, 1933. See Fr. 742,924 (C. A. 27, 3721).

**Oxidation catalyst.** Harlan A. Bond and Lee B. Smith (to E. I. du Pont de Nemours & Co.). U. S. 1,937,381, Nov. 28. A catalyst suitable for use in reactions such as production of aldehydes from alcs. comprises electrolytic Ag

crystals carrying a small amt. of an oxide of W, V, Mo, Ce, Th, Zn, Al or Cr.

**Oxidation catalyst.** Joseph C. W. Frazer. U. S. 1,937,689, Dec. 5. A catalyst suitable for use in the oxidation of CO at low temps. is prepd. by converting a Ni or Co compd. such as  $\text{Co}(\text{NO}_3)_2$  to oxide contg. less than the limit of poisoning impurities tolerable for such activity and heating the oxide in an oxidizing atm. at an elevated temp. not exceeding about  $350^\circ$ . Cf. C. A. 28, 867.

**Catalyst for ammonia oxidation.** Mayor F. Fogler (to Atmospheric Nitrogen Corp.). U. S. 1,936,936, Nov. 28. In producing a catalyst, a material comprising a soln. of Co nitrate and alumina is heated to remove liquid and produce an agglomerated mass; the mass is broken up to form granules and fines, and fines in the solid phase are sepd. and are used for producing addnl. catalyst in granular form, by mixing with a Co salt soln. such as the nitrate and granulating.

**Manganese dioxide catalysts, etc.** Leslie G. Jenness (to Intermetal Corp.). U. S. 1,937,499, Nov. 28. Substantially all the bivalent Mn is removed from Mn sesquioxide (suitable by use of dil.  $\text{H}_2\text{SO}_4$ ) to obtain a catalyst which is suitable for use in the low-temp. oxidation of CO. Ni aluminate may be treated with NaOH.

**Catalyst for absorbing olefins.** N. V. de Bataafsche Petroleum Maatschappij. Ger. 580,929, July 19, 1933. Addn. to 541,628 (C. A. 26, 2466). In absorbing olefins by strong acids in the presence of catalysts to form hydrolyzable products, the catalysts of 541,628 are replaced by the complex compds. obtained by treating metal CN compds. with unsatd. hydrocarbons and acid under conditions which result in polymerization of the hydrocarbons. Thus, strong  $\text{H}_2\text{SO}_4$  is stirred with KCN and  $\text{C}_2\text{H}(\text{CH}_3)_2$  to give a catalyst used in absorbing  $\text{C}_2\text{H}_4$ .

**Nickel catalysts.** Wm. W. Myddleton. Brit. 397,295, Aug. 24, 1933. Catalysts are prepd. by mixing Ni oxide with a Si ester, decompd. the ester and heating the mixt. in a reducing atm. In an example NiO, prepd. from  $\text{NiCO}_3$ , is mixed with a PhMe soln. of Et orthosilicate and  $\text{NH}_4\text{OH}$  is added. The coagulated product is broken into granules, dried and reduced in H. The catalyst may be used for the hydrogenation of cottonseed oil.

**Artificial materials.** Soc. pour l'ind. chim. à Bâle. Fr. 754,100, Oct. 31, 1933. In making lamellar artificial masses, a fusible non-hardening resin having a base of amine of the type of the anhydride of aminobenzyl alc. and its homologs, is used as binder. The layers provided with this binder are assembled by the action of heat and pressure.

**Condensation products.** Bakelite G. m. b. H. (Fritz Seebach, inventor). Ger. 579,748, July 3, 1933. Products capable of being hardened are formed by treating urea or its derivs., or thiourea, or mixts. of these, with  $\text{AcNH}_2$  and  $\text{CH}_2\text{O}$  in the presence or absence of catalysts. The product is dried, powd. and given the usual optional addns. of coloring matter, filling materials, plasticizing agent, etc., and is molded. The products are hardened by hot pressing. The  $\text{AcNH}_2$  may be partly or wholly replaced by  $\text{C}_2\text{H}_5\text{NHC}_2\text{H}_5\text{O}$ . Examples are given.

**Condensation products.** I. G. Farbenind. A.-G. (Heinz Scheyer, inventor). Ger. 580,010, July 5, 1933. The condensation products obtained in Ger. 571,523 (C. A. 27, 4415) by treating methyleneanthrone or its substitution products with a mild acid condensing agent are treated with  $\text{SO}_2\text{Cl}_2$ . The product can be subjected to the action of a mild alk. condensing agent by the method of 577,560 (C. A. 28, 654). Examples are given.

**Condensation products.** H. Römmler A.-G. Ger. 583,563, Sept. 6, 1933. Products are obtained by treating 1 mol. of thiourea and 1 mol. of urea with less than 4 mols. of  $\text{CH}_2\text{O}$ , the  $p_K$  value being 5. The products have a hydrophobe character. Examples are given.

**Condensation products.** I. G. Farbenind. A.-G. (Karl Daimler and Berthold Vahlberg, inventors). Ger. 584,703, Sept. 22, 1933. Condensation products contg. silicates are obtained by treating taurines with fatty acid chlorides and Na silicate contg. free alkali (obtained by

heating sand with NaOH) at  $0-50^\circ$ . Thus, an aq. soln. of Na taurine is treated with crude Na silicate contg. excess of NaOH and palm oil acid chloride. The product is used as a washing agent. Another example is given.

**Condensation products.** Herbert Hönel. Ger. 584,858, Sept. 27, 1933. Addn. to 563,876 (C. A. 27, 1220). The method of 563,876 for producing stable high mol. products by adding excess of the therein described almost neutral condensation products to  $\text{CH}_2\text{O}$ -PhOH products, is modified by reducing the amt. of the excess. High temps. are employed. Thus, thymol is condensed with  $\text{CH}_2\text{O}$  in an alk. medium and is added at  $160^\circ$  to excess of a linseed oil-wood oil product to give a viscous oil useful as a binding agent, etc. Oxidation hardens the spread oil. Other examples are given.

**Condensation products.** Ambi Verwaltung A.-G. (Stefan Goldschmidt and Emil Gerische, inventor). Ger. 584,856, Sept. 28, 1933. In prepg.  $\text{CH}_2\text{O}$ -urea condensation products with a predetd. gelatinization period, lower alcs. are added immediately after the condensation in a weakly acid medium, without removal of the water. Thus,  $p$ - $\text{CH}_2\text{O}$ , urea, and a small amt. of 2 N NaOH are heated in a reflux condenser.  $\text{H}_2\text{SO}_4$  is then added and the whole heated till the mass becomes viscous. Alc. (96%) is then added to the hot mass which is allowed to cool. The mass remains fluid for several days and then gelatinizes. Other examples are given.

**Plastic condensation products.** Joseph C. Patrick. Ger. 579,692, June 20, 1933. Dihalogenated paraffins such as  $\text{C}_2\text{H}_4\text{Cl}_2$  are condensed with an aq. polysulfide soln. in the presence of freshly pptd.  $\text{Mg}(\text{OH})_2$ , the  $p_K$  value being maintained between 7 and 12 and preferably between 8 and 10. Polysulfides of the general formula  $\text{XS}_n$  are used,  $n$  being greater than 3.75 and X being a metal. The resulting latex is isolated by coagulation. Examples are given. Cf. C. A. 27, 2260, 5160.

**Plastic masses.** Bakelite Corp. Ger. 579,553, June 28, 1933. Urea and solid polymers of  $\text{CH}_2\text{O}$  are mixed to a plastic mass with filling material and cellulose derivs. stable at  $165^\circ$ , e. g., cellulose acetate. A plasticizing agent such as dialkyl esters, is added and the mass homogenized ready for pressing or molding.

**Plastic masses.** Franz Gassner. Ger. 579,720, June 30, 1933. See Fr. 734,382 (C. A. 27, 1114).

**Plastic masses.** Walter Hengstmann, Wolf Hengstmann and Anna-Marie Hengstmann née Wolf. Ger. 581,675, July 31, 1933. Addn. to 499,676 (C. A. 25, 568). The plastic mass of 499,676 consisting of cellulose ethers and aliphatic dicarboxylic acids, is improved by addn. of polymerized styrene. The product is useful for making dental plates, etc.

**Plastic materials.** Helmut Fritz and Emil Glaser. Fr. 752,452, Sept. 23, 1933. Powd. substances or mixts. which are hardened by water are transformed by anhyd. liquids into homogeneous plastic masses, and kept out of contact with moisture until the time of use. Thus,  $\text{ZnO}$  45,  $\text{ZnSO}_4$  20, monoacetin 15 and dichlorohydrin 20 parts are mixed, or portland cement 72.5 and an alc. soln. of  $\text{ZnCl}_2$  27.5 parts. Other examples are given.

**Plastic materials.** Fabriques de produits de chimie organique de Laire, and René Armand. Fr. 752,705, Sept. 29, 1933. Plastic materials contg. combined S are made by producing  $\text{H}_2\text{S}$  in the nascent state by double decompn. in the presence of urea- $\text{CH}_2\text{O}$  solns., either before or after the formation of methylolurea, the  $p_K$  of the medium being controlled so that it remains at the optimum value. The  $\text{H}_2\text{S}$  may be formed by the addn. of a sulfide or polysulfide and an acid.

**Resitols.** Aug. Nowack A.-G. and Richard Hessen. Ger. 580,560, July 12, 1933. Soluble condensation products from phenols and aldehydes capable of hardening and melting are heated in thin layers, e. g., on rollers, to high temps. till the resol is converted to resitol, the greater part of the volatile constituents being simultaneously removed. Novolack and hardening material may be used instead of resol.

**Adhesives.** George E. Heyl. Brit. 397,678, Aug. 31, 1933. Tiles, slabs, etc., particularly of glass, are secured

to surfaces by a plastic compn. consisting of concd., *e. g.*, 75%, rubber latex 15,  $\text{SiO}_2$  flour 3-12 and gum 0.5-1 parts. Coloring matter may be incorporated or painted on the tje back. Cf. *C. A.* 27, 4891.

**Adhesives.** I. G. Farbenind. A.-G. Fr. 752,565, Sept. 26, 1933. A covering material resistant to water such as linoleum is fixed to a substratum by an aq. emulsion of a resinous condensation product contg. radicals of a polyhydric alc., of a polybasic org. acid and of a drying fatty acid. Thus an emulsion of a condensation product contg. radicals of glycerol, phthalic acid and linseed oil fatty acid and a soln. of casein in aq.  $\text{NH}_3$  may be used. Pitch and finely powd. lignite may also be present. Cf. *C. A.* 28, 607<sup>2</sup>.

**Adhesive mass.** Ivo Giordano and Odoardo Diena. Fr. 751,348, Aug. 31, 1933. A plastic adhesive mass is made by heating rubber, if desired already vulcanized and aged, to 200-350°, and treating with an inorg. acid such as  $\text{HNO}_3$ . The products may be used for impregnating bandages made of cloth, paper or spun glass.

**Adhesive foil, etc.** Hugo Wilckcn. Ger. 581,968, Aug. 5, 1933. Foil, etc., which adheres under application of heat and pressure, is coated with albumin, a hygroscopic substance, and rubber latex.

**Adhesive for paraffined paper.** N. V. de Bataafsche Petroleum Maatschappij. Fr. 753,542, Oct. 18, 1933. Solns. of chlorinated rubber in org. solvents are used.

**Asbestos cement products.** Giovanni Morbelli. Ger. 583,554, Sept. 5, 1933. The products are rendered harder and more resistant to water by using 70 to 85% of fine ground slag contg.  $\text{SiO}_2$  as binding agent, and steam-hardening.

**Dental cement.** Pierre J. A. Husnot. Ger. 584,720, Sept. 23, 1933. A dental cement consists of chemically pure Sn in cryst. form and  $\text{ZnHPO}_4$ .

**Albumin.** Soc. pour l'ind. chim. à Bâle. Ger. 581,518, July 28, 1933. Solns. of albumin and its disintegration products are obtained by using liquid addn. products of alkylating agents and pyridine bases, with or without addn. of water-free diluents, as solvents. Cellulose may be added. The soln. may be treated with esterifying agents to acylate the solute. In an example, powd. casein is dissolved in a mixt. of pyridine and benzylpyridinium chloride. Cellulose may be added. Other examples are given. The solns. are used for the production of films, fibers, etc.

**Objects of molten silica.** Soc. anon. des manufactures des glaces et produits chimiques de Saint-Gobain, Chauny et Cirey (Gaston Delpéch, inventor). Fr. 752,926, Oct. 3, 1933. Objects made of molten  $\text{SiO}_2$  are subjected after leaving the furnace to a scraping at a temp. as high as possible and not below the temp. of transformation of the cristobalite, then the surface is subjected to a refusion at a temp. of at least 1000°.

**Cleansing agents.** Léon A. L. Morot. Fr. 752,898, Oct. 2, 1933.  $\text{PhNH}_2$  is mixed with a liquid soap or a lye and used for washing, cleaning, pickling, etc.

**Cleaning composition.** Paul Régeard. Fr. 751,240, Aug. 29, 1933. A cleaning compn. for paint, etc., contains peanut oil 55, a drying liquid or powder 35 and Prussian blue or other color 10%. The peanut oil may be replaced by a smaller proportion of linseed, colza, olive or other oil.

**Cleaning and dispersion agent.** Deutsche Hydrierwerke A.-G. Ger. 584,688, Sept. 22, 1933. Agents for cleaning and dispersing are prepd. by adding high mol. alcs. or ketones, optionally mixed with hydrocarbons, to alk. salts such as carbonates, borates, silicates, etc., and using salts of aliphatic sulfonic acids as emulsification promoters. Thus, an aq. soln. of the Na salt of naphthalene sulfonic acid is added to  $\text{Na}_2\text{CO}_3$  and cyclohexanol. Other examples are given.

**Cleaning and disinfecting metal articles.** Hermann Kantorowicz. U. S. 1,937,229, Nov. 28. Articles of metal such as Al or other receptacles or utensils are treated with a soln. contg. hypochlorite, alkali metal silicate and caustic alkali.

**Drain-pipe cleaning composition.** Oliver W. Hunter

(one-half to Robert A. Northcott). U. S. 1,938,560, Dec. 5. Caustic alkali and Al particles are used together with vegetable matter such as a powd. spice in such a proportion that fumes formed when the compn. is contacted with water will be rendered fragrant and non-irritating.

**Preservative composition suitable for treating paintings.** Hyman Deitchman. U. S. 1,937,813, Dec. 5. Gelatin and wood creosote are heated to 160-250° and the resulting vapors are condensed and then further cooled to form a colloidal mass.

**Extrusion process for pencil manufacture.** Jorgen E. Thomsen (to Joseph Dixon Crucible Co.). U. S. 1,937,104, Nov. 28. Various details of app. and operation are described.

**Composition for manufacture of pencil sheaths.** Jorgen E. Thomsen (to Joseph Dixon Crucible Co.). U. S. 1,937,103, Nov. 28. Wood flour is used with a non-water-absorbent comminuted cellulose fibrous material such as rice hulls and a water-sol. binder such as an alkyl cellulose, etc.

**Self-hardening graphite lead for pencils.** Jorgen E. Thomsen (to Joseph Dixon Crucible Co.). U. S. 1,937,105, Nov. 28. A marking material for pencils is formed comprising a comminuted wax-satd. calcined graphite and a water-sol.-binder such as one contg. an alkyl cellulose, etc.

**Bleaching agent.** Soc. anon. des cires Sultane. Fr. 754,112, Nov. 2, 1933. New bleaching salts are made by passing Cl into a soln. contg. a uni-, bi- or tri-basic alkali salt of  $\text{H}_3\text{PO}_4$  and a caustic alkali. The products are of the type  $\text{PO}_3\text{Na}(\text{ClONa})_2$ ,  $\text{PO}_2\text{Na}_2(\text{ClONa})$  and  $(\text{PO}_2\text{Na})_3(\text{ClONa})_3$ .

**Antifreeze agents.** Henkel & Cie. G. m. b. H. Fr. 751,084, Aug. 26, 1933. See Brit. 392,876 (*C. A.* 27, 5495).

**Compound sheet material.** General Electric Co. Brit. 396,405, Aug. 2, 1933. A molded laminated material, relatively bullet-proof, comprises alternate layers of fibrous material, *e. g.*, paper, and an abrasive, *e. g.*, powd. glass or quartz, the layers being bonded together with a resinous compn. or a varnish which hardens when heated and subjected to pressure.

**Laminated sound records.** Howard J. Billings (to Arthur D. Little, Inc.). U. S. 1,937,680, Dec. 5. A moldable material is used which comprises fibrous material such as paper pulp and a binder consisting of hardwood pitch and a gum of "low susceptibility factor" such as copal gum. Various details of laminated record manuf. are described.

**Flexible tubing.** Leopold Rado. U. S. 1,937,069, Nov. 28. Tubing is formed with a casing of flexible material such as rubber and a lining consisting of helically wound cellulose film coated with metal foil constituting in the lining a plurality of sepd. layers.

**Packing.** Eugene V. Hayes-Gratz. Brit. 397,219, Aug. 24, 1933. A calking, lagging and packing material is prepd. from unspun fibers, preferably sisal, hemp or coir, which are first softened by treatment with a neutralized sulfonated oil electrically ionized as described in Brit. 363,651 (*C. A.* 27, 1768), and then carded or formed into a loose blanket-like mass. The material is shaped into suitable form after addn. of any suitable binding material.

**Blanket for printing apparatus.** Louis Smith and Fred Vogel (to Louis Smith). U. S. 1,938,301, Dec. 5. A base of alternate layers of fabric and rubber cemented and pressed together and having an upper surface of a fabric layer carries on the latter a "dope coating" comprising nitrocellulose, castor oil and rape-seed oil and superposed varnish coatings over this "dope" coating.

**Waste products from galvanization.** Polskie Zakłady Przemysłu Cynkowego Spółka Akcyjna w. Bedzinie. Fr. 751,132, Aug. 28, 1933.  $\text{ZnCl}_2$  and oxides of Fe are obtained by treating  $\text{ZnO}$  ash from galvanization operations with used HCl contg.  $\text{FeCl}_3$ , while passing a current of air therethrough.

**Fly paper.** Chemische Fabrik Ludwig Meyer (Karl

Beier, inventor). Ger. 579,858, July 13, 1933. Fly papers are prepd. with a layer of hygroscopic mucin contg. chemically bound  $\text{CH}_2\text{O}$  or  $(\text{CH}_2)_n\text{N}_x$ . Examples are given.

**Fireproof bodies.** Ture R. Haglund. Ger. 579,530, June 27, 1933. Fused masses contg. at least 50%  $\text{Al}_2\text{O}_3$  or  $\text{MgO}$  and oxides which do not form spinel, e. g.,  $\text{SiO}_2$ ,  $\text{CaO}$ , etc., are molded; the amts. are adjusted so that 8–

30% of the product is a compd. of m. p. 100–500° below that of spinel.

**Fire extinguishers.** Soc. auxiliaire de matériel d'incendie. Fr. 752,621, Sept. 27, 1933. An aq. soln. of an energetic emulsifying agent in combination with an alkali or salt of alk. reaction is used for *extinguishing burning oil, fats, waxes*, etc. The emulsifying agent may be a Na alkylsulfonaphthenate. Cf. C. A. 27, 1121.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

**Essentials of glass technology.** Based on American practice. Samuel R. Scholes. *Ceram. Ind.* 22, 29–32 (1934); cf. C. A. 28, 595.

**Modern glass-works costing.** Practical guide to the compilation of glass-making accounts and costs. S. Howard Withey. *Glass* 10, 499–500 (1933). H. S. W.

**Methods and conditions of controlling the rate of drawing of glass ribbons in Fourcault machines.** N. P. Krasnikov. *Keram. i Steklo* 9, No. 8, 12–18 (1933).—K. discusses factors affecting the rate of drawing of glass ribbon, e. g., (1) thickness of the ribbon, (2) viscosity of the glass (its compn.), (3) the power of drawing, (4) power of friction. The obtaining of high-quality glass depends chiefly on how these factors are stabilized.

M. V. Kondoidy  
**Viscosity-time-temperature relations in glass at annealing temperatures.** Howard R. Lillie. *J. Am. Ceram. Soc.* 16, 619–31 (1933); cf. C. A. 25, 4986.—The viscosity of a newly drawn fiber increases with time of heat treatment according to a definite law which may be explained on the basis of a change in the state of aggregation in the glass. A finite equil. viscosity is indicated at each temp.; this limit is approachable from either side depending upon previous heat treatment. This is taken to indicate a equil. av. size of aggregate for any temp., the groups starting to break up again if the temp. is increased after a long treatment. The expression of Sheppard and Houck is used for estg. effective mol. or aggregate wts. in equil. at various temps., an example being 112,000 at about 500°. The variation of viscosity with time is at least one reason why glasses fail to conform to Adams' and Williamson's annealing equation at low temps.

C. H. Kerr  
**The electrical behavior of glass at room temperature.** E. M. Guyer. *J. Am. Ceram. Soc.* 16, 607–18 (1933).—Glass at room temp. is an excellent dielectric, also a conductor of electricity, its resistivity being  $10^8$ – $10^{14}$  ohms. Methods of study have been greatly improved by the development of plotron vacuum tubes. The time required to reach a steady flow of current may vary from a few min. to several hrs. Just as the elec. history of the glass at low temps. detrs. its subsequent behavior, so also does the thermal history as shown by pronounced variations produced by chilling or by prolonged heating above the annealing point. The effects of chilling are not due solely to the resulting mech. strain. A radio-frequency field applied to a sample of glass during d. c. cond. detns. produced no effect which could not be duplicated without the glass in the circuit. The work is exploratory and being continued.

C. H. Kerr  
**Effect of heat treatment on the expansivity of a Pyrex glass.** J. B. Saunders and A. Q. Tool. *Bur. Standards J. Research* 11, 799–810 (1933) (Research Paper No. 626).

E. H.  
**Lead crystal glass and its investigation from a hygienic standpoint.** P. Keim and Fr. Raeder. *Tech. Gemeinnutz* 36, 281–3 (1933); cf. C. A. 27, 2108.—Pb is not dissolved from Pb glass by acid solns. in amts. sufficient to affect health, and as foods are not alk. its soly. in alk. solns. is not important hygienically.

M. G. Moore  
**Physicochemical principles of the colored decorations of glass.** Jacques Wolf. *Rev. belge ind. verrieres* 4, 272–3 (1933); cf. C. A. 27, 5914.—Mosaics and stained-glass windows are discussed.

Herbert S. Willson  
**Scientific principles of fuel economy in the glass indus-**

try. Combined low-temperature carbonization and total gasification of coal. David Brownlie. *Glass* 10, 503–9 (1933); cf. C. A. 28, 596°.

Herbert S. Willson  
**The classical methods for the complete analysis of clays and refractory products, feldspar, kaolin, glass.** A. Noel. *Rev. belge ind. verrieres* 4, 266–8 (1933).

Herbert S. Willson  
**De-airing of clay as applied to the stiff-mud process.** W. Wurth Kriegl. *Bull. Am. Ceram. Soc.* 12, 338–40 (1933).

C. H. Kerr  
**Factors involved in the production of glazed brick by the dry-press process.** W. C. Rueckel. *J. Am. Ceram. Soc.* 16, 10–13 (1934).

C. H. Kerr  
**Water-tight terra cotta masonry.** F. O. Anderegg. *J. Am. Ceram. Soc.* 16, 634–8 (1933).

C. H. Kerr  
**Terra cotta cracking.** Fred. B. Ortman. *J. Am. Ceram. Soc.* 16, 639–42 (1933).

C. H. Kerr  
**British chemical stoneware.** G. N. Hodson. *Chemistry & Industry* 1933, 986–90.

E. H.  
**Approximate composition of the lowest fusing mixture of barium oxide, magnesium oxide and silica.** Cecil H. Turner. *J. Am. Ceram. Soc.* 17, 14–15 (1934).—The lowest fusing mixt. as detd. by a series of test cones was approx.: BaO 46, MgO 8,  $\text{SiO}_2$  46% by wt. The first signs of fusion occurred when standard cone 1 had fused to 3 o'clock position.

C. H. Kerr  
**Notes on cone 10 sagger bodies with talc as a component.** H. Thiemecke. *J. Am. Ceram. Soc.* 17, 3–6 (1934).—Adding talc in amts. up to 15% improved plastic working properties, increased both dry and fired mech. strength, decreased absorption, lowered thermal expansion, increased heat-shock resistance, decreased sag tendency, made smoother fired surface, and darkened the color. Over 15% gave no appreciable increase in benefits.

C. H. Kerr  
**Note on the discovery of a kaolin deposit in New Mexico.** L. M. Richard. *J. Am. Ceram. Soc.* 16, 632–3 (1933).—The kaolin deposit is plastic and suitable for whiteware, refractories or paper. Four samples analyzed:  $\text{SiO}_2$  45.20–48.25,  $\text{Al}_2\text{O}_3$  32.40–37.55,  $\text{Fe}_2\text{O}_3$  0.42–2.36,  $\text{Na}_2\text{O}$  0.24–3.30,  $\text{H}_2\text{O}$  12.28–13.86%.

C. H. Kerr  
**Effect of grain sizing on shrinkage and porosity of Georgia kaolin refractories.** F. H. Norton. *Bull. Am. Ceram. Soc.* 12, 336–7 (1933).—Porosities as low as 22% in a dry, packed condition were obtained in mixts. of crushed grog without discarding much of the product from the crusher. Grog mixts. of low porosity when fired gave both low porosity and low firing shrinkage.

C. H. K.  
**Electric furnace refractories in the brass foundry.** H. M. St. John, et al. *Metals & Alloys* 4, 183–91 (1933).

Downs Schaaaf  
**Notes on the coloration of glazes by light.** C. W. Parmelee and A. E. Badger. *J. Am. Ceram. Soc.* 17, 1–2 (1934).—Actinic darkening is described.

C. H. K.  
**App. for calcining clay and gypsum** (U. S. pat. 1,937,413) 1. Purifying  $\text{Al}_2\text{O}_3$  [suitable for refractories] (Brit. pat. 397,288) 18. Impregnating porous ceramic products with bituminous material (U. S. pat. 1,937,417) 20. Adhesives [for tiles, glass, etc.] (Brit. pat. 397,678) 18. Drier for clays (Ger. pat. 579,540) 1.

**Glass.** Jenaer Glaswerk Schott & Gen. Ger. 574,755, Aug. 8, 1933. Glass resistant to metal vapors con-

- sists of  $B_2O_3$ , up to 45%  $Al_2O_3$ , and from 6 to 80% of bivalent oxides such as  $MgO$ ,  $CaO$ ,  $BaO$ ,  $ZnO$  and  $PbO$ . The glass is practically free from quadrivalent oxides and oxides of alkali metals.
- Glass.** Soc. anon. d'études et de constructions d'appareils mécaniques pour la verrerie. Fr. 751,357, Sept. 2, 1933. Means for continuous withdrawal of glass from the furnace. Cf. C. A. 27, 2270.
- Glass.** I. G. Farbenind. A.-G. Fr. 751,524, Sept. 5, 1933. Colorless glass of high resistance to water and permeable to ultra-violet rays is composed for the greater part of Ba metaphosphate. Metaphosphates of Ca and Mg may also be present.
- Glass.** Compagnies réunies des glaces et verres spéciaux du Nord de la France. Fr. 752,548, Sept. 25, 1933. Perforated pouring device, the perforations of which increase in size from the interior to the exterior.
- Glass.** Soc. des verreries de Folembay (François Doutriaux and Lucien Lavère, inventors). Fr. 753,908, Oct. 27, 1933. A new glass contains  $SiO_2$  less than 70,  $B_2O_3$  12-25,  $Na_2O$  5-8,  $PbO$  2-10 and  $Al_2O_3$  1-5%. Good results are obtained with  $SiO_2$  67,  $B_2O_3$  20.26,  $Na_2O$  6.49,  $PbO$  3.9 and  $Al_2O_3$  2.37%.
- Apparatus for gathering mold charges of molten glass by suction.** Karl E. Peiler (to Hartford-Empire Co.). U. S. 1,937,479, Nov. 28. Structural and mech. features.
- Flux for glass.** Erich Heinz. Ger. 580,596, July 13, 1933. In making plain or colored silicate glass contg. B and Ba, the latter are introduced as powd. Ba borosilicate.  $Al_2O_3$  and alkali may also be added.
- Glass-making furnace.** George E. Howard (to Hartford-Empire Co.). U. S. 1,937,321, Nov. 28. Various structural and operative details are described.
- Tank furnace for glass manufacture.** Thomas C. McKinley and Clarence A. Rhonemus (to Libbey-Owens-Ford Glass Co.). U. S. 1,937,390, Nov. 28.
- Cylindrical fusion furnace for glass, etc.** François Schwallier. Fr. 753,472, Oct. 17, 1933.
- Apparatus for burning waste glass from glass articles such as shades or globes.** Theodore H. Sloan (to Macbeth-Evans Glass Co.). U. S. 1,937,723, Dec. 5. Structural and mech. features.
- Tunnel leer and associated apparatus for annealing glassware.** Wm. A. Morton and Paul L. Geer (to Amster-Morton Co.). U. S. 1,938,346, Dec. 5. Structural and mech. features.
- Muffle-heated tunnel furnace for annealing glass, earthenware or metal articles.** Chauncey E. Frazier. Brit. 397,729, Aug. 31, 1933.
- Canal annealing furnace for glassware.** Glaceries de la Sambre Soc. anon. Ger. 583,805, Sept. 9, 1933.
- Cooling furnace for glass plates.** Yvon Brancart. Ger. 580,568, July 13, 1933.
- Apparatus for melting glass, especially for preparing glass fibers.** Firma Oscar Gossler (Gedeon von Pазiczky, inventors). Ger. 580,502, July 12, 1933.
- Apparatus for making fibers of glass, etc.** N. V. Maatschappij tot Beheer en exploitatie van Octrooien. Ger. 579,689, June 29, 1933. Addn. to 539,738 (C. A. 27, 579).
- Apparatus for spinning glass fibers.** Walter Rössler. Ger. 564,700, June 28, 1933.
- Machine for making mats of glass wool.** Walter Rössler. Ger. 581,677, Aug. 1, 1933.
- Apparatus for manufacture of glassware such as bottles.** Karl E. Peiler (to Hartford-Empire Co.). U. S. 1,937,913, Dec. 5. Mech. features.
- Apparatus for making tubular glass objects.** Alfred Hofmann & Cy. Fr. 753,782, Oct. 24, 1933.
- Apparatus for blowing articles from glass tubing.** Jakob Dichter. Fr. 752,723, Sept. 29, 1933.
- Apparatus for drawing glass tubes.** Leopoldo Sanchez-Vello. Ger. 579,506, June 28, 1933.
- Device for drawing glass tubes.** Paul Bornkessel. Ger. 581,505, July 28, 1933.
- Device for drawing glass rods or tubes.** Compagnie des Lampes. Ger. 579,687, June 28, 1933.
- Device for drawing glass rods.** N. V. Maatschappij tot
- Beheer en Exploitatie van Octrooien and Leopoldo Sanchez-Vello.** Ger. 579,588, July 8, 1933.
- Fluid-cooled rolls suitable for use with sheet glass.** Carroll Cone (to Libbey-Owens-Ford Glass Co.). U. S. 1,937,382, Nov. 28. Various details are described of a roll construction and circulating system by which cooling fluid such as water is fed to the roll at a const. predetd. temp.
- Apparatus for manufacture and annealing of sheet glass.** James C. Blair (to Libbey-Owens-Ford Glass Co.). U. S. 1,937,380, Nov. 28. Mech. features.
- Apparatus for tempering glass by jets of air.** Soc. anon. des manufactures des glaces et produits chimiques de Saint-Gobain, Chauny et Cirey. Fr. 42,533, Aug. 4, 1933. Addn. to 720,348.
- Polishing glass.** Soc. anon. des manufactures des glaces et produits chimiques de Saint-Gobain, Chauny et Cirey. Fr. 753,909, Oct. 27, 1933. A small amt. of salts, particularly chlorides, is added to the water used for mixing with the Fe oxide or emery dust, so as to lower the vapor tension of the water and reduce its speed of evapn.
- Use of fused silver chloride for joining glass to metals such as in joints of chlorine-supply apparatus.** John C. Baker (to Wallace & Tiernan Co.). U. S. 1,937,865, Dec. 5.
- Protective glass.** Verreries de Goetzenbruck S. A. Fr. 752,615, Sept. 27, 1933. A glass which absorbs ultra-violet and infra-red rays contains CdS and FeO, with or without other metal compds. The fused glass must be protected from the influence of the atm. of the furnace by covering the crucibles with refractory materials.
- Laminated glass.** Harry T. Neher and Charles S. Hollander (to Röhm & Haas Co.). U. S. 1,937,323, Nov. 28. Glass sheets are used conjointly with a film comprising a polymer of a mixt. of at least 2 unsatd. org. compds. such as ethyl  $\alpha$ -methacrylate and methyl acrylate.
- Laminated glass.** George B. Watkins (to Libbey-Owens-Ford Glass Co.). U. S. 1,937,396, Nov. 28. Various details of app. and operation are described.
- Compound glass sheets.** Adolf Kämpfer and Adolf C. Plötze. Fr. 751,396, Sept. 2, 1933. The elastic sheet is formed by adding a soln. of rubber to a soln. of a natural or artificial resin, if necessary with the addn. of suppling agents and afterward vulcanizing the rubber. Cf. C. A. 27, 4646.
- Glassware reinforced with wire mesh.** Thomas W. McCreary. U. S. 1,938,540, Dec. 5. Various details of manuf. are described.
- Ceramic materials.** General Ceramics Co. Fr. 752,998, Oct. 4, 1933. The compactness of ceramic materials and materials which may be worked by processes used in ceramics, such as metals or metal carbides, is increased by eliminating air or gases contained in the primary materials by known means.
- Ceramic products.** Alfred Wanklin. Ger. 584,833, Sept. 29, 1933. App. is described for working up, conveying and firing objects made from a mixt. of clay and hot filling material.
- Porous products such as brick or tile.** Harry T. Belamy. U. S. 1,938,170, Dec. 5. See Brit. 392,465 (C. A. 27, 4896).
- Drying brick kiln products.** Erduin Schondorff. Ger. 580,627, July 13, 1933.
- Sagger suitable for use in firing porcelain, etc.** August Weber, Jr. (to Weber Elec. Co.). U. S. 1,937,450, Nov. 28. A sagger is formed with its exposed wall provided with corrugations for increasing the heating surface and reducing the wt. of the sagger.
- Firing ceramic ware.** John Thomas Bamford. Brit. 397,339, Aug. 24, 1933. To avoid danger of silicosis from use of powd. flint a bedding material contg. Sr is used for firing pottery. Thus a calcined mixt. of  $SrSO_4$  and  $Al(OH)_3$  with the ratio  $SrSO_4:Al_2O_3$  of 2:1 is used for china and of 3:1 for earthenware and glazed tiles.
- Vitrified product.** Soc. anon. des manufactures des glaces et produits chimiques de Saint-Gobain, Chauny et Cirey. Fr. 752,636, Sept. 27, 1933. A material of low d.

having insulating properties toward heat and sound is made by fusing vitrifiable materials contg. boric acid and a carbonaceous substance, and carrying the fused mass to the neighborhood of its softening pt., preferably after solidification. Thus, a glass formed of sand 100, borax 94, ZnO 97, hydrated  $\text{Al}_2\text{O}_3$  5 and charcoal 8 gives on heating to  $1000^\circ$  a product of apparent d. of 1.68.

**Refractory bricks.** Joseph Neidhart. Fr. 753,340, Oct. 13, 1933. Moisture in amt. only strictly necessary for molding the bricks is used so that no preliminary drying is necessary and deformations by shrinkage are avoided.

**Molding and vibration apparatus for manufacture of refractory bricks, etc.** Elisabeth Lux, Wilhelm H. Daniels and Eberhard Kühn (to Koppers Co. of Del.). U. S. 1,937,028, Nov. 28. Structural and mech. features.

**Refractory objects.** Soc. anon. des manufactures des glaces et produits chimiques de Saint-Gobain, Chauny et Cirey (Gaston Delpech, inventor). Fr. 752,967, Oct. 4, 1933. The extremities of graphite molds or formers, corresponding to the edges of the objects to be molded, are maintained at the temp. of the fused material while the temp. in the other parts of the mold or former is regulated before, during, and after contact with the fused material according to a law detd. for each of these parts.

**Abrasive and polishing articles such as abrasive wheels.** Harry C. Martin (to Carborundum Co.). U. S. 1,937,043, Nov. 28. To form a substantially uniform article and to prevent segregation of abrasive and assocd. binder, a synthetic resin is mixed with an abrasive material in an

atm. which is conditioned to maintain the temp. below that at which the resin begins to soften and the humidity below that at which the resin takes up water to the extent of forming lumps, the mixt. is molded under pressure and below the said crit. temp. and the shaped article is heated to transform the binder.

**Abrasive articles.** Raymond C. Benner, Prescott H. Walker and Wm. G. Soley (to Carborundum Co.). U. S. 1,936,820, Nov. 28. In forming articles such as abrasive wheels, an abrasive mixt. is transferred to a mold in an atm. of controlled humidity, in order to facilitate production of a uniform product. App. is described.

**Sharpening compositions.** Leo Steiner. Brit. 397,529, Aug. 28, 1933. An abrading compn. for application to the rollers of a razor-blade-sharpening machine comprises finely divided corundum 70, ozocerite 7 and paraffin 23 parts. The corundum may be partly replaced by powd.  $\text{Fe}_2\text{O}_3$ .

**Glazing earthenware.** Porzellanfabrik Ph. Rosenthal & Co. A.-G. Ger. 579,563, June 28, 1933. The glaze is fused and sprayed on to the heated earthenware.

**Enamel.** Ignaz Kreidl. Ger. 580,570, July 13, 1933. White enamel rendered turbid by gas is applied to objects by admixing materials which evolve H during firing. Thus, an enamel mass may be given an addn. of Zn, clay and water. The Zn may be replaced by other metals or metalloids such as Si, which evolve H with water.

**Device for coating iron objects with enamel.** Warsteiner und Herzoglich Schleswig-Holsteinische Eisenwerke A.-G. Ger. 581,693, Aug. 1, 1933.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

The liquid phase of portland cement in practical mixing proportions. Tutomu Maeda and Ryûzô Syôzô. *Ser. Papers Inst. Phys. Chem. Research (Tokyo)* 23, 137-52(1933)(in Esperanto); cf. *C. A.* 27, 5506.

The liquid phase was extd. with a high-pressure ultra filter or with a hand-screw filter press. Preliminary expts. with mixts. contg. 27, 40, 50 and 60%  $\text{H}_2\text{O}$  at  $25^\circ$  indicate that in the early stage of hardening the concns. of  $\text{SO}_4^{--}$  and  $\text{Na}^+ + \text{K}^+$  are greater, and that of  $\text{Ca}^{++}$  is less, with a small amt. of  $\text{H}_2\text{O}$ . In 50:50 cement- $\text{H}_2\text{O}$  mixts. the alky. due to alkali-metal hydroxide in the liquid phase is rather large; e. g., one sample was 0.17 *N* from this cause after 36 hrs., at which time only 7.8% of the total alky. was due to  $\text{Ca}(\text{OH})_2$ . The alkali-metal compd. in one cement gave up all its alkali to the soln. after about 3 weeks. Austin M. Patterson

The cause of the influence of added substances on the rate of hardening of gypsum cement. I. II. Sigeru Yamane. *Bull. Inst. Phys. Chem. Research (Tokyo)* 12, 871-83(1933)(Abstracts (in Esperanto) published with *Ser. Papers Inst. Phys. Chem. Research (Tokyo)* 22, Nos. 457-67); cf. *C. A.* 26, 3352.—Revised solubilities in moles per kg. at  $25^\circ$ , of  $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}(S)$  and  $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}(N)$ , resp., are: for  $\text{H}_2\text{O}$ , 0.055, 0.015; for  $\text{CuSO}_4$  soln. (0.783%), 0.054, 0.012; for  $\text{MgSO}_4$  soln. (0.999%), 0.052, 0.011; for  $\text{NaCl}$  soln. (1.006%), 0.075, 0.026; for  $\text{NH}_4\text{Cl}$  soln. (0.527%), 0.069, 0.023; for  $\text{NH}_4\text{NO}_3$  soln. (1.947%), 0.087, 0.029; for  $\text{NH}_4\text{OAc}$  soln. (3.709%), 0.118, 0.052; for sucrose soln. (18.537%), 0.050, 0.014; for gelatin, 0.053, 0.015. For  $\text{CuSO}_4$ ,  $\text{MgSO}_4$ ,  $\text{NaCl}$ ,  $\text{NH}_4\text{Cl}$  and  $\text{NH}_4\text{NO}_3$ , which accelerate the hardening,  $S-N$  is greater than for  $\text{H}_2\text{O}$ ; for sucrose and gelatin, which retard it,  $S-N$  is less than for  $\text{H}_2\text{O}$ . However, for  $\text{NH}_4\text{OAc}$  (which retards)  $S-N$  is greater; this may be due to adsorption of  $\text{NH}_4\text{OAc}$  by the crystal nuclei, as microscopic examn. seems to show. The formula  $(S-N)/N$  of Weiser and Moreland does not fit these cases as well as  $S-N$ . Austin M. Patterson

**Volcanic ash cement.** H. Brintzinger and W. Bubam. *Agnew. Chem.* 46, 779-80(1933).—The volcanic ash from the volcano Acetenango in Guatemala (June 25, 1925) and that fallen around Buenos Aires (April 11-13, 1932)

were examd. as addns. to cement. The Acetenango ash formed an excellent cement when mixed with  $\text{Ca}(\text{OH})_2$  or portland cement in the proportion 1:2(ash):9(sand). No regression in strength was observed after 1 year. The other ash, however, was totally unsuited as addn. to cement. It was found to be an acid silicate which was hardly attacked by concd. acid. The  $n$  was  $< 1.515$  and  $> 1.489$ . Both volcanic ashes were extremely fine in texture. Chem. analyses and test data are given. The authors point out that volcanic ash must consist of reactive silicates in order to be suitable for addns. to cements.

Karl Kammermeyer

**Air-slaked lime-mortars.** I. Ad. Stois and F. W. Meier. *Agnew. Chem.* 46, 794-6(1933).—Expts. were carried out with a no. of aged limes and it was found that aging generally increases the dispersion of lime. The older lime generally shows a higher  $\text{CaO}$  or  $\text{Ca}(\text{OH})_2$  content. The degree of dispersion greatly influences the quality of a lime. Not every lime aged for a long period, however, is better than one aged for a short period or a freshly slaked one; in general, the importance of aging time is overstd. Eight references. K. Kammermeyer

**Effect of steam sterilization on susceptibility of wood to blue-staining and wood-destroying fungi.** A. Dale Chapman. *J. Agr. Research* 47, 369-74(1933).—Expts. with heated and unheated pine wood on the effect (1) of staining fungi on strength properties and (2) of wood-destroying fungi on the loss in wt. of wood indicate that even the relatively mild treatments ordinarily used in disinfecting blocks for wood-decay expts. may so change the wood as to make it a more congenial substratum than normal unheated wood for at least some of the wood-deteriorating fungi. Any conclusions that may be drawn from expts. in which the wood has been steam sterilized are subject to considerable error unless due consideration is given to the effect of such sterilization in the interpretation of results. In view of the evidence submitted it seems necessary to qualify the acceptance of some of the past expl. work that has been done with wood disinfected by heat. Tests were made with a number of methods, most of them chem., involving the use of volatile toxic materials, but with little assurance that their application does not

change the compn. of certain constituents of the wood.

W. H. Ross

**New test methods for the protection of wood from combustion.** Carl G. Schwalbe and Käte Berling. *Chem.-Ztg.* 57, 881-3(1933).—A fire is kindled under the test specimen which is in the form of a square fluc. In a second method of test, combustion gases at about 550° impinge on a board. In this test the less the initial water content of the wood the greater is the inflammability. The protection of impregnating agents extends to dried-out wood. A test of the resistance to short circuit is described in which grooved boards with a wire passing through the grove are used.

P. S. Roller

**Photomicrographic swelling experiments on pine wood and beechwood on microtomic sections in transmitted light and on small blocks in reflected light.** W. Beiser. *Kolloid-Z.* 65, 204-11(1933).—Observations on microtomic sections, 10-15  $\mu$  thick, swollen in damp air, water, 0.1%  $\text{SO}_2$ , and 0.1%  $\text{NaOH}$  soln., showed a thickening of the cell walls and different expansions in the radial and tangential directions. The results were not directly comparable with the microscopic observations on small blocks or with the macroscopic results, probably because of the absence of restraining forces existing in blocks of wood and in the original wood. The results on blocks of late wood are several % lower than on the microtomic sections and are in agreement with the macroscopic results. The tangential and radial swelling of late wood with thick walls is somewhat greater than that of early wood, which often shows a slight decrease in the radial direction. For wood blocks cut against the grain, swelling is greater in the tangential direction than in the radial.

A. F.

**Studies in the decomposition of timber under industrial conditions. II. The decay of greenheart.** Ernest A. Rudge. *J. Soc. Chem. Ind.* 52, 447-9T(1933); cf. *C. A.* 27, 5927.—The mechanism of decay of greenheart is related to the presence of Ca in the woody tissues. The Ca is assocd. with the "Cross and Bevan" cellulose. In the presence of  $\text{H}_2\text{O}$  the hemicelluloses are degraded into pentoses, including xylose and Ca salts of uronic acids.

Alfred L. Kammerer

**Fuel problem in the manuf. of lime (Dérubéré).** 21. Hydrolytic decompn. of tricalcium silicate (Tavasci) 2. Prepn. of portland cement from gypsum (Royak, *et al.*) 18. App. for taking samples of cement on conveyors (U. S. pat. 1,937,473) 1. Water-absorbent pulverized Fe [as dressing for concrete surfaces] (Australian pat. 8291/32) 9. Tar for preserving wood (Fr. pat. 753,889) 21. Heat-treating comminuted material [cement] (Brit. pat. 397,666) 1.

**Cement.** Firma K. Schwenk. Ger. 580,777, July 15, 1933. Raw material contg.  $\text{CaCO}_3$  is intimately mixed with finely ground fuel and heated to sintering temp. in a shaft kiln. The conditions are arranged so that no de-oxidizing zone occurs in the kiln.

**Cement.** Paul Mecke. Fr. 754,113, Nov. 2, 1933. The hardening of cement is accelerated by mixing it with a powder formed of Si material (residues from the manuf. of  $\text{Al}_2(\text{SO}_4)_3$ ),  $\text{CaO}$  and calcined soda. The addn. of water forms a plastic mass which sets in a few min.

**Cement.** Soc. anon. des ciments français et des Portland de-Boulogne-Sur-Mer et Compagnie des Portland de Desvres. Fr. 754,296, Nov. 3, 1933. To obtain a deeply tinted cement a material rich in  $\text{MgO}$  is added to the raw material in amt. so as to obtain a clinker contg. 0.85-2% of  $\text{MgO}$ . Salts or other metal oxides which have a regular coloring effect may be used instead of  $\text{MgO}$ .

**Cements.** I. G. Farbenind. A.-G. Fr. 42,475, July 31, 1933. Addn. to 682,581 (*C. A.* 24, 4607). Cements are prepd. by mixing hydrated silicates, easily sol. and gelatinified, with substances capable of binding the  $\text{SiO}_2$  of the sol. silicates in the form of insol. silicates resistant to acids. Such substances include Ba silicate, fused  $\text{Al}_2\text{O}_3$  cement,  $\text{VO}$ , and double silicates of Ca and Al.

**Hydraulic cement.** Carl Pontoppidan. Fr. 752,671,

1 Sept. 28, 1933. A cement having a hydraulicity modulus (ratio between the basic and acid substance) above 2.2 and a moderate  $\text{SiO}_2$  modulus (ratio of  $\text{SiO}_2$  to  $\text{Al}_2\text{O}_3$  and  $\text{Fe}_2\text{O}_3$ ) is obtained by grinding the raw materials to a degree of fineness adopted for normal portland cement, so that the content of  $\text{CaO}$  is above the normal satn. pt., and, after fixing the clinker, reducing all or part of the excess  $\text{CaO}$  during or after the subsequent grinding of the clinker. The temp. is such (80-210°) that while the excess  $\text{CaO}$  is rapidly reduced, the cement is not or only slightly hydrated. The excess  $\text{CaO}$  is converted to hydrate.

**Apparatus for cooling cement clinker and simultaneously extracting moisture from slurry.** Lester E. Palmer (one-half to Wabash Portland Cement Co.). U. S. 1,937,094, Nov. 28. The hot clinker is fed through a revolvable cylinder, heat-conducting fins projecting from which extend into receptacles for the slurry.

**Stable foam suitable for incorporation with cement slurries.** Richard Ericson (to U. S. Gypsum Co.). U. S. 1,937,472, Nov. 28. Starch is mixed with cold water and there is then added to the mixt. sufficient boiling water to raise the temp. of the mixt. to the gelatinizing point of the starch; soap bark is dissolved in the starch soln. while the latter is hot, and air is dispersed into the resulting hot mixt. to form a foam and the foam is allowed to cool.

**Device for spraying cement slurry, etc., into a rotary-drum furnace for burning.** Fellner & Ziegler A.-G. Ger. 584,758, Sept. 27, 1933.

**Apparatus for dehydrating cement pulp.** Jacques J. Durieu and Francisque L. Dubois. Fr. 754,218, Nov. 3, 1933. The pulp is pressed through a system of tubes perforated by holes through which the water exudes.

**Apparatus for filtering, drying and burning raw cement sludge.** Alfred Schmid (to Fried. Krupp Grusonwerk A.-G.). U. S. 1,936,861, Nov. 28.

**Cement kiln.** Fried. Krupp Grusonwerk A.-G. Ger. 580,573, July 13, 1933.

**Cement kiln.** Lepol Internationale Patentverwertungs-G. m. b. H. and N. V. Solopol, Ingenieur-Bureau tot Exploitatie van het System Polysius. Ger. 584,937, Sept. 26, 1933.

**Rotary cement furnace.** Kristian Middelboe. Fr. 752,540, Sept. 25, 1933.

**Rotary cement furnace.** Lucien P. Basset. Fr. 753,622, Oct. 20, 1933.

**Rotary furnace for cement by the wet process.** Mikael Vogel-Jørgensen. Fr. 754,020, Oct. 30, 1933.

**Rotary-drum furnace for burning cement, ores, etc.** Vickers-Armstrong Ltd. Ger. 579,615, June 29, 1933.

**Shaft furnaces for burning cement.** Fried. Krupp Grusonwerk A.-G. Ger. 580,692, July 14, 1933. Details of a closing device are given.

**Kiln for burning portland cement.** Mathias Fränkl. Ger. 583,641, Sept. 11, 1933.

**Aggregates from refuse suitable for use in concrete.** Maxwell M. Upson. U. S. 1,936,810, Nov. 28. Combustible matter recovered from relatively large ash particles is utilized for incinerating bulky constituents of refuse such as that of the ash to reduce its bulk and convert the refuse into a state in which it is suitable for sintering; the incinerated material is then sintered and formed into aggregate. App. is described.

**Impregnating concrete and porous ceramic products with bituminous material.** Edwin C. Wallace (to Warren Bros. Co.). U. S. 1,937,417, Nov. 28. After drying, the product to be impregnated is immersed in a bath of a penetrating, mobile, volatile hydrocarbon oil with which asphalt is miscible; surplus oil is drained off, and the product is then submerged in asphalt heated to a temp. sufficient to vaporize part of the oil to facilitate impregnation.

**Bituminous material suitable for use as a binder in road construction.** Alfred R. Ebberts (to Colprovia Roads, Inc.). U. S. 1,937,749, Dec. 5. A cracking still residue is mixed with a fluid flux oil to increase its solvent power for a finely divided high-melting bitumen and the

flux-oil mixt. and bitumen are then amalgamated with-out heating.

**Road materials.** Soc. J. R. Geigy S. A. Fr. 754,119, Nov. 2, 1933. Chlorinated rubber is added to bituminous materials used for road construction.

**Road surfacing.** Robert J. Lacau. Ger. 584,936, Sept. 26, 1933. Addn. to 582,997 (C. A. 28, 875<sup>a</sup>). Emulsions for road surfacing are prep'd. by adding 2-5% of middle oil to fused bitumen or low-temp. tar.

**Treating stone, bricks, etc.** Eugène Garapon. Fr. 753,719, Oct. 23, 1933. Saltpeter in stone, marble, bricks, lime, cement or plaster is suppressed by preventing the growth of bacteria by treatment with a bactericide.

**Building material.** Arthur Sprenger. Ger. 580,491, July 12, 1933. Addn. to 577,932 (C. A. 28, 806<sup>a</sup>). The method of 577,932 for making highly fireproof building material by fusing together  $MgO$ ,  $Al_2O_3$ ,  $Cr_2O_3$  and  $SiO_2$  is modified by adjusting the amt. of oxides so that the  $Cr_2O_3$  and  $MgO$  together constitute 50% or more of the mass.

**Building material.** Ernst Weber. Ger. 583,556, Sept. 5, 1933. Blocks for building purposes are made by mixing long fibrous material, such as wood fiber, with gypsum and cement, and pressing.

**Building blocks.** Carl Francke. Ger. 583,969, Sept. 13, 1933. Material for building is made by mixing clay with pine bark, molding and firing the blocks.

**Apparatus for spray coating walls or other surfaces with asphalt, etc.** James E. String (to Vortex Mfg. Co.). U. S. 1,936,997, Nov. 28. Various structural, mech. and operative details are described.

**"Acoustical" plaster.** Leslie B. Eaton (to Kalite Co., Ltd.). U. S. 1,937,011, Nov. 28. An under-coat comprises a finely ground aggregate such as pumice, a plaster binder such as a gypsum stucco plaster and an aq. soln. of a gelatinous material such as glue and alum forming wall cells throughout the under-coat during its wet application and forming intercommunicating pores when the under-coat is dry, and a finish coat of similar materials contg. a more finely ground aggregate than the under-coat and troweled to a smooth surface. Cf. C. A. 27, 3381.

**Brown coat plaster.** George F. Moore. U. S. 1,937,202, Nov. 28. A "synthetic gypsum" formed as a by-product in the manuf. of  $H_3PO_4$  from phosphate rock, free from active acid and contg. as impurities at least some sol. phosphates, is calcined to the "first settle" and  $Al_2(SO_4)_3$  introduced at the end of the "first settle."

**Lacquer coatings on plaster.** Charles Rogin (to Commercial Solvents Corp.). U. S. 1,937,484, Nov. 28. A bare plaster base or the like is provided with at least one coat of a casein-contg. undercoating (the last of which coats contains at least 15% casein) and over this there is applied at least one coat of a brushing nitrocellulose lacquer or the like.

**Wall coverings.** Jules A. Barbier dit Barbier-Daumont. Fr. 752,912, Oct. 8, 1933. An antiphonetic, insulating and incombustible covering for walls is made by causing  $(NH_4)_2CO_3$  to react on gypsum and adding a silicate, preferably  $K_2SiO_3$ , to give sufficient solidity after setting, and naphtha oil in amt. sufficient to harden the product and prevent hydration. An example contains  $(NH_4)_2CO_3$  3.5-4.5,  $K_2SiO_3$  10-15, naphtha oil 15-20, gypsum 450-420 and water 500-1000 parts.

**Waterproof insulating board suitable for use on milk-cooling tanks, etc.** Everett S. Penn (to Armstrong Cork Co.). U. S. 1,938,351, Dec. 5. An insulating corkboard is enclosed in a waterproof reinforcing envelope including fabric substantially coextensive with the surface of the corkboard, a continuous imperforated layer of asphalt mastic bonding the fabric and the corkboard and a similar united layer overlying the fabric.

**Wall board.** John A. Wiener and John B. Harmon. U. S. 1,937,679, Dec. 5. A wall board is formed with a base including fibers and mica, impregnated with  $(NH_4)_2SO_4$ , borax and  $ZnCl_2$ , which serve as fireproofing agents of successively higher m. ps.

**Cellular product suitable for wall board, etc.** Hugh M. Spencer (to Upson Co.). U. S. 1,936,887, Nov. 28. A mixt. is formed of relatively finely divided inorg. material such as ground limestone and sulfite liquor soln., and the mixt. is heated to cause it to intumesce and form a cellular product.

**"Composition board."** George D. King and James S. Offutt (to U. S. Gypsum Co.). U. S. 1,937,907, Dec. 5. A bonding agent such as molasses slop is continuously applied to a moving strip of paper and a cementitious core material composed mainly of gypsum is then applied to the treated surface. App. is described.

**"Synthetic lumber" from cornstalks.** Orland R. Sweeney (to Iowa State College of Agriculture and Mechanical Arts). U. S. 1,937,366, Nov. 28.  $HgCl_2$  is injected into a mass of cornstalks broken up into particles, in order to serve as an insecticide and the mass is then formed into "lumber" by pressing and drying.

**"Synthetic lumber" not attacked by insects.** Orland R. Sweeney (to Iowa State College of Agriculture and Mechanical Arts). U. S. 1,938,227, Dec. 5. Fine pieces of cornstalks are mixed with water, the mass is formed into "lumber" by heat and pressure and the product while still warm is sprayed with  $HgCl_2$  soln.

**Preserving wood.** Soc. Sep. Fr. 754,219, Nov. 3, 1933. A compn. which preserves and polishes wood is composed of a soln. of wax in a heavy solvent, such as a dichlorobenzene having insecticidal properties.

**Impregnating wood.** Wacaw Iwanowski and Josef Turski. Ger. 581,948, Aug. 5, 1933. Wood and other vegetable material is impregnated with tri- or poly-chlorophenolates in the pure state or in soln. to prevent rotting. Other antiseptics or nitrochlorophenolates may be admixed.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

**Ethyl alcohol motor fuel.** K. R. Dietrich. *Automobiltech.* Z. 36, 519-20(1933).—A general discussion on the advantages of alcohol-gasoline-benzene motor fuels.

A. A. Boetlingk

**The desirable characteristics of fuels for high-speed compression-ignition engines.** J. Kewley. *Petroleum Times* 30, 593(1933).—The essential properties for a high-speed Diesel fuel are considered to be (1) a good ignition quality, (2) suitable viscosity, (3) absence of dirt, and (4) low pour point.

Chas. Wirth, III

**Carbureted charcoal gas for automobile engines.** Erwin Wawrziniok. *Automobiltech.* Z. 36, 546-9(1933).—The efficiency of an automobile gas producer operated with charcoal was considerably augmented by the introduction of alc. The gas mixt. was forced through the hot zone of the producer whereby gum-forming substances were

destroyed. Diagrams reproducing the performance of the motor are given.

A. A. Boetlingk

**Summary of factors causing formation of carbon deposits in internal-combustion engines.** W. A. Gruse. *Oil and Gas J.* 32, No. 27, 15-16(1933); cf. C. A. 27, 2288.—Oxidation tests are very valuable in predicting the amt. of deposit likely to form in an engine, but have not yet established any significance for ordinary service, nor have the distn. tests.

J. R. Strong

**The fuel problem in the manufacture of lime.** M. Dérubert. *Rev. matériaux construction trav. publics* 1933, 357-61.—Ten fuels for lime kilns (coals and oils) are discussed with respect to their suitability and economy. Data for sp. gr., proximate analysis, heating value, theoretical and actual air vols. are presented and a heat balance is carried out for a sp. case.

Karl Kammermeyer

**Proximate analysis of Chinese coals.** K. Y. King and T. C. Hung. Contribution from Sin Yuan Fuel Laboratory, *Geol. Survey China* No. 13, 170 pp.(1933); *Bull. Geol. Survey China* No. 21; cf. C. A. 28, 284<sup>a</sup>.—Analyses of over 2000 samples of Chinese coals are tabulated.

Alden H. Emery

**Recent investigations on the nature, preparation, storage and coking of typical coals from the Sydney Area, Nova Scotia.** R. E. Gilmore and R. A. Strong. *Trans. Can. Inst. Mining Met.* 1933 (in *Can. Mining Met. Bull.* No. 260) 549-61; cf. C. A. 27, 4902.—Discussion.

Alden H. Emery

**The latest developments in hydrogenation of coal and tar.** M. Pier. *Automobiltech. Z.* 36, 492-3(1933).

A. A. Boehtlingk

**Spontaneous combustion of coal.** Donald Andrews. *Steam Engr.* 3, 93-4(1933).—General discussion.

Alden H. Emery

**The swelling of coal during the determination of the volatility.** D. J. W. Kreulen. *Chem. Weekblad* 30, 770-1 (1933).—The form of the coke after the detn. of the volatility is dependent upon the way the particles are packed in the crucible before the detn. This is in accordance with the expts. of Lambris (cf. C. A. 23, 4324).

E. Schotte

**The role of water conditions in the formation and differentiation of common (banded) coals.** David White. *Econ. Geol.* 28, 556-70(1933).—The formation of peat and the biochem. decompn. products of microbial activities are discussed. The initial role of water is to cover the vegetable debris, excluding atm. O. It also stabilizes the temp., acts as a solvent and a medium for microbial or plant growth and may conc. or dissipate biochem. decompn. products. The proportions in which the principal components of coal are deposited depend on the state of the water into which the ingredient material falls. With low biochem. action the coal will be distinctly humic or with nearly all the plant matter lost will be more hydrogenous because of the remaining spore exines, resins and waxes. The laminas of banded coals are records of periodic fluctuations in environment, the factors being seasonal variations in rainfall and temp. A. M. Brant

**Spontaneous combustion. XVI. The layers A and C of the Tandjoeng-Enim coal.** D. J. W. Kreulen. *Chem. Weekblad* 30, 718-22(1933); cf. C. A. 27, 5513.—Numerous curves expressing the analyses of the Tandjoeng-Enim coal are presented. The temp. of max. rate of evolution of volatile matter is the only property that is a function of the percentage content of volatile matter. The heat of combustion varies with the degree of carbonization of the humic nucleus in coals that do not contain free humic acid. For coals contg. free humic acids the heat of combustion varies according to the content of these acids. E. Schotte

**Mildew formation on briquets (compressed coal).** Sandor Gömöry. *Angew. Chem.* 46, 781(1933).—The flour which is added as binder to the lignite, or coal screenings, frequently results in considerable mildew formation and consequent mech. decompn. of briquets. The use of antiseptics was investigated for prevention of mildew formation (1) as addn. before pressing to the mixt. and (2) by immersion of the briquets into an aq. soln. The latter method gave better results. Forty-two chemicals and mixts. were tested and a 5% soln. of Napyroborate was found most effective. K. K.

**Chemical technical uses for a resinous pitch lignite coal. II. Borneo coal.** H. H. Müller-Neuglück. *Angew. Chem.* 46, 792-3(1933); cf. C. A. 28, 729<sup>a</sup>.—Expts. are reported on the use of extd. resin as well as of the coal itself, distributed as powder in a solvent, for com. purposes. The ether-extd. resin can be used in the *lacquer industry*, while the coal suspension in oil of turpentine, with addn. of linseed-oil varnish, gives an excellent *coating material*, which has the addnl. advantage of showing good *insulating properties* for elec. purposes. The covering power of the resinous substances can also be used to advantage in *shoe polishes* and *dyes*. A table gives test results on various formulas with asphalt, resinous and resin-free Borneo

coal, for *film thickness*, *drying time* and *elec. breakdown resistance*.

Karl Kammermeyer

**Chemical and microscopical detection of lignite in bituminous coal dust.** F. Roll and E. Stach. *Giesserei* 20, 563-5(1933).—The dust is heated at 350° and the distillate caught in water, dissolved in hot acetone, and the clear soln. cooled in ice water. Silky needles of paraffin indicate lignite. Confirmation is made by microscopic examn. of the dust (cf. C. A. 25, 3150). With oil immersion the lignite appears darker. C. L. W.

**Production of oil from [brown] coal.** R. Heinze. *Automobiltech. Z.* 36, 493(1933).—A general discussion.

A. A. Boehtlingk

**The development of gas as an industrial fuel.** Joseph B. White. *Inst. Gas Engrs.* Communication No. 72, 46 pp.(1933); cf. C. A. 27, 3584.—The use of oxy-coal gas for metal cutting is described. With O<sub>2</sub> costing 18d., C<sub>2</sub>H<sub>2</sub>, 39d., and gas 3.3d. per 100 cu. ft., the cost of cutting 27.5 ft. of 1/2 in. rusty ship's plate is 14.34d. for O-C<sub>2</sub>H<sub>2</sub> and 8.16d. for O-coal-gas. The use of gas for carburizing and general heat treating is general. Costs on a battery of Gibbons furnaces were £11 5s.; on the coal furnaces displaced, costs were £15 10s. Two tons of coal were used per ton of steel carburized against 99-100,000 cu. ft. of gas. The same amt. of heavy forging was done with 137,000 cu. ft. of gas as with 10-12 tons of coal, and the substitution reduced time for heating up 1 1/2-2 hr. per day, reduced repairs, released fireman, etc. Results on use of town's gas in a rolling mill are described. Gas consumed was 3377 cu. ft. per ton (including heating up) at a cost (2.475d. per therm) of 3s. 5-3/4d. per ton. Cost figures for 6 months show 8-10% saving over producer gas. Uses in motor vehicles, in a steam plant, in a bakery, etc., are described briefly.

Alden H. Emery

**Gum formation and compression of city gas.** A. Pignot. *J. usines gas* 53, 414-17(1933).—The attack of bottled gas containers by typical gas gum, deposited in them after 7-8 months use, is shown in photomicrographs. It is recommended to use an aq. lubricant for the compressor (colloidal aq. suspension of oil or of graphite) in order to reduce the dehydration of the gas by the compression.

B. J. C. van der Hoeven

**Benzene and coal tars.** F. Müller. *Automobiltech. Z.* 36, 493(1933).—A general discussion on the production of C<sub>6</sub>H<sub>6</sub> and motor fuels from coal tar. A. A. B.

**Development of the coal-tar industry.** August Mers. *Official Digest Fed. Paint Varnish Production Clubs*, No. 131, 324-35(Dec., 1933).—Lecture. G. G. Sward  
**Coal tar as Diesel fuel.** Ihder. *Automobiltech. Z.* 36, 493(1933).—Coal tar oil is suitable for Diesel engines if used with a compressor. Special precautions are needed for compressorless Diesel engines. A. A. Boehtlingk

**Pyrite in coal beds of the Ruhr (Winter, Frey) 8. Fuel economy in the glass industry (Brownlie) 19. Coke-oven gas (Borodkin) 18. Testing and evaluation of carbureting oils [for water gas] (Schläpfer, Schaffhauser) 22. App. for taking samples of coal on conveyors (U. S. pat. 1,937,473) 1. Heat-treating comminuted material [coal] (Brit. pat. 397,666) 1. Pitch and tar (Brit. pat. 397,484) 22. SO<sub>2</sub> [prepn. of granular fuel] (Brit. pat. 398,023) 18. Conversion of low-temp. tars to hydrocarbons (Fr. pat. 750,697) 10.**

**Motor fuel.** Fabrication française de produits du lait. Fr. 753,890, Oct. 26, 1933. A fuel contg. Et<sub>3</sub>CH and Me<sub>3</sub>CH is obtained by passing a mixt. of vapors of AcCl and EtOH over Ni or Fe-Ni heated to 200-50°, or a gaseous mixt. of AcCl, ethylene chloride, C<sub>2</sub>H<sub>2</sub> and H over the same catalyst at 250-300°.

**Smokeless fuel.** Préparation industrielle des combustibles. Fr. 753,838, Oct. 25, 1933. Smokeless fuel agglomerated by flour not resistant to moisture, is completely surrounded by a thin layer of a product resistant to water.

**Briquetting fuel.** Marcel H. Hue. Ger. 579,646,

July 1, 1933. In making fuel briquets, the binding agent consists of petroleum pitch dissolved in mazout with a small addn. of semi-drying vegetable oil such as cotton-seed oil.

**Agglomerating fuel.** Carl Nimz (trading as Hugo Dau & Co.). Brit. 398,007, Sept. 7, 1933. Coal dust is mixed with sorghum meal, *e. g.*, 1.5–2%, and steam is supplied to the mixt. in a closed container, *e. g.*, a kneading or pugging mill, briquets then being made as with coal-pitch mixts.

**Gasifying solid fuel.** S. I. R. I. (Società italiana ricerche industriali). Ger. 580,566, July 12, 1933. Gases with a high CO content are prepd. by gasifying solid fuels with O and steam or CO<sub>2</sub>, the ash being removed as dust, the temp. being raised to over 1500° and the gases being led in at not less than 10 m. per sec.

**Apparatus for the pressure-hydrogenation of solid fuels.** J. G. Farbenind. A.-G. (Ernst Pfeiderer, inventor). Ger. 583,789, Sept. 12, 1933.

**Low-temperature distillation of solid fuel.** Compagnie des mines d'Aniche. Fr. 750,763, Aug. 18, 1933.

**Retort with horizontal chambers for distilling fuel.** Société générale de fours à coke systèmes Lecocq (Soc. anon.). Ger. 583,847, Sept. 11, 1933.

**Apparatus for distilling bituminous fuels.** Didier-Werke A.-G. Ger. 583,913, Sept. 12, 1933.

**Continuous furnace for carbonization and distillation.** Maurice Lambot. Fr. 753,783, Oct. 24, 1933.

**Carbonizing pulverized coal.** Archibald H. Davis, Jr. (to National Aniline & Chemical Co.). U. S. 1,937,552, Dec. 5. Coal particles are heated to a carbonizing temp. while the particles are kept from contact with each other by inducing a like electrostatic charge upon each particle. App. is described.

**Method and apparatus for the low-temperature carbonization of coal.** Wm. A. Caunt. Brit. 397,072, Aug. 17, 1933.

**Distilling coal.** Harold Stevens. U. S. 1,938,121, Dec. 5. A column of coal in a vertical retort is heated from within the column outwardly by a centrally located elec. resistor, elec. current being passed through this resistor and through progressively coked portions of the coal column, and the column is also simultaneously heated externally through the retort walls. App. is described. U. S. 1,938,122–3–4–5 also relate to generally similar app. and operation for coal distn.

**Distilling coal, etc.** Edgar W. Brocklebank and Wm. B. Mitford. Fr. 751,011, Aug. 25, 1933. See Brit. 393,602 (C. A. 27, 5493).

**Low-temperature distillation of coal.** Harald Nielsen and Wm. G. Trower. Ger. 580,978, July 19, 1933. In carrying out the above process in a rotating drum furnace, 1.6 cu. m. of a flushing gas is used per kg. of coal. O may be used as the flushing gas.

**Apparatus for distilling coal, etc.** Sigismund Sternberg (Julius Geller, inventor). Ger. 584,608, Sept. 30, 1933.

**Chamber furnace for distilling coal, etc.** Carl Still (a. m. b. H. Ger. 583,925, Sept. 12, 1933. Details of removing the distn. gases by suction are given.

**Retort for low-temperature distillation of coal, etc.** André Guagnino. Fr. 751,176, Aug. 28, 1933.

**Heat treatment of coal and tar together.** Harold J. Rose and Wm. H. Hill (to Koppers Co. of Del.). U. S. 1,936,882, Nov. 28. Coal and tar are heated together in thin layers in the presence of steam and substantially all the tar oils are vaporized to obtain a homogeneous mass of undecompd. coal and pitch suitable for gas manuf., etc. App. is described.

**Hydrogenating coal, etc.** I. G. Farbenind. A.-G. Fr. 750,296, Aug. 8, 1933. The catalysts used are org. sulfonic acids along with metals of the 4th to the 8th group or their compds. or org. carboxylic acids or acid salts or oxygenated mineral acids derived from S or N, or anhydrides of these acids. Acid salts of Sn, Mo, W, Mn, Mg, Zn, Cd, Al, V or Cr may be mentioned. Acid salts of alkali metals do not give as good results. As mineral acids H<sub>2</sub>SO<sub>4</sub> and HNO<sub>3</sub> may be used, as carboxylic acids AcOH, HCOOH and oxalic acid and as sulfonic

acids PhSO<sub>3</sub>H, C<sub>10</sub>H<sub>7</sub>SO<sub>3</sub>H and unsatd. sulfonated hydrocarbons may be used.

**Hydrogenation of coal, oil, etc.** Deutsche Hydrierwerke A.-G. Fr. 750,850, Aug. 19, 1933. Metal salts of org. acids of high mol. wt., excluding alkali, alk. earth and precious-metal salts, are used as catalysts. Examples are given of the use of resinates, oleates, linoleates and pulmitates of Co, Zn, Al, Cu and Hg.

**Hydrogenation products of coal.** I. G. Farbenind. A.-G. (Karl Schönmann, inventor). Ger. 584,763, Oct. 16, 1933. The products obtained by hydrogenating coal are worked up by stirring with an equal or less than equal amt. of kerosene or gas oil, whereby the mass seps. into asphalt and oil layers. The kerosene or gas oil, after sepn. of the layers, can be recovered by steam distn.

**Coal-washing plant.** Léon Hoyois. Ger. 580,507, July 12, 1933.

**Apparatus for removing water from, or washing, fuel, ores, etc.** Gutehoffnungshütte Oberhausen A.-G. and Ludwig Altpeter. Ger. 583,679, Sept. 7, 1933.

**Montan wax.** A. Riebeck'sche Montanwerke A.-G. Ger. 581,891, Aug. 4, 1933. The m. p. of crude montan wax is raised by heating the wax with about 1% of a metal hydroxide, basic oxide or carbonate to above 100° in the presence of water. In examples, the wax is heated with NaOH, CaO or K<sub>2</sub>CO<sub>3</sub>.

**Montan wax.** A. Riebeck'sche Montanwerke A.-G. Ger. 583,333, Sept. 1, and 583,494, Sept. 8, 1933. Addns. to 581,891 (preceding abstr.). In raising the m. p. of crude montan wax by treating the fused wax with a small amt. of metal hydroxide, or basic metal oxide or carbonate in the presence of water, the reaction is carried out at temps. between 100° and the m. p. of the wax (583,333). Instead of fusing the wax, it may be treated with the metal hydroxide, etc., while dissolved in an org. solvent, in which case the reaction is carried out at temps. up to 200° (583,494).

**Montan wax.** A. Riebeck'sche Montanwerke A.-G. (Fritz Zschoch, inventor). Ger. 583,872, Sept. 11, 1933. The wax is obtained by extg. lignite which has been pre-dried to reduce the water content to less than 15%. Extn. agents such as C<sub>6</sub>H<sub>6</sub> are used. Cf. C. A. 28, 613<sup>h</sup>.

**Tube driers for lignite, etc.** I. G. Farbenind. A.-G. (Karl Heil, inventor). Ger. 583,757, Sept. 8, 1933.

**Lignite-tar oil.** Kohlenveredlung und Schwelwerke A.-G. (Paul Rosin, inventor). Ger. 579,729, June 30, 1933. The oil is desulfurized by the action of ZnCl<sub>2</sub> at raised temp. and pressure.

**Device for dehydrating peat by heating.** Wilhelm Nachtigall. Ger. 579,914, July 3, 1933.

**Removing carbon deposits from internal-combustion engines.** Wheeler G. Lovell and Thomas A. Boyd (to General Motors Research Corp.). U. S. 1,936,681, Nov. 28. A mixt. such as may be formed of carvone 40, C<sub>6</sub>H<sub>6</sub> 30 and alc. 30% is used. U. S. 1,936,682 relates to the similar use of a mixt. such as may be formed from methyl furoate 50, C<sub>6</sub>H<sub>6</sub> 25 and alc. 25%. Cf. C. A. 27, 5518.

**Gas purification.** Gilbert A. Bragg (to Koppers Co. of Del.). U. S. 1,936,570, Nov. 28. For sepg. acidic constituents such as H<sub>2</sub>S, HCN and CO<sub>2</sub> from gases such as fuel, oil or refinery gases, the flowing gas is treated with a non-aq. solvent immiscible with water such as a hydrocarbon oil by which the acidic substances are absorbed, the fouled solvent is removed from the gas, treated with an aq. alk. absorbent soln. such as Na<sub>2</sub>CO<sub>3</sub> to effect a transfer of the acidic substances to the latter, and the regenerated solvent is recirculated for further gas treatment. The soln. is treated for removal of absorbed acidic material and is then recirculated to treat further fouled solvent from the gas treatment. App. is described. Cf. C. A. 27, 5519; 28, 615<sup>h</sup>.

**Purifying gases.** Gewerkschaft Mathias Stinnes. Brit. 398,047, Sept. 7, 1933. See Fr. 741,406 (C. A. 27, 2790).

**Purifying fuel gas.** Joseph A. Shaw (to Koppers Co. of Del.). U. S. 1,936,862, Nov. 28. In treating fuel gas by recirculating through it cooling liquor which removes

tar and  $\text{NH}_3$  from the gas, an alk. liquid contg. tar acid is added to the cooling liquor.

**Fuel gas.** Dessauer Vertikal-Ofen G. m. b. H. Ger. 583,334, Sept. 1, 1933. Addn. to 539,731 (C. A. 26, 2306). App. for making the fuel gas of 539,731 from distn. gas and water gas has a number of distn. chambers and at least two water-gas producers arranged so that the distn. gas is swept into the mixing chambers of the water-gas producers before its arrival at the collecting chamber.

**Fuel-distillation gases.** Ida Brown née Altmann and Concordia Berghau. A.-G. Ger. 580,876, July 17, 1933. Gases obtained by the distn. of fuel are led, while still hot and mixed with water vapor, over catalysts at  $500^\circ$  to remove the CO; the S is then removed by cooling. The gases are then subjected to the usual processes.

**Oil gas.** Charles A. Rosier. Brit. 398,037, Sept. 7, 1933. See Fr. 744,910 (C. A. 27, 4380).

**Producer gas.** Sven C. G. Ekelund. U. S. 1,938,139, Dec. 5. For producing, from solid fuel such as coal or a mixt. of coal and coke, a producer gas having a temp. above  $1000^\circ$  and composed essentially of CO, H and N, hot air is injected into a lower coke zone in a gas producer, thus generating producer gas and forming molten slag; a portion of the hot producer gas is passed into a superposed fuel preheating and distn. zone in which the fuel is coked; mixed producer gas and distn. vapors and gases are withdrawn and the mixt. is passed into the incandescent coke zone and the vapors are decompd. and fixed into gas; hot producer gas is withdrawn from the upper part of the incandescent zone and from below the superposed preheating and distn. zone, and molten slag is withdrawn from the lower portion of the incandescent zone. App. is described.

**Treating coke-oven gas.** Victor Fischer. Ger. 580,421, July 10, 1933. Addn. to 567,894 (C. A. 27, 2790). App. for liquefying and sepg. constituents of coke-oven gas to obtain a mixt. of H and N is described.

**Apparatus (with a light-sensitive cell) for measuring dust concentration in blast-furnace gas, etc.** Alfred W. Simon, Leonard C. Kron, Coleman H. Watson and Henry Raymond. U. S. 1,937,721, Dec. 5. Structural features. U. S. 1,937,722 (Alfred W. Simon, Leonard C. Kron and Henry Raymond) also relates to app. for the same general purpose.

**Separating a gas rich in hydrogen from a gaseous mixture.** Mathias Pier and Ernest Donath (to Standard-I. G. Co.). U. S. 1,938,087, Dec. 5. A gaseous mixt. contg. H, such as waste gases from the destructive hydrogenation of brown coal tar is washed at a temp. of  $100\text{--}200^\circ$  and under a pressure of 50–200 atm. with a hydrocarbon liquid such as a middle oil having a pos. temp. coeff. of solvent power for H and a gas rich in H is recovered from the soln. thus obtained by cooling.

**Gasifying heavy oils by partial combustion.** Constantin Chilowsky. Fr. 42,553, Aug. 23, 1933. Addn. to 732,260 (C. A. 27, 836).

**Apparatus for the catalytic treatment of gases and vapors obtained by distilling fuels.** Braunkohlen- und Brikett-Industrie A.-G. Bubiag. Ger. 579,650, July 1, 1933.

**Flue-gas cleaner.** Arthur Tittel and Ernst Wenger. Ger. 583,803, Sept. 11, 1933. Addn. to 546,519 (C. A. 26, 3653).

**Gas generator with an upright shaft suitable for production of fuel gas from coal.** Henry O. Loebell (to Henry L. Doherty). U. S. 1,937,580, Dec. 5. Structural and operative details.

**Gas producer for a mixture of water gas and coal gas.** Vergasungs-Industrie A.-G. (Pierre de Brouwer, inventor). Fr. 751,323, Aug. 31, 1933.

**Device for introducing air into gas producers.** Imbert-Gasgeneratoren. G. m. b. H. Ger. 580,664, July 14, 1933.

**Rotary fuel supports for gas producers.** Paul A. J. Cousin (to Établissements Ernest Arnoult, Soc. anon.). U. S. 1,938,517–18, Dec. 5. Structural and mech. details.

**Gas-producer plants.** James A. Macdonald. U. S. 1,938,296, Dec. 5. Structural and operative details.

U. S. 1,938,297 relates to generating producer gas by supplying air to a closed firing chamber through a restricted inlet to create a highly incandescent zone adjacent to the delivery end of the inlet and delivering water onto this zone in excess of the reaction requirements to localize the zone and maintain the base of the chamber wet.

**Chamber oven for the production of gas and coke.** Carl Still. U. S. 1,937,853, Dec. 5. Various details of a system for drawing off volatile distn. products, etc., are described.

**Plant for producing water-gas.** The Western Gas Construction Co. Ger. 579,552, July 3, 1933.

**Horizontal gas retorts.** Établissements Tourtellier (S. à. r. l.). Fr. 753,324, Oct. 13, 1933. Charging means is described.

**Ammonia recovery from fuel gas.** Frederick W. Sperr, Jr. (to Koppers Co. of Del.). U. S. 1,936,864, Nov. 28.

Ammoniacal liquor and tar are condensed from the gas by cooling, and the gas is then scrubbed with an aq. liquid which removes a further quantity of  $\text{NH}_3$  and thus becomes ammoniated; condensed ammoniacal liquor is sepd. from tar and at least a part of such condensed liquor is recirculated to cool a further quantity of gas; excess liquor is withdrawn from the cooling system, and the ammoniated scrubbing liquor is separately collected and distd. to remove free  $\text{NH}_3$  from it, then cooled and recirculated to scrub  $\text{NH}_3$  from a further quantity of gas. Excess liquor is withdrawn from the scrubbing system, combined with that from the condensing system, and the combined liquor is treated to remove free and fixed  $\text{NH}_3$  from it. App. is described. Cf. C. A. 27, 1740.

**Removing naphthalene from gases.** Wilhelm Mühlendyck. U. S. 1,937,460, Nov. 28. Naphthalene is washed out of gases by use of a fine mist-like spray of water. App. is described.

**Removing phenols from various waste effluents.** Charles E. Braun (to Barrett Co.). U. S. 1,937,941, Dec. 5. Coal-tar oil of a different sp. gr. from that of the liquor under treatment, and contg. its original content of tar acids is used as an extg. medium for removing phenols.

**Phenols.** Jacob Meyer. Ger. 584,857, Sept. 25, 1933. Pure phenols are obtained by extg. lignite and shale tars with alkali, oxidizing the ext. and driving impurities off from the product by steam at a temp. of at least  $150^\circ$ .

**Refining tar oils and phenols.** Gilbert T. Morgan and Alfred E. J. Pettet. Brit. 397,847, Aug. 29, 1933. Phenols and neutral tar oils from low-temp. or vertical-retort carbonization processes are purified so as to eliminate or prevent the formation of red color by heating with a small proportion of  $\text{CH}_3\text{O}$ , or substance yielding  $\text{CH}_3\text{O}$ , e. g., formalin, paraformaldehyde, trioxymethylene, methylal,  $(\text{CH}_2)_3\text{N}_4$ , and an acid or alk. catalyst, e. g., NaOH or concd. HCl, and distg.

**Ammonium sulfate.** Fred Denig (to The Koppers Co. of Delaware). Brit. 397,537, Aug. 21, 1933.  $\text{NH}_3$  is removed from fuel gas by continuously treating the gas to remove tar and  $1/3$  its  $\text{NH}_3$  content, forming  $\text{NH}_4\text{HSO}_4$  with the  $\text{NH}_3$  so removed by reaction with  $\text{SO}_2$  and O in presence of  $\text{H}_2\text{O}$  in 1 or more vessels and continuously contacting the treated gas with the aq. bisulfate in another vessel to form  $(\text{NH}_4)_2\text{SO}_4$ . App. is described.

**Tar.** Werschen-Weissenfelder Braunkohlen-A.-G. Ger. 584,707, Sept. 26, 1933. Distn. and generator tar from lignite and shale is worked up by first treating it with alkali and centrifuging to remove the cresol, and then with concd.  $\text{H}_2\text{SO}_4$  to remove resins. The purified tar is then distd. Examples are given.

**Tar for preserving wood.** Gaëtan P. Lièvre. Fr. 753,899, Oct. 26, 1933. The tar is obtained by neutralizing the alk. residual lyes from the chem. refining of petroleum with the vitriolic muds obtained from another part of the refining.

**Hydrogenating tar, etc.** I. G. Farbenind. A.-G. (Mathias Pier and Karl Winkler, inventors). Ger. 581,941, Aug. 5, 1933. Coal tars, mineral oils, etc., are subjected to a pressure-hydrogenation process and the gases from the reaction chamber are treated with washing oil before condensing the more readily condensable con-

- stituents. A Mo-Zn contact agent is employed during the hydrogenation. Cf. C. A. 28, 612<sup>1</sup>.
- Apparatus for dehydrating tars.** Bergedorfer Eisenwerk A.-G. Astra-Werke. Ger. 584,860, Sept. 25, 1933.
- Centrifugal apparatus for removing tar, etc., from gases.** Émile A. Barbet. Fr. 750,670, Aug. 16, 1933.
- Destructive hydrogenation of tars, mineral oils, etc.** Mathias Pier and Walter Simon (to Standard-I. G. Co.). U. S. 1,938,542, Dec. 5. The initial material is treated with a large excess of H in the presence of a catalyst comprising active C and an O compd. of P or As such as  $H_3PO_4$  at an elevated temp. within the destructive hydrogenation range and under a pressure of at least 50 atm. App. is described.
- Coking fuels.** Luigi Vertù and Giuseppe Pisanello. Ger. 584,607, Sept. 21, 1933. A briquetted mixt. of powd. coal and 15-20% naphtha or crude petroleum is subjected to a high-temp. coking process to give coke and light oils.
- Coking bituminous fuel.** Gustav Hilger. Ger. 583,992, Sept. 13, 1933. Details of coking app. and devices for removing the distn. gases by suction are given. Cf. C. A. 27, 1150.
- Apparatus for coking bituminous materials.** The American Tar Products Co. Ger. 580,632, July 14, 1933.
- Apparatus for coking coal.** National Fuels Corp. Ger. 583,926, Sept. 14, 1933.
- Coking coal.** Harold J. Rose and Wm. H. Hill (to Koppers Co. of Del.). U. S. 1,936,881, Nov. 28. A mixt. of coal with naphthalene (suitably in equal quantities) is heated in a closed chamber to the carbonizing temp. of the coal but below the crit. temp. of the naphthalene (suitably to about 450°) and after the carbonization naphthalene and tar are sepd. from the coke.
- Oven for coking coal.** Gustav Hilger. Ger. 579,747, July 5, 1933.
- Charging coking chambers with coal.** C. Otto & Co. G. m. b. H. Ger. 579,727, June 30, 1933.
- Coke ovens.** C. Otto & Co. G. m. b. H. Ger. 581,074, July 20, 1933. Addn. to 579,727 (preceding abstr.). Details of an internal coal distributor are given.
- Coke oven.** C. Otto & Co. G. m. b. H. Ger. 581,940, Aug. 5, 1933.
- Coke-ovens.** Pierre E. H. Forsans. Fr. 42,543, Aug. 4, 1933. Addn. to 736,303 (C. A. 27, 1487). Construction of door is described.
- Coke ovens.** Evence Coppée & Cie. Fr. 750,829, and 750,830, Aug. 19, 1933.
- Coke ovens.** Pierre E. H. Forsans. Fr. 753,309, Oct. 14, 1933.
- Coke ovens with horizontal chambers.** C. Otto & Co. G. m. b. H. Fr. 750,825, Aug. 19, 1933.
- Device for introducing gases and vapors into coke ovens, etc.** C. Otto & Co. G. m. b. H. Ger. 584,508, Sept. 20, 1933. Addn. to 578,993 (C. A. 28, 694<sup>1</sup>).
- Leveling bar for coke ovens.** Charles E. Underwood (to Bethlehem Steel Co.). U. S. 1,937,734, Dec. 5. Structural details.
- Means for withdrawing distillates from coke ovens.** Carl Still. Brit. 397,050, Aug. 17, 1933.
- Continuously operating, vertical coking or gas-generating chambers.** C. Otto & Co. G. m. b. H. Brit. 397,082, Aug. 17, 1933.
- Oven for the production of coke and coal gas.** Heinrich Stöter-Tillmann. Fr. 752,432, Sept. 22, 1933.
- Coke.** N. V. Maatschappij Voor Keramische En Chemische Industrie "Kero-Chemica." Fr. 752,468, Sept. 23, 1933. Coal, particularly bituminous, is coked at a medium temp. by mixing it in broken or powd. state, preferably dry with the product obtained by treating coal at a high temp.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. PARAGHER

- Application of tube stills to petroleum refining.** C. M. Johnson. *Refiner Natural Gasoline Mfr.* 12, 383 (1933). J. L. Essex
- A theoretical comparison of petroleum distillation systems.** Percy Meyer. *J. Inst. Petroleum Tech.* 19, 819-34 (1933).—A criterion or coeff. has been worked out to express the degree of fractionation accomplished in a distn. of a petroleum mixt. whether by batch or continuous distn. or by equil. flash vaporization. It was M.'s purpose that the coeff. should depend upon the app., the no. of bubble plates, the reflux ratio and the mode of operating. Exptl. data in the literature available for testing the correctness of the expressions reached are scanty. Calcs. from the data of Leslie and Good (cf. C. A. 21, 2182) and of Fancher (cf. C. A. 25, 1977)\* for flash vaporization showed a fair approach to equality between overlap and underlap, that is, between the light ends in the residue and the heavy ends in the overhead. The av. numerical value of the overlap for a no. of crude oils of wide boiling range flash-vaporized between 300° and 500°F. was 20. With a given overlap coeff., the compn. of the overlap is nearly const. when batch distn. is compared with batch distn. or continuous with continuous, though operating conditions are varied; but this does not hold when batch and continuous distn. are compared. The vol. of the overlap and the degree of sepn. are not affected by the vol. of material boiling outside of the range of the overlap-underlap. With a high reflux ratio and a given no. of plates, batch distn. affords sharper cutting than continuous operation. At commercially practicable reflux ratios, the continuous process has the advantage.
- Emma E. Crandal
- Economics of petroleum cracking.** Gustav Egloff. *Ind. Eng. Chem.* 26, 41-5 (1934). E. H.
- Heat-flow diagram of the cracking still.** G. Vandenberg. *Refiner Natural Gasoline Mfr.* 12, 380 (1933); cf. C. A. 27, 2023.—An excellent diagram showing the step-by-step heat balance for every stage of cracking is given. Calcs. show that the distillate carries off only 5 million B. t. u. out of the 25 million furnished by the furnace and 50 million retained by the oil in the system. Tars are the sources of greatest heat losses. J. L. Essex
- Use of continuous vacuum filters in contact treating.** L. C. Trescott. *Refiner Natural Gasoline Mfr.* 12, 396 (1933); cf. C. A. 27, 5524.—The adaptation of the metallurgical filter to large-scale refinery operations is discussed. J. L. Essex
- The nitrobenzene process—installation and operating costs.** S. W. Ferris, W. A. Myers and A. G. Peterkin. *Refiner Natural Gasoline Mfr.* 12, 435 (1933).—A discussion of plant installation and its operation when nitrobenzene is used as the solvent. J. L. Essex
- Study of oil-field water analysis. III. Estimation of sodium by dihydroxytartaric acid.** Abol H. K. Radjy and Charles E. Wood. *J. Inst. Petroleum Tech.* 19, 845-62 (1933); cf. C. A. 27, 1741.—Na can be correctly estd. by pptg. with K dihydroxytartrate if it is present in a concn. of 8-16 g. per l. or 20-40 g. of NaCl. The K salt soln. should be added, drop by drop, to the soln. contg. Na, and the ppt., after 4.5-5 hrs., should be filtered off at a temp. not exceeding 5°. The washed ppt. and paper are placed in a flask contg. an excess of  $KMnO_4$  soln. acidified with definite quantities of  $H_2SO_4$  and  $H_3PO_4$ , together with a catalyst consisting of freshly prepd. 0.05%  $NH_4$  metavanadate soln. The excess of  $KMnO_4$  is titrated back with standard  $(COOH)_2$  soln.  $Ce(SO_4)_2$  may be used as the oxidizing agent instead of  $KMnO_4$ . Emma E. Crandal
- Determination of water in hydrocarbons.** Hans Broche and Wolfram Scher. *Brennstoff-Chem.* 14, 408-9 (1933).—The use in a previously described method (C. A. 26, 5196) of a polystyrene-resin capsule,  $C_6H_5$ -sol. but impervious

to H<sub>2</sub>O vapor, is explained. Errors due to changing temp. and barometric pressure can be corrected by recalc.

F. W. Jung

**Anomalies in the viscosity of mineral oils at low temperatures.** Louis, Jordachescu and Thiebault. *Physica* 4, 401-2(1933).—Viscosity measurements at low temps. show that after a temp. change an oil may require several weeks to attain an equil. state. The oil shows no "yield value," since it flows under very slight pressure.

L. E. Steiner

**Stabilizing and refining shale-oil gasoline by means of pressure hydrogenation.** A. D. Petrov, D. N. Andreev and E. A. Pozhiltzeva. *Foreign Petroleum Tech.* 1, 135-48(1933).—A shale-oil gasoline obtained from Veimarn-shale tar, having a final b. p. of 230°, S content of 0.889% (by the lamp method) and a max. gum formation of 658 mg., was hydrogenated at 50 atm. and 330-350° for 1 hr. in the presence of 5-10% MoS<sub>2</sub> and 5-10% CuO catalysts. Numerical data obtained on the hydrogenation of various gasoline cuts as well as of amylene (trimethylethylene), diisobutylene and C<sub>6</sub>H<sub>6</sub> in the presence of the above catalysts are given. The S content was lowered to 0.644% for the wide fraction, to 0.44% for the 90-100° and to 0.48% for the 110-120° fractions. The O-contg. compds., namely, aldehydes, ketones and peroxides, which represent the natural transition link toward the formation of gum, as well as diene hydrocarbons, were completely eliminated. To establish a possible change in the structure of the olefin and paraffin hydrocarbons, the product was treated with mercuric acetate and free cyanide. It was found that the Hg no. decreased after hydrogenation. This change is probably due to a lowering in the amt. of olefins with normal structure, while changes in the thiocyanate no. indicate that olefins of the isostructure were hydrogenated to paraffins.

**Effect of gasoline volatility on engine economy.** Neil MacCough. *S. A. E. Journal* 33, 363-70T(1933).

H. A. Beatty

**Ozone, knock-inducer extraordinary.** Donald H. Brooks. *J. Inst. Petroleum Tech.* 19, 835-44(1933).—The chance connection of a Cottrell precipitator to the intake manifold of a CFR testing engine led to the discovery that O<sub>3</sub> in the intake air greatly increased the knocking of a fuel. The lowering of the octane no. appeared to be linear in relation to the percentage of O<sub>3</sub> in the air. The "O<sub>3</sub> equivalents" of Ph(C<sub>2</sub>H<sub>5</sub>)<sub>4</sub>, C<sub>6</sub>H<sub>6</sub> and EtOH in Fuel A-2 (a working-standard fuel for CFR engine tests) were compared by adding enough of the resp. antiknock agents to portions of the fuel to give an octane no. of 59.6, and detg. the amts. of O<sub>3</sub> that must be added to the intake air to match the fuels with 4 reference fuels, one of them the untreated A-2. Roughly 30% more O<sub>3</sub> was necessary to overcome the effect of the C<sub>6</sub>H<sub>6</sub> than of the Ph(C<sub>2</sub>H<sub>5</sub>)<sub>4</sub>, and 60% more to overcome the effect of the abs. EtOH. A fact not yet explained is that a richer mixt. was necessary for max. detonation when the air contained O<sub>3</sub>. The rating of the fuels contg. cracked gasoline was less influenced by O<sub>3</sub> than that of the other fuels. "Depreciation" of the fuels by the CFR motor method, power, efficiency and spark advance were scarcely affected by the presence of O<sub>3</sub>.

Emma E. Crandal

**The testing and evaluation of carbureting oils.** P. Schläpfer and S. Schaffhauser. *Schweiz. Ver. Gas Wasserfach. Monats. Bull.* 13, 125-43, 159-68, 193 204(1933).—An effort was made to find a reliable lab. method for the evaluation of carbureting oils for water gas. Method and app. are described for gasification of oil, giving results reproducible to within 3%. The effects of temp. and flow of oil on the results are shown for Echelbronn No. 6 oil. For rising temp. of gasification (650-790°) (vaporization at 400°) there is an increase in the amt. of gas made, and increases in the sp. wt. of the tar and in the percentages of H<sub>2</sub> and CH<sub>4</sub>; heating value drops. The product of a l. of gas per 100 cc. oil and heating value in kg.-cal. per cu. m. (Hempels "effective value") for any given flow of oil goes through a max. Each type of gas oil has its own optimum gasification temp.; the effective values at optimum temp. vary with the oil compn. The

1 Holmes no. (C. A. 26, 2582) gives good results for evaluation of good carbureting oils. For poor oils the gasification test is more reliable. The influence of chem. compn. on sp. gr., distn. curve and H content is discussed at length. Paraffins are best suited for carburetion (high effective values) with the exception of the lower-boiling, stabler ones; the aromatic hydrocarbons are least suited. Oils with more than 50% boiling below 300° are unsuitable.

2 The tar yield is not related to the effective value but depends on the oil compn. as well as on temp. and rate of gasification. A considerable amt. of H<sub>2</sub> is added to the unsatd. compds. of the vapors (calcd. by difference). For each H<sub>2</sub> concn. a temp. of max. H addn. exists. The olefin yield of the oil remains practically const. with rising H concn. but it is appreciably higher than that without H<sub>2</sub> present. The Ostwald figure alone is an unsatisfactory index; if, however, it is multiplied by wt. percentage of H<sub>2</sub> of the oil and divided by the sp. gr., it becomes a useful value index, better even than the Holmes value. The usefulness of these figures is limited to the best gasification temp. range of 700° to 790°; with certain restrictions, depending on the chem. compn., they can be used also down to 650° B. J. C. van der Hoeven

**Use of phenol as selective solvent in the production of high-grade lubricating oils.** R. K. Stratford, O. S. Pokorny and J. L. Huggett. *Refiner Natural Gasoline Mfr.* 12, 458(1933).—Results from the use of phenol as solvent are described.

J. L. Essex

**Synthetic lubricating oils.** A. D. Petrov and E. A. Pozhiltzeva. *Foreign Petroleum Tech.* 1, 23-6, 43-9(1933).—Synthetic AlCl<sub>3</sub> was caused to act on the kerosene fraction from sapropelite tar. The oils b. 150-240°. Other properties are d<sub>4</sub> 0.8350, n<sub>D</sub><sup>20</sup> 1.4650, I no. 83.5, aniline pt. 31.4° before and 74.8° after treatment with 3 1/4% H<sub>2</sub>SO<sub>4</sub>, and content of 65% of unsatd. and aromatic compds. as detd. by the Kattwinkel method. The treatment at atm. pressure and low temp. produced very low yields of oils with high b. ps., and, therefore, expts. with the application of 7 atm. pressure and a temp. up to 200° were run, yielding up to 25% of a fraction b. above 240°. A detailed investigation of fractions obtained by the above treatment revealed that olefins only are polymerized to naphthenes (together with the polymerization of the olefins with aromatic compds. to alkylaromatic hydrocarbons); and that a condensation of olefins with naphthenes also takes place, whereby bicyclic naphthene hydrocarbons are most probably obtained. The AlCl<sub>3</sub>-treated fractions are characterized by a higher content of aromatic compds. than those produced on condensing unsatd. gases. Properties of these fractions are tabulated. In the condensation of gaseous hydrocarbons with naphthalene at 150°, 6% AlCl<sub>3</sub> and a duration of 10-12 hrs., an oil was obtained which was almost completely sol. in H<sub>2</sub>SO<sub>4</sub> and had a very high absolute viscosity and a high temp.-viscosity coeff. A gas oil subjected to vapor-phase cracking produced a fraction b. 100-180° which contained 30% unsatd. and aromatic compds., the latter being in great excess. On condensation with AlCl<sub>3</sub>, a fraction boiling above 180° (12 mm.), amounting to 20% and having the following properties, was obtained: d<sub>4</sub> 0.8938, n<sub>D</sub><sup>20</sup> 1.4970, I no. 10.2, aniline pt. 74.5° before and 92.4° after H<sub>2</sub>SO<sub>4</sub> treatment and an Ostwald viscosity at 20° of 19.8 and at 50° of 6.5. Conclusion: Oils obtained by condensing olefins with naphthalene have a great similarity, par-

ticularly in their temp.-viscosity coeffs., to Davis and Blackwood's paraffin (cf. C. A. 26, 1107). A. A. B.

**The chemical nature of Ural crude oil.** N. D. Zelinskii. Acad. of Sci. of U. S. S. R. Trans. of the June Session dealing with the problems of the Ural-Kuznetak district. Petrograd 1932, 14 pp. Petrograd Acad. of Sci. (Translation in *Foreign Petroleum Tech.* 1, 27-30, 51-56(1933).—A kerosene fraction from the Ural (Perm) crude oil was investigated. It had the following properties: b. p. 150-240°,  $n_D^{20} = 1.4856$ ,  $d_4^{20} = 0.8529$ , and S by the Engler method 1.58%. The S was removed with Hg salts. The kerosene was then washed, dried and distd. (over freshly reduced Cu) with a Vigreux dephlegmator. Six fractions were obtained (sp. gr.,  $n_D^{20}$  and max. aniline points are tabulated for each fraction). The fractions were treated with  $H_2SO_4$  (monohydrate). The content of aromatic compds. was 43.5-62%. The naphthenes were then detd. by catalytic dehydrogenation (cf. C. A. 25, 41(12), which was carried out at 310°, 330° and 350°. The content of aromatic compds. was 13-28%. The residue left after these operations consisted of paraffin and polymethylene hydrocarbons, the latter increasing in the higher-boiling fractions. The sulfo acids obtained in the removal of aromatic compds. were decompd. with steam, washed, dried and redistd. over metallic Na. Naphthalene was not found. In the oxidation of aromatic compds. by the Ullmann method (cf. *Ber.* 36, 1797-1806(1903)) mono- and di-substituted compds. were traced, and benzoic acid and phthalic acids (terephthalic acids prevailing) were established. Thus, the kerosene b. p. 150-250° showed monosubstituted aromatic compds. in the 225-240° cut, and no trace of decahydronaphthalene which was found in the Baku crude oils.

**Petroleum oil distillation.** Otto Behimer (to Texas Co.). U. S. 1,936,657, Nov. 28. In a continuous process of distg. petroleum oil to evolve heavy lubricating oil fractions having a decomp. temp. below their vaporizing temp. when heated under a substantial vacuum, while substantially preventing decompn., material contg. such

heavy fractions and lighter lubricating oil fractions is fed into a single distn. zone maintained at substantially a const. temp. below the decomp. temp. of the heavy fractions and under a reduced pressure to vaporize the heavy fractions in the presence of vapors of the lighter fractions; mixed vapors and residue are continuously withdrawn from the distg. zone in such relation of vol. and speed as to cause the vaporization of both the heavy and light lubricating oil fractions, and the material is thereafter condensed into a plurality of distillates of different b. p. range. App. is described.

**Desulfurizing petroleum distillates.** Wm. A. Smith. U. S. 1,938,117, Dec. 5. A distillate is desulfurized, without materially decreasing its antiknock properties, by contact with Cu silicate and a relatively small proportion of Zn compd. such as Zn silicate. Cu nitrate, etc., also may be used.

**Deodorizing petroleum distillates.** Wm. A. Smith. U. S. 1,938,116, Dec. 5. Metallic Cd is used for treating distillates while in liquid phase.

**Gum-inhibiting treatment of cracked petroleum distillates.** Herman P. Lankelma (to Standard Oil Co. of Ohio). U. S. 1,938,456, Dec. 5. Volatile cracked distillates are treated with a small proportion of an acyl-substituted aminophenol such as *p*-acetylaminophenol.

**Breaking petroleum emulsions.** Truman B. Wayne. U. S. 1,937,259, Nov. 28. A water-in-oil emulsion is treated with a complex condensation product prepd. from a sulfonated aromatic amine such as sulfonated aniline and an alc. of aldehyde of the aliphatic series. Various examples are given.

**Breaking petroleum emulsions.** Melvin De Groote and Louis T. Monson (to Tretolite Co.). U. S. 1,938,322, Dec. 5. A sulfonic acid or sulfuric acid ester such as the sulfuric ester of cetyl alc. (or its NH<sub>4</sub> salt) is used as a demulsifying agent. U. S. 1,938,323 relates to the similar use of a demulsifying agent such as the Na salt of a sulfonic acid derived from lauryl alc. Cf. C. A. 27, 5960.

**Pump for liquefied petroleum gas.** Roswell W. Thomas (to Phillips Petroleum Co.). U. S. 1,937,859, Dec. 5. Mech. features.

**Cracking hydrocarbon oils.** Joseph G. Alther (to Universal Oil Products Co.). U. S. 1,937,863, Dec. 5. A reflux condensate formed in the process is passed through a heating coil in which it is heated to a cracking temp. under pressure in a furnace; the heated product thus formed is discharged into an enlarged reaction zone whence vapors are passed to a dephlegmating zone for indirect heat exchange with fresh charging oil for the process. The charging oil is then passed through a second coil in a cooler portion of the furnace (than the coil first mentioned) and is then passed in direct contact countercurrent to the vapors of the reflux condensate introduced to the reaction zone. Unvaporized oil is isolated from the process, and condensed heavier fractions from the dephlegmating zone are supplied to the first-mentioned heating coil as reflux condensate, vapors uncondensed in the dephlegmating zone being removed and condensed. App. is described. Cf. C. A. 28, 309<sup>a</sup>.

**Cracking and coking hydrocarbon oils.** Harry L. Pelzer (to Sinclair Refining Co.). U. S. 1,937,163, Nov. 28. A hydrocarbon oil is vaporized and is cracked in the vapor phase; hot vapor mixt. from the vapor phase cracking operation is released at a temp. above 480° in a coking receptacle into which there is simultaneously introduced a heavy hydrocarbon oil to be coked at a rate at least as great as that at which oil is supplied to the vapor phase cracking operation and at a temp. not more than about 80° lower than the temp. prevailing in the coking receptacle, and the heavy oil is reduced to coke. An arrangement of app. is described.

**Purifying and cracking hydrocarbon materials such as gas oil, etc.** Mathias Pier (to I. G. Farbenind. A.-G.). U. S. 1,938,086, Dec. 5. Liquid carbonaceous materials which contain compds. of S or O or of both are first treated to remove such compds. by heating the initial materials to 300-450° without addn. of H in the presence of a

catalyst comprising a metal of the 6th or 7th periodic group or Co under such pressure that the main portion of the initial materials remains liquid, and then the resulting hydrocarbon products are subjected to a cracking treatment at 350-650°. An arrangement of app. is described.

**Apparatus for the pressure-heat cracking of hydrocarbon oils.** Universal Oil Products Co. Ger. 581,873, Aug. 4, 1933.

**Apparatus for "cracking" oil vapor.** Jean Mercia. Ger. 579,582, June 28, 1933.

**Cracking oils to produce gasoline.** Eugene C. Herthel (to Sinclair Refining Co.). U. S. 1,937,759, Dec. 5. In the production of gasoline by cracking oils of higher b. p. at temps. above 480°, the raw cracked gasoline fraction is sepd. into 2 liquid fractions, one contg. those constituents of higher b. p. than butane and the other contg. butane and lower-boiling constituents; the higher-boiling sepd. fraction is contacted with an adsorptive catalyst such as fuller's earth at a temp. of about 175° or higher and below its crit. temp. under a pressure sufficient to maintain it substantially in liquid phase and a fraction is distd. free from unduly high-boiling constituents. Propane and lower-boiling substances are sepd. from the lower-boiling initially sepd. fraction and the latter is then refined with caustic alkali and combined with the distd. gasoline fraction. An arrangement of app. is described.

**Treating residuum from hydrocarbon-oil cracking.** Gustav Egloff (to Universal Oil Products Co.). U. S. 1,937,946, Dec. 5. Residuum from pressure-oil cracking is removed from the cracking process and while still hot is treated with an oil-sol. acidic material and a metal reacting therewith to form H<sub>2</sub> and hydrogenating conditions of temp. and pressure are maintained, to form an increased yield of satd. products of low b. p. Various details and examples are given.

**Column for fractional distillation of materials such as hydrocarbon oils.** Hugo F. Huff (to Universal Oil Products Co.). U. S. 1,937,958, Dec. 5. Structural features.

**Fractionating hydrocarbon oil vapors.** Harold R. Snow (to Standard Oil Co. of Ind.). U. S. 1,938,118, Dec. 5. Hot vapors contg. asphaltic matter are introduced into a fractionating column, and reflux formed in the column and free from asphaltic matter is mixed with the vapors directly before their discharge into the column. App. is described.

**Heating system for hydrocarbon oil conversion.** Joseph B. Weaver (to Gyro Process Co.). U. S. 1,936,699, Nov. 28. Various details of operation are described, and of app. including a converter and preheater successively supplied with heating gases the temp. of which may be regulated by admixture with recirculated gases.

**Refining hydrocarbon oil products containing sulfur.** Thomas T. Gray (to Gray Processes Corp.). U. S. 1,937,113, Nov. 28. Vapor of the desired portion of products from hydrocarbon oil cracking is contacted with an adsorbent polymerizing agent such as fuller's earth and with a sweetening material such as Cu oxide both before and after the contact with the adsorbent polymerizing agent. App. is described, in which the treating materials may be arranged in layers.

**Refining light hydrocarbon oils.** Philip L. Krauel and George W. Watts (to Standard Oil Co. of Ind.). U. S. 1,936,629, Nov. 28. A light oil such as a light pressure-still distillate is subjected to the action of a Na plumbite soln. under conditions to leave dissolved org. Pb-S compds. in the oil, heated to decompose such dissolved compds. and form insol. PbS while simultaneously vaporizing a portion of the oil and sepg. the vaporized from the unvaporized portion, insol. PbS is sepd. from the unvaporized portion, and the latter is recombined with the vaporized portion. App. and various details of operation are described. Cf. C. A. 28, 624°.

**Refining hydrocarbon oils such as cracked gasolines.** Roland B. Day (to Universal Oil Products Co.). U. S. 1,937,873, Dec. 5. For removing color, gum-forming and S-contg. substances, the heated material is subjected to the action of HCl while in contact with a catalyst such as

1 brass or other metallic material which has been pre-conditioned and activated by a previous treatment with HCl. App. is described. Cf. C. A. 27, 4916, 4918.

**Apparatus for refining hydrocarbon oil by adsorption agents.** Imperial Oil Ltd. Ger. 581,635, July 31, 1933.

**Desulfurizing hydrocarbon oils.** Herman Pines (to Universal Oil Products Co.). U. S. 1,937,914, Dec. 5. Materials such as cracked distillates are contacted in the vapor phase and in substantially anhyd. condition, with sodamide. Cf. C. A. 28, 628°.

**Dewaxing hydrocarbon oils.** Frederick W. Sullivan, Jr. (to Standard Oil Co. of Ind.). U. S. 1,938,548, Dec. 5. MeOAc is used as a diluent.

**Hydrocarbon oils from carbonaceous material such as tar, coal, wood or crude oil.** Richard Bayer (to Friedrich Uhdde). U. S. 1,936,819, Nov. 28. Carbonaceous material, together with liquid water and a metal such as spongy Fe capable of reacting with water to produce nascent H at temps. above 380°, is heated to at least this temp. in a closed reaction zone to build up a self-generated pressure and effect hydrogenation while preventing substantial vaporization, and the elevated temp. and pressure are maintained until low-boiling oils are formed and hydrogenated. Cf. C. A. 27, 3587°.

**Catalytic hydrogenation of heavy liquid hydrocarbon distillates.** Manfred Dunkel and Eugen Dorrer (to Standard-I. G. Co.). U. S. 1,937,554, Dec. 5. Material such as a mineral coal tar is treated in the liquid phase, at 300-430°, with a H-contg. gas under at least 10 atm. pressure in the presence of a S-immune catalyst such as may be prepd. from W sulfides and Co oxide under conditions milder than those required for substantial splitting reactions. The initial material is rendered readily mobile before the treatment by mixing it with a solvent such as tetrahydronaphthalene. An arrangement of app. is described.

**Destructive hydrogenation of high-boiling hydrocarbons or derivatives.** Roland H. Griffith (to Gas Light & Coke Co.). U. S. 1,938,328, Dec. 5. Materials such as low-temp. tars are heated to about 440° with H under about 200 atm. pressure in the presence of a catalyst mixt. comprising Mo and a promoter comprising Li, B, Si, P or Ca in specified proportions. Various details are given.

**Destructive hydrogenation of materials such as gas oil, etc.** Mathias Pier and Walter Simon (to Standard-I. G. Co.). U. S. 1,937,588, Dec. 5. A catalyst is used comprising at least 3 different constituents: (a) Al, alumina or an aluminous clay; (b) an oxide or hydroxide of a metal of group 6 of the periodic system such as molybdenic acid and (c) an oxide or hydroxide of a different metal of group 6 of the periodic system such as chromic acid. Cf. C. A. 27, 5173°.

**Apparatus for separating the constituents of liquid mixtures of hydrocarbon oils, acid resins and acids.** Aktiebolaget Separator-Nobel. Ger. 581,584, July 29, 1933.

**Hydrocarbons.** I. G. Farbenind. A.-G. (Mathias Pier, inventor). Ger. 580,828, July 17, 1933. Tars, mineral oils, etc., are treated with H in one or more stages under raised temp. and pressure and in the presence of catalysts to produce low-boiling hydrocarbons of the benzine, middle oil and illuminating oil types. In the first stage, the vaporized products are passed over a contact agent such as Mo-Zn prior to further treatment to render them innocuous. The second contact agent may be MoO<sub>3</sub> and CrO<sub>3</sub>. Cf. C. A. 27, 2799°.

**Decolorizing hydrocarbon distillates.** Sumner E. Campbell. U. S. 1,938,094, Dec. 5. A stream of a distillate such as a gasoline or kerosene distillate is passed through a dil. H<sub>2</sub>SO<sub>4</sub> soln. in the presence of contact material such as inert solid material and then through an alk. soln. such as NaOH and then through a plurality of chambers contg. contact material and concd. H<sub>2</sub>SO<sub>4</sub> and arranged in series relation, and the passage of distillate is continued until the concd. H<sub>2</sub>SO<sub>4</sub> is substantially exhausted in the chambers in rotation; exhausted H<sub>2</sub>SO<sub>4</sub> and reaction products are removed from successive chambers and are treated with

water to obtain the dil.  $\text{H}_2\text{SO}_4$  used in the process. An arrangement of app. is described. Cf. C. A. 27, 3601.

**Mineral oils.** The Sharples Specialty Co. Fr. 752,463, Sept. 23, 1933. Mineral oils are fractionally distd. with a min. of cracking by submitting the oil to vaporization in contact with an entraining vapor to form one or more primary distillates and a primary residue. The primary residue is submitted separately to contact with entraining vapor and with a reflux. The reflux is composed of the primary distillate(s), e. g., the distillate of highest b. p. An app. is described.

**Refining mineral oils, etc.** Aktiebolaget Separator-Nobel. Fr. 42,423, July 19, 1933. Addn. to 659,725 (C. A. 23, 5313). App. for measuring and delivering the purifying liquid to the oil in a continuous manner.

**Cracking mineral oils.** Henry Thomas (to Sun Oil Co.). U. S. 1,938,406, Dec. 5. The crit. temp. of the oil to be subjected to the cracking operation is detd., and the oil is rapidly heated for a relatively short time to a gradually increasing temp. ranging from the temp. at which it starts substantially to crack to a temp. close to the initially detd. crit. temp. but somewhat below the crit. temp., while maintaining the oil under sufficient superatm. pressure that it is largely in liquid phase and heating under such conditions is continued to effect most of the cracking operation desired. App. is described.

**Filtration apparatus for separating paraffin from mineral oils.** Texaco Development Corp. Fr. 754,185, Nov. 2, 1933.

**Bituminous shale.** Sven V. Bergh. Ger. 579,623, June 29, 1933. See Swed. 70,948 (C. A. 27, 3069).

**Apparatus for testing the dielectric strength of oil.** David B. Clark (to Goulds Pumps, Inc.). U. S. 1,937,744, Dec. 5. An app. is described in which flow of oil through a testing device to a receiving tank is automatically stopped when any oil of less than a predetd. dielec. strength passes through the testing device. Cf. C. A. 27, 5586.

**Device for taking samples of oils or other liquids from tanks, etc.** Benjamin F. Remington and Clarence C. Stevenson (Remington to Texas Co.). U. S. 1,938,224, Dec. 5. Structural and mech. details.

**Motor fuels.** I. G. Farbenind. A.-G. (Wilhelm Gaus, inventor). Ger. 508,917, July 17, 1933. Addn. to 448,620. Motor fuels of the gasoline type are improved by adding  $\text{Fe}(\text{CO})_2$  and hydrocarbons contg. O or N, except those contg. halogen also. Thus,  $\text{Fe}(\text{CO})_2$  is added with toluidine, quinone, benzaldehyde, etc. The addns. prevent knocking.

**Motor fuels.** I. G. Farbenind. A.-G. (Wilhelm Wilke, Ernst Kuss and Gerhard Ritter, inventors). Ger. 518,232, July 24, 1933. Addn. to 508,917 (preceding abstr.). The method of 508,917 for improving motor fuel by adding  $\text{Fe}(\text{CO})_2$  and sol. org. compds. of the  $\text{C}_2\text{H}_5$  series contg. O or N but no halogen is applied to Diesel-engine fuels. Thus,  $\text{Fe}(\text{CO})_2$  and iso-BuOH, aldehydes, ketones, esters, amines, etc., are added to prevent knocking.

**Motor fuel.** Standard Oil Co. of Indiana. Fr. 752,981, Oct. 4, 1933. An antiknock fuel for motors is obtained by cracking hydrocarbons of high b. p. under pressure, but without catalysts or the use of inert gases. The hydrocarbons are completely vaporized by a rapid heating from below decompn. temp. (about  $370^\circ$ ) to a decompn. temp. of  $455\text{--}525^\circ$  while a pressure of 100–400 pounds is maintained for a time sufficient to obtain a min. proportion of decomposed products having the desired characteristics per passage (2.5 at 100 to 15% at 400 lb.). The rapid heating is such that about 85% of the total conversion per passage is effected at above  $455^\circ$ . A part of the decompn. takes place in a coil and the rest in an enlarged chamber. An app. is described. Fr. 752,982. In decomposing hydrocarbons by heating in a coil and discharging them to an enlarged chamber in which decompn. takes place, a liquid and vaporizable cooling agent, e. g., vaporizable hydrocarbons forming part of the stock of fresh materials for conversion, is introduced into the vaporous products when they leave the enlarged chamber, and is carried along with the vapors.

**"Nonknocking" motor fuels.** Frits Winkler, Hans

Haeuber and Paul Feiler (to I. G. Farbenind. A.-G.). U. S. 1,937,619, Dec. 5. In the production of low-boiling non-knocking hydrocarbon products contg. aromatic hydrocarbons by dehydrogenation of vaporized paraffinic hydrocarbons and subsequent condensation of the resulting dehydrogenated products, the dehydrogenation and condensation are effected in sep. vessels of which at least the parts coming into contact with the reacting substances are constructed of a material comprising free Si such as by use of a Si reaction tube. Various details of app. arrangement are described.

**Gasoline recovery from natural gas.** Edwin R. Cox (to Texas Co.). U. S. 1,937,871, Dec. 5. Gasoline is absorbed in oil in a zone from which the gas passes in a substantially gasoline-free condition; the absorbent oil, relatively rich in gasoline, is passed to an evapg. zone in which gasoline-like constituents are vaporized; resulting vapors are partially condensed to sep. heavier gasoline-like constituents; uncondensed vapors are compressed to form a bulk supply of a refrigerant comprising the lighter condensable hydrocarbons and a portion of this bulk supply is used in a compression refrigerating system. Various details of app. and operation are described. U. S. 1,937,872 relates to various features of app. and operation for absorbent recovery of gasoline from natural gas.

**Non-detonating gasoline.** Frederick W. Sullivan, Jr. and Vanderveer Voorhees (to Standard Oil Co. of Ind.). U. S. 1,938,546, Dec. 5. Hydrocarbon compds. of Pb suitable for use with gasoline are prepd. by establishing a silent elec. discharge in the presence of metallic Pb, within a body of gaseous or vaporized hydrocarbon which yields free alkyl radicals on decompn., such as  $\text{C}_2\text{H}_5$ ,  $\text{C}_3\text{H}_7$ ,  $\text{C}_4\text{H}_9$  or  $\text{C}_4\text{H}_{11}$ . App. is described.

**"Leadized" gasoline.** Frederick W. Sullivan, Jr. and Fred F. Diwoy (to Standard Oil Co. of Ind.). U. S. 1,938,547, Dec. 5. A high-tension arc is established within a body of hydrocarbon material yielding free alkyl radicals on disocn., and the hydrocarbon disocn. products thus formed are immediately contacted with metallic Pb to form hydrocarbon derivs. of the latter which are then immediately removed from the zone of the arc. App. is described.

**Hydrocarbon wax.** Lawrence M. Henderson, Seymour W. Ferris and Henry C. Cowles, Jr. (to Atlantic Refining Co.). U. S. 1,937,518, Dec. 5. A substantially oil-free hydrocarbon wax m.  $25\text{--}50^\circ$  and having a  $\eta$ , measured at  $80^\circ$ , greater than that derived from the expression  $\eta = 1.425 + 0.00075 T$  and less than 1.48, where  $T$  denotes the m. p. of the wax, is prepd. by various described modifications of treatment.

**Working up naphthenic acid soap-containing oily residues.** Richard Brunck, Alfred Kreutzer and Walther Boeck (to Deutsche Gasolin A.-G.). U. S. 1,938,513, Dec. 5. Oily residues obtained in the distn. of acid-contg. mineral oils over alkalis or alk. earths are treated in the water-free state with concd.  $\text{H}_2\text{SO}_4$  by which the naphthenic acids removed from the oil by the alkali or alk. earth are liberated so that they may be sepd.

**Lubricating oil.** Alfred Henriksen and Bert H. Lincoln (to Continental Oil Co.). U. S. 1,936,670, Nov. 28. A small proportion of a halogenated diphenylene oxide (suitably about 0.1–10% of a mono- or di-chlorinated deriv.) is added to a hydrocarbon lubricating oil in order to give lubricating films of greater strength.

**Lubricating oils.** Wilhelm Pungs, Hans Rabe and Hermann Zorn (to I. G. Farbenind. A.-G.). U. S. 1,938,088, Dec. 5. For producing a lubricating oil, a mixt. of a cyclic hydrocarbon such as naphthalene, anthracene or cyclohexane with liquid products obtained by cracking paraffin wax in the vapor phase is subjected, at ordinary temp. or a temp. which may be up to  $150^\circ$ , to the action of any anhyd. halide such as  $\text{AlCl}_3$  which gives rise to a strong evolution of heat when treated with water. App. is described. Cf. C. A. 27, 1161.

**Lubricating oil.** Edeleanu G. m. b. H. Ger. 580,875, July 17, 1933. Refined oil for lubricating is obtained by

extg. crude oil with liquid  $\text{SO}_2$  in the presence of org. substances sol. in liquid  $\text{SO}_2$ . Cf. C. A. 27, 2800.

**Petroleum lubricating oil.** Arthur E. Pew, Jr. (to Sun Oil Co.). U. S. 1,937,782, Dec. 5. A petroleum distillate lubricating oil is produced which has a flash point of about the range 300–350° and a higher fire point within about the range 330–400° and which has an org. acidity as tested by the A. S. T. M. method not exceeding 0.02 neutralization number and with a Conradson C content of 0.4–1.0%. App. and various details of distn., etc., are described.

**Lubricating composition.** Edward A. Nill (to P. E. Selby, Inc.). U. S. 1,937,462, Nov. 28. A mineral oil is used with the addn. of a small proportion (suitably about 5%) of an amide of a fatty acid such as stearanilide serving as a stiffening agent, and of a metallic soap (suitably about 0.75% of Na soap and 2.75% of Zn soap) to raise the m. p. U. S. 1,937,463 relates to an app. and method for prepg. lubricating mixts. by mixing a mineral oil with a stiffening agent (such as stearanilide and a metallic soap) at a temp. above the m. p. of the latter and then rapidly and uniformly cooling to a temp. at which the mixt. is of semi-solid consistency.

**Automatic feed-control device for liquids such as engine lubricating oil.** Sanford E. White. U. S. 1,936,778, Nov. 28. Various features of valve control are described.

**Apparatus suitable for filtering engine lubricating oil.** Jerome Brown (to Briggs & Stratton Corp.). U. S. 1,937,943, Dec. 5.

**Funnel suitable for use with fuel oils, etc.** Percy L. Downs. U. S. 1,938,138, Dec. 5. Structural features.

**Lubricating grease.** Erwin R. Lederer. U. S. 1,936,632, Nov. 28. A grease suitable for lubricating engine rocker arm bearings, etc., is prepd. by mixing a high-viscosity steam-refined paraffin base residual mineral oil of approx. 150 Saybolt viscosity at 99° with about 10% Al oleate and Al stearate which is solid at 100°.

**Waste lubricating oils.** Ferdinand J. F. Karthaus. Fr. 752,497, Sept. 23, 1933. Waste oils are purified for reuse by heating them to 80–100° with an emulsion of a mineral, vegetable or animal oil. The emulsion is prepd.

by adding water, or a soln. of a volatile inorg. base or a basic salt in water to a colloidal system, comprising an anhyd. soap and oil and heating to 100°.

**Purifying waste oils.** Soc. du naphthe S. A. Fr. 752,047, Sept. 27, 1933. Waste oils are purified by acidifying with a fatty acid or appropriate vegetable oil, then adding an alkali to make a soap which absorbs the impurities and which is sepd. by decantation.

**Renovating oil recovered from journal-box waste.** Leonard T. Evans. U. S. 1,936,901, Nov. 28. A heated mixt. of the oil together with Na silicate, water and saponifiable fatty material such as "red oil" is agitated, and the mixt. is then permitted to stratify and the renovated oil is drawn off.

**Pitch and tar.** Otto Reynard and Errol H. Thompson. Brit. 397,484, Aug. 23, 1933. Tars, tar oils and pitches are consolidated by treating with com.  $\text{H}_2\text{SO}_4$ , heating the mixt. to 150–180° and blowing compressed air therethrough. The mixt. may be preliminarily treated by passage over a cascade of shallow trays heated progressively from 100° to 150°, the system being under reduced pressure. Cf. C. A. 27, 4657.

**Bitumen emulsions.** Wilhelm Ackermann. Ger. 581,540, Sept. 21, 1933. Stable high percentage aq. emulsions of bitumen are prepd. by the aid of soap and a buffer soln. of  $p_{\text{H}}$  value of about 10.

**Retort and associated apparatus for wood distillation.** John T. Myers. U. S. 1,938,494, Dec. 5. Various structural and operative details are described.

**Drying oils and resins from pine extracts.** Samuel M. Cooper (to Gulf Refining Co.). U. S. 1,938,320, Dec. 5. A pine ext. is caused to react with  $\text{AlCl}_3$  in the presence of an inert solvent such as naphtha or  $\text{CCl}_4$  at temps. below 50°, the solvent and any unreacted turpentine are distd. off, and a drying oil is recovered from the residue.

**Charcoal.** Paul Guillaume. Fr. 751,031, Aug. 25, 1933. An economical wood charcoal of high calorific power is obtained from sound, creosoted wood, such as old railway sleepers or paving blocks. The app. used is interiorly coated with a refractory compn. having 25–42% of  $\text{Al}_2\text{O}_3$ .

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**Modern developments in applied cellulose chemistry.** Gustavus J. Esselen. *Ind. Eng. Chem.* 26, 26–30 (1934). E. H.

**Unit cell of cellulose in cotton stalks and cusps.** J. P. Saunders and F. K. Cameron. *Ind. Eng. Chem.* 25, 1371–3 (1933).—The cellulose of the stalks and cusps is found to be the same as that from cotton, spruce, pine and poplar. The fundamental structure obtained by chem. means is the same irrespective of the origin of the cellulose. The differences in phys. properties are to be found in the micelle or fibroid structure. P. S. Billington

**The structure of cellulose.** Alexander Gerö. *Naturwissenschaften* 21, 693–4 (1933).—An effort is made to explain the formation of mellitic acid by slow oxidation of charcoal on the basis of cellulose structure. The glucose units are assumed to be linked in the cellulose mol. not by O but by direct C bonds giving 6-membered rings in which 3 "head" and 3 "tail" ends of 6 glucose chains are held, i. e., in sym. arrangement 3 carbinol and 3 aldehyde groups. Trihydroxycyclohexane contg. 6 side chains is the basis of the cellulose molecule. From this structure are explained the  $(\text{C}_6\text{H}_{10}\text{O}_5)_n$  formula, the hydrolysis reaction, the absence of reducing power in native cellulose and its appearance on partial hydrolysis. Opposed to this structure are the absence of preformation of cellobiose and the failure of mellitic acid to be formed directly from cellulose. This failure is attributed to hydrolysis. The yield in mellitic acid from charcoal checks with the original cellulose content of charcoal. There is no evidence that mellitic acid is formed from the lignin of charcoal. B. J. C. van der Hoeven

**Formylcellulose. IV. Conditions of formation of formylcellulose.** Yoshisuke Uyeda and Koji Fujiwara; *Cellulose Ind.* (Tokyo) 9, 274–5 (in English 35) (1933). cf. C. A. 27, 188.—Formylation was carried out with 4.0 g. regenerated cellulose, 40.0 g.  $\text{HCO}_2\text{H}$  (100%) and 3.0 g.  $\text{H}_2\text{SO}_4$  (sp. gr. 1.84) which were kept at 20° for a definite time and then poured into water. Duration of formylation in hrs., percentage of  $\text{HCO}_2\text{H}$ , sp. gr., film strength in kg./sq. mm. and percentage of elongation were summarized as follows: 20, 34.68, 4.53, 3.53, 15.5; 24, 37.21, 4.00, 3.79, 8.0; 32, 39.40, 3.10, 4.32, 6.5; 40, 39.90, 2.80, 4.6, 4.5; 45, 38.74, 2.51, 4.64, 4.3; 48, 37.88, 2.45, 4.62, 4.3; 55, 37.72, 2.56, 4.94, 4.5. K. Konda

**A method for determination of the solvent power of organic liquids for cellulose esters.** Ichiro Sakurada and Ichiro Kido. *Cellulose Ind.* (Tokyo) 9, 238–46 (in German 27–33) (1933).—The method consists in comparing the solvent-power curves of the same cellulose esters in a series of liquid mixts. which are composed of a non-polar indifferent liquid, e. g.,  $\text{C}_6\text{H}_6$ , and the solvent in question. This curve, usually S-formed, follows a different course for the same cellulose ester in different solvents, and it serves as a measure of the solvent power of various solvents. The order of solvent power has been detd. as follows:  $\text{Me}_2\text{CO} > \text{MeEtCO} > \text{Ac}_2\text{O} > \text{AcOEt} > \text{AcOPr} > \text{C}_6\text{H}_6\text{N} > \text{AcOAm} > \text{HCO}_2\text{Me} > \text{MeCHOHCO}_2\text{Et}$  (for higher nitrocellulose with 13.7% N);  $\text{Me}_2\text{CO} > \text{MeEtCO} > \text{C}_6\text{H}_6\text{N} > \text{Ac}_2\text{O} > \text{AcOEt} > \text{AcOAm} > \text{AcOMe} > \text{HCO}_2\text{Me} > \text{PhNO}_2$  (for lower nitrocellulose with 11.6% N). K. Konda

**Manufacturing viscose film on a small scale.** Johann Eggert. *Kunststoffe* 23, 229–31 (1933).—Methods and

app. as well as the economic side of the manuf. of viscose foil on a small scale are discussed. J. W. Perry

New types of packagings from cellulose esters. Kafa. *Kunststoffe* 23, 231-3 (1933).—A general discussion.

J. W. Perry  
Sulfur forms in crude viscose rayon yarn. Philip C. Scherer, Jr. *Ind. Eng. Chem.* 25, 1319-21 (1933).—A portion of the S present is easily removed by aq. solns. It is probably present as an easily hydrolyzable or  $H_2O$ -sol. sulfate of org. residues. The difficultly removable residues may be in the form of a sulfide of cellulose. P. S. B.

The elimination of stretch drying. Zentaro Kawata. *Cellulose Ind.* (Tokyo) 9, 248-9 (in English 33) (1933).—The elimination of preliminary drying under tension, which is carried out before viscose threads are submitted to desulfurization and other treatment, does not affect the length of threads but causes a little injury to the luster. However, it slightly improves the feel, strength and elongation of threads and somewhat strengthens the absorbing power of threads for dyes. It is advantageous in reducing the manuf. cost. K. Konda

The utilization of wood for the production of foodstuffs, alcohol and glucose. Friedrich Bergius. *Chemistry & Industry* 1933, 1045-52; *Trans. Inst. Chem. Engrs.* (London) Nov. 15, 1933, 12 pp. (preprint). E. H.

The cooking process. V. Cooking wood with sodium sulfite. S. I. Aronovsky and Ross A. Gortner. *Ind. Eng. Chem.* 25, 1349-54 (1933); cf. *C. A.* 28, 317<sup>a</sup>.—The residual wood (after cooking) is very light in color. It contains less lignin, and more pentosans and Cross and Bevan cellulose than corresponding water cooks. The destruction of  $\alpha$ -cellulose is hindered by  $Na_2SO_3$ , which is shown to be a strong pulping agent. P. S. Billington

The acidity of paper. Kaare Haug. *Papir-J.* 21, 184-7, 196-8, 205-7, 240-4, 251-4 (1933).—Relative  $p_H$  values in papers can be detd. by extn. with cold  $H_2O$ . Heating of the suspension causes formation of H ions not previously present in the paper and does not accelerate equil. between the 2 phases, which is attained immediately in cold suspension, and is dependent on other than H ions. This explains variations in the  $p_H$  of papers cooked at the same  $p_H$ . Quant. extn. of H ions from paper requires an interchange with other pos. ions. The abs. acidity of paper cannot be detd. by  $p_H$  detn. after one extn. with  $H_2O$  or neutral salt soln., although it is possible that a rough detn. could be made by extn. with a high concn. of a neutral salt. Because of the difficulty of making accurate  $p_H$  detns. and the fact that the acids and salts responsible for the  $p_H$  are the same for most papers, detn. of total acidity by titration after extn. with a neutral salt soln. or in the suspension itself is preferable to  $p_H$  detn. Sufficient information can be obtained by titration to a given  $p_H$  with a suitable indicator. Clinton L. Brooke

De-inking and reprocessing paper accomplished by new method. Sidney D. Wehs. *Chem. & Met. Eng.* 40, 634-7 (1933).—See *C. A.* 28, 633<sup>a</sup>. G. G.

Practical values of various sizes. Mitsunori Higaki. *Cellulose Ind.* (Tokyo) 9, 275-81 (in English 36) (1933).—Of rosin, soy-bean oil, tallow, lard, Na aluminate, etc., examd. for sizing effect, soy-bean oil, tallow and lard are inferior to rosin. If paper sized with soy-bean oil, tallow or lard is dried at a somewhat higher temp., the sizing effect is stronger than that of rosin; these sizes can therefore be satisfactorily used for paper of ordinary quality. The addn. of lard to rosin results in a considerable lowering of the m. p. of the latter; sizing can, however, scarcely be effected because the emulsified size is electrically inactive; such a size is therefore unfit for engine sizing. The  $p_H$  and temp. bear a certain intimate relation to gelatinization or coagulation of size. K. Konda

Paper dyeing. A. Myasnikov. *Bumashnaya Prom.* 12, No. 7, 48-54 (1933).—A discussion of problems of production of colored paper as affected by present and projected conditions of the dye industry in U. S. S. R. Chas. Blanc

Factors influencing resin concn. in loblolly and slash pine (Bishop, Marckworth) 11D. Solns. of Cl [for delignification of cellulose] (Fr. pat. 752,897) 18. Artificial materials [products for making films, threads] (Fr. pat. 750,873) 26. Albumin [production of films, fibers] (Ger. pat. 581,518) 18. Adhesive for paraffined paper (Fr. pat. 753,542) 18. Recovering alkali metal compds. from waste [cellulose liquors] (Brit. pat. 397,787) 18.

Cellulose. Otto Engel and Edgar Wedekind. Ger. 581,806, Aug. 3, 1933. Fibrous vegetable material is disintegrated by treatment with dioxane in the presence of a catalyst. Thus, pine wood meal is treated with dioxane and HCl to give a 60% yield of cellulose.

Device for obtaining cellulose from fibrous materials. The Bauer Brothers Co. Ger. 584,560, Sept. 21, 1933.

Apparatus for purifying cellulose. Papeteries Navarre (Soc. anon.) Ger. 579,075, June 21, 1933. Addn. to 556,838 (*C. A.* 27, 412).

Cellulose esters. Henry Dreyfus. U. S. 1,936,585, Nov. 28. Cellulose is esterified by the action of an aliphatic acid anhydride such as  $Ac_2O$  in the presence of at least 2% the wt. of the cellulose of a H halide and at least 2% of a halide of a metal of at. wt. between 53 and 65, such as  $FeCl_3$ .

Cellulose esters. Henry Dreyfus. U. S. 1,936,586, Nov. 28. A cellulosic material such as cotton is pre-treated with a lower aliphatic acid such as formic acid and then esterified with an aliphatic acid anhydride in the presence of a ferric halide as sole catalyst. U. S. 1,936,587 relates to a process in which cellulosic material is rendered more reactive to subsequent esterification by previous treatment with a halide of a metal of at. wt. between 53 and 65, such as  $FeCl_3$  or  $SnCl_4$ . U. S. 1,936,588 specifies conducting at least part of the esterification of cellulose in the presence of a ferric halide catalyst contg. Fe in ferric form in greater quantity than is equiv. to the halogen present in the catalyst, e. g.,  $FeCl_3$  and  $Fe(OH)_3$ , used together. U. S. 1,936,589 relates to the treatment of cellulosic material such as cotton linters with less than 2% its wt. of H halide such as HCl without disintegration, and then esterifying, e. g., by treatment with  $Ac_2O$ , etc. U. S. 1,936,590 relates to treatment of cellulosic material with an acid anhydride such as  $Ac_2O$  in the presence of a H halide and of at least 2% of catalyst including a halide of Fe, Mn, Co, Ni or Cu, e. g.,  $FeCl_3$ .

Cellulose esters. George A. Richter (to Brown Co.). U. S. 1,938,299, Dec. 5. Cellulose fiber is hydrolyzed to lower its soln. viscosity to below 1, the hydrolyzed fiber is blended with about 20-50% (based on the total wt. of the blend) of substantially unhydrolyzed cellulose fiber, and the blend is esterified as for the production of cellulose nitrate or xanthate which has a low soln. viscosity.

Cellulose esters. Georg Jayme. Brit. 397,638, Aug. 31, 1933. See Fr. 738,760 (*C. A.* 27, 2033).

Cellulose esters. C. F. Boehringer, & Soehne G. m. b. H. (Richard Müller, Martin Schenck and Wilhelm Wirbatz, inventor). Ger. 581,827, Aug. 3, 1933. Cellulose is esterified by treatment with fatty acid anhydride in the presence of  $CH_3(HSO_3)_2$  as catalyst. Thus, cellulose is treated with  $Ac_2O$ ,  $CH_2Cl_2$  and  $CH_3(HSO_3)_2$  to give an esterified product useful for making artificial products.

Cellulose esters such as cellulose acetate. Franz Becker (to I. G. Farbenind. A.-G.). U. S. 1,936,976, Nov. 28. A starting material such as bleached linters is treated, in the presence of a diluent such as HOAc, with an amt. of  $H_2SO_4$  comprising less than 2% of free  $H_2SO_4$  calcd. on the wt. of the cellulose compd.; an aliphatic acid anhydride such as  $Ac_2O$  is added, partial esterification is effected, and the reaction product thus obtained is treated with a mixt. of free  $H_2SO_4$  and a neutral or acid salt or ester of  $H_2SO_4$  such as  $NaHSO_4$  or  $Et_4SO_4$  in order to minimize the cooling required to control the reaction. Cf. *C. A.* 27, 840.

Cellulose nitrate-acetate esters. Camille Dreyfus and George W. Miles (to Celanese Corp. of America). U. S. 1,938,176, Dec. 5. Cellulosic material such as cotton

1. of timber under industrial conditions (Rudge)  
20. Chemistry of Australian timbers (Cohen, et al.) 11D.

liners is treated with  $\text{Ac}_2\text{O}$  and fuming nitric acid in one bath.

**Esters of carbohydrates.** Albrecht Schmidt, Gerhard Balle and Hans Lange (to I. G. Farbenind. A.-G.). U. S. 1,938,044, Dec. 5. Esterification reactions such as the treatment of cotton liners with  $\text{Ac}_2\text{O}$  are effected in a bath contg. liquid  $\text{SO}_2$  and a sol. inorg. oxidizing agent such as  $\text{CrO}_3$  which will form  $\text{H}_2\text{SO}_4$  or sol. acid-reacting sulfates with the  $\text{SO}_2$ . Cf. C. A. 28, 639<sup>1</sup>.

**Wood sugar.** Holzhydrolyze A.-G. (Hugo Koch, inventor). Ger. 584,838, Sept. 25, 1933. Xylose is refined without loss by treatment with alk. earth metal oxides at low temps. after bringing its reducing capacity to below 15%.

**Benzylcellulose.** I. G. Farbenind. A.-G. (Eduard Dörr, inventor). Ger. 583,560, Sept. 6, 1933. Pure benzylcellulose is obtained by converting the crude substance to an emulsion, preferably with soap, before extg. impurities. Thus, crude benzylcellulose is washed with water to remove  $\text{NaCl}$  and  $\text{NaOH}$ , emulsified with K soap and purified by extn. with  $\text{MeOH}$ .

**Benzylcellulose compositions.** Louis Light. Brit. 397,773, Aug. 31, 1933. Viscous chlorinated biphenyl isomers are admixed as plasticizers with benzylcellulose and suitable liquid media to yield films, lacquers, filaments and plastic masses. Resinous chlorinated biphenyl isomers may be added also. Examples are given.

**Ethers of cellulose.** David Traill (to Imperial Chemical Industries Ltd.). U. S. 1,938,360, Dec. 5. Cellulose such as wood pulp or cotton pulp is mercerized in a soln. such as a soln. of  $\text{NaOH}$  of 18–20% strength, pressed to a wt. 2–4 times that of the raw material, matured by storing at a temp. within the range of  $-10^\circ$  to about  $50^\circ$  to secure the desired viscosity characteristics in the product, and treated with alkali corresponding to at least 50% as much  $\text{NaOH}$  as the wt. of the cellulose; the resulting mixt. of alkali and alkali cellulose is then treated with an alkyl halide such as  $\text{MeCl}$  or  $\text{EtCl}$  or with an aralkyl halide such as benzyl chloride.

**Cellulose derivatives.** Leon Lilienfeld. U. S. 1,938,033, Dec. 5. Products suitable for the manuf. of films, etc., are produced by treating cellulose, in the presence of an alkali, with an alkyl isothiocyanate. Cf. C. A. 27, 4927.

**Cellulose derivatives.** Soc. pour l'ind. chim. à Bâle. Ger. 583,398, Sept. 5, 1933. Addn. to 554,781 (C. A. 26, 6159). Partly esterified or etherified cellulose products sol. in org. solvents are condensed with heterocyclic compds. contg. one or more  $\text{N}=\text{C}$ —halogen groups, in the presence of a tertiary base. Thus, acetylcellulose contg. 41.5% acetyl, sol in acetone, is kneaded with dimethylaniline, cyanuric chloride and  $\text{CHCl}_3$  to give a viscous product. Other examples are given.

**Cellulose carboxylates.** Hans T. Clarke and Carl J. Malm (to Kodak Ltd.). Brit. 397,906, Sept. 4, 1933. Cellulosic material, e. g., reverted cellulose, cotton, wood pulp, cellulose ethers or partially acylated cellulose, is esterified with an unsubstituted aliphatic (including cycloparaffinic), an aromatic or an aralkyl monocarboxylic acid in the presence of a methoxy, ethoxy or propoxy fatty acid anhydride as impeller. The reaction may be in the presence of solvents, e. g., glacial  $\text{AcOH}$ , ethylene chloride, alkoxy fatty acids, or of non-solvents, e. g., ligroin. Among examples (1) cotton fibers are esterified by glacial  $\text{AcOH}$  in presence of ethoxyacetic anhydride (I) and (2) lower cellulose acetate is esterified by lauric acid in presence of I and methyl methoxyacetate.  $\text{MgClO}_4 \cdot 3\text{H}_2\text{O}$ , *p*-toluenesulfonyl chloride,  $\text{ZnCl}_2$ , benzenesulfonic acid, red P and  $\text{Cl}$  may be used as catalysts. The products are used to produce artificial filaments, leathers, plastics, etc.

**Cellulose composition suitable for coatings, films, etc.** Marcel J. L. Ledru, Florentin Bidaud and Paul Berger (to E. I. du Pont de Nemours & Co.). U. S. 1,937,280, Nov. 28. A cellulose deriv. such as cellulose acetate or ethylcellulose is used with an *N*-alkylol sulfamide of benzene or a homolog as a suppling agent.

**Machines for producing bands of regenerated cellulose.** Soc. anon. La Cellophane. Ger. 584,807, Sept. 25, 1933.

**Apparatus for drying cellulose films.** Otto Sindl. Ger. 579,900, July 3, 1933.

**Plasticizing agents.** I. G. Farbenind. A.-G. Fr. 754,178, Nov. 2, 1933. Plasticizers and softening agents for cellulose are composed of neutral esters prepd. by combination of diglycolic acid and polyhydric alc. ethers which still contain a free OH group. Examples of such ethers are 3-butoxy- and 3-methoxy-1-butanol and 2-methoxy-ethanol.

**Cellulose ester lacquers.** Alexander Wacker Ges. für elektrochemische Industrie G. m. b. H. (Eugen Galitzstein, inventor). Ger. 580,592, July 13, 1933. These are made by mixing 1,1,3-trimethyl-3-cyclohexen-5-one with spirit and collodion wool or other cellulose esters.

**Plastic materials, varnishes, etc.** Zellstoffabrik Waldhof and Otto Faust. Fr. 752,797, Sept. 30, 1933. Cellulose derivs. used for making plastic sheets, masses or varnishes of the type of celluloid are made from cellulose obtained from a single kind of wood suitably selected.

**Digester for making celluloid.** Caliqua Wärmegesellschaft m. b. H. Ger. 583,682, Sept. 7, 1933.

**Viscose products.** Algemeene Kunstzijde Unie N. V. Ger. 584,876, Sept. 25, 1933. Silk and other products are obtained by working up viscose solns. contg. small amts. of an emulsion of lanolin, and fat solvents such as  $\text{C}_6\text{H}_6$ ,  $\text{CCl}_4$ , oil of turpentine, etc.

**Viscose solutions.** Richard Elssner (to American Glanzstoff Corp.). U. S. 1,937,110, Nov. 28. A salt, such as the Ca or Ba salt, of dithiocarbonic acid *O*-isobutyl ester is used in viscose solus. and serves to give filaments a dull luster similar to that of real silk.

**Thin shrinkable viscose products such as bottle caps, etc.** Earle H. Morse. U. S. 1,937,836, Dec. 5. Coagulation, without substantial drying or regeneration, is effected by heating a viscose soln. in a mold; the coagulated product is then regenerated and desulfurized.

**Artificial threads, etc., from cellulose derivatives such as viscose.** Leon Lilienfeld. U. S. 1,938,032, Dec. 5. A dissolved cellulose compd. such as viscose is treated with a halogen deriv. of a polyhydric alc. such as  $\alpha$ -dichlorohydrin and the resulting reaction product is isolated (suitably as a ppt. which forms), dissolved (suitably in a  $\text{NaOH}$  soln.), brought into desired shape, coagulated and plasticized not later than immediately after coagulation.

**Cellulose tubing from viscose.** Alfred G. Hewitt (to Visking Corp.). U. S. 1,937,225, Nov. 28. Viscose is extruded through an annular orifice to form seamless tubing and the tubing is passed repeatedly through a regenerating bath in such a manner that the gas evolved during the regeneration operation will collect in approx. equal quantities in a plurality of long lengths of the tubing extending above the bath. App. is described.

**Rayon.** Henry Dreyfus. Fr. 42,607, Aug. 23, 1933. Addn. to 679,618 (C. A. 24, 3902). The point of introduction of the evapg. agent can be varied by the use of a tube with a no. of holes, any one of which can be opened singly.

**Rayon.** Édouard Haegelin. Fr. 750,909, Aug. 22, 1933. Construction of viscose pump is given.

**Rayon, etc.** Henry Dreyfus. Fr. 752,724, Sept. 29, 1933. In dry-spinning solns. of cellulose derivs., a current of evapg. agent is introduced in the neighborhood of the spinning nozzles from an exterior source and is produced by heat. This current may be supplementary to a main evapg. current moving in the opposite direction to the filaments.

**Rayon filaments.** Harry P. Bassett and James H. Torrence (to Tubize Chatillon Corp.). U. S. 1,938,312, Dec. 5. Pigment-like particles such as  $\text{TiO}_2$  are thoroughly mixed with a low-viscosity viscose soln. or the like, and this mixt. is further mixed with a larger bulk of soln. such as viscose from which filaments are to be spun to incorporate the pigment-like particles evenly throughout the mass.

**Apparatus for spinning rayon.** J. P. Bemberg A.-G. Ger. 583,873, Sept. 11, 1933.

**Device for spinning rayon.** J. P. Bemberg A.-G.

Ger. 579,005, June 22, 1933. Addn. to 530,911 (C. A. 26, 3608).

Apparatus for wet-spinning acetate rayon. August Rosse, August Seidel and Hugo Sedlacek. Ger. 579,981, July 4, 1933.

Rayon spinning pot. Soc. de constructions mécaniques de Stains. Fr. 753,657, Oct. 21, 1933.

Device for spinning artificial fibers. J. P. Bemberg A.-G. Ger. 584,579, Sept. 21, 1933. Addn. to 566,537 (C. A. 27, 2578).

Device for after-treating artificial fibers in the spinning pot. Ernst Berl. Ger. 584,802, Sept. 25, 1933.

Spinning bobbins. I. G. Farbenind. A.-G. Fr. 751,596, Sept. 6, 1933. The bobbins are made of fibrous material impregnated with a resinous or waxy polychloro-hydrocarbon, e. g., polychloronaphthalenes.

Dry spinning of artificial filaments from cellulose derivative solutions such as those of cellulose acetate or the like. Wm. Whitehead (to Celanese Corp. of America). U. S. 1,937,614, Dec. 5. A heated soln. such as a soln. of cellulose acetate in 95% acetone is forced through a passage surrounded by a relatively large vol. of a heating medium such as oil or water by which the soln. is maintained at a uniform temp. of about 55° and then extruded through the orifices of a spinneret into an evaporative atm. drawn through the spinning cell. App. is described.

Artificial threads. British Celanese Ltd. and Wm. I. Taylor. Brit. 397,509, Aug. 18, 1933. Artificial filaments are stretched continuously with production, the stretching force being prevented wholly or partly from extending back to the liquid filaments at the point of extrusion by a tensioning device or devices applied initially at points which are successively brought closer to the point of extrusion. Stretching of the filaments when in a condition too weak to withstand the shock of the initial application of the tensioning means may be effected thus.

Apparatus and method for producing imitation spun yarn from continuous filamentous material, e. g., of cellulose acetate or other organic cellulose derivative, reconstituted cellulose, silk. British Celanese Ltd., Matthew M. Taylor and Stephen M. Fulton. Brit. 397,138, Aug. 8, 1933.

Artificial fibers. A. Formhals. Ger. 584,801, Sept. 25,

A device for spinning fibers by rapidly rotating a wheel, etc., in the spinning soln. and catching the fibers on a second rotating wheel, etc., is described, the soln. being subjected to an elec. field.

Artificial fibers, films, etc. Aceta G. m. b. H. Ger. 581,971, Aug. 5, 1933. Fibers, films, etc., are made from a soln. of cellulose derivs. contg. halogenated hydrocarbons and not more than 10% of org. substances which will bind HCl, such as substitution products of cellulose,  $\alpha$ - $\beta$ -unsatd. ketones or org. oxido compds. Thus, rayon is spun from a mixt. of cellulose acetate,  $\text{CH}_2\text{Cl}_2$ , alc. and mesityl oxide. Other examples are given.

Thin sheet material. Henry Dreyfus. Fr. 753,314, Oct. 13, 1933. Thin films or sheets, particularly for wrapping, are made by extruding solns. of org. derivs. of cellulose, e. g., the acetate, receiving the product in a coagulating bath contg. softening agents for the cellulose deriv. and drawing the product as it is made. The softening agent may be diacetone alc., ethyl tartrate or ethyl lactate. An app. is described.

Seasoning pyroxylin sheets, etc. Gustavus J. Easelen and Irving Weber (to Fiberloid Corp.). U. S. 1,937,687, Dec. 5. Material such as pyroxylin sheets contg. alc. is treated with  $\text{EtOAc}$ , then treated with V. M. P. naphtha and dried.

Fiber from wood chips. Jonas Jonsson. U. S. 1,936,000, Nov. 28. Various details of app. and operation are described for comminuting wood in water between rolls which are rotated at greatly different peripheral speeds.

Digester for cellulose, etc. Anton Gentil. Ger. 583,786, Sept. 9, 1933.

Device for introducing steam into cellulose digesters. Einar Morterud. Ger. 583,820, Sept. 9, 1933.

Drying plates of wood pulp, etc. Ewald Slompelkamp. Brit. 397,785, Aug. 31, 1933. Plates of wood pulp, etc.,

contg. binding agents are dried by subjecting to a temp. below that at which binding occurs, while compressed to the desired ultimate thickness, and then applying a higher temp. to effect binding under pressure. In the first stage the temp. is above the b. p. of  $\text{H}_2\text{O}$ , and the duration of the sec. stage may be sufficient for complete polymerization of the binder.

Paper pulp from wood chips. John Traquair (to Mead Research Engineering Co.). U. S. 1,936,697, Nov. 28. Raw uncooked hard deciduous wood chips together with caustic liquor at a temp. below 50° are introduced into a rod mill, and the chips are milled in the liquor while passing through the mill.

Apparatus for screening paper pulp. Thomas O'Connor. U. S. 1,937,526, Dec. 5. Mech. features.

Treating paper pulp in beater units arranged in groups. Wm. V. Knoll (to Midwest-Fulton Machine Co.). U. S. 1,937,156, Nov. 28. Various details of app. arrangement and operation are described.

Apparatus for continuous bleaching of paper pulp. International Paper Co. Fr. 751,230, Aug. 20, 1933.

Dehydrating apparatus for pulp and paper making. F. H. Banning & Seybold Maschinenbau-G. m. b. H. & Co. Ger. 580,972, July 25, 1933.

Purifying sulfite liquors. James D. Butler (to General Chemical Co.). U. S. 1,937,944, Dec. 5. A water-sol. sulfide such as that of Na is added to liquors such as an alk. impure  $\text{Na}_2\text{SO}_3$  liquor to ppt. impurities such as Fe, Pb, etc.

Apparatus for treating cellulose with sulfite lye. Metallges. A.-G. Fr. 750,769, Aug. 18, 1933.

Device for evaporating waste cellulose lye. Industriemiska Aktiebolaget. Ger. 579,524, June 29, 1933.

Paper. Justus C. Sanburn (to Strathmore Paper Co.). U. S. 1,938,543, Dec. 5. During the manuf. of a web from paper-making material there is incorporated with the latter a multiplicity of detecting-fibers of a certain color and a multiplicity of other fibers of the same certain color but treated differently so that when the finished paper is treated with certain reagents such as ink removers one only of the kinds of colored fiber used will change its appearance. The paper is suitable for documents to prevent their alteration. Various details and examples are given.

Paper. Brown Co. Brit. 396,980, Aug. 17, 1933. Paper contg. viscose is deodorized by treatment with an oxidizing agent, e. g.,  $\text{Cl}_2$  as gas or in soln.,  $\text{O}_3$ ,  $\text{NaClO}$ ,  $\text{Na}_2\text{O}_2$ ,  $\text{H}_2\text{O}_2$ . Either the finished paper or paper during process of manuf. may be treated, e. g., a web of paper material impregnated with viscose is treated. The paper may be partially dried before treatment.

Paper. Marcel Demouy. Fr. 751,000, Aug. 24, 1933. Paper pulp is made from the stems, branches or trunks of banana trees.

Paper. Papeteries de Malaucène (Soc. anon.) (Louis P. Schweitzer and Albert Renard, inventors). Fr. 752,628, Sept. 27, 1933.  $\text{TiO}_2$ , pure or mixed with other products, is used as a charge for thin paper weighing 10-50 g. per sq. cm. The  $\text{TiO}_2$  is fixed by mordanting with tannin,  $\text{Al}_2(\text{SO}_4)_3$ , etc.

Paper-making apparatus. Benjamin E. Teale. U. S. 1,936,609, Nov. 28. Mech. features.

Paper-making machine. Wm. H. Millspaugh. Ger. 583,743, Sept. 8, 1933.

Paper-making apparatus of the fourdrinier type. John P. Pederson. U. S. 1,937,125, Nov. 28. Mech. features.

Horizontal sieve paper-making machine. Francis S. McDonnell. Ger. 581,807, July 31, 1933.

Suction cylinder mold for paper-making machines. Theodore L. Formaini. U. S. 1,937,426, Nov. 28. Structural and mech. features.

Suction roller for paper machines. Downingtown Manufacturing Co. Ger. 579,638, June 29, 1933.

Oscillating suction box for paper-making machines. Wm. P. Muir (to Dominion Engineering Works Ltd.). U. S. 1,937,478, Nov. 28.

Wet-presses for paper-making and like machines. Fibroplast G. m. b. H. Brit. 396,632, Aug. 10, 1933.

- Bleaching hollander for paper making.** I. G. Farbenind. A.-G. (Erich Opfermann, Walter Fischer and Gustav A. Feldtmann, inventors). Ger. 583,895, Sept. 11, 1933.
- Machine for drying paper.** Netzschkauer Maschinenfabrik Franz & Söhne. Ger. 579,525, June 27, 1933.
- Drying paper, etc.** Jaroslaw's, Erste Glimmerwarenfabrik. Ger. 580,705, July 15, 1933.
- Waxing and drying paper.** Charles C. Willis (to John Waldron Corp.). U. S. 1,937,317, Nov. 28. Paper to be waxed is passed through a bath of melted wax, then through a cold water bath to harden the coating and is thoroughly dried on its way to the reel. App. and various details of operation are described.
- Sizing paper.** Philip W. Codwise (to Certain-teed Products Corp.). U. S. 1,937,317, Nov. 28. Sizing of low penetrating power is applied to the paper after the latter has been subjected to drying, and the paper is then subjected to a compacting pressure (suitably by the action of rolls) which leaves the sizing mainly as a surface coating.
- Sizing paper.** Soc. anon. Ferdinand Dohler. Fr. 753,871, Oct. 26, 1933. A very small amt. of an acid substance, preferably a salt of  $Al_2O_3$ , is added to the pulp before its arrival on the paper machine, and the paper is passed, after a suitable degree of drying according to the quality of the paper, into a resinous sizing bath, with or without the addn. of animal or vegetable glues. The paper is then dried.
- Emulsions of resin.** Antoine C. Gillet. Fr. 752,970, Oct. 4, 1933. Stable emulsions of resin for *sizing papers*, etc., are obtained by sapon. about 15% of the mass of resin with a mixt. of  $Na_2CO_3$  and  $NaHCO_3$ , and then sapon. about 10% of the remainder by means of  $NH_3$ . An app. is described.
- Apparatus for coloring paper rolls, etc.** I. G. Farbenind. A.-G. (Gebhard Blaser, inventor). Ger. 580,903-4, July 18, 1933.
- Coloring rolls of paper, etc.** I. G. Farbenind. A.-G. (Gebhard Blaser, inventor). Ger. 581,032, July 22, 1933. Addn. to 580,903 (preceding abstr.).
- Waterproofing paper, etc.** Papeteries Navarre (Soc. anon.). Fr. 42,521, Aug. 4, 1933. Addn. to 720,333 (C. A. 26, 3923). Coagulants other than  $CH_3O$  are used in the process of Fr. 720,333, e. g.,  $CaO$  or salts thereof.
- Waterproofing fibrous materials.** I. G. Farbenind. A.-G. Fr. 753,510, Oct. 18, 1933. Paper, textiles, leather, etc., are waterproofed by impregnation with an aq. agent contg. a substance of the nature of an aliphatic acid of at least 8 C atoms, a salt sol. in water of a multivalent basic metal giving rise to an insol. salt with the acid, and a protective colloid sol. in water of the formula  $RO(C_2H_5O)_xH$  or  $RO(CH_2CHOH.CH_2O)_xH$  ( $x$  is a whole no. equal to or higher than 2 and R is an org. radical contg. at least 6 C atoms). Several examples are given.
- Filter paper.** Eugène H. Agrenier. Fr. 751,013, Aug. 25, 1933. App. for applying a reënforcing canvas to the paper is described.
- "Glassine" paper.** Roy C. Charron and Willard E. Swift (to U. S. Envelope Co.). U. S. 1,938,133, Dec. 5. "Glassine" paper or the like, rendered transparent by high hydration and heavy calendering, is first softened to improve its texture, and a film of nitrocellulose is then deposited on its surface to counteract the impairment of its transparency by the softening. An arrangement of app. is described. The softening may be effected by a glycerol bath or the like.
- Preventing expansion and contraction of printing paper.** Joseph L. Kelly, Rudolf Brenner and John P. Hoffer. U. S. 1,937,703, Dec. 5. Paper in stacks or rolls is treated at the edge portions of the stack or roll with a pore sealing soln. contg. beeswax and paraffin oil.
- Copying papers.** Soc. anon. des anciens établissements Braunstein frères. Fr. 751,410, Sept. 4, 1933. Paper is impregnated with a fatty substance before applying the ink, or the fatty substance, e. g., stearic acid, is added to the paper pulp. A sol. stearate may be used and decomposed by oxalic acid.
- Device for working up waste paper.** Fredrik Grewin. Ger. 584,561, Sept. 21, 1933.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

- Limit charge of initiating explosives.** J. Barcikowski and J. Kielczewski. Z. ges. Schiess-Sprengstoffw. 28, 340-1 (1933); cf. C. A. 28, No. 645<sup>2</sup>. C. G. Storm
- Effect of low temperatures on brisance of explosives.** L. V. Clark. Z. ges. Schiess-Sprengstoffw. 28, 345-8 (1933) (in English).—C. has investigated the effect of low temps. ( $-80^\circ$  and  $-183^\circ$ ) on the performance of various types of elec. detonators as indicated by (1) their action on unconfined cartridges of liquid O explosives (L. O. X.), (2) Pb plate tests and (3) small Trauzl block tests. Only detonators of the mannitol hexanitrate type gave complete detonation of an insensitive L. O. X. when cooled to  $-183^\circ$  by being left in the cartridge for 1-3 min. Brisance, as indicated by Pb plate tests, is greatly reduced by low temp.; strength (Trauzl block tests) is not greatly affected. Rate of detonation tests (in Pb tubes) of various explosives commonly used in detonator charges showed that low temp. does not affect the rate of detonation.
- C. G. Storm
- The combustion of black powder.** Satoshi Watanabe. Bull. Inst. Phys.-Chem. Research (Tokyo) 12, 884-6 (1933) (Abstracts 12 (in English) published with Sci. Papers Inst. Phys.-Chem. Research (Tokyo) 22, Nos. 457-67).—The combustion of black powder is accompanied by complicated steps of evolution and absorption of heat caused by the combustion and transformation of its constituents.
- K. Konda
- The influence of pressure on the spontaneous ignition of inflammable gas-air mixtures. II. Pentane-air mixtures.** Donald T. A. Townend and M. R. Mandlekar. Proc. Roy. Soc. (London) A143, 168-76 (1933); cf. C. A. 27, 5189.—As with  $C_4H_{10}$ , the spontaneous ignition points of  $C_5H_{12}$ -air mixts. lie in 2 groups, one above  $490^\circ$  and the other below  $350^\circ$ . The transference of the ignition points from the higher to the lower group occurred at crit. pressures dependent on the compn. of the mixts., the value for rich mixts. being 1.25 atm. At pressures near the crit. pressure, Et.Pb raised the ignition points to the higher group; at all pressures above 1 atm. small amts. of AcH lowered the points to the lower group. L. E. Steiner
- The action of nitric acid on different sugars.** Stan. v. Monasterski. Z. ges. Schiess-Sprengstoffw. 28, 349-50 (1933).—Pure octonitrates of sucrose and maltose, resp., were prep'd. and their chem., phys. and explosive properties det'd. Before nitrating, the sugars were mixed with urea nitrate or pinene-HCl to eliminate N oxides from the nitrating acid, thereby preventing oxidation reactions. The properties of an explosive composed of a mixt. of maltose octonitrate and dinitrobenzene (designated Maltobenzit) were also det'd.
- C. G. Storm
- The color reaction for the detection of disubstituted urethans.** Fr. Becker and G. A. Hunold. Z. ges. Schiess-Sprengstoffw. 28, 372-6 (1933).—The usual test for substituted urethans in *smokeless powders*—production of a red coloration on treatment with EtOH and NaOH after previous treatment with  $HNO_3$ —is not specific. A study of the resulting reaction products showed that if the nitroaniline or nitrodiphenylamine produced contains a substituted alkyl group, the red color does not appear. In the case of methylphenylurethan or ethylphenylurethan, if dil.  $HNO_3$  (d. 1.18) is used, the final product is methyl-nitroaniline, which gives no red color; if concd.  $HNO_3$  (d. 1.42) is used, the product is dinitroaniline and the red color results.
- C. G. Storm
- Progress in pyrotechnics.** A. Foulon. Z. ges. Schiess-Sprengstoffw. 28, 376-8 (1933).—A review. C. G. S.

**Explosions in Colorado coal mines, 1883 to 1932.** B. M. Kintz and E. H. Denny. Bur. Mines, *Information Circ.* 6753, 20 pp. (1933).—Data on 119 explosions are tabulated and generalizations are drawn. A. H. Emery

**Explosions in Utah coal mines, 1900-1932.** D. J. Parker. Bur. Mines, *Information Circ.* 6752, 15 pp. (1933). Alden H. Emery

**Explosives.** Luis E. d'A. Callery. Brit. 397,600, Aug. 31, 1933. See Fr. 738,900 (C. A. 27, 2036).

**Explosives.** Akt.-Ges. Lignosc. Ger. 579,815, July 1, 1933. The addn. product of PbO and neutral Pb salt of picric acid is used as the principal constituent of blasting charges for use in mining.

**Explosives.** Heaters Ltd. Fr. 754,087, Oct. 31, 1933.

1 An explosive charge for mines consists of  $\text{NH}_4\text{NO}_3$  or other salt decomposed to gases by heat and a heating element consisting of a combustible mixt., and means for lighting this, all enclosed in a container which had a relatively easily broken closing disk.

**Explosive mixture.** Dynamit-A.-G. vorm. Alfred Nobel & Co. (Ph. Naoum and R. von Sommerfeld, inventors). Ger. 581,814, Aug. 3, 1933. See Fr. 742,312 (C. A. 27, 3612).

**Vacuum drying apparatus for explosives.** Berthold Block. Ger. 580,557, July 13, 1933.

**Purifying trinitrotoluene.** Wm. H. Rinckenbach. U. S. 1,936,607, Nov. 28. The material is recrystd. from a solvent mixt. comprising  $\text{CCl}_4$  and "ethylene dichloride."

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**Quantitative investigations of the action of added substances in the dyeing of acetate rayon with basic dyestuffs.** Peter F. Bernoulli. *Helv. Chim. Acta* 16, 1226-48 (1933).—The Na salts of sulfonic acids of certain aromatic hydrocarbons have an effect in the dyeing which cannot be referred to any change in the degree of swelling of the acetate fiber but is a true soly. effect. This is confirmed by the extensive parallelism between the partition coeffs. for the dyestuff for  $\text{H}_2\text{O}/\text{EtOAc}$  and  $\text{H}_2\text{O}/\text{acetate rayon}$ . A. P. Sachs

**Some studies of the yolk in New Zealand wools. II. A study of yolk in the fleece during one year.** Wm. G. Sutton. *J. Textile Inst.* 24, 341-50T (1933); cf. C. A. 25, 5294. —Samples of wool were taken at approx. monthly intervals for a year from 40 New Zealand Romney sheep and were analyzed for the ether-sol. and water-sol. fractions of the yolk. A sudden marked increase in the quantity of yolk was found at the beginning of winter. Half the sheep were covered to det. the effect of leaching by rain. The water-sol. fraction was removed more than the ether-sol. fraction. The finer wool appears to be accompanied by a higher proportion of yolk than the coarser. Ruby K. Worner

**A photographic study of stretching, twisting and swelling of wool and other fibers.** P. W. Cunliffe. *J. Textile Inst.* 24, 417-20T (1933).—Photographs show the visible damage in structure that occurs when a fiber is stretched or twisted in aq. medium, or when it is swollen in  $\text{Na}_2\text{S}$  soln. Results of studies on negro hair are included. R. K. W.

**Behaviors of aqueous solutions of domestic cocoons. XV. Apparent specific gravities of sericin A and B.** Hideo Kaneko. *J. Agr. Chem. Soc. Japan* 9, 905-7 (1933); cf. C. A. 27, 5984. —The apparent sp. grs. of sericin A and B were, resp., 1.356 and 1.309 from the estn. in  $\text{H}_2\text{O}$  at  $15^\circ$ . The apparent sp. gr. of sericin A was generally larger than that of sericin B, even though the estn. was performed in various org. solvents. XVI. **Sericin as a protective colloid.** *Ibid.* 1049-55. —The gold no. of sericin was 0.02-0.038. It is approx. equal to that of egg globulin, gelatin and egg albumin. The more reatable the cocoon is, the smaller the gold no. is. Sericin has the max. gold no. at its isoelec. point ( $p_H$  4.2-4.3). The gold no. decreased with the elevation of the temp. of the soln. Sericin A generally has a smaller gold no. than sericin B in the same condition. Sericin protects the oxidation of pyrogallol by Co complex salts and the decompn. of  $\text{H}_2\text{O}_2$  by Pt sol. XVII. **Separation of sericin.** *Ibid.* 1056-9. —By the electrodialysis of sericin soln. sericin A coagulated rapidly in the elec. field and sericin B remained in soln. Sericin sol may be considered as a colloid suspending sericin A particle in sericin B soln. Y. K.

**Bleaching with strongly alkaline hydrogen peroxide.** Walter Fehre. *Rev. gén. mat. color.* 37, 466-7 (1933). —It has been found that different vegetable fibers require different alk. strengths for the best bleaching and that weak org. acids develop from these fibers during bleaching, weakening the desired alky. As a practical matter, it is

recommended to bleacheries treating a variety of fibers to check the alky. at intervals, with phenolphthalein as indicator against 0.1 N oxalic acid and renew to the desired strength. Halsey E. Silliman

**Influence of  $p_H$  on amino dyes of triphenylmethane and the decompn. of these dyes by light (Henriquez) 3. Indigo dyes (Tobler) 10. Chem. tech. uses for a resinous pitch lignite coal [resins for use in dyes] (Müller, Neuglück) 21. Anthraquinone derivs. (Ger. pat. 580,647) 10. Aralkylaryl carboxylic acids (U. S. pat. 1,937,963) 10. Arylides of hydroxybenzocarbazolecaboxylic acid (Ger. pat. 580,581) 10. Soap [for protecting wool, etc., against moths] (Ger. pat. 581,990) 27. Dyeing (Brit. pat. 397,129) 29. Drier for dyes (Ger. pat. 579,540) 1. Halogenated pyridinoanthraquinones (U. S. pat. 1,937,154) 10. Waterproofing [textiles] (Fr. pat. 753,510) 23. Pyrobenzanthrones (Fr. pat. 753,828) 10. Condensation products of the anthraquinone series (U. S. pat. 1,938,043) 10. Hydroxy carboxylic acid arylides (U. S. pat. 1,936,926) 10. Anthrapyridone derivs. (Ger. pat. 580,283) 10.**

**Barker, S. G.:** Coir: Report on the Attributes and Preparation of Coconut Fibre. Published by the Empire Marketing Board (E.M.B. 71). London: H. M. Stationery Office. 60 pp. 1s. Reviewed in *J. Textile Inst.* 24, P288 (1933).

**Bruggemann, Heinrich:** Zwirne: Ihre Herstellung und Veredelung. Berlin: R. Oldenbourg. 461 pp. M. 40. Reviewed in *J. Textile Inst.* 24, P207 (1933).

**American Society for Testing Materials Standards on Textile Materials.** By Committee D-13 of the A. S. T. M., Philadelphia: A. S. T. M. Headquarters, 1315 Spruce St., 164 pp. \$1.00. Reviewed in *Am. Dyestuff Repr.* 22, 683; *J. Textile Inst.* 24, P287 (1933).

**Dyes.** Compagnie nationale de matières colorantes et manufactures de produits chimiques du nord réunies établissements Kuhlmann. Ger. 583,871, Sept. 11, 1933. **Leuco compds. of hydroxyanthraquinones are treated with aliphatic or aromatic aldehydes or their bisulfite compds. and the resulting products reoxidized and, if desired, sulfonated. The aldehydes may be replaced by aldehydic acids such as glyoxalic acid. Thus,  $\alpha$ -hydroxyanthraquinone is treated with  $\text{Na}_2\text{S}_2\text{O}_4$  to form the leuco compd. which is then treated with  $\text{CH}_2\text{O}$ . The product is oxidized by an air current and  $\text{NaHSO}_3$  added. A dye giving an orange soln. in  $\text{H}_2\text{SO}_4$  results. Other examples are given. Cf. C. A. 27, 5547-8.**

**Dyes.** I. G. Farbenind. A.-G. (Paul Nawiasky, Berthold Stein and Albert Palm, inventors). Ger. 583,715, Sept. 8, 1933. Dyes of the anthraquinone series are prep'd. by treating nitroanthrimide with the  $\text{NO}_2$  group in the  $\sigma$ -position to the imino group, with alc. caustic alkalis. Thus, 1-nitro-2,1'-anthrimide is heated with KOH and MeOH to give a dye. Other examples are given.

**Azo dyes.** Erwin Hoffa and Eugen Glietenberg (to General Aniline Works). U. S. 1,936,979, Nov. 28. Dyes of good fastness and which are insol. in alk. solns., dyeing red shades, are formed from components such as a 2,5-dimethyl-4-halo-1-aniline and an arylamide of 2-hydroxynaphthalene-3-carboxylic acid.

**Azo dyes.** Arthur Zitscher (to General Aniline Works). U. S. 1,937,181, Nov. 28. Azo dyes of good fastness to soaping (generally of orange or various red shades) which may be formed on the fiber are produced by coupling 1-amino-2-methyl-5-chlorobenzene, 2-amino-3-hydroxynaphthalene and other components with a 2-(3'-hydroxynaphthyl-2')-4-hydroxy-6,7-benzopseudoazaminobenzene. Numerous examples are given.

**Azo dyes.** Ernst Fellmer (to General Aniline Works). U. S. 1,938,012, Dec. 5. Tetrakisazo dyes which generally dye silk bluish black to black shades are prep'd. by tetrazotizing a benzidine sulfonic or carboxylic acid or a deriv., such as benzidine-*o*-disulfonic acid, coupling with 2 mols. of a middle component such as cresidine, capable of further diazotization, again diazotizing, and coupling with one mol. each of different naphthalenesulfonic acid compds. such as 2,8-aminonaphthol-3,6-disulfonic acid and butyl-2-amino-8-naphthol-6-sulfonic acid (some other examples with details of procedure also being given). Cf. C. A. 27, 1189.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 750,915, Aug. 22, 1933. Azo dyes insol. in water are prep'd. by coupling with a diazo component an arylamide of 2-hydroxy-5,6-dihydro-7,8-benzocarbazole-3-carboxylic acid (I), the components being free from groups causing soly. in water. I is prep'd. from 2-hydroxy-5,6-dihydrobenzocarbazole, m. 183° (from 2-amino-5,6-dihydro-7,8-benzocarbazole) by the Kolbe synthesis. An aniside, m. 244°, 2'-methyl-4'-aniside, m. 234°, 2'-chloroaniside, m. 237°, 4'-chloroaniside, m. 264°, 2'-toluide, m. 247°, 4'-aniside, m. 251°, 3'-nitroaniside, 2'-naphthylamide and a 2'-carbazolylamide of I, m. above 300°, are referred to and a list of components with the colors obtained from the dyes is given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 751,088, Aug. 28, 1933. Azo dyes insol. in water are prep'd. by coupling with a diazo component an arylamide of 2-hydroxy-5,6- (I), -6,7- (II), or -7,8-benzocarbazole-3-carboxylic acid (III). Examples are given of the prep'n. of 5,6-, m. 245°, and 7,8-benzo-2-hydroxycarbazole, m. 241°, and of I, m. 245°, and III m. 241°, and of a *m*-, m. 273°, and *p*-chloroaniside, m. 292°, *o*-toluide, m. 254°, aniside, m. 251° of I and an *o*-, m. 237°, *m*-, m. 249°, and *p*-chloroaniside, m. 257°, *m*-nitroaniside, m. 257°, *o*- and *p*-aniside, m. 246°, *o*-toluide, 2'-methoxy-4'-chloro-1'- (m. 248°), 2'-methoxy-5'-chloro-1'- (m. 248°), 2'-methyl-4'-chloro-1'- (m. 248°), 2'-methyl-5'-chloro-1'- (m. 243°), and 2'-methyl-4'-methoxy-1'-phenylamide and a 2'-carbazolylamide (m. above 300°) of III. Examples of dyes prep'd. from these are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 751,087, Aug. 26, 1933. The products obtained by condensing aromatic amines with aliphatic ketones, e. g., acetone and PhNH<sub>2</sub>, *o*-toluidine or *o*-anisidine are tetrazotized and combined with hydroxybenzenes or their derivs. free from SO<sub>2</sub>H or COOH groups, to form dyes.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 751,183, Aug. 28, 1933. Substantive azo dyes are prep'd. by linking together 2 mols. of azo dyes, derived from 4'-nitro-4'-aminostilbene- (or -dibenzyl)-2,2'-disulfonic acid by appropriate transformation of their NO<sub>2</sub> groups, or by linking 2 mols. of 4'-nitro-4'-aminostilbene- (or -dibenzyl)-2,2'-disulfonic acid, tetrazotizing (if necessary after reduction) the intermediate products and combining with appropriate coupling components. Several examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 751,258, Aug. 30, 1933. As many mols. of one or more diazotized aromatic amines as the pyridinonaphthol contains OH groups is caused to react, on each mol. of a pyridinonaphthol. Thus, 4-hydroxy-1(*N*)-2-pyridinonaphthalene (from 1(*N*)-2-pyridinonaphthalene-4-sulfonic acid) coup-

led with diazotized *o*-chloroaniline dyes cotton yellow. A list of coupling components with the shades obtained is given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 751,581, Sept. 6, 1933. Dia- and poly-azo dyes are prep'd. by combining a tetrazo comp'd. with a hydroxy comp'd. in which the azo radical enters into the position next to the OH group, first unilaterally one or more times in the presence of acid so that only one diazonium group is united, then combining the free diazonium group or groups of the tetrazo comp'd. with the same or another OH comp'd. in feebly acid, neutral or alk. soln., with formation of di- or poly-azo dyes. Thus, benzene-1,4-bis-diazonium-borofluoride is combined with 1-(2'-hydroxycarbazole-3'-carboxylamino)-4-chlorobenzene and  $\beta$ -naphthol giving a violet-black dyeing. Several examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 751,582, Sept. 6, 1933. Azo dyes are prep'd. by coupling malonylureas or malonylthiourcas with any diazo or tetrazo compds. not contg. OH groups. Thus, barbituric acid, diphenyl-, di-*o*-tolyl- or di-*o*-anisylthiobarbituric acid may be combined with 1-diazo-2-methoxy-4-nitrobenzene or 1-diazo-2,5-dichlorobenzene. Several examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 753,589, Oct. 19, 1933. Azo dyes are prep'd. by coupling diazotized *Bz*-1-aminobenzanthrone or its 2-methoxy or 2-ethoxy derivs. with suitable coupling components, e. g., 1-(2',3'-hydroxynaphthoylamino)-3-nitrobenzene (gives a violet-black dye) or 2-hydroxy-3-naphthoyl- $\beta$ -naphthylamide (gives a bright metallic blue-black dye). Other examples are given in tabular form.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 754,028, Oct. 30, 1933. Azo dyes giving reddish violet to bluish violet shades are prep'd. by coupling an arylamide of 2,3-hydroxynaphthoic acid with a diazotized pseudoazimine of

the formula (2-R'O-4-H<sub>2</sub>N-5-R'OC<sub>2</sub>H<sub>2</sub>)N:N:R:N (R is a C<sub>6</sub>H<sub>5</sub> radical and R' is an alkyl radical), e. g., 2-(4'-amino-2',5'-dimethoxyphenyl)-6,7-benzopseudoaziminobenzene.

**Azo dyes.** Soc. anon. des matières colorantes et produits chimiques de Saint-Denis and Robert Lantz. Fr. 751,387, Sept. 2, 1933. Azo dyes are prep'd. by coupling with known coupling components nitroaminodiphenyl sulfides, substituted or not, having the following characteristics: the NO<sub>2</sub> group is ortho or para to the S in one of the rings, the NH<sub>2</sub> is ortho or para to the S in the other ring and one *o*-position with respect to the S in one of the rings is occupied by a substituent which may be the NO<sub>2</sub> or NH<sub>2</sub> group. Thus, 2-nitro-4'-aminodiphenyl  $\rightarrow$  1-(4'-sulfo-phenyl)-3-methyl-5-pyrazolone dyes wool fast yellow.

**Mono azo dyes.** J. R. Geigy A.-G. Brit. 397,668, Aug. 31, 1933. See Ger. 573,555 (C. A. 27, 4408).

**Triazo dyes.** Henry Jordan and Harold E. Woodward (to E. I. du Pont de Nemours & Co.). U. S. 1,938,182, Dec. 5. Fast green dyes are formed from components such as *m*-4-xylylidine-5-sulfonic acid, 1-amino-2-naphthol methyl ether-6-sulfonic acid, 1-amino-8-naphthol-3,6-disulfonic acid and acetoacetanilide or the like.

**Triazo dyes.** Imperial Chemical Industries Ltd. and Clifford Payne. Brit. 397,879, Aug. 28, 1933. Triazo dyes are obtained by coupling a diazotized amine of the C<sub>6</sub>H<sub>5</sub> or C<sub>10</sub>H<sub>7</sub> series with a 1-(*m*- or *p*-aminoaryl)-3-methyl(or 8-carboxy)-6-pyrazolone, diazotizing the resulting aminoazo comp'd., coupling with a usual middle component, again diazotizing and coupling, in acid, neutral or alk. medium, with a naphthol, naphthylamine or aminonaphthol, or a sulfonic acid of these, or a naphthol-carboxylic acid or a *N*-substituted naphthylamine or aminonaphtholsulfonic acid, the end component being other than a 1,8-aminonaphtholsulfonic acid, or a *N*-acyl deriv. thereof, when the third component is a 1-amino-2-naphthol ether or a deriv. thereof. When the *N*-substituent contains a diazotizable amino group the triazo product may be diazotized and coupled with a component in substance or on the fiber. Among examples (1) sulfonic acid  $\rightarrow$  1-(*m*-aminophenyl)-3-methyl-6-pyrazolone  $\rightarrow$  2,5-dimethoxyaniline  $\rightarrow$  (in NH<sub>3</sub> soln.) 1-(*p*-amino

benzoylamino)-8-naphthol-4-sulfonic acid, which dyes cotton clear bluish green and may be diazotized and developed on the fiber with 1-phenyl-3-methyl-5-pyrazolone to give clear yellowish green shades, (2) *m*-aminobenzoic acid  $\rightarrow$  1-(*p*-aminophenyl)-5-pyrazolone-3-carboxylic acid  $\rightarrow$  1-naphthylamine  $\rightarrow$  (in  $\text{NH}_3$  soln.) 1-amino-8-naphthol-2,4-disulfonic acid, which dyes cotton green and (3) metanilic acid  $\rightarrow$  1-(4'-amino-1'-naphthyl)-3-methyl-5-pyrazolone  $\rightarrow$  1-amino-2-ethoxynaphthalene-6-sulfonic acid  $\rightarrow$  (in ammoniacal pyridine soln.) 2-phenylamino-5-naphthol-7-sulfonic acid, which dyes cotton blue-green.

**Vat dyes.** Durand & Huguenin S. A. Fr. 754,235, Nov. 3, 1933. Sulfuric ester salts of leuco derivs. of vat dyes which are sol. in water are obtained by transforming sulfuric acid esters of leuco derivs. of vat dyes into their alkylolamine salts. Examples are given.

**Vat dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 42,574, Aug. 23, 1933. Addn. to 738,251 (C. A. 27, 1765). Vat dyes which are substituted 1,3-diaminoanthraquinones contg. residues capable of being vatted in both amino groups, one at least of the residues being different from the rest of the 1-aminoanthraquinone group are described. They may be prep'd. by causing 2 mols., the same or different, capable of being vatted and each contg. an  $\text{NH}_2$  group, to react with 1 mol. of 1,3-dihaloanthraquinone, or by condensing 2 mols. of a 1,3-dihaloanthraquinone with 1 mol. of a deriv. capable of being vatted and contg. at least 2  $\text{NH}_2$  groups, then condensing the product thus obtained with 2 mols. of a deriv. capable of being vatted but contg. at least 1  $\text{NH}_2$  group. Derivs. capable of being vatted contg. one or 2 amino groups capable of reacting with the 1,3-dihalo compds. include 1- and 2-amino-, 1,4-, 1,5-, 1,8-diamino-, monobenzoyldiamino-, monoacetyldiamino-, mono(*p*-methoxy)benzoyldiamino- and aminonitroanthraquinones, aminodibenzanthrones, aminopyranthrones, aminoanthanthrones, aminoanthrimides, aminoanthrimidecarbazoles, aminoanthraquinoneacridones, monobenzoyldiaminoanthrimidecarbazoles and the  $\text{NO}_2$  derivs. of these compds. The products are also intermediates for other dyes. Several examples are given.

**Vat dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 581,583, July 29, 1933. Vat dyes and their intermediates are prep'd. by treating *Bz*-1,*Bz*-1'-dibenzanthronyl with a nitrating agent and fusing the product, optionally after reduction, with caustic alkali. The product can then optionally be halogenated, nitrated, oxidized or alkylated. Thus, *Bz*-1, *Bz*-1'-dibenzanthronyl is dissolved in  $\text{H}_2\text{SO}_4$ - $\text{H}_2\text{O}$  and treated with  $\text{HNO}_3$ . The resulting dye is fused with  $\text{KOH}$ , and the product halogenated.

**Solid dye preparation.** J. R. Geigy A.-G. Ger. 583,700, Sept. 8, 1933. A solid prep'n. is obtained by mixing undreduced vat dyes, excepting those of the anthraquinone series, with solid alkali salts of polyhydric alcs. Thus, the Na salt of glycol is mixed with 2-thionaphthencacenaphthene indigo.

**Basic dyes.** I. G. Farbenind. A.-G. (Alfred Blömer, inventor). Ger. 580,591, July 13, 1933. Carbon tetrahalide is caused to react with bases derived from heterocyclic  $\text{NH}_2$  salts with reactive Me groups in  $\alpha$ - or  $\gamma$ -positions to the N atom. Thus, the base trimethylmethylenindoline is treated with  $\text{CCl}_4$  to give a dye which imparts a red-violet color to cotton mordanted with tannic acid. Other examples are given.

**Acid wool dyes.** I. G. Farbenind. A.-G. (Karl Zahn and Heinrich Koch, inventors). Ger. 584,872, Sept. 25, 1933. 1-Amino-4-haloanthraquinone-2-sulfonic acids are treated with *m*- or *p*-aminoaryl alkyl sulfones or their derivs. substituted in the aryl, alkyl or both residues. Thus, Na 1-amino-4-bromoanthraquinone-2-sulfonate is treated with an aq. soln. of *m*-aminophenyl methyl sulfone in the presence of  $\text{NaHCO}_3$  and  $\text{CuCl}$  to give a blue dye. Several other examples are given. Cf. C. A. 27, 607.

**Anthraquinone dyes.** Donald G. Rogers, James Ogilvie and Joyce H. Crowell (to National Aniline & Chemical Co.). U. S. 1,937,531, Dec. 5. By the condensation of hydroxyanthraquinone such as 2-chloroquinizarin

with an arylamine such as aniline, a product is obtained which in the form of its sulfonic acid dyes chrome mordanted wool a redder shade than the sulfonic acids of the related polyarylaminoanthraquinone derivs. resulting from the condensation of the corresponding hydroxyanthraquinone with the corresponding arylamine. A like product may be produced by the partial elimination of arylamino groups from a polyarylaminoanthraquinone.

**Azine dyes.** I. G. Farbenind. A.-G. Fr. 753,534, Oct. 18, 1933. Dyes of the azine series are obtained by introducing into the mol. one or more residues of the formula  $-\text{CH}_2\text{CH}_2\text{SO}_2\text{H}$ , or by replacing the H atom of the amino group cont'd. in azine dyes by the ethanesulfonic acid group, e. g., by treatment with chloroethanesulfonic acid. Thus, 1,3-bis(phenylamino)naphthalene-8-sulfonic acid is oxidized with 4-aminoethylphenylamine to give a dye, 9-[ethyl( $\beta$ -sulfoethyl)amino]-5,7-dihydro-7-phenyl-5-phenylimino- $\alpha$ -benzophenazine-4-sulfonic acid.

**Polymethine dyes.** I. G. Farbenind. A.-G. Fr. 752,563, Sept. 26, 1933. Polymethine dyes, the central C of which is substituted, are prep'd. by causing quaternary N bases having a reactive Me group in their  $\alpha$ -position to react with alkyl esters of *o*- $\alpha$ -thiophenic acid, preferably in the presence of condensing agents and solvents. Examples are given of dyes prep'd. from the Et ester of *o*-thiophenic acid and the Et iodide of methylbenzoxazole and the diethyl sulfate of methylbenzothiazole, methyl- $\beta$ -naphthothiazole and methylbenzoselenazole. Pyridine is used as solvent. Cf. C. A. 28, 336°.

**Nitrogenous anthracene dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 579,841, July 1, 1933. Solns. of leuco 1,4,5,8-tetrahydroxyanthraquinone are heated in aq. solns. of  $\text{NH}_3$  or primary amines, preferably in the presence of a reducing agent, to temps. above  $100^\circ$ . The resulting leuco compds. are oxidized to form the corresponding anthraquinone derivs. Examples are given.

**Green dyes.** Bruno Francke (to General Aniline Works). U. S. 1,938,014, Dec. 5. Dyes producing clear yellowish green shades of good fastness on wool are obtained by oxidizing bis(*p*-dialkylaminophenyl)sulfonaphthylmethanes. Several examples with details of procedure are given.

**Hydroxythionaphthene compounds.** Norbert Steiger and Walter Brunner (to General Aniline Works). U. S. 1,938,053, Dec. 5. Dye intermediates corresponding to

the general formula  $\text{C}_6\text{X}_4\text{COCH}_2\text{S}$  (where 2 X's mean methyl, the third X an alkoxy group and the fourth X H or halogen), which compds. are nearly colorless powders of a definite m. p. are produced by converting dimethylalkoxybenzenes which contain an amino group or a sulfonic acid group and a free position ortho thereto, or both such groups in *o*-position to each other and which may contain halogen, into dimethylalkoxybenzenethioglycolic acids which contain in the *o*-position relative to the thioglycolic acid group H or substituents such as  $\text{NH}_2$ , CN,  $\text{CONH}_2$  or COOH and which may contain halogen, and subjecting the latter (after elimination or transformation of the groups in *o*-position if desired) to a ring-closing reaction. Details are given of the production of 4,7-dimethyl-6-ethoxy-3-hydroxythionaphthene, m.  $94-6^\circ$ , 6,7-dimethyl-5-methoxy-3-hydroxythionaphthene, m.  $150^\circ$ , 4,7-dimethyl-5-chloro-6-methoxy-3-hydroxythionaphthene, m.  $128-30^\circ$ , and some similar and related compds. suitable for use in the production of indigoid dyes.

**Indigoid dyes.** Norbert Steiger and Walter Brunner (to General Aniline Works). U. S. 1,938,054, Dec. 5. Dyes of various shades and good fastness are obtained by oxidizing the hydroxythionaphthenes produced as described in U. S. 1,938,053 (preceding abstr.) to form sym. dyes. Asymmetrical dyes are obtained by condensing the same hydroxythionaphthenes with an isatin or a reactive  $\alpha$ -deriv. of this isatin or of a 2,3-diketodihydrothionaphthene, these components being of the benzene or naphthalene series. Furthermore such dyes are produced by condensing an isatin of U. S. pat. 1,938,055 (following abstr.) or a reactive  $\alpha$ -deriv. thereof or a 2-deriv. of the 2,3-diketodihydrothionaphthene corresponding to the

hydroxythionaphthenes described in our U. S. pat. 1,958,053 with a hydroxythionaphthene of the benzene or naphthalene series. Dyes contg. halogen may be prepd. either by starting from halogen-contg. materials or by an after-halogenation of the dyes if either of their components is still capable of being halogenated. Numerous examples with details of procedure are given.

**Isatins.** Norbert Steiger and Walter Brunner (to General Aniline Works). U. S. 1,938,055, Dec. 5. New isatins suitable for use as intermediates in producing indigoid dyes, and which correspond to the general formula

$C_6X_4CO.CO.NH$  (wherein two X's are methyl groups, the third X an alkoxy group and the fourth X H or halogen), which compds. represent light colored powders having a definite m. p., are obtainable from the dimethylalkoxyaminobenzenes or halodimethylalkoxyaminobenzenes, resp., contg. a free *o*-position to the amino group, *e. g.*, according to the known isatin synthesis of Sandmeyer. Moreover, the halodimethylalkoxyisatins may be obtained by after-halogenating the dimethylalkoxyisatins. 4,6-Dimethyl-7-methoxyisatin, m. 210-12°; 5-chloro-4,6-dimethyl-7-methoxyisatin, m. 268-70°; 5-bromo-4,6-dimethyl-7-methoxyisatin, m. 274-6°. Corresponding ethoxy compds. are mentioned. 6-Chloro-4,7-dimethyl-5-methoxyisatin, m. 238-40°. 5-Methoxy-6,7-dimethylisatin, m. 181-3°. The corresponding isonitrosoacetanilide m. 192-4°. 4-Chloro-5-methoxy-6,7-dimethylisatin, m. 264-8°, and the corresponding isonitrosoacetanilide m. 154-6°. 7-Chloro-4,6-dimethyl-5-methoxyisatin m. 229°. 4,6-Dimethyl-5-methoxyisatin m. 223-4°. 4,7-Dimethyl-5-chloro-6-methoxyisatin m. 259-61°.

**Indigoid dyes.** I. G. Farbenind. A.-G. (Karl Thiess and Theodor Meissner, inventors). Ger. 583,649, Sept. 11, 1933. See Brit. 383,543 (C. A. 27, 4411).

**Thioindigoid dyes.** Imperial Chemical Industries Ltd., Frank Lodge and Colin H. Lumsden. Brit. 398,161, Aug. 29, 1933. Dyes contg. 2,1(*S*)-anthracene or anthraquinone residues are prepd. by treating an anthracene- or anthraquinone-1-thioglycolic acid where the 5- and 8-positions are substituted by halo (particularly Cl or Br), NO<sub>2</sub>, sulfo, COOH, (substituted) OH or (substituted) NH<sub>2</sub> and the anthracene or anthraquinone nuclei may contain further substituents, with ClSO<sub>3</sub>H, with or without H<sub>2</sub>SO<sub>4</sub>. When the substituent in the 5- or 8-position is a substituted NH<sub>2</sub> group the substituent of said group may form part of a ring structure attached to the anthracene or anthraquinone residues. The products are vat or acid dyes, according to the substituents. Among examples the lactam from 1-aminoanthraquinone-2,5-dithioglycolic acid (prepd. according to example (1) of Brit. 398,162 (following abstr.)) is treated with ClSO<sub>3</sub>H at 20-5° to give a brown vat dye for cotton; the lactam ring may be hydrolyzed by alkali and the product then applied to wool as described in Brit. 377,740 (C. A. 27, 4097); reduction of above lactam with Zn dust and NH<sub>2</sub> and treatment of the resulting anthracene compd. with ClSO<sub>3</sub>H also gives a brown vat dye.

**Dye intermediates.** Imperial Chemical Industries Ltd., Frank Lodge and Colin H. Lumsden. Brit. 398,162, Aug. 29, 1933. 1-Amino-2,5- (or 2,8)-dimercaptoanthraquinones are prepd. by treating 1-amino-5- or -8-sulfoanthraquinone with hot alkali sulfide or by treating 1-chloro-5- or -8-nitroanthraquinone with hot alc. alkali H sulfide in an autoclave. In examples (1) 1-amino-5-sulfoanthraquinone is heated with Na<sub>2</sub>S at 140°; the resulting 2,5-dimercapto deriv. is condensed with Na chloroacetate and the resulting thioglycolic deriv. converted to the lactam form by hot HCl and (2) 1-chloro-5-nitroanthraquinone is converted to 1-amino-2,5-dimercaptoanthraquinone by treatment with aq. alc. NaHS in a closed vessel at 110-15°.

***m*-Hydroxyphenyl arylamino carboxylic acids.** Leopold Laska and Oskar Haller (to General Aniline Works). U. S. 1,938,031, Dec. 5. By the action of CO<sub>2</sub> (at an elevated temp. and under pressure) on starting materials such as are derived by condensing resorcinol with aniline or its homologs, alkoxyanilines, aryloxyanilines or halogen

substitution products of these compds., dye intermediates are obtained such as the following derivs. of 3-hydroxydiphenylamine-4-carboxylic acid: 2'-methyl, m. 180-2°; 3'-methyl, m. 176-7°; 4'-methyl, m. 185-6°; 2'-methoxy, m. 199-200°; 4'-methoxy, m. 176-7°; 2'-chloro, m. 198°; 3'-chloro, m. 189-90°; 4'-chloro, m. 188-90°; 2',4'-dimethyl, m. 175°; 2',5'-dimethyl, m. 175-6°; 3'-methyl-4'-methoxy, m. 165°; 2'-methyl-4'-chloro, m. 180-1°; 2'-methyl-5'-chloro, m. 208-10°; 3'-methyl-4'-chloro, m. 195-7°; 4'-methyl-3'-chloro, m. 190°; 2',4'-dichloro, m. 215°; 3',4'-dichloro, m. 199°; 3',4'-dichloro-6'-methyl, m. 203°; and 4'-phenoxy, m. 180°.

**Aminoanthraquinone derivatives.** Henry Dreyfus. Fr. 750,838, Aug. 19, 1933. Anthraquinone derivs. contg. an OH in one  $\alpha$ -position, an amino group, free or non-aromatically substituted, in a 2nd  $\alpha$ -position and an arylamino group in 3rd  $\alpha$ -position form new dyes for cellulose ester and other materials. The dyes may be applied in the reduced state as leuco compds., in soln. or aq. suspension or after being brought to the colloidal state. Examples are given of the prepn. of 1-amino-4-*o*-tolylamino- and 1-amino-4-anilino-5-hydroxyanthraquinone. Fr. 750,839. Compds. such as the above which also contain addnl. substituting radicals are used for the same purpose. Examples are given of the prepn. of 4-amino-8-phenylamino-1,5-di-, 4-amino-5-phenylamino-1,8-di-, 4-amino-5-*p*-tolylamino-1,8-di-hydroxyanthraquinone and products obtained by arylation of 1,4,5-trihydroxy-8-aminoanthraquinone with *o*-anisidine and with PhNH<sub>2</sub>. Fr. 750,840. Improved products are obtained by substituting the aryl groups of  $\alpha$ -arylaminanthraquinones by alkoxy or other ether groups, particularly when these groups occupy the position ortho to the N atom. Examples of dyes are 1-amino-4-*o*-methoxyphenylamino-, 1-*o*-hydroxyethylamino-4-*o*-methoxyphenylamino-, 1-amino-4-(2,5-dimethoxyphenylamino)-, 1-amino-4-(2-methoxy-5-methylphenylamino)-, 1,3-di-amino-4,6-di-*o*-methoxyphenylamino-, 1,8-dihydroxy-4-*o*-methoxyphenylamino-, 1-amino-4-*o*-phenoxyphenylamino-, 1,5-di-(2-methoxyphenylamino)-4,8-diamino- and 1-amino-4-(2-methoxyphenylamino)-anthraquinone. Fr. 750,841. Improved products are obtained by introducing acylamino groups into the aryl residues of arylaminanthraquinones. Examples of dyes are 1-hydroxy-4-*p*-acetamidophenylamino-, 1-hydroxy-4-(4-acetamido-3-methylphenylamino)-, 1-*p*-acetamidophenylamino-4,5-dihydroxy-, 1-amino-4-*p*-acetamidophenylamino-, 1-hydroxy-4-(4-acetamidophenylamino)- and 1,8-dihydroxy-4-(4-acetamidophenylamino)-anthraquinone.

**Naphthol derivatives.** Chemische Fabrik vorm. Sandoz. Fr. 751,237, Aug. 29, 1933. 1-Iodo-8-naphthol sulfonic acids are prepd. from the 1-diazo compds. by known methods. Examples are given of the prepn. of 1-iodo-8-naphthol-4-, -4,6-di- and -7,6-di-sulfonic acid. The products are intermediates for dyes and therapeutic products.

**Derivatives of the benzanthropepyrazoleanthrone series.** Karl Wilke, Josef Stock and Fritz Schubert (to General Aniline Works). U. S. 1,938,059, Dec. 5. Dyes and dye intermediates are obtained by treating a negatively substituted benzanthropepyrazoleanthrone in the presence of an inert org. solvent with a compd. of the general formula  $R-NH-X$  in which X stands for eH and R for methyl, acyl, benzyl or aryl or in which X and R represent methyl groups. The condensation is effected generally during heating by using a suitable solvent of high-b. p. in the presence of an acid-binding agent and an agent accelerating the reaction, such as NaOAc, Cu carbonate, Cu<sub>2</sub>Cl<sub>2</sub> or the like. In some cases, the amine used as reaction component at the same time has a dissolving and an acid-binding action. In the presence of volatile substances it is necessary to work in a closed vessel under pressure. Also the same or similar derivs. of the benzanthropepyrazoleanthrone are obtained by causing aminobenzanthrone-pyrazoleanthrones to react with such compds. as have a substituting action upon the H attached to N. Compds. of this kind are, for instance, acid anhydrides, acid halides, negatively substituted, especially halogen-contg. compds.

of different classes, aldehydes, quinones, etc. Numerous examples with details of procedure are given.

**Condensation products of the anthraquinone series.** Paul Nawiasky and Berthold Stein (to General Aniline Works). U. S. 1,936,948, Nov. 28. Dye intermediates are produced by condensing a 1-amino-2-haloanthraquinone in which both of the H atoms of the amino group are replaced by the carbonyl groups of an aromatic dicarboxylic acid capable of forming a monomolecular anhydride, with a 1-aminoanthraquinone. Examples are given of the use of 1-phthalimido-2-bromoanthraquinone with 1-aminoanthraquinone, etc. The dicarboxylic acid radical may be split off from the condensation products by heating with  $\text{NH}_3$  or alkali metal phenolates or the like, and the 1,2-diaminoanthraquinones substituted in the N atom in the 2-position thus obtained are readily condensed to form dyes of the *N*-dihydro-1,2,2',1'-anthraquinonazine series. Numerous examples with details are given.

**Halogenation products of acenaphthindandione diketimide.** I. G. Farbenind. A.-G. (Wilhelm Eckert and Heinrich Sieber, inventors). Ger. 580,518, July 12, 1933. These are prepd. by treating the above with halogenating agents in neutral or acid soln. In an example, the diketimide of acenaphth-*peri*-indandione is treated with water, concd. HCl and  $\text{KClO}_3$  to give a chlorinated product m. 193°. Other examples are given. The products are useful as dye intermediates. Cf. C. A. 27, 5754.

**Dyes and intermediates.** Cecil Shaw and John Thomas (to Scottish Dyes Ltd.). U. S. 1,937,718, Dec. 5. Phthalic anhydride is heated with nitrodibenzanthrone or nitrosodibenzanthrone at a temp. (suitably about 250°) at which the phthalic anhydride is in the liquid phase, in order to form a product dyeing cotton gray to black shades.

**Dye intermediates; vat dyes.** Soc. pour l'ind. chim. à Bâle. Brit. 398,053, Sept. 7, 1933. See Fr. 745,841 (C. A. 27, 4415).

**Dyeing.** British Celanese Ltd., Henry C. Olpin and George H. Ellis. Brit. 397,534, Aug. 17, 1933. Materials made of or contg. cellulose esters and ethers are colored by applying thereto and retaining therein a compd. contg. 2 aryl radicals or aromatic residues united directly by a single linkage, said compd. contg. a single  $\text{NH}_2$  group and a single  $\text{NO}_2$  group in *o*-position to each other. The  $\text{NH}_2$  group and the nuclei may be further substituted. In examples cellulose acetate, alone or mixed with cotton or viscose (which may be dyed with a direct cotton dye) is colored with (1) 3-nitro-4-aminobiphenyl, (2) 3-nitro-4-amino-4'-chlorobiphenyl, (3) 3-nitro-4-amino-2,2'-bitolyl. Yellow shades, fast to light and volatilization, are obtained.

**Dyeing.** Imperial Chemical Industries Ltd., Mordecai Mendoza and Wilfred A. Sexton. Brit. 398,163, Aug. 29, 1933. Azo dyes are formed on the fiber by coupling an arylamide of 2,3-hydroxynaphthoic acid with the tetrazo compd. of a diamine obtained by condensing an *o*-alkyloxyaniline, or a deriv. thereof (2 mols.), and an aromatic aldehyde (1 mol.), the components being free from  $\text{H}_2\text{O}$ -solubilizing and  $\text{NO}_2$  groups. Claret shades fast to kier-boiling and Cl are obtained. In an example cotton is impregnated with  $\alpha$ -naphthylamide and developed with tetrazotized 4,4'-diamino-2,2'-dimethyl-5,5'-dimethoxytriphenylmethane.

**Coloring bone articles.** Soc. pour l'ind. chim. à Bâle. Ger. 584,062, Sept. 27, 1933. See Swiss 162,206 (C. A. 28, 657°).

**Machine for dyeing piece goods.** Hans W. Mettler. Ger. 584,595, Sept. 21, 1933.

**Dyeing vat.** Théophile E. Foulon. Fr. 753,546, Oct. 18, 1933.

**Textile fibers.** Leo Nordmann. Ger. 581,527, July 29, 1933. Flax fibers, etc., are obtained from raw flax, etc., by removing the pithy substances by treatment with solns. or emulsions of  $\text{H}_2\text{SO}_4$ ; the flax is then irradiated with ultra-violet rays and finally treated with alkali to neutralize the acid. The treatment with  $\text{H}_2\text{SO}_4$  may be replaced by treatment with NaOH, alkali carbonate,  $\text{Na}_2\text{BO}_3$ ,  $\text{Na}_2\text{PO}_4$ , HCl, AcOH, etc.

**Separating fibers of fibrous plant material.** Bernard R. Wood. U. S. 1,938,060, Dec. 5; Brit. 398,033, Sept. 7, 1933. See Fr. 743,462 (C. A. 27, 3833).

**Machine for decorticating and cleaning fibrous leaves and stems, e. g., of sisal, flax, hemp, ramie.** The Hydraulic Engineering Co. Ltd. and Arthur R. Mangnall. Brit. 397,193, Aug. 24, 1933.

**Bleaching animal fibers.** Josef Müller (to E. I. du Pont de Nemours & Co.). U. S. 1,937,710, Dec. 5. Material to be bleached such as rabbit hair stumps is treated with an acid soln. contg. a sol. Al salt such as K alum and a compd. capable of liberating active O, such as  $\text{H}_2\text{O}_2$ .

**Protecting animal fibers.** I. G. Farbenind. A.-G. (Oskar Palek and Hans Seifert, inventors). Ger. 583,533, Sept. 5, 1933. Animal fibers are protected against harmful influences by treatment with glycine or its salts.

**Sizing textile fibers.** Maurice Cordier. Fr. 753,628, Oct. 20, 1933. Volatile solvents such as white-spirit are added to oils, superoxidized or not, and the mixt. is treated with a neutralizing agent, the oils being then emulsified for sizing textiles, etc.

**Treating textiles.** Résines et vernis artificiels (Soc. anon.). Fr. 753,559, Oct. 19, 1933. Textiles of a cellulosic nature are impregnated by sol. condensation products of  $\text{CH}_3\text{O}$  with  $\text{NH}_4$  sulfides or  $\text{NH}_4\text{SCN}$  in the presence of urea, or thioaldehydes with urea, dried and heated to polymerize the condensation products. Wet-ting or plastifying agents, dyes or fillers may be added to the impregnation bath.

**Treating textiles.** Kalle & Co. A.-G. Fr. 753,728, Oct. 23, 1933. Textile materials of various kinds are desized and purified by amylase preps. with the addn. of basic N compds., e. g., amines, polyanines, oxoamines, hydroxyamines, hydrazines and their substitution compds.

**Finishing textiles.** Max Cassvan. Fr. 751,447, Sept. 4, 1933. A finishing agent is composed of solubilized starch with the addn. of a small amt. of alkali or alk. earth peroxides, percarbonates, persulfates or perborates.

**Decolorizing textiles.** Imperial Chemical Industries Ltd. Fr. 752,728, Sept. 29, 1933. Textiles dyed with azo dyes are decolorized with a reducing liquor contg. an amine or an amine salt (preferably a quaternary  $\text{NH}_4$  salt) of which one radical does not contain less than 10 C atoms, e. g., cetyltrimethylammonium,  $\beta$ -hydroxyethyl-*N*-octadecylmorpholinium and octadecylpyridinium bromides and  $\beta$ -diethylaminoethylol:thylamide acetate.

**Decolorizing textiles.** I. G. Farbenind. A.-G. Fr. 752,831, Sept. 30, 1933. Dyeings made with vat dyes are removed by an aq. bath contg. an alk. reducing agent, adding a Mg compd. to the bath toward the end of the treatment of elimination, and preferably adding initially a protective colloid. Examples are given of the use of  $\text{MgCl}_2$ ,  $\text{MgSO}_4$ , and  $\text{Mg}(\text{OH})_2$ .

**Apparatus for fulling textiles.** Krafft Göbel and Georg Friede. Ger. 584,773, Sept. 27, 1933.

**Treating fabrics.** British Celanese Ltd. Brit. 397,711, Aug. 31, 1933.  $\text{H}_2\text{O}$ -insol., polymerized vinyl compds. are incorporated in relatively small amts. in textile fabrics to improve their wear-resistance, reduce their tendency to slip or ladder and render them waterproof. Fabrics thus treated may be used for making tops of fancy shoes. The compds. may be used in various states of polymerization and are preferably applied as solns. in alc.,  $\text{C}_6\text{H}_6$ , PhMe, etc. They may be applied as aq. dispersions with the aid of soap or Turkey-red oil. In an example a twill weave fabric of yarns of cellulose acetate is impregnated with a 1-2.5% soln. of polymerized vinyl acetate in  $\text{C}_6\text{H}_6$ .

**Device for the wet treatment of textile pieces.** Marcel 9 Cassé. Ger. 584,598, Sept. 21, 1933.

**Device for the wet treatment of fabrics.** Eduard Esser & Co. G. m. b. H. Ger. 584,599, Sept. 22, 1933.

**Air-drying sizing machine for fabrics.** Hans G. Benade. Ger. 581,650, July 31, 1933.

**Wetless cord fabric.** Boutwell H. Foster (to Morgan & Wright). U. S. 1,937,558, Dec. 5. Various details of app. and operation are described for coating parallel cords with a soln. such as a rubber dispersion and then drying.

**Delustering knit fabrics formed of cellulose derivatives** such as cellulose acetate. Wm. McC. Cameron and Cyril M. Croft (to Celanese Corp. of America). U. S. 1,937,544, Dec. 8. The knit fabric is subjected to the action of a delustering agent such as hot aq. soap soln. while under tension.

**Machine for mercerizing fabrics.** Paul Buschmann. Ger. 579,822, June 29, 1933.

**Filaments from solutions of natural silk.** Camille Dreyfus and George W. Miles (to Celanese Corp. of America). U. S. 1,936,753, Nov. 28. Natural silk is dissolved in a strong acid such as  $H_2SO_4$  and the soln. is extruded into a coagulating medium such as water or EtOH maintained at a temp. below  $10^\circ$ .

**Treating silk.** Heberlein & Co. A.-G. Brit. 397,838, Aug. 25, 1933. Silk is modified in transparency, luster, dyeing properties and feel by treatment with a mineral acid in the presence of a reagent preventing decompn. of the silk. Decompn.-preventing agents are (1) a mono- or poly-hydric alc., e. g.,  $AmOH$ , glycol, glycerol, (2) pyridine or a homolog or deriv. thereof, e. g., pyridine-HCl, pyridine sulfate, picoline, lutidine, (3)  $CH_2O$ , or a polymer, or a compd. yielding  $CH_2O$ , e. g.,  $(CH_2)_nN_4$ , or (4) an  $NH_4$  salt that is not a swelling agent for silk, e. g.,  $(NH_4)_2SO_4$ ,  $NH_4Cl$ ,  $NH_4OAc$ .  $H_2SO_4$  of at least  $45^\circ$  Bé.,  $HCl$  of at least  $20^\circ$  Bé.,  $H_3PO_4$  of at least  $50^\circ$  Bé. or another mineral acid, except  $HNO_3$ , of the same order of concn. may be used. An example is given in which degummed and bleached silk fabric is passed through  $52^\circ$  Bé.  $H_2SO_4$ , contg. a little  $CH_2O$ , and then through  $25^\circ$  Bé.  $NaOH$  with intermediate and final washings. In 397,878, Aug. 23, 1933, the silk is modified by treatment with a swelling agent followed by washing. Swelling agents are (1) alkali hydroxide soln. of at least  $20^\circ$  Bé., (2) mineral acids of strengths stated above or (3) solns. of known swelling agents for cotton, e. g.,  $ZnCl_2$ , thiocyanates, ammoniacal  $CuO$  or  $NiO$ , alk. Cu-glycerol soln. Examples are given.

**Sizing silks.** Soc. de recherches et d'exploitations petrolifères. Fr. 752,683, Sept. 28, 1933. Silk is sized by a soln. of linseed oil, etc., in org. solvents. The solvents are recovered and the oil oxidized by a current of air at a low temp. (below  $25^\circ$ ) whereby contamination by oil of the solid absorbing agent is avoided.

**Rayon.** Henry Dreyfus. Fr. 42,454, July 31, 1933. Addn. to 697,216 (C. A. 25, 2849). The solvent used to soften the threads in the process of Fr. 697,216 is spread over a fibrous or porous material. The evapg. agent used for the 2nd evapn. is led to the 1st evapn. stage.

**Rayon.** Marcel Guinet. Fr. 751,430, Sept. 4, 1933. Mat effects are obtained by dipping rayon into a colloidal bath formed by dissolving animal gelatin or pickled hide in a boiling alk. soln. contg.  $CaO$ ,  $BaO$  or  $SrO$  so as to form salts of  $Ca$ ,  $Ba$  or  $Sr$ . Fr. 751,431. Rayon is weighted by immersion 1st. in a bath contg. a colloidal soln. of animal gelatin or pickled skin and then in a bath contg. a vegetable tannin or salts of  $Cr$ . The process may be repeated a no. of times.

**Drying spools of rayon.** Vereinigte Glanzstoff-Fabriken A.-G. Ger. 583,837, Sept. 9, 1933.

**Apparatus for unwinding rayon cakes.** Vereinigte Glanzstoff-Fabriken A.-G. Brit. 398,126, Sept. 7, 1933.

**Apparatus for shrinking rayon fabrics.** Zittauer Maschinenfabrik A.-G. Ger. 580,763, July 15, 1933.

**Apparatus for cleaning wool.** Ernst Voigt and Erich Mittelsteiner. Ger. 581,985, Aug. 10, 1933.

**Recovering neutral grease from wool-washing water.** Eugene Mertens. U. S. 1,937,291, Nov. 28. See Fr. 705,894 (C. A. 26, 320).

**Yarn-washing machine.** L. Ph. Hemmer G. m. b. H. Ger. 581,640, July 31, 1933.

**Device for treating spools of yarn with various liquids in succession.** Vereinigte Glanzstoff-Fabriken A.-G. Ger. 584,600, Sept. 23, 1933.

**Composition suitable for coating fabrics, etc.** Gustave D. Fortman (one-half to Charles S. Harper). U. S. 1,938,553, Dec. 5. A coherent but nonsticky compn. is formed comprising principally particles of solid elastic vegetable matter such as cork, sawdust or leather scraps united by gelatinous casein residue of a hydrocarbon soln. of casein.

**Coating cloth with rubber.** Les établissements Maréchal. Fr. 753,873, Oct. 26, 1933. An emulsion of rubber for coating cloth is treated with alk. earth oxides in soln. or by metal hydrates pptd. in this emulsion, with the exclusion of all products having a pos. elec. potential. All charges and pigments compatible with the results to be obtained may be added.

**Apparatus and method for coating paper or fabric with wool fiber to obtain an imitation woolen fabric.** Harald Baltzer. Brit. 396,591, Aug. 10, 1933.

**Cleaning agent.** Ernst H. Riesenfeld. Ger. 584,515, Sept. 22, 1933. A non-inflammable agent for cleaning spots from fabrics consists of up to 30%  $C_6H_6$  or benzine mixed with  $CH_2Cl$  or chlorinated aliphatic hydrocarbons such as  $CHCl_3$ ,  $CH_2Cl_2$ ,  $CCl_4$ , etc.

## 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

**Mildew prevention on painted surfaces.** Henry A. Gardner, L. P. Hart and G. G. Sward. *Natl. Paint, Varnish, Lacquer Assoc. Circ. No. 448*, 17-32 (1934); cf. C. A. 27, 4694.—The results contained in the previous report are in general confirmed. Microscopic examn. is usually necessary to detect growing mildew. G. G. S.

**Sun exposure of test panels.** O. J. Sieplein. *Natl. Paint Varnish Lacquer Assoc. Circ. No. 447*, 1-10 (1934).—By means of solar observations and calcs. the energy reaching the surfaces of exposed paint panels was obtained for Lat. of Miami, Fla. ( $25^\circ 48'$ ) and  $42^\circ$  N. Curves are given for surfaces facing the 4 cardinal directions, both vertical and inclined. The relation of the solar energy and other climatic conditions upon variously placed panels is discussed. G. G. Sward

**Pigmented bitumastic compounds.** J. Mitchell Fain and Foster Dee Snell. *Ind. Eng. Chem.* 26, 88-91 (1934).—Pigmented bitumens are widely used in the manuf. of floor tilings, enamels, floor coverings, paints, lacquers and cements. Aluminum-asphalt paints give a good protective covering and are lustrous. W. A. Moore

**Darkening of chrome oxide green by high temperatures.** Raquin. *Farben-Chem.* 4, 458 (1933).—Polemical with Vanino (cf. C. A. 27, 5556). True  $Cr$  oxide green prepd.

by reduction of dichromates with  $^4S$ ,  $C$ , etc., has a compn.,  $Cr_2O_3$ , and is practically unaffected by heating to red heat. G. G. Sward

**The chemistry of sea slime.** F. Krauss and Annie Kollath. *Farben-Chem.* 4, 415-16, 447-52 (1933).—Review with 47 references extending back to 1857. The chemically unsatd. character of sea slime is denied. Cf. Carprow, C. A. 27, 1525. G. G. Sward

**Oil requirements and thixotropy of linseed oil paints.** Hans Wolff. *Paint & Varnish Production Mgr.* 10, No. 1, 22-5 (1934).—Calcn. of factors ( $F$ ) from the sp. wt. of the oil-enveloped particles and the crit. pigment vol. agrees in many cases with those obtained from the ratio of pigment vol. at crit. and min. oil contents ( $F_w$ ) (cf. C. A. 28, 915<sup>a</sup>). In the cases in which it did not agree (being less) the paint system was plastic and thixotropic. Min. oil contents greater than 15% usually indicate plastic systems. It is possible by means of a few easily detd. values to predict a large no. of properties of oil paints. G. G. S.

**Viscosity of oil colors.** Hans Wolff. *Kolloid-Z.* 65, 228-33 (1933); cf. C. A. 26, 2330, 5436, 6161. A. F.

**The viscosity of oleo varnishes.** Johannes Scheiber. *Farbe u. Lack* 1933, 580.—Boller's statements that the viscosity of a varnish depends upon the vol. ratio of the

thinner rather than upon its nature are shown to be erroneous. The errors are ascribed to faulty use of the Engler viscometer.

**Requirements of silver varnishes.** H. Nolte. *Farbe u. Lack* 1933, 559-60, 569-70, 583, 605-6.—The wide variety of requirements for metal decorating, food can and metal-sign coatings are discussed.

**Picture finishing.** C. R. Bragdon. *Ind. Finishing* 10, No. 2, 11-14(1933).—A description of the materials and methods to be used in applying transparent preservative coatings such as dammar, shellac and synthetic resin varnishes and nitrocellulose lacquers to photographs, paintings, color prints, maps, blue prints, sketches and drawings on paper or canvas.

**The velocity of the hardening process.** K. Brandenburger. *Kunststoffe* 23, 251-3(1933).—It is suggested that the use of high-frequency elec. current would permit the pre-heating of resin masses to temps. in the vicinity of the hardening temp. and thus greatly reduce the time required for hardening in the press.

**Manufacture of linoleum.** Giles B. Cooke. *J. Chem. Education* 11, 3-13(1934).

**Liquo-crystalline resins and lacquers.** D. Vorländer. *Trans. Faraday Soc.* 29, 907-10(1933).—If one increases the ramification and bifurcation of mols. too far, one gets stationary super-cooled resins and lacquers; if only one dimension predominates, one gets resins and lacquers stable at room temp.

**Poly-vinyl resin masses.** Siegfried Malowan. *Kunststoffe* 23, 225-6(1933).—A general discussion.

**Hydraulic precision presses.** Wilh. Weuringh. *Kunststoffe* 23, 204(1933).—A new precision press for molding artificial resins is described with the aid of a diagram.

**Modern developments in synthetic resins.** Carleton Ellis. *Ind. Eng. Chem.* 26, 37-40(1934).

**The possibility of skin diseases from synthetic resins.** Walter Meyer. *Farben-Chem.* 4, 453-7(1933).—Eczema of the lower lip was traced to the use of a cigar holder made of synthetic resin. Other authorities are cited to show that a real hazard exists in the manuf. and use of articles made of phenol formaldehyde condensation products. Hydrolysis of the resin by the body fluids is given as a possible cause.

**Factors influencing resin concn. in loblolly and slash pine** (Bishop, Marckworth) 11D. Dctn. of apparent vol. of [pigments] (Becker) 1. Physiol. products of the lac insect (Rao, Sreenivasaya) 11I. Chem. tech. uses for a resinous pitch lignite coal [resins for the lacquer industry] (Müller-Neuglück) 21. Transformation products of rubber [for making paints, varnishes] (Fr. pat. 752,502) 30. Treating Zn sulfide ores [production of pigments] (U. S. pat. 1,937,638) 9. Drying oils and resins from pine exts. (U. S. pat. 1,938,320) 22. Cellulose ester lacquers (Ger. pat. 580,592) 23. Varnishes (Fr. pat. 752,797) 23. Vinylacetylene derivs. [prepn. of lacquers, varnishes, enamels] (Fr. pat. 753,465) 10.

**Paint, etc.** I. G. Farbenind. A.-G. (Hermann Friedrich and Walter Droste, inventors). Ger. 581,844, Aug. 3, 1933. The covering properties of coloring materials such as zinc white,  $\text{TiO}_2$ , rouge or lithopone, etc., is improved by addn. of monoacidylalkylenediamine or monoacidylpolyalkylenediamine or their alkylated products including quaternary  $\text{NH}_4$  bases. Thus,  $\text{TiO}_2$  is ground up and mixed with linseed oil, benzine and monoethyl-ethylenediamine. Other examples are given. Cf. C. A. 27, 5994.

**Painting.** Rudolf W. Moll. Fr. 750,777, Aug. 18, 1933. Porous objects to be painted are first coated with a soln. in a common solvent of a mixt. of chlorinated rubber and neutral suint.

**Painting or printing on cellulosic materials.** Pierre L. Herbinet. Fr. 753,365, Oct. 14, 1933. The colors used are dissolved in AcOH or other solvent of low volatility.

<sup>1</sup> The AcOH is preferably dild. with solvents having a moderating influence on its action, e. g., MeOH, EtOH or eucalyptol.

**Pigments.** I. G. Farbenind. A.-G. (Hans Georg Grimm and Ekbert Lederle, inventors). Ger. 580,701, July 18, 1933. Yellow pigments are prepd. by pptg.  $\text{PbCrO}_4$  together with  $\text{SrCrO}_4$  or  $\text{BaCrO}_4$ , or by treating  $\text{PbO}$  or other difficultly sol. Pb compds. with alk. earth chloride and pptg. with chromate. The resulting pigment is a yellow double chromate of varying compn. Examples are given.

**Pigments.** I. G. Farbenind. A.-G. (Friedrich A. Henglein and Oswin Nitzschke, inventors). Ger. 584,766, Sept. 23, 1933. A homogeneous mixt. of  $\text{CrO}_3$  and alk.-earth sulfate is obtained by heating alk.-earth chromate to glowing in an atm. of  $\text{SO}_2$  or  $\text{SO}_3$ .

**Titanium oxide pigment.** Marion L. Hanahan (to Krebs Pigment & Color Corp.). U. S. 1,937,037, Nov. 28. For sepg. a calcined  $\text{TiO}_2$  pigment into fractions of different particle sizes, a suspension of the pigment in a liquid such as water is deflocculated and the deflocculated suspension is elutriated at a predetd. speed of flow.

**Zinc sulfide pigment.** Niels C. Christensen. U. S. 1,937,639, Dec. 5. Finely divided solid  $\text{ZnO}$  is treated with  $\text{H}_2\text{S}$  and the resulting sulfidic material is calcined, quenched and ground.

<sup>4</sup> **Colloid mill suitable for treating pigments, enamels, etc.** Oscar A. Ross. U. S. 1,937,788, Dec. 5. Numerous structural, mech. and operative details are described.

**Printing ink.** Hans Kurz and Karl Albert. Brit. 396,654, Aug. 10, 1933. Addn. to 371,527 (C. A. 27, 3627). The process of 371,527 for the prepn. of a body for intaglio printing inks is modified by first sponging the resin with aq. solus. of alkalis and (or)  $\text{NH}_3$  and then adding alc. or other volatile  $\text{H}_2\text{O}$ -sol. org. solvent or a soln. of a resin in such a solvent. Examples are given. Cf. C. A. 27, 5995.

**Printing inks.** Walter Denzler. Brit. 396,618, Aug. 10, 1933. A printing ink, particularly for intaglio printing, consists of an emulsion the continuous phase of which is an aq. liquor not contg. an agglutinant but contg. colloidal substances, e. g., soaps, saponins, Turkey-red oil or other high-mol. sulfonated org. compds. or their salts, alkylated or oxyalkylated salts of amines or amides of the higher fatty acids, proteins, tannins, pectins, vegetable mucus, gums, pigments, with or without solids in soln. or suspension which act to stabilize the emulsion, e. g., phenols, higher alcs., and the dispersed phase, a  $\text{H}_2\text{O}$ -insol. agglutinant, e. g., a resin or bituminous substance, wax, cellulose ester, linseed or other drying oil, especially in the oxidized or polymerized form, India rubber, balata, in soln. in a  $\text{H}_2\text{O}$ -immiscible volatile org. solvent, e. g., a  $\text{C}_6\text{H}_6$  hydrocarbon, petroleum distillate, hydrogenated derivs. of  $\text{C}_6\text{H}_6$  and  $\text{C}_{10}\text{H}_8$ , turpentine, org. acid ester. The pigment may be partly or wholly replaced by  $\text{H}_2\text{O}$ -insol. coloring matter dissolved in the dispersed phase. The pigment is ground with either liquid prior to emulsification or with the prepd. emulsion. Examples are given.

**Printing inks and colors.** Alexander Wacker Ges. für elektrochemische Industrie G. m. b. H. Fr. 752,492, Sept. 23, 1933. Paraffin hydrocarbons contg. a small amt. of solvents known in the lacquer industry, e. g., benzine and 10% of alc. or ethyleneglycol monoethyl ether, are used instead of the usual benzoic hydrocarbons in the manuf. of printing colors and inks.

**Drying extracts.** I. G. Farbenind. A.-G. (Friedrich Meidert and Hermann Schatz, inventors). Ger. 578,416, July 21, 1933. Addn. to 576,939 (C. A. 28, 351<sup>4</sup>). In prepg. homogeneous drying exts., by the method of 576,939, the fatty acid solvent is partly replaced by linseed, wood, soy-bean, poppy-seed or other oils.

**Drying extracts.** I. G. Farbenind. A.-G. (Friedrich Meidert, inventor). Ger. 579,683, June 29, 1933. Addn. to 576,939 (C. A. 28, 351<sup>4</sup>). In prepg. drying exts. for use in the paint and varnish industry by the method of 576,939, the free fatty acids of the drying and semi-drying oils are wholly or partly replaced by free lower olefinic carboxylic acids or their aromatic homologs, or by  $\text{NaOH}$

or its derivs. with free COOH groups. Examples are<sup>1</sup> ketone such as methylene ethyl methyl ketone, vinyl methyl ketone or the like (suitably by heating with or without addn. of emulsifying agents, etc.). Various examples with details of procedure are given.

**Varnish.** Bernhard Baumeister. Ger. 581,526, July 29, 1933. An oil for making varnishes is prepd. by heating wood oil with an aq. soln. of an org. acid such as (CO<sub>2</sub>H)<sub>2</sub>, sepg. the oil layer and further heating it.

**Varnish.** Soc. de gaz de Paris. Fr. 751,305, Aug. 31, 1933. A varnish contains coal-tar pitch 65, PhOH 5 and benzene 30% by wt.

**Varnish or enamel for producing imitation leather finishes.** Dale M. Phillippi (to Kay and Ess Chemical Corp.). U. S. 1,936,913, Nov. 28. A synthetic resin formed of cresol, formaldehyde and colophony is used with PbO, Mn linoleate, Co linoleate, China wood oil and linseed oil. Cf. C. A. 27, 434.

**Nitrocellulose lacquer.** Garrett H. Peters (to Hercules Powder Co.). U. S. 1,936,989, Nov. 28. A lacquer free from water-miscible ingredients and capable of forming an unclouded film on evapn. of volatile ingredients contains nitrocellulose, water, BuOAc, toluene ester gum and tricresyl phosphate (the water being emulsified in dispersed phase in the liquid ingredients).

**Lacquer-drying furnace.** Siemens-Schuckertwerke A.-G. Ger. 584,938, Sept. 26, 1933.

**Electrically heated drying oven for lacquered ware.** Siemens-Schuckertwerke A.-G. (Johann Schnepf, inventors). Ger. 583,839, Sept. 9, 1933.

**Rotating-drum furnace for heating lithopone, etc.** Eisenwerk Albert Gerlach G. m. b. H. Ger. 579,895, July 3, 1933.

**Artificial materials.** Röhm & Haas A.-G. Fr. 750,873, Aug. 2, 1933. Polymerization products of acrylic acid or its derivs. or homologs, or vinyl alc. or its esters or ethers or vinyl ketones, taken separately or in admixt., are treated with Cl preferably with heat and pressure and in the presence of a catalyst. The products may be used for making lacquers, films, threads, artificial leather, etc. Cf. C. A. 28, 270<sup>a</sup>.

**Polymerizing, condensing and oxidizing crude tall oil.** Richard H. Patch and Fritz Dambacher (to E. F. Houghton & Co.). U. S. 1,938,532, Dec. 5. Crude tall oil is subjected to the action of O at a temp. (suitably about 110° with air and Fe resinate) and for a time (suitably about 40 hrs.) sufficient to condense and refine the material and form a substantially odorless, non-sludging, dark, clear oil which is suitable for use as a cooling oil in cutting metals and for various other purposes.

**Resinous materials.** Imperial Chemical Industries Ltd. Fr. 751,605, Sept. 7, 1933. Bubbles of air are removed from plates, blocks or other compact masses of thermoplastic resinous materials by submitting the material under pressure to a temp. sufficient to soften the mass, but insufficient to cause decompn. or loss of plasticity. The free surface of the material is covered with an inert liquid.

**Shellac-like resins from agatho-copal resins.** Johannes Scheiber (to Walter Dux). U. S. 1,938,468, Dec. 5. Agatho-copal resins are dissolved in a soln. of an alkali such as NaOH or KOH and this soln. is mixed with an alk. soln. of a polyhydroxy-carboxylic aliphatic acid such as trihydroxystearic acid and the mixt. is pptd. with an inorg. acid such as HCl and the filtered ppt. is heated until the melt is sol. in cold alc. Cf. C. A. 27, 3350.

**Artificial resins.** Kurt Meisenburg, Walter Bock and Otto Bächle (to I. G. Farbenind. A.-G.). U. S. 1,937,063, Nov. 28. Artificial resins, which are generally colorless or but slightly colored and which are more sol. in benzene than the corresponding ketone resins and less brittle than the corresponding olefin benzene and naphthalene resins, are obtained from a mixt. of styrene (or  $\alpha$ -alkylstyrenes, divinylbenzene, or a vinyl naphthalene) with a

ketone such as methylene ethyl methyl ketone, vinyl methyl ketone or the like (suitably by heating with or without addn. of emulsifying agents, etc.). Various examples with details of procedure are given.

**Synthetic resin.** Israel Rosenblum. U. S. 1,937,533, Dec. 5. A permanently fusible and oil-sol. synthetic resin is produced by the reaction of glycerol with cracked rosin and with the acids obtained by hydrolysis of linseed oil. Cf. C. A. 27, 3096.

**Synthetic resins.** N. V. Philips' Gloeilampenfabrieken. Brit. 397,690, Aug. 31, 1933. See Fr. 743,859 (C. A. 27, 4110).

**Synthetic resins.** Isidor Feinmann. Brit. 397,609, Sept. 4, 1933; Fr. 752,431, Sept. 22, 1933. In the manuf. of resins by condensing aldehydes with other compds, e. g., urea, PhOH, in the presence or absence of an acid, basic or neutral catalyst the reaction product is fractionated by treatment with H<sub>2</sub>O into portions with different affinities for H<sub>2</sub>O and the sepd. fractions are mixed in desired proportions to produce the final product. Thus the min. amt. of distd. H<sub>2</sub>O necessary to effect sepu. into 2 layers on cooling to 15° is added to the hot reaction mixt., the lower layer formed, contg. the highest condensation products, is sepd. and the aq. upper layer further dild. to ppt. middle condensation products.

**Synthetic resins.** Allgemeine Elektrizitäts-Ges. Ger. 580,931, July 22, 1933. In making resins by treating polyhydric alcs. with polybasic acids, an org. acid contg. the group HSO<sub>3</sub> is added to the starting materials. A monobasic org. acid may also be present. In an example, a resin is formed by heating together phthalic anhydride, 4-aminotoluene-2-sulfonic acid and glycerol.

**Synthetic resins.** F. Raschig G. m. b. H. Ger. 581,907, Aug. 4, 1933. The surfaces of hardened PhOH-aldehyde resins are colored blue or black by cold or slightly warm treatment first with an aq. soln. of *p*-phenylenediamine and then with H<sub>2</sub>O<sub>2</sub>.

**Synthetic resins.** F. Raschig G. m. b. H. Fr. 751,161, Aug. 28, 1933. Molding compns. are made by condensing phenols with CH<sub>2</sub>O, or substances yielding CH<sub>2</sub>O, in amt. of 1 mol. of PhOH for more than 1.5, preferably 2, mols. of CH<sub>2</sub>O, hardening this resin at a moderate temp. until the solidified resin gives a powder which does not assume a concretionary state at 70-100°, and removing volatile substances by heating to 80-100° under vacuum.

**Synthetic resin.** Soc. française Duco. Fr. 752,620, Sept. 27, 1933. A resin of the glyptal type which is insol. in water, neutral and sol. in org. solvents is obtained at a low temp. (140-60°) by sepg. the neutral glycerol phthalate formed during this reaction. The reaction mass is taken up in an org. solvent (acetone, alc.), the acid and neutral phthalates are dissolved and addn. of an alk. substance or soln. ppts. the desired resin.

**Synthetic resins and resinous compositions.** Standard Oil Development Co. Brit. 397,699, Aug. 31, 1933. Resins and plastic resinous products, which may be used as constituents of paints, varnishes, lacquers, rubber compns., etc., or as paving or coating materials or for molding, are prepd. or extd. from tars obtained in cracking petroleum oils by (a) subjecting the tar to the action of a condensing agent, e. g., AlCl<sub>3</sub>, with or without the addn. of unsatd. hydrocarbons to take part in the condensation, and sepg. the condensation products so formed together with the resinous products already contained in the tar, or (b) subjecting the tar to distn. to sep. an oil which boils at 330-660°F. at 1 mm. Hg pressure and sepg. by appropriate extn. or other method the resins from the residue (which contains also asphaltenes) or (c) distg. off the oil as in (b) and then subjecting said oil to condensation, with or without addn. of reactive hydrocarbons, and sepg. the resinous condensation products therefrom.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

The kernel fats of some members of the Palmae: *Acrocomia selerocarpa* Mart. (gru-gru palm), *Manicaria*

*saccifera* Gaertn., *Astrocaryum tucuma* Mart., *milliana caribaea* Griseb., *Attalea excelsa* Mart. (*pallia*

palm) and *Cocos nucifera* Linn (coconut). Geoffrey Collin. *Biochem. J.* 27, 1366-72(1933).—Data for 6 seed fats of this family are given. Benjamin Harrow

Comparison of various methods of determining iodine values and their effect on the calculated results of fat analysis. A. D. Barbour. *Oil and Soap* 11, 7-9(1934).—The Wijs and Margosches methods give the highest I nos., the Rosenmund-Kuhnheim method gives the lowest and the Margosches the most variable. The Kaufmann method is outstanding for ease of prepn. and convenience in use. The reagent is superior to the Wijs in stability and to the Hanus in ease and convenience of prepn. It is also neutral and does not show a recurrent end point.

E. Scherubel

Composition of fatty acid mixtures. II. Twitchell mixed-melting-point method—for the determination of individual saturated fatty acids? Robert N. Wenzel. *Ind. Eng. Chem., Anal. Ed.* 6, 1-7(1934); cf. C. A. 28, 6057.—A distinct improvement in the results by the mixed m.-p. method is obtainable by an improvement in the m.-p. detn. with Burk's app. and an extremely slow rate of heating in a closed m.-p. tube. There are 8 tables of results.

E. Scherubel

The chemistry of some little-known oils. E. Bursch. *Chimie & industrie Special No.*, 1056-77(June, 1933).—*Peach kernel oils*, obtained by extn. with  $\text{Et}_2\text{O}$ , cold petr. ether, boiling petr. ether,  $\text{CHCl}_3$ ,  $\text{CCl}_4$ ,  $\text{CS}_2$  and  $\text{C}_6\text{H}_6$ , differed but little in compn.; the best quality (as judged by the acid no.) was obtained with  $\text{CHCl}_3$  and the poorest with boiling petr. ether. The characteristics were: yield 33.3-49.0%,  $d_{20}^{20}$  0.911-0.920, acid no. 9.29-27.77, sapon. no. 196.12-198.82, I no. (Hübl) 97.39-104.41, I no. (Hanus) 97.64-104.92, Reichert-Meissl no. 0.403-1.53, Polenske no. 0.615-0.856, Hehner no. 92.54-94.08, Ac no. (on  $\text{Et}_2\text{O}$ -extd. oil only) 22.90-24.56, ester no. 173.68-188.98, glycerol 9.50-10.34%. The oil contains the following acids 55-60% oleic, 45-20% linolic and not over 5% satd. acids consisting chiefly of stearic and palmitic with probably a small amt. of myristic acid. The oil contains about 0.01% phytosterol, m. 129°. *Oils of para nut kernels*, obtained by extn. with the same solvents as above, differed but little in compn. and had the following characteristics: yield 50.75-68.80%,  $d_{20}^{20}$  0.909-0.917, acid no. 0.80-4.00, sapon. no. 196.80-206.90, I no. (Hübl) 92.23-99.50, I no. (Hanus) 93.40-102.12, Reichert-Meissl no. 0.960-1.859, Polenske no. 0.140-3.140, Hehner no. 89.15-95.94, Ac no. (on  $\text{Et}_2\text{O}$ -extd. oil only) 8.20-13.73, ester no. 195.77-202.59, glycerol 10.71-11.08%. The oil contains the following fatty acids: 50-55% oleic, 15% linolic and 15% satd. acids consisting mainly of palmitic with some stearic. The oil contains 0.04-0.08% phytosterol, m. 130°. *Apricot kernel oils*, obtained by extn. with  $\text{Et}_2\text{O}$ , petr. ether,  $\text{CHCl}_3$ ,  $\text{CCl}_4$ ,  $\text{CS}_2$ , cold  $\text{C}_6\text{H}_6$  and boiling  $\text{C}_6\text{H}_6$ , differed but little in compn. and had the following characteristics: yield 26.3-49.0%,  $d_{20}^{20}$  0.944-0.956, acid no. 9.07-29.92, sapon. no. 191.30-205.82, I no. (Hübl) 95.17-113.78, I no. (Hanus) 98.97-116.39, Reichert-Meissl no. 0.877-3.275, Polenske no. 1.567-2.987, Hehner no. 89.30-94.60, Ac no. (only on oil extd. with boiling  $\text{C}_6\text{H}_6$ ) 26.65-33.82, ester no. 173.74-196.40, glycerol 9.50-10.74%. The oil contains the following fatty acids: 65% oleic, 15% linolic and 2-3% satd. acids consisting of palmitic and stearic. The oil contains 0.19% phytosterol, m. 133.5-134°, I no. (Hanus) 139.5, giving phytosterol acetate, m. 119-20°, and hexabromophytosterol acetate, m. 80-1°. *Pear-seed oils*, obtained by extn. with cold  $\text{Et}_2\text{O}$ , boiling  $\text{Et}_2\text{O}$ , petr. ether,  $\text{CHCl}_3$ ,  $\text{CCl}_4$ ,  $\text{CS}_2$  and  $\text{C}_6\text{H}_6$ , showed but little difference in compn. The oil obtained with boiling  $\text{Et}_2\text{O}$  m. 21-2° and has  $d_{20}^{20}$  0.918. The characteristics were: yield 14.1-25.5%,  $d_{20}^{20}$  0.914-0.918, acid no. 22.16-28.34, sapon. no. 196.20-200.62 I no. (Hübl) 119.95-122.26, I no. (Hanus) 119.11-121.85, Reichert-Meissl no. 1.21-1.75, Polenske no. 0.851-0.988, Hehner no. 90.14-93.05, ester no. 160.99-175.66, glycerol 8.81-9.61%. The oil contains stearic acid 5-6%, palmitic 2-3%, lauric up to 0.5%, linolic 4-6%, oleic about 65%. The phytosterol m. 115°. *Oils of horse-radish (Raphanus raphanistrum) seed*, obtained by extn. with  $\text{Et}_2\text{O}$ , cold

petr. ether, boiling petr. ether,  $\text{CHCl}_3$ ,  $\text{CCl}_4$  and  $\text{C}_6\text{H}_6$ , differed but little in compn. The oil obtained with boiling petr. ether m. 23-4° and has  $d_{20}^{20}$  0.914. The characteristics were: yield 26.5-29.3%,  $d_{20}^{20}$  0.910-0.932, acid no. 2.12-4.39, sapon. no. 175.36-178.99, I no. (Hübl) 105.59-109.72, I no. (Hanus) 105.22-109.40, Reichert-Meissl no. 0.652-1.39, Polenske no. 0.657-0.949, Hehner no. 92.34-93.84, ester no. 172.91, 176.48, glycerol 9.46-9.65%. The oil contains: arachidic acid 1.5-2%, linolic 8-10%, linolenic 5-7%, rapic about 80%, oleic trace, solid unsatd. 1-1.5%. The oil contains 0.2-0.3% phytosterol m. 128°.

A. Papineau-Couture

Refining losses on edible vegetable oils. Alan P. Lee. *Oil and Soap* 11, 12-16(1934).—Statistical. E. S.

Yield calculations for oil extractions. M. Junker. *Seifensieder-Ztg.* 60, 833-4(1933).—The usual analytical oil extns. of several hrs.' duration dissolve besides oil the phosphatides and other substances while factory extns. of  $\frac{1}{4}$  hr. do not; the  $\text{H}_2\text{O}$  contents of lab. and factory residues are not the same; these 2 factors cause the differences between the calcd. and actual oil yields. P. Escher

The ultra-violet absorption capacity of olive oils. Gulbrand Lunde, Hans Kringstad and Harald W. Weedon. *Angew. Chem.* 46, 796-8(1933); cf. C. A. 27, 3099.—A no. of virgin olive oils, as well as refined, pressed and extd. oils were examd. at  $\lambda$  = about 2750 Å., as the various types of olive oils showed marked differences in the absorption at this wave length. The extinction per cm. was  $E = 10-22$  for virgin oils, 35-55 for the refined pressed oils and 54-90 for the refined extd. oils. Stronger ultra-violet absorption was accompanied by a stronger blue fluorescence. The change of extinction was examd. for heat treatment and neutralization in the hot and cold. The absorption curves of 4 representative oils are presented and are very characteristic, particularly for the refined pressed oil, which shows a flat portion at 2600-2700 Å. Both absorption in the ultra-violet and measurement of the fluorescence are suitable for the detns. of the quality of olive oils. Six references. Karl Kammermeyer

Absorption spectra in relation to the constitution of fish oils. Joseph R. Edisbury, Richard A. Morton and John A. Lovern. *Biochem. J.* 27, 1451-60(1933).—The well-defined narrow absorption bands owe their origin to unsatn. in the absorbing mols. The highly absorbing acids are not present in the original oils as the corresponding glycerides. The hypothesis that the absorbing acids are straight-chain compds. with conjugated double bonds is not in harmony with the evidence. During sapon., unsatd. acids with low absorption are changed to unsatd. acids with high and selective absorption. Cyclization is a probable explanation of this change. B. Harrow

The A. L. C. A. methods of analysis for sulfonated oils. Ralph Hart. *J. Am. Leather Chem. Assoc.* 28, 593-602(1933). H. discusses criticisms by Burton and Robertshaw (C. A. 26, 613; 27, 3630). The difference between results for so-called total oil in the A. L. C. A. and in the Burton-Robertshaw methods is one merely of nomenclature and method of calcn. The ether-abs. alc. method for salts gives low results for NaCl. Detn. of active groups is considered more important than a complete fractionation of the oil. H. B. Mcerrill

Qualitative test for waxes. D. Holde. *Fettchem. Umschau* 40, 233(1933).—The usual qual. test for unsaponifiable oil, wax, paraffin, etc., in fats and oils consists in boiling for 2 min. 6-8 drops of the oil with 2-3 cc.  $N$  KOH and adding dropwise 1-10 cc.  $\text{H}_2\text{O}$ , when the unsaponifiable substances cause a turbidity, with the exception of spermaceti oil, and bottlenose oil. G. Buchner reports that a long-continued boiling also keeps beeswax, spermaceti and other waxes dissolved in the hot soap soln.; only spermaceti seps. as a turbidity on cooling. P. Escher

Change in the composition and analytical constants of beeswax at 150-200°. G. Buchner. *Fettchem. Umschau* 40, 234(1933).—When heating pure beeswax or its mixts. with paraffin to 150-250°, the acid no. decreases, the ester no. and sapon. no. increase, but on further heating a re-esterization or estolide formation occurs which again decreases the ester no. and sapon. no. P. Escher

**Extraction of triethanolamine oleate from aqueous solution.** Frank M. Biffen and Foster Dee Snell. *Ind. Eng. Chem., Anal. Ed.* 6, 78(1934).—In extn. of oil from triethanolamine soap-oil emulsions, fatty acid accompanies the extd. oil. Prolonged extn. with correction of the extd. oil for the free fatty acid so extd. may be used.

Foster Dee Snell

**Some new detergents.** A. S. Richardson. *Oil and Soap* 11, 10-11(1934).—One class of new detergents consists of alkyl sulfates, e. g., Na lauryl sulfate. To date they have been sold mainly in the textile industry; and their most interesting property is resistance to pptn. in hard water. Another class of new cleansing agents may be called acylated sulfonates, one type of which consists of the fatty acid esters of hydroxysulfonates of low mol. wt. Another type consists of the corresponding acid amides in which the O involved in the ester linkage is replaced by NH or NR. These compds. have cleansing and sudsing power similar to that of soap or of alkyl sulfates. The mol. formula is capable of variations similar to those of the alkyl sulfates.

E. Scherubel

**Effects of sulfonates of aliphatic alcohols upon shaving soaps and shaving creams.** Welwart. *Seifensieder-Zig.* 60, 872-3(1933).—The lathering power of shaving soaps on the skin is not improved by adding up to 8% of sulfonated lauric or cetyl alc. or of "lanette wax," especially when using regular com. products which contain a high percentage of Na<sub>2</sub>SO<sub>4</sub>. An addn. of 10% of these sulfonates may increase stability of soap toward Ca compds. but this effect can be obtained more cheaply with other preps.

P. Escher

**Disinfectants in soap base.** R. Voss. *Seifensieder-Zig.* 60, 855-6, 875, 893-4(1933).—Disinfecting soaps should kill coli bacteria or staphylococci in 3-5 min. in 1-2% soln. without irritating the skin. Soaps without disinfectants have varying degrees of bactericidal properties. Expts. are tabulated in which Na soaps of satd. fatty acids contg. phenols were superior in power to kill bacteria to similar K soaps of satd. or unsatd. fatty acids.

P. Escher

**Fire extinguishers [for extinguishing burning oil, fats, waxes]** (Fr. pat. 752,621) 18. Recovering neutral grease from wool-washing water (U. S. pat. 1,937,291) 25. Oxidizing hydrocarbons [waxes, etc.] (Ger. pat. 579,988) 10. Ni catalysts [for hydrogenation of cottonseed oil] (Brit. pat. 397,295) 18. Vegetable oil (Fr. pat. 752,876) 12. Fatty acids (Ger. pat. 581,829) 10.

**Fats.** Deutsche Hydrierwerke A.-G. Ger. 579,806, July 3, 1933. See Fr. 738,505 (C. A. 27, 2056).

**Sulfonating fats and fatty acids.** H. Th. Böhme, A.-G. Chemische Fabrik. Ger. 581,658, July 31, 1933. Addn. to 553,503 (C. A. 26, 5780). The method of 553,503, whereby fats, etc., are sulfonated by treatment with H<sub>2</sub>SO<sub>4</sub> in the presence of anhyd. org. acids, anhydrides or acid chlorides, is applied to unsatd. fatty acids. Anhydrides or chlorides of aliphatic carboxylic acids contg. more than 3 C atoms are used. Thus, oleic acid is sulfonated with H<sub>2</sub>SO<sub>4</sub> in the presence of Ac<sub>2</sub>O.

**Still suitable for distillation of fatty acids, etc.** Wilhelm Gensecke (to American Lurgi Corp.). U. S. 1,936,964, Nov. 28.

**Distillation of volatile substances such as free fatty acids from vegetable and animal oils and fats.** Hans Franzen and Max Schellmann (to I. G. Farbenind. A.-G.). U. S. 1,937,320, Nov. 28. A volatile liquid such as water in the form of a continuous capillary stream at a velocity of at least 40 cm. per sec. is introduced into oil or fat in the liquid state, such as peanut oil heated to above the b. p. of the volatile liquid introduced. App. is described.

**Oils and fats.** Metallgesellschaft A.-G. Fr. 753,947, Oct. 27, 1933. Free fatty acids present in animal or vegetable oils or fats are neutralized by solns. of alkali and the alkali soap formed is transformed to an alk. earth soap by suitable solns. The alk. earth soaps obtained are split into neutral oil and fatty acid soap by means of a solvent such as benzene, and the fatty acid soap is decom-

posed by a mineral or org. acid into fatty acid, which dissolves in the solvent. The solvent is removed from the fatty acid by distn.

**Aromatizing oils, fats, etc.** Georges H. Dupont. Fr. 752,693, Sept. 28, 1933. Oils, fats, margarine, etc., are aromatized by tartaric acid, dihydroxymaleic acid and dihydroxytartaric acid, alone or in admixt. The esters may be used instead of the free acids.

**Detectors for oils, fats, etc.** I. G. Farbenind. A.-G. Fr. 751,608, Sept. 7, 1933. Colorless or colored compds. of 1,2,4-trihydroxybenzene from which the trihydroxybenzene is liberated by strong HCl, if necessary in the presence of reducing agents, are incorporated in very small amts. in oils or animal or vegetable fats whereby the presence of these may be detected. Examples are given of the use of 1,2,4-triacetoxybenzene and a dye-prepd. from diazotized o-toluidine and tributyrat of hydroxyhydroquinone.

**Refining fatty oils, etc.** Ludwig Rosenstein and Walter J. Hund. Ger. 580,874, July 17, 1933. See U. S. 1,885,859 (C. A. 27, 1225).

**Catalytic treatment of oils, etc.** Soc. anon. français pour la fabrication des essences et pétroles. Fr. 753,335, Oct. 13, 1933. Means is provided to vary the capacity of the contact mass in circuit according to the state, in the stage considered, of the matter admitted to the contact chamber, at the same time as the temp. is varied inversely. The flow of oil, etc., is maintained as nearly as possible the same during the successive stages. An app. is described.

**Soluble oils.** Gustav J. C. Beckmann. Fr. 754,228, Nov. 3, 1933. Sol. oils, soaps, etc., are made by mixing animal, mineral or vegetable oils with resin as a catalyst and sapon. with NaOH lye.

**Apparatus for extracting oil from oleaginous fruits.** Fried. Krupp Grusonwerk A.-G. Fr. 751,523, Sept. 5, 1933.

**Recovery of solvents from animal skins.** Alexander Wacker Ges. für elektrochemische Ind. G. m. b. H. Fr. 751,088, Aug. 26, 1933. Volatile solvents used to ext. fats, etc., from skins, etc., are recovered by appropriate gases in the presence of hot water.

**Sulfonation products.** Oranienburger chemische Fabrik A.-G. (Kurt Lindner and Johannes Zickermann, inventors). Ger. 583,686, Sept. 7, 1933. High-mol. products are obtained by treating natural fats, fatty acids or fat-like substances with about 50% of their wt. of a strong sulfonating agent such as ClHSO<sub>3</sub>, in the presence of aromatic hydrocarbons or their derivs.

**Terpineol sulfonic acids.** Soc. pour l'ind. chim. à Bâle. Brit. 398,086, Sept. 7, 1933. H<sub>2</sub>O-sol. derivs. of terpineol are obtained by treatment thereof with a sulfonating agent at a comparatively low temp. In examples ClSO<sub>3</sub> and 30% fuming H<sub>2</sub>SO<sub>4</sub> are used. The products are used as wetting, emulsifying and washing agents in the prepn. of lubricants, dressings and sizes for textiles.

**Soap.** I. G. Farbenind. A.-G. (Hermann Stötter and Theodor Hermann, inventors). Ger. 581,990, Aug. 5, 1933. A soap for cleaning wool, feathers, hair, etc., and for protecting them against moths, etc., comprises a mixt. of neutral or acid soap and a mothicide which remains on the fiber, such as 1,3-dichlorobenzene-4-sulfo-1,3-phenylenediamine. Salts of quaternary phosphonium bases or sol. salts of selenic or selenious acids or the free acids are accepted as mothicides. Cf. C. A. 27, 2056.

**Soap.** Robert P. Bordier. Fr. 750,972, Aug. 24, 1933. An activated and stabilized inorg. material, such as colloidal clay, is incorporated with the fatty material before sapon., to obtain a conveniently regulatable acceleration of the sapon., and increased detergent power.

**Soaps.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Fr. 42,548, Aug. 4, 1933. Addn. to 740,401 (C. A. 27, 4707). Difficultly sol. compds. of Ag, e. g., sub-halides or rhodanide of Ag, are incorporated in soap. The ions of Ag necessary for the disinfectant action are liberated, while, on account of the low soly., undesirable colorations are not produced.

**Acid soap.** Neoukh Baskin. Fr. 752,879, Oct. 2, 1933. Different fatty acids are mixed with sulfonated

fatty acids or sulfonic acids of high mol. wt. and partially neutralizing the mixt. with alkalis.

**Wetting agents.** Gaëtan P. Lièvre. Fr. 751,422, Sept. 4, 1933. Solns. having a high wetting power for textile fibers are obtained by neutralizing with a suitable base org. acid, sulfonated or not, contained in the washing residues obtained during the refining of combustible liquids. Salts of org. acids not only sulfonated but sulfured are preferably added. An example contains Na sulfonaphthenates 97 and  $\text{NH}_4$  ichthyolsulfonate 3%.

**Wetting, agents, etc.** Deutsche Hydrierwerke A.-G. Fr. 752,756, Sept. 30, 1933. Wetting, cleaning, dispersing and froth-producing agents are composed of free or neutralized hydroxyalkylsulfonic acids, having a max. of 6 C atoms in the mol., and in which one or more OH groups are etherified by alkyl groups contg. at least 6 C atoms. These substances are particularly useful for processes carried out at a low temp.

**Wetting, agents, etc.** Chemische Fabrik vorm. Sandoz. Fr. 753,752, Oct. 24, 1933. Wetting, washing,

emulsifying and dispersing agents are prepd. by condensing, with the aid of appropriate agents, aryl or aralkyl ethers of polyalcs. with aliphatic mono- or poly-alcs. or with derivs. of these alcs. contg. at least one OH, or with mixts. of such alcs. Sulfonic groups may be introduced before, during or after the condensation. Thus, the monocresyl ether of glycol is condensed with BuOH in the presence of  $\text{H}_2\text{SO}_4$ . Other examples are given. Cf. C. A. 28, 670,1,2,3.

**Wetting, agents, etc.** Deutsche Hydrierwerke A.-G. Fr. 753,753, Oct. 24, 1933. Amino- or aminohydroxy-sulfonic acids which are substituted in the  $\text{NH}_2$  group by at least one hydrocarbon radical of the aliphatic or alicyclic series of high mol. wt. contg. at least 8 C atoms, and which may contain a substituted hydroxy group or groups are used as wetting, impregnating, dispersing, froth-producing and cleansing agents. Examples are given of the prepn. of the Na salts of 1-dodecylaminonaphthalene-, 2-dodecylamino-6,8- and 2-octadecylamino-3,6,8-trisulfonic acid.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

Problems of tech. reactions. I. Decompn. of C compds. (sugar splitting) (Schmidt) 13. How to calculate sirup strengths quickly (Robertson) 12. Potash fertilization of the sugar beet (Zehentner) 15. Fumigation of cane grubs (Jarvis) 15.

**Sugar juices.** Soc. industrielle et agricole de la Somme. Fr. 42,530, Aug. 4, 1933. Addn. to 742,018 (C. A. 27, 3633).  $\text{Al}_2\text{O}_3$  in the form of a hydrosol is used for purifying sugar juices.

**Apparatus for leaching sugar sap out of cut-up beet or cane.** Hermann Claassen. Ger. 583,037, Sept. 7, 1933.

**Apparatus for concentrating solutions of sugar sap.** Paul Knichalik. Ger. 579,621, June 29, 1933.

**Filter press for sugar refineries, etc.** Fritz Scheibler Maschinenfabrik. Ger. 583,994, Sept. 13, 1933.

**Diffusion battery for extracting sugar.** C. Tixier & Compagnie (S. à r. l.). Fr. 751,534, Sept. 5, 1933.

**Diffusion batteries for sugar refining.** W. Eismann. Ger. 583,623, Sept. 6, 1933.

**Sugar.** Oskar Spengler, Georg Bartsch and Jochen Wigand. Ger. 583,624, Sept. 6, 1933. App. for pptg. lime and other undesired constituents of sugar sap by introduction of gases is described.

**Betaine hydrochloride and potassium hydrochloride**

from waste molasses. Yoshitaro Takayama. Ger. 581,819, Aug. 3, 1933. See U. S. 1,870,319 (C. A. 26, 5783 4).

**Starch.** Arthur P. Bryant (to Clinton Corn Syrup Refining Co.). U. S. 1,937,543, Dec. 5. For making a thicker boiling starch without decreasing the amount of  $\text{SO}_2$  normally added to the starch milk, the starch milk contg. normal amounts of  $\text{SO}_2$  is treated with NaOCl soln. in quantity sufficient to remove all of the  $\text{SO}_2$  and render the starch softer, more sterile and better adapted for the production of a thicker boiling starch than if the NaOCl were not used; the product is then dewatered, washed and dried.

**Corn starch.** International Patents Development Co. Fr. 754,127, Nov. 2, 1933. Corn is subjected in a fragmented state to sepn. operations in water to remove the germs and bran. Water is removed from the starch and the concd. starch is treated to remove the gluten. The water is used in another sepn. operation.

**Dextrin from corn starch.** Arthur D. Fuller (to National Adhesives Corp.). U. S. 1,937,752, Dec. 5. Wet starch is reacted with a Cl-contg. compd. such as  $\text{Ca}(\text{OCl})_2$ , and an alk. medium is added to produce a Cl reaction starch product having a  $p_H$  between the neutral point and the normal  $p_H$  of purified starch, and the product is then heated to form dextrin.

## 29—LEATHER AND GLUE

ALLEN ROGERS

**Apparatus for determining non-tannin in tanning materials.** F. Pothier. J. Intern. Soc. Leather Trades Chem. 17, 719-22(1933).—The app. combines the principles of the shake and filter-bell methods. Data indicate that reproducible results are obtained. H. B. Merrill

**Valonia and its tannins.** L. Todeschini. Boll. ufficiale staz. sper. ind. pelli mat. concianti 11, 541-7(1933).—The prepn. and compn. of exts. prepd. from valonia are discussed. J. W. Perry

**The flavonic compounds in wood, their fluorescence and relations with the tannins.** F. Vignolo-Lutati. Boll. ufficiale staz. sper. ind. pelli mat. concianti 11, 436-48 (1933).—The uncertainties and difficulties involved in detecting or detg. tannins by means of Woods's light are discussed. Evidence is presented indicating that the yellow fluorescence due to fisetin is dependent on its phys. state, while the action of inhibiting substances seems to be of secondary importance at most. Various theories of the biochem. significance of compds., such as fisetin, and their glucosides are briefly reviewed. The author suggests that the formation of such compds. in

heartwood occurs during the death of cellular plasma and is analogous to that of lignin. J. W. Perry

**Tanning with pine and oak extracts hides cut from the bellies of pigs by the side-cut method.** A. I. Zhemochkin. Ouladenie Tekhniki: Koshobuynoe Proizvodstvo 1932, No. 4, 44. —Pig belly skin should be preliminarily treated with S. This operation should precede the oak or pine tanning. The leather obtained can be used for uppers. A. A. Boehltigk

**The determination of iron and manganese in vegetable products.** Andrea Ponte and Renato Allegrini. Boll. ufficiale staz. ind. pelli mat. concianti 11, 297-305(1933).—Several samples of chestnut bark were found to contain approx. 10-40 times as much Fe and Mn as the wood from the same logs. Colorimetric methods were used, Fe being detd. as  $\text{Fe}(\text{CNS})_3$  and Mn as permanganate. J. W. Perry

**Tannery bates. II. The combination of pancreatin with hide substance.** A. Vlček and J. Pospíšil. Gerber. 59, 99-100, 111-14(1933); cf. C. A. 27, 5214.—The ability of hide powder to remove pancreatin from aq.

soln. was studied. It was found that the enzymic action on casein of salt-free, aq. pancreatin solns. was greatly decreased by allowing 200 cc. of the latter to stand in contact with 0.25-8.0 g. of hide substance for 35 min. at lab. temp. This was taken to indicate that the pancreatin was in some way bound by the hide substance. Since the decrease in enzymic activity was not, however, directly proportional to the amt. of hide powder used, it was concluded that certain fractions of the pancreatin combined more readily with the hide substance. No one method appears adequate for detg. the strength and suitability for practical use of enzyme preps. used as tannery bates.

J. W. Perry

**Skinner rabbits and hares and the treatment of furs.** G. S. Katzevas and V. N. Sveshnikova. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Kozhevennoi Prom.* 1932 No. 2, 23-4. After the coarse hair had been cut off, the skins were treated with 8-12% soln. of NaOH, dried, soaked in water at 18° for 20-30 hrs., fleshed, immersed in a soln. of 0.2% NaOH at 30°, washed for 20 min., immersed in a second bath at 25°, contg. 0.4% NaHCO<sub>3</sub>, for 1-2 hrs., washed for 15-20 min., immersed in a third bath contg. 0.4% NaHCO<sub>3</sub>, 0.4% H<sub>2</sub>BO<sub>3</sub>, 3% "sozhal" (prepd. by fermentation with *Aspergillus orizae*) at 35°. This method yielded a satisfactory skin as well as good down. Use of pancreatic ext. produced a good soft leather, but the down was of a lower quality.

A. A. Boehlingk

**A cause of discrepancy in Procter-Searle acidity results.** I. D. Clarke and R. W. Frey. *J. Am. Leather Chem. Assoc.* 28, 580 3(1933).—Data are presented which show that variations in rate of heating may cause a 200 % increase in the apparent percentage of H<sub>2</sub>SO<sub>4</sub> in leather tanned with sulfite cellulose ext. Smaller differences are produced with leathers tanned with sulfited exts., and rate of heating makes no difference with leathers tanned with unsulfited exts.

H. B. Merrill

**Determination of acidity of vegetable-tanned leather.** I. D. Burton, et al. *J. Intern. Soc. Leather Trades Chem.* 17, 710-19(1933).—Collaborative tests showed that the Innes and Atkin-Thompson methods lead to practically the same conclusions when applied to different leathers, some of which were treated with H<sub>2</sub>SO<sub>4</sub>. The Procter-Searle method gave discordant results and in some cases neg. results even when 2% H<sub>2</sub>SO<sub>4</sub> was added to the leather.

H. B. Merrill

**Deterioration of vegetable-tanned leather on storage.** V. Protective action of non-tans. R. Faraday Innes. *J. Intern. Soc. Leather Chem.* 17, 725-56(1933); cf. C. A. 26, 1823. Premature rotting is generally, but not always, assocd. with the presence of catechol tannin. In rotted leathers of catechol tannage the  $p_{H_2O}$  value of the aq. ext. is lower than in that from rotted leathers of pyrogallol tannage. Neither degree of tannage nor grease content has much effect on deterioration. The H<sub>2</sub>SO<sub>4</sub>-H<sub>2</sub>O<sub>2</sub> accelerated aging test (C. A. 26, 1823) is shown to be valid by application to protected portions of old bindings, of which some were sound and some had rotted in exposed parts. Rate of rotting in the test varies with relative humidity; the max. is at 70%. A high content of H<sub>2</sub>O-sol. matter (non-tannin) protects against deterioration. This was demonstrated by impregnating leathers with solns. of tannin and non-tannin (sepd. by absorption of tannin by hide powder and subsequent extrn. with acetone) from sumac, mimosa and gambier, and subjecting the leathers to the peroxide test. This protective action of non-tans may account for more rapid deterioration of catechol-tanned leather, since catechol tanning materials usually have a low non-tannin content. It explains the greater deterioration of dyed as opposed to crust leather. Salts, including NaCl and Na<sub>2</sub>SO<sub>4</sub>, and especially salts of org. acids, are highly effective in protecting against deterioration. The best results were obtained with Na citrate and tartrate. The effect cannot be accounted for by the neutralizing effect of the salts on H<sub>2</sub>SO<sub>4</sub>. Tests with upholstery leathers gave results similar to those with book leathers. A few rotted leathers that do not obtain

1 excessive H<sub>2</sub>SO<sub>4</sub> are found to contain excessive Fe.

H. B. Merrill

**The origin of certain yellowish orange spots which developed on the skins of furs during the finishing operations.** Paolo Buzzi. *Boll. ufficiale staz. sper. ind. pell. mat. concianti* 11, 513-15(1933).—B. traces the development of yellowish spots on the hide parts of furs to incomplete removal of H<sub>2</sub>SO<sub>4</sub> taken up by the hide during the acid-alum tanning process. It is suggested that the spots were due to reaction of the H<sub>2</sub>SO<sub>4</sub> with the cholesterol in the skin. At any rate the removal or neutralization of the free H<sub>2</sub>SO<sub>4</sub> in the hide prevented or corrected the defect.

J. W. Perry

**Studies in the physiology of molds. IV. Molding of chrome-tanned skins.** Irvin H. Blank. *J. Am. Leather Chem. Assoc.* 28, 583-93(1933).—By use of *A. niger* spores on Czapek's medium, the concn. required to (a) inhibit growth and (b) kill the spores was detd. for 28 org. and inorg. compds. Data so obtained are not directly applicable to molding of chrome-tanned skins. By use of chrome-tanned pieces soaked in a 1 to 100 soln. of the compd., and inoculating with *Penicillium* sp., growth was inhibited for 40 days by HgCl<sub>2</sub> and *p*-nitrophenol, 10 15 days by *p*-chlorophenol and Na salt of *p*-chloro-*m*-cresol, 4-7 days by *p*-cresol and HCHO, while CuSO<sub>4</sub>, *o*-nitrophenol, NaH<sub>2</sub>PO<sub>4</sub>, and phenol had no effect. *p*-Nitrophenol, 1 to 20,000, inhibits growth on skins for 13 days. The ratio *p*-nitrophenol : H<sub>2</sub>O governs, not *p*-nitrophenol : skins. Tests with pieces split after impregnation with *p*-nitrophenol showed no mold growth on the split side, indicating good penetration of the antiseptic. Comparative tests showed that *p*-nitrophenol is as effective as 3 times its wt. of the widely used  $\beta$ -naphthol.

H. B. Merrill

**The effect of injuries caused by acarids on finished leather.** Augusto Ganner. *Boll. ufficiale staz. sper. ind. pell. mat. concianti* 11, 230-7(1933).—A careful microscopical examn. of several damaged leathers revealed that defects, which a casual examn. had attributed to various other causes, were very probably actually due to acarids (mites). The need of a close, careful examn., if such mistakes are to be avoided, is emphasized.

J. W. P.

**A. L. C. A. methods of analysis for sulfonated oils (Hart) 27. Waterproofing [leather] (Fr. pat. 753,510) 23. Artificial materials [products for making artificial leather] (Fr. pat. 750,873) 26.**

**Tanning agents.** J. R. Geigy A.-G. Brit. 397,672, Aug. 31, 1933. The agents are prepd. by condensing a non-sulfonated dihydroxydiphenylsulfone with an aromatic sulfonic acid and CH<sub>2</sub>O or S chloride. Particularly suitable sulfonic acids are those of substituted phenol ethyl ethers, such as obtained by etherifying PhOH with glycolchlorohydrin or ethylene dichloride. Among examples (1) naphthalenesulfonic acid (I) is condensed with dihydroxydiphenylsulfone (II) and CH<sub>2</sub>O, (2) the product obtained by sulfonating diphenylglycol ether with 93% H<sub>2</sub>SO<sub>4</sub> is condensed with II and CH<sub>2</sub>O and (3) I and II are condensed with S chloride.

**Tanning compositions.** Johann Huismann and Gustav Mauthe (to I. G. Farbenind. A.-G.). U. S. 1,938,022, Dec. 5. Tanning compns. are obtained by condensing bis(3-aminobenzenesulfonyl)benzidine - *m,m'*-disulfonic acid with 1,2-dichlorobenzene-4-sulfonyl chloride or by other described reactions which form condensation products of the general probable formula R<sup>1</sup>SO<sub>2</sub>-NHRNHSO<sub>2</sub>R<sup>2</sup> where R stands for a benzene, naphthalene or diphenyl radical, both nuclei of the diphenyl radical being linked together directly or by means of a bridge, and R<sup>1</sup> and R<sup>2</sup> represent di- or poly-nuclear aryl-sulfonylarylamide derivs. of the benzene or naphthalene series with chain-like linkage in which the sulfonylimide groups combining the aryl nuclei may be partly replaced by aliphatic or aromatic carboxamide groups, and where at least one nucleus contains a sulfonic acid group, and where all nuclei may be further substituted by halogen or

alkyl or hydroxy or carboxylic or alkylacetyl amino groups. Several examples with details of procedure are given.

**Tannin extract.** Erik Schirm. Ger. 584,541, Sept. 21, 1933. Vegetable tannin exts. are improved by subjecting them to the action of diazonium compds. in order to convert constituents capable of coupling, into azo dyes. Diazonium compds. of  $\text{PhNH}_2$ , its homologs or substitution products, such as aminobenzenesulfonic acids, are preferred. Examples are given.

**Tanning and dyeing.** Matthew M. Merrit (to United Shoe Machinery Corp.). Brit. 397,129, Aug. 11, 1933. Tanning or simultaneous tanning and dyeing is effected by treating the skins, etc., in a bath in which the treating materials are gradually dissolved as treatment proceeds. The skins are placed in the usual salt soln. in a drum with tanning material contained in waxed paper bags, enclosed in outer fabric bags, with or without similarly enclosed dyeing material. The paper bags are ruptured when drumming is commenced, and the material slowly dissolves.

**Tanning hides.** Alphons O. Jaeger (to Selden Co.). U. S. 1,938,388, Dec. 5. Hides are treated with an aq. soln. contg. at least one salt of a condensation product of a carbohydrate such as old sulfite paper pulp, starch or sugar,  $\text{H}_2\text{SO}_4$ , and the polymerization residue from the vaporization of a crude aromatic hydrocarbon such as that from crude anthracene. U. S. 1,938,389 relates to the similar use of an aq. soln. contg. a salt of a condensation product of a carbohydrate, phthalic anhydride, an aromatic hydrocarbon such as crude naphthalene residue and  $\text{H}_2\text{SO}_4$ . U. S. 1,938,390 relates to the similar use of an aq. soln. contg. a condensation product of a carbohydrate such as cellulose, an aromatic hydrocarbon such as crude naphthalene residue and  $\text{H}_2\text{SO}_4$ , after the condensation product has been subjected to the action of a bleaching agent such as a hypohalite. U. S. 1,938,391 relates to the use of an aq. soln. contg. a condensation product, obtained by reaction of a carbohydrate such as cellulose and an aromatic hydrocarbon such as a crude anthracene residue with  $\text{H}_2\text{SO}_4$  and an aldehyde such as formaldehyde or an alkali metal salt of such a condensation product.

**Tanning leather.** J. R. Geigy A.-G. Ger. 579,634, June 29, 1933. Skins and hides are treated with ext. of animal organs such as the liver, spleen, kidney, stomach or blood, and enough  $\text{H}_3\text{BO}_3$  or  $\text{AcOH}$  to give the ext. a  $\text{pH}$  value of 5-6.

**Leather.** La Chevette (Soc. anon.). Fr. 750,728, Aug. 17, 1933. One or more layers of a soln. composed of  $\text{Al}_2(\text{SO}_4)_3$ , oxalic acid,  $\text{BzOH}$ , water, alc. and acetone, in which a dye of any shade is incorporated, is applied to leather.

**Artificial leather.** Julius Votteler's Nachfolger G. m. b. H. Brit. 397,741, Aug. 31, 1933. See Fr. 747,253 (C. A. 27, 4952).

**Artificial leather, etc.** Arthur H. Kilner. Ger. 584,606, Sept. 21, 1933. Fabric such as cotton is impregnated or coated with viscose and passed through a pptg. bath. The product is then passed through a bath of glycerol or other softening agent and finally dried. The product can then be worked up to resemble leather, oil-cloth, etc.

**Finishing furs and skins.** I. G. Farbenind. A.-G. Brit. 396,495, Aug. 10, 1933. Pelts and skins are finished by incorporating with the hairs a prepn. comprising a mono ester of a polyhydric alc. and a soap-forming carboxylic acid, the prepn. being free from alkali. The prepn. may be applied by means of wood shavings impregnated therewith. Suitable esters are those obtained by heating coconut oil and glycerol in the presence of potash soap and the mono esters of the fatty acids of olive, castor, peanut and rape oils, tallow or other vegetable and animal fats and lauric, stearic and oleic acids combined with glycol, glycerol, polyglycerol, sorbitol, manitol, erythritol, etc., and derivs. of such compds., e. g., sulfuric and phosphoric esters thereof.

**Glue.** Breslauer Bankverein E. G. m. b. H. Ger. 581,634, July 31, 1933. Animal glue is caused to exert tension when dry by admixing cork meal and anhyd.  $\text{CaSO}_4$ . A small amt. of talcum may also be added.

**Apparatus for dividing glue solutions or other liquids into drops.** Gustaf Eckerbom (to Stockholms Benmjölsfabriks Aktiebolag). U. S. 1,938,219, Dec. 5. Structural features.

### 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

The automobile tire of 1933 and why it gives outstanding service. C. R. Park. *Ind. Eng. Chem., Anal. Ed.* 11, 343 6(1933).--A semi-popular review, dealing with improvements in construction and compn., with special attention to the use of org. accelerators, protective agents and reinforcing powders as the chief factors in the greatly increased resistance to abrasion of present-day tread rubber mixts.

C. C. Davis

Is litharge an antioxygen or a prooxygen toward rubber? The practical consequences. Charles Dufraisse, Nicolas Drisch and Mme. Denise Pradier-Gibello. *Rev. gén. caoutchouc* 10, No. 94, 3 23(1933); cf. Dufraisse and Drisch, C. A. 26, 3697; 27, 6017.--Systematic expts. on the comparative behaviors upon oxidation of rubber mixts. accelerated with litharge (I) and with diphenylguanidine (II), resp., in the raw state and vulcanized to different degrees, lead to certain conclusions regarding the part played by I during hot and cold oxidation, a subject hitherto unsettled in spite of the work of various investigators (references to which are cited). II was chosen as a control accelerator because of its relatively insignificant effect on autooxidation and its similar activity to that of I. At room temp., mixts. with I absorbed O much more rapidly than did the corresponding mixts. with II, irrespective of the state of vulcanization. Mixts. vulcanized the most oxidized most rapidly. At higher temps. (80-100°) these differences between I and II diminished. There was no proportionality between the rate of oxidation and the percentage of I. To prove whether the more rapid absorption of O with I present is

catalytic or results from the reaction:  $\text{PbS} + 4\text{O} \rightarrow \text{PbSO}_4$ , oxidation was carried far beyond the stage corresponding to transformation of all PbS to  $\text{PbSO}_4$ . The absence of a change in the rate at the satn. point indicated no preferential absorption of O by PbS, but rather a catalytic effect. With the aid of tensile strength and extensibility measurements, a comparison was made of vulcanizates contg. I and those contg. II, both after equal periods of aging (hot and cold) and after equal proportions of O had been absorbed. With II mixts. the extent of deterioration was the same for the same O absorption, both when hot and at room temp., whereas with I mixts. deterioration was far more advanced at a given state of oxidation when the latter was carried out at elevated temp. than at room temp. Judged by the mech. properties, mixts. vulcanized with I or with II behaved in the same way on aging at room temp. (cf. Tener, Smith and Holt, C. A. 21, 4095). On the contrary, the oxidation of mixts. contg. I was 4 times as great as that of mixts. contg. II, and in general at room temp. a given proportion of O was less deleterious in the presence of I. On the basis that I diminishes the bad effect of O on the mech. properties, but promotes O absorption catalytically, the effects of antioxygens were tested. In their diminishing order of effectiveness as antioxygens stood phenyl- $\beta$ -naphthylamine, aldol- $\alpha$ -naphthylamine, dinaphthylamine, hydroquinone, diphenylhydrazine,  $\beta$ -naphthol, cupferron, benzidine, *m*-toluylenediamine, naphthohydroquinone, *p*-nitrosodimethylaniline, *m*-propylguaiacol, trioxymethylene, benzil and quinoline, while *o*-cresotic acid,

hydrazobenzene, piperidine, pyridine and triphenylamine were prooxygen with activities increasing in the order given. The expts. in general show that (1) I is a prooxygen and not an antioxygen as believed in the past; (2) I does not protect rubber against heat; (3) I diminishes the harmful effect of O on the mech. properties of rubber; and (4) this favorable effect of I is more pronounced at room temp. than at elevated temps. The exptl. technic and quant. results are given in detail.

C. C. Davis

Studies on the electrical behavior of rubbers. Takao Hasumi. *J. Soc. Rubber Ind. Japan* 6, 517-24(1933).—Samples were prepd. by compounding 60-80% rubber with S and vulcanizing. Both a. c. and d. c. (1000 cycle) were used for the test. The resistivity (ohm. per cc.) varied inversely with the temp. The dielec. const. was not influenced by a change of temp. (0-100°) except for a few samples which might have been influenced by the percentage of combined S. The puncture voltage (kv. per mm.) was not influenced by an increase of temp. (0-100°).

K. Kitsuta

Effect of changing angles in the aging test by exposure of rubber and a few other articles. Shobei Saito. *J. Soc. Rubber Ind. Japan* 6, 525-32(1933).—Raw and vulcanized rubbers, rubber-coated cloth, silk and vulcanized bitumen were exposed to direct sunlight at angles of 30°, 45°, 60° and 90°, after which chem. and phys. tests for aging were made. The deterioration was not only influenced by the amt. of ultra-violet light received, but the difference in the temps. at the different angles is another factor which should not be overlooked.

K. Kitsuta

A new type of rubber flooring. H. P. Stevens and W. H. Stevens. *Bull. Rubber Growers' Assoc.* 15, 537-44 (1933).—It is practicable to manuf. flooring of any dimensions from mixts. which cure at low temps. and which therefore make possible curing in air at relatively low temps. such as those used for linoleum. Mixts. of rubber, wood flour, color, S, ZnO, ultra-accelerator and a suitable softener and inorg. filler are recommended. These ingredients can be varied according to the phys. properties desired, and a product competitive with linoleum can thus be made.

C. C. Davis

The antioxidants of rubber latex. I. H. F. Bondy, with G. G. Lauer. *Ber.* 66B, 1611-21(1933).—The object of the investigation is to identify the natural antioxidant in raw rubber, to isolate it, and to establish its constitution and mode of action. Contrary to previous investigators, it was believed that changes in viscosity would be a more precise indication of autoxidation and its retardation than would O absorption measurements. Purified balata and purified Et<sub>2</sub>O-sol. *Hevea* rubber were used, and all measurements were carried out in a Ubbelohde viscometer. In agreement with Staudinger and Leopold, it was found that rubber solns. do not autoxidize in darkness. In light the solns. decompd. in the same way, whether or not the natural antioxidant was present. There was no decompn. on exposure in N to light, and only in light and air were pos. results obtained. Ultra-violet light was used for greater uniformity. Heating of the rubber or balata resin in air at 120° increased its protective action. A study of the effects of various components of the acetone-sol. material from rubber showed that stearic acid, the neutral components and acid amides are inactive, that the acids, amino acids and bases of the serum, and that phenols have a slight antioxidant effect, while the basic components account for practically the whole effect of the complete acetone-sol. part of both the rubber and of balata. Those solns. which had the deepest brown color had the least tendency to autoxidize, and further expts. showed that a dye is present in the rubber which retards autoxidation by absorbing the radiation which promotes autoxidation. Tests of known dyes proved that some have a very marked protective effect, whereas others have only a slight effect. The activity of the dyes is sp., with the color alone determinative, so that no chem. action is involved. In general only dyes with a particular absorption spectrum are effective, and later work will correlate their absorption curves with the curve

of the natural antioxidant. In this way wave lengths which influence autoxidation can be detd. C. C. D.

Sulfuric acid as a latex coagulant. J. L. Wiltshire. *Rubber Chem. and Tech.* 6, 415-21(1933).—See C. A. 27, 2336.

C. C. Davis

Diphase rubber. The diphase-forming tendency of rubber as shown by the action of pigments. F. B. Menadue. *India Rubber J.* 85, 689-92, 717-22; 86, 53-4, 56 (1933).—Below certain proportions, the incorporation by milling of pigments into raw rubber does not change materially its soly. in org. solvents. With higher proportions, however, the hardness of the mixt. becomes disproportionately great in view of the increasing mastication. By sepn. of the pigments (e. g., Mg carbonate by AcOH and Et<sub>2</sub>O) and treatment of the rubber with C<sub>6</sub>H<sub>6</sub>, the rubber can be sepd. into an *insol.* A (I) fraction and a *sol.* B (II) fraction. I is also formed when pigments are added to rubber already dissolved in a solvent, though only after the pigmented rubber has been mechanically masticated in the dry state is I formed to any considerable extent. The phenomenon is complex, for continued mastication diminishes the proportion of I, and in general the quantity finally obtained by any particular method varies inversely with the extent of mastication. In general, the smaller the particle size and the greater the sp. surface of the pigment the more effective is the ability of the pigment to form I. Thus under similar conditions, ZnO, MgO, ZnCO<sub>3</sub>, PbO, S, dextrin and Na borate yielded 82, 78.3, 68, 84, 47.2, 32, 2, 0 and 40% of I. With all pigments, the percentage of I increases rapidly to a max. at a definite proportion of pigment, above which it slowly diminishes. The formation of I has an unfavorable effect on the phys. properties of the pigmented rubber when vulcanized, as shown by the low tensile product of vulcanized I compared with that of vulcanized II, in spite of I and II combining with S at about the same rate. I is not an individual substance of definite phys. properties, and its hardness, toughness, resistance to solvents, etc., increase with increase in the proportion formed from the original rubber. The yields of I from different types of rubber are almost the same, but the phys. properties differ; e. g., the product from *Ficus elastica* is softer than that from *Hevea*. The formation of I takes place in industrial mixing, and to a disproportionately great extent in localized parts of a batch where the pigment concn. is momentarily high. Since its formation is a function of the concn. of pigment, time of mastication and method of mixing (pressure and deformation), and since I gives vulcanizates of better quality than does II, certain variations in the quality of com. products may be accounted for thus. On heating I in the absence of air it partially reverts to II, while on heating in air it oxidizes rapidly.

**Temperature coefficient of vulcanization. III. Determination for mixes accelerated with various compounds.** R. E. Morris. *Ind. Eng. Chem.* 25, 1400-2 (1933); cf. *C. A.* 27, 3853.—The temp. coeffs. of a base mixt. of rubber-S-ZnO accelerated with (1) mercapto-benzothiazole (I), (2) I + diphenylguanidine (II); (3) I + neutral II succinate; (4) dibenzothiazyl disulfide (III), and (5) III + Zn dimethyldithiocarbamate, and vulcanized at various temps. (172-306°F.) were detd., and the results compared with temp. coeff. data of other investigators. As judged by modulus data and combined S values, the results were 1.41 and 1.54, 1.41 and 1.54, 1.43 and 1.43, 1.50 and 1.52, and 1.48 and 1.51, for the mixts. accelerated with (1), (2), (3), (4) and (5), resp.

C. C. Davis

**Latex and jute.** F. Harriss Cotton. *India Rubber J.* 86, 598-603 (1933).—Expts. are described which indicate that it should be practical commercially to rubberize jute fabrics by impregnation with latex. Latex of 60% concn., e. g., "Jatex," is recommended, and this may be compounded by known methods to give any type of vulcanizate desired. Vulcanization is effected in hot air or on heated rotary drums, and smooth finishes are obtained by calendering when semi-cured. A wide variety of uses is suggested for rubberized jute. Expts. are described and illustrated which led to the technic and suggestions resulting from the work.

C. C. Davis

Mn in Malayan soils [effect on rubber plant] (Akhurst) 15. Coating cloth with rubber (Fr. pat. 753,873) 25.

**Rubber.** Mario Paldini (to Società italiana Pirelli). U. S. 1,938,011, Dec. 5. A plastic dough is formed of disintegrated rubber together with an emulsion of oxygenated alicyclic compds. such as cyclohexanol in which rubber is insol.; the dough is emulsified in water contg. a water-miscible colloid such as soap and rubber compounding ingredients such as S, ZnO and an accelerator are added to form a compn. which is suitable for manuf. of articles by dipping, etc.

**Rubber.** Lucien Gaisman. Fr. 750,938, Aug. 22, 1933. See Brit. 386,846 (*C. A.* 27, 6030).

**Rubber.** Duhois & Kaufmann G. m. b. H. Fr. 753,476, Oct. 17, 1933. Factice, before mixing with rubber for vulcanization, is heated in the presence of water or steam toward 100°, with or without pressure, and with the addn. of substances which combine with the HCl formed, until the unstable Cl in the factis is eliminated. The vulcanization accelerators are incorporated with the factice before its introduction into the rubber soln.

**Rubber solutions.** I. G. Farbenind. A.-G. Fr. 751,535, Sept. 5, 1933. Rubber solns. of high concn. but of very reduced viscosity are made by dissolving rubber in the unmasticated state in a suitable solvent under the influence of air or O and in the presence of compds. of metals which are O carriers. High temps. are preferred and chemically active rays accelerate the process. The solns. obtained may be chlorinated, ozonized or sulfonated, alone or mixed with aromatic hydrocarbons, or may be submitted to the action of compds. causing cyclicization, such as AlCl<sub>3</sub>, POCl<sub>3</sub> or ClHSO<sub>3</sub>. Examples are given.

**Rubber compositions.** Compagnie française pour l'exploitation des procédés Thomson-Houston. Fr. 42,447, July 19, 1933. Addn. to 683,772. Rubber and an alkyl resin are assocd. to give a flexible product resistant to the action of mineral oils and hydrocarbons. Thus a suspension of an alkyl resin in a soln. of NH<sub>3</sub> is made and mixed with a concd. soln. of latex, e. g., "Revertex," and the whole is coagulated by AcOH. The product is mixed with S, a vulcanization accelerator, fillers, etc., and vulcanized.

**Rubber compositions.** Paul Bary and Lucien Graffé. Fr. 752,736, Sept. 29, 1933. Pptd. basic carbonates, e. g., of Zn, are used as dry powders or aq. pastes as reinforcing substances for rubber. The Zn compd. is sol.

in rubber to above 5% and gives clear products therewith.

**Rubber-like compositions.** Waldo L. Semon (to The B. F. Goodrich Co.). Brit. 398,091, Sept. 7, 1933; Fr. 751,504, Sept. 5, 1933. See U. S. 1,929,453 (*C. A.* 28, 371).

**Anti-agers for rubber, etc.** I. G. Farbenind. A.-G. (Brich Rietz, inventor). Ger. 583,342, Sept. 2, 1933. Addn. to 564,912 (*C. A.* 27, 1235). Aging in natural or synthetic rubber is prevented by the products obtained by condensing *ar*-tetrahydro-*a*-naphthylamine with AcH, crotonaldehyde or aldol in the presence of a water-sol. alc. in weakly acid soln., the product being finally treated with hot water. Examples are given. Cf. *C. A.* 27, 3112.

**Rubber oxides.** The International Latex Processes Ltd. Fr. 754,030, Oct. 30, 1933. In making threads, filaments or tubes of rubber, etc., from aq. dispersions by passage from orifices into a dehydrating and solidifying liquid, this liquid is composed of a concd. soln. of a salt of a weak acid capable of being highly dissoed. and hydrolyzed (the *pH* value is preferably not below 5), and to the aq. dispersions are added inactive substances which are decomposed when they come in contact with the feebly acid liquid to give substances causing coagulation of the dispersions, e. g., NH<sub>4</sub> soaps, ethanolamine, fatty acids and colophony.

**Rubber thread.** The International Latex Processes Ltd. Fr. 754,241, Nov. 3, 1933. Apparatus for making and drawing the thread is described.

**Elastic threads.** Dunlop Rubber Co. Ltd. and Felicite A. H. Heynert. Brit. 397,890, Sept. 1, 1933. Rubber threads are coated and ornamented by rendering the surface adhesive, e. g., by treating with solvents or application of rubber, celluloid and cellulose, varnishes, (synthetic) resins, linseed oil, glue, and then applying a coating thereto, e. g., of cork dust, paper, comminuted cotton linters, powd. crumb rubber, asbestos.

**Apparatus for making sheets, threads or filaments of rubber.** The International Latex Processes Ltd. Fr. 753,974, Oct. 28, 1933.

**Filaments, films, etc., from rubber.** I. G. Farbenind. A.-G. (Otto Schmidt, inventor). Ger. 583,145, Aug. 29, 1933. Addn. to 568,906 (*C. A.* 27, 2845). The method of 568,906 for producing filaments, etc., by treating rubber-like butadiene condensation products with sulfurizing agents is modified by using inorg. S compds. such as S<sub>2</sub>Cl<sub>2</sub>. Examples are given.

**Apparatus for making rubber bands or sheets.** The B. F. Goodrich Co. Fr. 754,033, Oct. 30, 1933.

**Rubber articles.** Jacques Aumaréchal. Fr. 751,531, Sept. 5, 1933. See Brit. 386,464 (*C. A.* 27, 6022).

**Apparatus for making dipped rubber goods such as finger cots or nipples.** John R. Gammeter. U. S. 1,938,420, Dec. 5. Structural and mech. features.

**Transformation products of rubber.** The Walpamur Co. Ltd. Fr. 752,502, Sept. 23, 1933. Crude or laminated rubber is treated in the presence of an agent formed exclusively or partly of a compd. contg. P, O and Cl, the proportion of O in the compd. being higher than that in POCl<sub>3</sub>. The reagent may be obtained by partially hydrolyzing PCl<sub>5</sub> or POCl<sub>3</sub> or as the residue from the distn. of a mixt. of H<sub>3</sub>PO<sub>4</sub> and PCl<sub>5</sub> or POCl<sub>3</sub>. The Cl may be replaced by Br and the products may be chlorinated or brominated. The products are used for making plastics, films, paints, varnishes and elec. insulators, etc.

**Inner tubes, etc.** The Goodyear Tire & Rubber Co. Brit. 397,467, Aug. 16, 1933. Pneumatic rubber articles are coated with a gas-impermeable extensible film that adheres to the article and stretches therewith. The film preferably comprises a gel-forming colloid, e. g., gelatin, glue, casein, hemoglobin and a plasticizer, e. g., glycerol, polyglycerol, and may be applied to the article prior to vulcanization, in which case vulcanization must be effected in the absence of solvents for the colloid. Rubber latex may be added to assist adhesion to the surface of the article. In an example an inner tube is coated with a

film consisting of 6 coats having varying proportions of latex to gelatin.

**Inflated balls, etc.** Dunlop Rubber Co. Ltd., Douglas P. Twiss, Albert E. T. Neale and Albert S. Carpenter. Brit. 397,209, Aug. 24, 1933. The inflation pressure of tennis balls and other permanently sealed objects is maintained or rehabilitated by a continuous generation of gas at an appropriate rate inside the object by embodying therein a substance or substances generating gas. One or more of the gas-generating substances is preferably incorporated in the material of the walls or in a mixt. applied to the inner surface of said walls. A suitable mixt. is rubber 100, mercaptobenzothiazole 1.3, S 3, ZnO 5, stearic acid 1 and  $Al_2C_3$  30 parts. Such a mixt. can be vulcanized and in the presence of  $H_2O$  generates  $CH_4$  at a suitable rate. Alternatively the gas-generating substance (s) may be supported in gelatin-glycerol jelly, the rate of generation being controlled by the H-ion concn. Suitable gas-generating substances are Al, Zn,  $BaO_3$  and  $MnO_2$ , urea and oxalic acid with a soln. of  $NaNO_2$ ,  $H_2O_2$ , etc.

**Covering balls.** Dunlop Rubber Co. Ltd., Samuel G. Hall and Ernest W. Allen. Brit. 396,530, Aug. 10, 1933. In the application of a cover of unvulcanized rubber, balata, gutta-percha, etc., or a mixt. thereof, to the core of a golf, etc., ball a thin layer is applied and then a sec. layer to complete the ball which is allowed to dry, vulcanized or semivulcanized by a gas or "cold" process and finally molded. The final molding may include such steps as rolling or cold pressing and is completed by heat treatment in a 2-part mold.

**Rubber coatings.** Accumulatoren-Fabrik A.-G. Fr. 750,937, Aug. 22, 1933. A viscous material which may be used for coating articles is obtained by adding to aq. dispersions of rubber, besides the usual filling materials and vulcanizers, cations of one or more metals, anions of one or more weak acids,  $NH_3$  and sol. glass, e. g.,  $ZnCO_3$ ,  $Na_2SiO_3$  and  $NH_4$ .

**Coating articles.** Dunlop Rubber Co. Ltd., The Anode Rubber Co. Ltd., Edward A. Murphy and David N. Simmons. Brit. 397,270, Aug. 24, 1933. A coating compn. for producing a smooth mat finish on articles, e. g., on fabric or rubber surfaces consists of a flocculent ppt. of rubber, obtained from an aq. dispersion thereof, admixed with starch. In an example 100 parts of 60% latex are dild. to 5%, a 5% soln. contg. 120 parts  $Na$  silicate and then a 5% soln. contg. 96 parts  $Al_2(SO_4)_3$  are stirred in to form the ppt. which is drained on a filter plate to a mass contg. 15-16% solids and starch, equal in wt. to that of the solids, is ground in until a smooth cream is obtained which may be dild. as required. Vulcanizing, compounding, etc., ingredients may be added.

**Coated articles.** Dunlop Rubber Co., Ltd., The Anode Rubber Co. Ltd. and Geoffrey W. Trobridge. Brit. 397,277, Aug. 24, 1933. Fibrous sheets, e. g., woven or

knitted fabric, felt, papier mâché, cardboard, compressed paper, are coated by applying aq. dispersions of rubber, including coagulated, vulcanized, synthetic, waste or reclaim rubber, gutta-percha, balata or similar vegetable resins, by spreading, dipping or spraying, superposing a sheet or sheets of heat-conducting material, e. g., Al, which may be embossed or engraved, subjecting to heat and pressure and removing the heat-conducting sheet(s). The manuf. of a floor mat is described.

**Rubberizing difficultly penetrable materials such as rope, belting, etc.** Merwyn C. Teague (to General Rubber Co.). U. S. 1,936,999, Nov. 28. The material is treated with an aq. rubber dispersion contg. sulfonated castor, cottonseed, olive or peanut oils, *o*-toluidine, Na sulfanilate, thiourea, Na salicylate,  $NH_4$  linolenate or isolinolenate, saponin, Na dihydroxynaphthalenedisulfonate, K oleate or Na naphthalenesulfonate, and is then dried.

**Rubber insulation for electrical conductors such as wire.** Harold D. Rice (to National India Rubber Co.). U. S. 1,936,994, Nov. 28. Insulation is formed of vulcanized and grainless unmilled rubber compn. contg. not more than 5% of natural non-rubber constituents.

**Artificial rubber dispersion suitable for use as an adhesive.** Charles P. MacIver (to Dispersions Process, Inc.). U. S. 1,938,078, Dec. 5. A stable adhesive compn. is prepd. contg. dried formaldehyde-treated rubber latex having the rubber suspended in finely divided form in an aq. menstruum contg. a water-sol. soap.

**Adhesive.** Wm. F. Zimmerli and Robert S. Havenhill (one-half each to B. F. Goodrich Co. and to Chrysler Corp.). U. S. 1,937,861, Dec. 5. A non-aq. adhesive compn. suitable for securing rubber matting to floors comprises approx. equal proportions of reclaimed rubber of high-rubber content and rosin and a small proportion of a lime soap.

**"Imitation rubber."** Shozo Fuji and Tatsuzo Fukuda. U. S. 1,938,015, Dec. 5. A vegetable oil such as perilla oil is heated to about  $250^\circ$  and mixed with 5-10% of Pb carbonate. The mixt. is gradually heated to about  $300^\circ$  and the heating is continued until the Pb carbonate decomposes, liberating  $CO_2$  and forming a Pb salt with the oil. The product thus obtained may be used for coating metals, wood or cloth, etc.

**Carbon for use in vulcanizing rubber.** Carbonfix Soc. anon. Ger. 580,886, July 18, 1933. In vulcanizing rubber with addn. of C, the C obtained by the wet coking of lignite in the presence of heavy metal catalysts is used. The C is washed with alkali carbonate soln. and dried at low temps. in the absence of air before use. Examples are given.

**Regenerating vulcanized rubber.** Ernest Bemelmans. Ger. 584,892, Sept. 26, 1933. Vulcanized rubber is regenerated by heating in air till a dry distn. ensues. Preferably the rubber is heated to  $130^\circ$ . The heated mass may be heated by hot rollers and may be revulcanized.

# CHEMICAL ABSTRACTS

Vol. 28

MARCH 10, 1934

No. 5

## 1-APPARATUS AND PLANT EQUIPMENT

W. L. RADGER

An improved melting-point apparatus and a comparative study of several types of apparatus for melting-point determinations. Chao-Lun Tseng. *J. Chinese Chem. Soc.* 1, 143-82(1933).—Mulliken's m.-p. app., modified to use a smaller flask and shorter thermometer, is superior to an open beaker, the Thiele tube and Fisher's app.

New apparatus and method for mechanical phase analysis. F. V. Suiromyatnikov. *Mineral. Svir's* 8, Nos. 8-9, 17-25(1933).—A somewhat modified lab. centrifugal separator is described.

Unitized gas-analysis apparatus. Maryan P. Matuszak. *Ind. Eng. Chem., Anal. Ed.* 6, 72-8(1934).—The app. combines the advantages and eliminates the disadvantages of the Hempel and Orsat systems, and is described with 15 cuts and 17 references.

A new color comparator. J. W. Forrest. *Paper Trade J.* 97, No. 22, 38-9(1933).—A brief review of the Munsell color system, together with a description of the Bausch & Lomb color comparator developed to utilize the Maxwell rotating-disk procedure in a way that provides greater ease of manipulation.

New apparatus for determination of size distribution of particles in fine powders. Robert T. Knapp. *Ind. Eng. Chem., Anal. Ed.* 6, 66-71(1934).—The "Microneter," based on the sedimentation principle, is described in detail with 13 cuts and 5 references.

An automatic, modified falling-sphere viscometer. R. A. Jones. *Ind. Eng. Chem., Anal. Ed.* 6, 80-4(1934).—A description, with 5 cuts and 11 references, of an electrically indicating app. designed primarily for factory control of the consistency of rubber cements, but applicable to other viscosity detns.

Technic of combustion with chlorine. Józef Brdós and Béla Groák. *Z. anal. Chem.* 95, 327-9(1933).—An app. is shown which is suitable for destroying org. matter by the action of HCl and a satd. soln. of NaClO<sub>2</sub>. It consists of an 800-ml. Kjeldahl flask with provision in the glass stopper for a dropping funnel and a short condenser. At the top of the condenser is a 2-bulb tube contg. NaOH soln. to prevent the escape of Cl<sub>2</sub> fumes. Details are given for decomp. 200 g. of stools prior to the detn. of Pb.

A new method of producing maximum pressures and temperatures. Carl Ramsauer. *Physik. Z.* 34, 890-4(1933).—An app. for exptl. work with gases is shown with 4 cuts, and the method is discussed mathematically.

Glass and other electrodes for measuring  $p_{\text{H}}$  values of very dilute buffers and of distilled water. John O. Burton, Harry Matheson and S. F. Acree. *Ind. Eng. Chem., Anal. Ed.* 6, 79(1934).—A modified Partridge glass electrode-potentiometer system (cf. *C. A.* 23, 1312) gives a sensitivity of 0.007 mv. per mm. scale division with 0.0001 M Na acid phthalate soln. and 1 mv. for distd. water. Glass electrode values for  $p_{\text{H}}$  agree with those detd. by the isohydric indicator method but are more trustworthy for colored, turbid, oxidizing or reducing solns.

New type of antimony electrode for  $p_{\text{H}}$  measurements. T. R. Hall, Webster B. Schmidt and Karl S. Bergstresser. *Ind. Eng. Chem., Anal. Ed.* 6, 80-1(1934).—Data on the prepn. of, and results obtained with, sulfide-coated electrodes are given.

Vacuum photoapparatus. V. I. Arkharov. *J. Tech.*

*Phys.* (U. S. S. R.) 3, 493 9(1933).—Six diagrams are shown.

Pyrometric economies. W. Bowen. *Ice and Cold Storage* 36, 168(1933).—The various metals used in thermocouples are discussed. The so-called Pyrofer thermocouple was recommended.

The use of the thyatron for temperature control. R. M. Zabel and R. R. Hancox. *Rev. Sci. Instruments* 5, 28-9(1934).

Coating W wire [core for discharge-tube cathodes] (Ger. pat. 588,414) 9.

Stohn, Rudolf: Temperaturregler. Berlin: V. D. I.-Buchhandlung. 177 pp. M. 6; bound, M. 7.

Chemical distilling apparatus, etc. Rudolf Lowag. Ger. 584,283, Sept. 18, 1933 (Cl. 12a. 1). Addn. to 567,979 (C. A. 27,2604).

Apparatus for effecting exothermic catalytic gas reactions. L'Air Liquide (Soc. anon. pour l'étude et l'exploitation des procédés Georges Claude). Ger. 585,278, Nov. 14, 1933 (Cl. 12g. 4.02). See Brit. 268,722 (C. A. 22,1444) and 275,592 (C. A. 22,2248).

Apparatus for effecting exothermic catalytic gas reactions under pressure. Hans Harter. Ger. 589,014, Dec. 1, 1933 (Cl. 12b. 3). See Brit. 325,028 (C. A. 24,3678).

Apparatus for sampling liquids. Ed. Sprenger optisch-mechanische Werkstätten. Ger. 589,048, Dec. 1, 1933 (Cl. 42l. 18). The app. is combined with means for detg. the temp. and sp. gr. of the liquid.

Liquid-sampling and -testing device suitable for testing milk for dirt or sediment. Christian E. Brackbill. U. S. 1,939,873, Dec. 19. Various structural and operative details are described.

Core-taking apparatus suitable for taking samples of material in drilling. Granville A. Humason (to Reed Roller Bit Co.). U. S. 1,940,866, Dec. 26. Mech. features.

Apparatus for controlling or indicating the level of material, e. g., a conducting liquid, in a container. Joakim U. F. Andersen. Brit. 398,065, Sept. 7, 1933.

Glass colorimeter plunger. Gustave Fassin (to Bausch & Lomb Optical Co.). U. S. 1,939,547, Dec. 12. Structural details.

Temperature indicators. British Celanese Ltd., George H. Ellis and Alexander J. Wesson. Brit. 397,520, Aug. 25, 1933. A solid mass of a compn. contg. fusible and (or) sublimable substance(s), e. g., BiBr<sub>3</sub>, Se, K pyrosulfite, 1,5-dinitronaphthalene, anthraquinone-disulfonic acid, anthracene (I) and a filler, e. g., chalk, fuller's earth, ZnO, powd. pigments, is applied to surfaces to be tested, e. g., of an iron or calender for textile operations, and leaves a deposit of filler if the temp. thereof is above the melting or subliming point. Substances, e. g., C<sub>12</sub>H<sub>11</sub> in the case of I, may be added to lower the m. p. The fillers may be colored by dyes, e. g., Lithol Fast Yellow 2G, Sudan 2G, *p*-chloro-*o*-nitroaniline, 2,6-dinitro-4-methylaniline, Fast Oil Orange T, Fast Oil Scarlet 2R, which sublime and (or) change color at about the desired temp. of the surface.

Differential pressure gage for use with liquid flow

- meters. **Electrode Meters Co. Ltd. and Friedrich V. A.** *E. Engel. Brit. 398,558, Sept. 21, 1933.*
- Vacuum pumps.** **The British Thomson-Houston Co. Ltd. and Frank P. Whitaker.** *Brit. 398,902, Sept. 25, 1933.*
- Apparatus (with parallel shafts carrying rotating disks) for classifying ores, coal, etc.** **Hans-Joachim Jöhlige (to Fried. Krupp Grusonwerk A.-G.). U. S. 1,941,147, Dec. 26. Structural and mech. features.**
- Filters.** **Maurice Hanslin and Charles Kyburz.** *Fr. 755,265, Nov. 22, 1933.* Each filtering unit is composed of a vat in which are disposed 2 or more perforated hollow plates connected alternately to a lead-in and a lead-out for the liquid, the entry and exit plates being sepd. by an appropriate filtering mass.
- Ultrafilter.** **Eugen Haas.** *Ger. 585,947, Oct. 13, 1933.*
- Air filter.** **Gordon Wallace.** *U. S. 1,940,034, Dec. 19.*
- Air filter suitable for use with sterilizing chambers.** **Ronald G. Canti and Joseph Robinson.** *U. S. 1,939,103, Dec. 12.*
- Filter for ultra-violet light.** **Robert B. Withrow (to General Development Laboratories, Inc.). U. S. 1,938,734, Dec. 12. A relatively thin sheet of flexible regenerated cellulose has adsorbed in its surface a filtering substance such as phthalic anhydride, K H phthalate or Na benzoate substantially opaque to wave lengths in the ultra-violet region lying below 2900 Å.**
- Filter suitable for use with oils.** **Lewis L. Scott.** *U. S. 1,938,934, Dec. 12.*
- Oil filter.** **Wm. A. McLean (to C. Schnackel's Sons, Inc.). U. S. 1,941,311, Dec. 26.**
- Oil and gas separator (having an upright tank with baffles).** **Jay P. Walker and Elmer R. Williams (to National Tank Co.). U. S. 1,941,028, Dec. 26. Structural features. *U. S. 1,941,030 (Elmer R. Williams to (Nat'l Tank Co.))* also relates to a separator construction.**
- Apparatus for separating oil and water or other liquids (or liquids and solids) of different specific gravities.** **Wm. R. Mobley.** *U. S. 1,938,604, Dec. 12.* Various structural and operative details are described.
- Apparatus suitable for filtering liquids by gravity or suction.** **Arthur P. Dieman.** *U. S. 1,940,208, Dec. 19.* Structural details are given of a filter comprising a grid having a hollow hub provided with an axial bore and a covering of filtering material such as cloth.
- Filtering material.** **Henry S. Montgomery (one-half to H. A. Brassert & Co.). U. S. 1,939,860, Dec. 19. A material suitable for filtering hydrocarbon liquids, etc., is prepd. from the lighter portion of screened, washed and elutriated mineral wool, mixed with diatomaceous earth which has been cleaned to remove colloidal, clayey and sandy matter.**
- Laboratory apparatus for separating finely divided particles of minerals of high specific gravity, e. g., gold, platinum, from raw material by currents of water.** **Carl T. Rauschenbusch and Felix Rauschenbusch.** *Brit. 397,319, Aug. 24, 1933.*
- Apparatus (with an air-pervious table) for separating different solids such as those of ores or coal mixtures.** **Richard Peale (to Peale-Davis Co.). U. S. reissue 19,021, Dec. 12. A reissue of original pat. No. 1,832,048 (C. A. 26, 683).**
- Apparatus for separating mixtures of materials, e. g., coal and stone, having different rolling or sliding velocities.** **James A. Cook.** *Brit. 398,210, Sept. 5, 1933.*
- Apparatus for separating dust and small particles from granular materials, e. g., coal.** **The General Electric Co. Ltd. and Arnold Kay.** *Brit. 396,828, Aug. 17, 1933.*
- Classifier suitable for separating ground cement clinker, etc., from gas currents.** **Marcel A. Lissman (to International Precipitation Co.). U. S. 1,939,710, Dec. 19. Various structural and operative details are described.**
- Device and method for removing dust from gases.** **Eugene C. Saint-Jacques.** *Brit. 398,779, Sept. 21, 1933.*
- Differential-flow apparatus for separating solids or liquids from gases or vapors.** **Eugen Haber.** *Ger. 585,277, Oct. 10, 1933.*
- Centrifuge for the continuous separation of solids from liquids.** **Herbert Schulz.** *Brit. 398,821, Aug. 17, 1933.*
- Centrifugal apparatus for separating dust from gases.** **Gebrüder Bühler.** *Ger. 587,474, Nov. 3, 1933.*
- Centrifuge for purifying liquids.** **Maskin-och Bruyggnads Aktiebolaget.** *Ger. 588,263, Nov. 16, 1933 (Cl. 82b. 7).*
- Centrifugal apparatus for producing foam by agitating a foam-forming liquid with a gas.** **Drysdale & Co. Ltd. and John W. W. Drysdale.** *Brit. 398,002, Sept. 7, 1933.*
- Centrifugal hydro-extractors.** **Edward L. Clapham.** *Brit. 396,863, Aug. 17, 1933.*
- Adjustable feed device for centrifugal drum.** **Maschinenfabrik Buckau R. Wolf A.-G.** *Ger. 585,138, Sept. 29, 1933.*
- Apparatus for testing gases.** **Siemens-Schuckertwerke A.-G. (Emil Duhme, inventor).** *Ger. 588,383, Nov. 17, 1933 (Cl. 42f. 4.10).* An app. is described of the type in which the gas to be tested surrounds an electrically heated conductor, the resistance of which varies with variations in the thermal cond. of the gas.
- Diffusion apparatus for indicating foreign gases in air.** **Paul Sewerin and Heinrich Sewerin.** *Ger. 588,180, Nov. 13, 1933 (Cl. 42f. 4.12).*
- Means for mixing gases in flow in proportionate quantities.** **Ferdinand P. Choubry.** *Brit. 397,675, Aug. 31, 1933.*
- Gas-cleaning apparatus suitable for dust separation.** **Frederick H. Wagner.** *U. S. 1,940,190-7-8-9, Dec. 19.* Various structural and operative details are described.
- Apparatus for treating gases such as smoke by passing through water.** **Edward A. Bertram.** *U. S. 1,939,949, Dec. 19.* Structural features.
- Gas compressor, which may be built into an armature of an electric driving motor.** **Robert Bosch A.-G.** *Brit. 398,719, Sept. 21, 1933.*
- Device for introducing gases into flowing liquids.** **Gustav Schlick.** *Ger. 583,849, Sept. 11, 1933.*
- Device for introducing gases into flowing liquids.** **Gustav Schlick.** *Ger. 585,595, Oct. 7, 1933.* Addn. to 583,849 (preceding abstr.).
- Apparatus for mixing gases and liquids.** **Fritz Garthe.** *Ger. 586,830, Sept. 27, 1933 (Cl. 12e. 4.01).*
- Device for washing two mutually insoluble liquids by countercurrents.** **Heinrich Koppers A.-G.** *Ger. 585,517, Oct. 10, 1933.*
- Apparatus for heating and cooling flowing liquids.** **Walter König.** *Ger. 585,534, Oct. 5, 1933.*
- Apparatus (of the drum and coil type) for cooling liquids such as water.** **Richard H. Brewer (to Halsey W. Taylor Co.). U. S. 1,940,741, Dec. 26. Structural features.**
- Apparatus for emulsifying liquids.** **Wm. M. Melmore and Fluid Pressure Pumps Ltd.** *Brit. 399,014, Sept. 28, 1933.*
- Apparatus for thickening liquid suspensions.** **John F. Borden (to Oliver United Filters Inc.). U. S. 1,940,903, Dec. 26. Various structural and operative details are described.**
- Flexible walled bags or like containers for liquids, e. g., rubber latex, intended to form the inner members of double-walled transport cases.** **Marcel Dupret.** *Brit. 397,644, Aug. 31, 1933.*
- Drying apparatus.** **Büttner-Werke A.-G.** *Ger. 589,141, Dec. 2, 1933 (Cl. 82a. 1.02).* App. is described in which the material to be dried is circulated in suspension in a heated gas. The cycle includes means for sepg. dried and wet material by taking advantage of the difference in sp. gr.
- Drying apparatus (plate type).** **Karl Neynaber.** *Ger. 589,009, Dec. 2, 1933 (Cl. 82a. 1.01).*
- Device for rapidly drying liquids.** **Georg F. Stieger.** *Ger. 585,515, Oct. 12, 1933.* Addn. to 583,848 (C. A. 28, 936<sup>b</sup>).
- Rotary-drum drier.** **Heinrich Kröger.** *Ger. 586,503, Oct. 21, 1933 (Cl. 82a. 21.01).*
- Rotary drying drums, furnaces, etc.** **I. G. Farbenind. A.-G. (Karl Heil, inventor).** *Ger. 588,339, Nov. 18, 1933 (Cl. 82a. 19.01).* Means is described for sealing an aperture in a wall through which a rotary tube or drum extends.
- Drying drum with connected cooling drum.** **Maschinen-**

- fabrik Buckau R. Wolf A.-G. Ger. 588,262, Nov. 16, 1933 (Cl. 82a. 19.04).
- Drying drum for sludges and pastes. Fritz Haas. Ger. 588,261, Nov. 20, 1933 (Cl. 82a. 19.01).
- Vacuum drier. Mako & Vacuumtrockner G. m. b. H., Ges. für industrielle Chemie und Technik. Ger. 585,800, Oct. 11, 1933.
- Circulatory evaporating apparatus. Wilhelm Vogelbusch. Ger. 581,653, Aug. 1, 1933. Addn. to 537,185 (C. A. 26, 879).
- Tubular evaporators of the barometric type for evaporating acid liquors. James Strachan, James Holmes and Henry A. Kingcome. Brit. 398,004, Sept. 7, 1933.
- Evaporation or distillation system for high-boiling substances such as fatty acids. Metallges. A.-G. Ger. 589,013, Dec. 1, 1933 (Cl. 12a. 47).
- System for heating evaporators, driers, distillation vats, etc., by superheated steam. Metallgesellschaft A.-G. Fr. 754,919, Nov. 16, 1933.
- Device for the rapid estimation of the water content of solid bodies by evaporation. Norddeutsche Seekabelwerke A.-G. (Gustav Becker and C. Traugott, inventors). Ger. 586,696, Oct. 24, 1933 (Cl. 42f. 9.50).
- Device for filling (and preventing overfilling) of warm evaporators for liquefied gases. Christian W. P. Heylandt (to Flüga A.-G.). U. S. 1,941,304, Dec. 26. Various structural details are described.
- Gas-fired furnaces. Julius Pintsch A.-G. Ger. 585,436, Oct. 11, 1933. A device for regulating the admixture of the gas with air is described.
- Regenerative flame furnace fired with cold coke-oven gas. Hoesch-Köln Neuessen A.-G. für Bergbau und Hüttenbetrieb. Ger. 589,395, Dec. 12, 1933 (Cl. 24c. 6). Addn. to 507,211 (C. A. 27, 2351).
- Rotary furnace for burning asphalt, tar, acid resin and other difficultly combustible materials. Metallges. A.-G. (Carl P. Debusch, inventor). \*Ger. 588,232, Nov. 21, 1933 (Cl. 24b. 2.01).
- Furnace for drying, carbonizing and like thermal processes. André Bourdet. Ger. 587,510, Nov. 4, 1933 (Cl. 10a. 38.01). Addn. to 514,068 (C. A. 25, 1346-7). The furnace for calcining gypsum described in Ger. 514,068 is used for other thermal processes, e. g., for distg. wood. Modifications in the construction of the furnace are described.
- Inclined furnace suitable for conditioning adsorbent clays, activated carbon or other finely divided adsorbent materials by heating and treatment with air, etc. Norris S. Evans and Carl H. Alsborg (to L. Sonneborn Sons, Inc.). U. S. 1,939,678, Dec. 19.
- Apparatus for circulating the atmosphere in a tunnel furnace. Stanley R. Hind and Brittain Adams, Jr. Brit. 399,436, Oct. 5, 1933.
- Tunnel kiln with parallel drying channels. Erika Lengersdorff. Ger. 575,106, Nov. 23, 1933 (Cl. 80c. 5).
- Safety device for gas-fired furnaces. Franz Baessler. Ger. 589,030, Dec. 1, 1933 (Cl. 24c. 3).
- Burner and tuyère suitable for use with gaseous fuel. Garnet W. McKee. U. S. 1,938,851-2, Dec. 12.
- Pressure gas burners for furnaces. Walter Jönsson and Selas A.-G. Brit. 397,813, Aug. 31, 1933.
- Hydraulic apparatus for tilting converters. Demag A.-G. Ger. 588,216, Nov. 14, 1933 (Cl. 18b. 17).
- Hydraulic apparatus for tilting furnaces, etc. Demag A.-G. Ger. 588,436, Nov. 18, 1933 (Cl. 18b. 3).
- Regenerative preheater for air suitable for use with boiler furnaces. Armando S. Villasuso. U. S. 1,939,153, Dec. 12. Numerous structural details are described.
- Bottom for slag-tap furnaces. Bartley E. Broadwell (to Republic Carbon Co.). U. S. 1,940,115, Dec. 19.
- slag-tap steam-boiler furnace bottom comprises a monolithic carbon layer supported by a layer of unbonded granular material such as sand.
- Apparatus for swelling and rendering porous liquid furnace products such as slag. Carl H. Schol. U. S. 1,939,138, Dec. 12. Mech. details of an app. in which successive portions of the material may be treated with various liquids, etc.
- Heat exchanger (plate type). John E. Watson and V. S. Lewis. Ger. 585,189, Sept. 30, 1933. This corresponds to Brit. 372,961 (C. A. 27, 2354).
- Tubular heat-exchange apparatus suitable for use as a surface condenser. Francis C. W. Wilkinson (one-half each to Crane Packing Co. and Crane Packing Ltd.). U. S. 1,941,194, Dec. 26. Structural features.
- Heat-exchange apparatus suitable for heating air or water, etc. Charles C. Hansen (to Chase Cos.). U. S. 1,938,588-9, Dec. 12. Structural features.
- Heat-exchange apparatus suitable for condensing steam and heating water. Fred H. Schaub. U. S. 1,939,415, Dec. 12. Various structural and operative details are described.
- Apparatus for effecting heat exchange between gases and solids or liquids. Arno Andreas. Ger. 585,497, Oct. 9, 1933. Addn. to 535,056 (C. A. 26, 880).
- X-ray apparatus. Oscar H. Pieper. U. S. 1,941,270, Dec. 26. Structural and elec. details.
- X-ray-tube cooling system. Julius Wantz (to General Elec. X-Ray Corp.). U. S. 1,938,946, Dec. 12. Various structural and operative details are described.
- Cathode-ray tubes. Electric & Musical Industries Ltd. Fr. 754,518, Nov. 8, 1933. Means for concentrating and delimiting the electron pencil emitted from the cathode.
- Anticathodes, with tungsten reflecting surfaces, for Röntgen tubes. Heraeus Vacuumschmelze A.-G. and Wilhelm Rohn. Ger. 589,322, Dec. 8, 1933 (Cl. 21g. 17.02). Manufg. details are described.
- Electron tube. The M-O Valve Co. Ltd. Fr. 754,967, Nov. 17, 1933. Construction of cooling grating is given.
- Protection means for thermionic and like tubes. N. V. Thermion Radiolampenfabriek. Fr. 754,773, Nov. 14, 1933.
- Thermionic valves. Radio Patents Corp. and Hans E. Hollmann. Brit. 398,263, Sept. 14, 1933.
- Thermionic valves. The M-O Valve Co. Ltd., Colin J. Smithells and Geoffrey W. Warren. Brit. 398,607, Sept. 21, 1933.
- Thermionic valves. Eugene A. Giard and Earl A. Fritz (to Igranic Electric Co. Ltd.). Brit. 399,311, Oct. 5, 1933.
- Thermionic valves. N. V. Philips' Gloeilampenfabrieken. Brit. 399,477, Oct. 2, 1933.
- Safety or indicating device for use with liquid-cooled thermionic valves and operated by failure of liquid flow. Marconi's Wireless Telegraph Co. Ltd. and Harry A. Ewen. Brit. 398,880, Sept. 25, 1933.
- Operating luminescent tubes such as those containing neon. Daniel P. A. A. Kayser. U. S. 1,939,903, Dec. 19.
- A high-frequency current is caused to flow through the tube, and the tension of the current is slowly and gradually varied, in order to control operation.
- Coating composition for electron-emitting elements. Leon McCulloch (to Westinghouse Elec. & Mfg. Co.). U. S. 1,939,075, Dec. 12. A compn. suitable for coating filaments comprises an alk. earth metal carbonate or oxalate with a binder including an aq. soln. of an alk. earth metal acetate, formate or azide.
- Light-sensitive cell. Arthur W. Carpenter (to United Research Corp.). U. S. 1,940,245, Dec. 19. A transparent support such as glass carries a conductive support comprising both Pt and Pd with which Se is in contact.
- Photoelectric tube. Vladimir K. Zworykin (to Westinghouse Elec. and Mfg. Co.). U. S. 1,939,531, Dec. 12. Structural features.
- Photoelectric cells. Richard A. Hartley (to The Westinghouse Brake & Saxby Signal Co. Ltd.). Brit. 398,552, Sept. 18, 1933. In a photoelec. cell comprising a metal body with a compd. of the metal formed thereon, elec. connection with the layer of compd. is effected through a conductor formed as an integral part of the layer of compd. The cell may be produced by heating a Cu blank to form superposed layers of Cu<sub>2</sub>O and CuO, the latter being removed and the surface being coated with beeswax to leave exposed spaced areas of the Cu<sub>2</sub>O. The blank is placed in an electrolytic bath to reduce the exposed Cu<sub>2</sub>O

to Cu and the wax is then removed. Alternatively the blank may be formed with a layer of  $\text{Cu}_2\text{O}$  and an outer layer of  $\text{CuO}$ , which is chemically reduced to Cu, a protective coating of wax is applied to spaced areas and the blank placed in a soln. to dissolve the exposed Cu and leave the  $\text{Cu}_2\text{O}$  formed as an integral part of a Cu grid when the coating is removed.

Apparatus (with a photoelectric cell) for sorting articles in accord with their light-modifying properties. Malcolm M. Rich (to Westinghouse Elec. & Mfg. Co.). U. S. 1,940,882, Dec. 26. Various structural, elec. and operative details are described.

Discharge apparatus. N. V. Philips' Gloeilampenfabrieken. Brit. 399,041, Sept. 28, 1933. An anode, particularly for a gas-filled rectifier or a triode, consists of a body having at least 1 cavity which is closed by a plug. Thus a graphite or C cylinder may have its end closed by a graphite or C plug screwed or pressed into position. The anode may have several apertures drilled into it, each closed by a graphite plug.

Electric discharge tubes. N. V. Philips' Gloeilampenfabrieken. Fr. 754,579, Nov. 9, 1933.

High-tension electric discharge tubes. C. H. F. Müller A.-G. Fr. 755,334, Nov. 23, 1933.

Luminous thermionic discharge tubes. Compagnie des lampes. Fr. 754,459, Nov. 8, 1933.

Electron discharge tubes. Compagnie des lampes. Fr. 755,326, Nov. 23, 1933. The tube is filled with a mixt. of gases, the metastable potential of the principal gas being higher than the ionization potential of the added gas. It has 2 principal electrodes, an auxiliary electrode adjacent to each of these and means for producing a discharge between the auxiliary and the principal electrodes.

Coating electrodes for discharge tubes. Telefunken Ges. für drahtlose Telegraphie m. b. H. (Horst Rothe, inventor). Ger. 587,886, Nov. 3, 1933. See U. S. 1,902,185 (C. A. 27, 3124).

Discharge-tube cathodes. N. V. Philips' Gloeilampenfabrieken (Hans J. Spanner, inventor). Ger. 588,487, Nov. 18, 1933 (Cl. 21g. 13.03). Borides, arsenides and tantalides of metals such as Th, Zr, Er, Mg or Cs are used as emitting substances in the manuf. of cathodes for gas-filled discharge tubes, particularly rectifying tubes. Wire of Ni, Mo or W may be used as the support for the emitting substance. Cf. C. A. 28, 8<sup>a</sup>.

Membranes for acoustic apparatus, etc. Telefunken Ges. für drahtlose Telegraphie m. b. H. (Walter Schottky, inventor). Ger. 587,370, Nov. 2, 1933. A mineral of high elasticity and low d., e. g., corundum or beryl, is vaporized, e. g., in an arc furnace, and condensed on a support of the desired shape. Various details are given.

Nickel vessels for organic acids. Vereinigte deutsche Nickelwerke A.-G. vormalig Westfälisches Nickelwalzwerk, Fleitmann, Witte & Co. Ger. 586,556, Oct. 23, 1933 (Cl. 48d. 4.02). Vessels for org. acids such as lactic, acetic, citric or formic acids are made from Ni, Ni alloys or Ni plate, and are given a protective coating by surface oxidation.

Sifting apparatus. Soc. anon. mécanique et outillage (to Soc. anon. ateliers J. Hanrez). Brit. 397,754, Aug. 31, 1933.

Vibratory sifting and screening apparatus. Pegson Ltd. and Charles H. Green. Brit. 397,009, Aug. 17, 1933.

Apparatus for preparing graded products from scrap mica by sorting, air blasting, etc. Conrad L. Johnson. U. S. 1,941,212, Dec. 26. Various structural and mech. details are described.

Bone and other crushers. Sven B. M. Wiberg. Brit. 398,107, Sept. 7, 1933.

Vapor engines. Henri M. R. Barjot. Brit. 398,586, Sept. 21, 1933. A binary vapor cycle utilizes anhyd.  $\text{AlBr}_3$  and steam, the condenser for the  $\text{AlBr}_3$  functioning as the steam generator.

Air-humidifying apparatus. Sewell M. Corbett. U. S. 1,940,787, Dec. 26. Various details of app. are described including a vaporizer with a thermostatically controlled valve.

Tungsten tubes. N. V. Philips' Gloeilampenfabrieken (Johannes A. M. van Liempt and Wilhelmus D. van Wijk, inventors). Ger. 587,330, Nov. 2, 1933. See Brit. 342,648 (C. A. 25, 4513).

Ozonizer. Siemens & Halske A.-G. (Richard Wiche, inventor). Ger. 585,666, Oct. 7, 1933.

Acetylene generators. Habran frères et Dubé. Fr. 754,850, Nov. 14, 1933.

Thermostatic device suitable for serving as an indicator by color change. John H. Derby. U. S. 1,938,583, Dec. 12, 1933. Structural features of a device which may include a wax and a dye.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

In memory of Angelo Angeli. Livio Cambi. *Gazz. chim. ital.* 63, 527-60(1933).—An obituary with portrait, a discussion of important org. chem. investigations, and a bibliography of 238 publications of A. and his collaborators from 1880 to 1931. C. C. Davis

Franz Wilhelm Dafert. Wolfgang Himmelbauer. *Oesterr. Chem.-Ztg.* 36, 183-6(1933).—Obituary with a bibliography. E. H.

Alfred Edward Johnson. Ernest V. Jones. *Analyst* 59, 2(1934).—Obituary. W. T. H.

The work and life of James Marsh. A. Cardoso Pereira. *Arch. inst. med. legal Lisboa* [B], 6, 1-88(1929-32). E. H.

Some hitherto unpublished letters of Pettenkofer, relating especially to his correspondence with Liebig on the hygienic value of meat extract. Alfons Fischer. *Munch. med. Wochschr.* 80, 1665-71(1933). Milton Levy

Liebig's death. R. Carrière. *Munch. med. Wochschr.* 80, 1670-1(1933).—Correspondence relating to Liebig's last days between his son-in-law and Wöhler and Kopp. Milton Levy

Perkin Medal award to Colin G. Fink. Accomplishments of the medalist. Harold Hibbert. *Ind. Eng. Chem.* 26, 232-4(1934). Chemistry and art. Colin G. Fink. *Ibid.* 234-8. G. G.

The terrestrial abundance of the permanent gases. Henry N. Russell and Donald H. Menzel. *Proc. Natl.*

*Acad. Sci.* 19, 997-1001(1933).—Consideration of the rate of escape of the permanent gases and of their cosmic distribution leads to the hypothesis that most, but not all, of the primitive A, N, and Ne escaped rapidly during the initial cooling of the earth's surface. J. B. Austin

A nomogram for the conversion of potentiometer readings to hydrogen-ion concentration. Alec Webster. *Chemistry and Industry* 1934, 38. E. H.

Origin of atmospheric ozone—observations made at Scoresby Sound during the polar year. A. Dauvillier.

*Compt. rend.* 197, 1339-41(1933).—Two hundred and fifty observations on the east coast of Greenland from November, 1932, to August, 1933 show an increase of ozone content during spells of high winds, but no connection with barometric pressure or the aurora. G. M. Evans

The errors arising in measurements of surface temperature. E. V. Polovnikova and L. S. Eigenson. *J. Tech. Phys.* (U. S. S. R.) 3, 518-24(1933).—Theoretical. F. H. Rathmann

Types of graphic classifications of the elements. I. Introduction and short tables. G. N. Quam and Mary Battell Quam. *J. Chem. Education* 11, 27-32(1934).—A bibliography of periodic tables, beginning with the work of Mendeléeff and Meyer, is presented. The tables are classified into 5 definite types and each type is treated chronologically with illustrations and descriptions. E. H.

**The periodic table.** B. S. Hopkins. *J. Western Soc. Eng.* 38, 307-18(1933).—All studies of the elements go back to the periodic system. W. H. Boynton

**Effect of oxygen and sulfur on the photoelectric effect from alkali metals.** V. V. Nalimov and P. V. Timofeev. *J. Tech. Phys.* (U. S. S. R.) 3, 602-9(1933).—Max. photo-effect occurs when  $4 \times 10^{-7}$  g.  $O_2$  is present per sq. cm. surface on K or  $6 \times 10^{-7}$  on Na. There is also a max. effect at  $5 \times 10^{-7}$  g. F. H. Rathmann

**Structure of inorganic peroxides.** I. A. Kazarnovskii. *J. Phys. Chem.* (U. S. S. R.) 1, 93-8(1930).—A review of the possible existence of asym. mols. of  $H_2O_2$  in which the bond of the second O atom with the  $H_2O$  mol. is realized by purely polarization forces. Calcn. reveals that the stability of the bond cannot exceed approx. 0.58 kg.-cal. but exptly. the stability proved to be about 100 times as large. If the possibility of the polar bond of the O with the ion of O is neglected the asym. formula for  $H_2O_2$  is impossible. F. H. Rathmann

**The chemical bond and quantum mechanics.** Yu. B. Rumer. *Uspekhi Khim.* 2, 393-411(1933).—The elements from H to He are considered from the classical and the Schrödinger viewpoints. Valences are derived from theoretical considerations. F. H. Rathmann

**Exchange of energy between gas atoms and solid surfaces.** III. Accommodation coefficient of neon. J. K. Roberts. *Proc. Roy. Soc. (London)* A142, 518-24(1933); cf. *C. A.* 26, 2357.—The accommodation coeff. of Ne on a clean W surface is 0.07 at 295° abs. and increases slightly down to 79° abs. A comparison with the values for He indicates that the atoms do not behave as elastic spheres. If the repulsive potential energy between a gas atom and a solid atom at a distance  $r$  be expressed by  $Ce^{-\lambda r}$ ,  $C$  and  $\lambda$  const., the upper value of  $\lambda$  is approx.  $6 \times 10^8$  cm.<sup>-1</sup> for Ne and W. E. J. Rosenbaum

**Chemical thermodynamics and molecular spectra.** Ya. A. Gerasimov. *Uspekhi Khim.* 2, 475-92(1933).—Theoretical and review. Entropies as calcd. by the third law are compared with those given by spectroscopic data for many substances. F. H. Rathmann

**Dia- and paramagnetism in metallic mixed crystal series.** II. Eckhart Vogt and Hans Krueger. *Ann. Physik* 18, 755-70(1933); cf. *C. A.* 26, 5233.—Expts. on 4 alloys of Au-Ni, contg. 1, 2, 4 and 6% of Ni by wt. indicate that Ni enters the Au lattice up to the limit of soly. with a paramagnetism which is const. between 300° and 200°K. with  $\chi'_A = +380 \times 10^{-4}$  per g. atom of Ni. Below 200°K. there is an accelerated increase in paramagnetism that does not appear in the 1% alloy. If this increase is due to the  $Ni^{2+}$  ions, whose moments obey the Curie law, the concn. of which below 200°K. gradually increases from zero, the results indicate that this concn. attains only a few tenths % of the dissolved Ni atoms. Expts. were made on the alloys CuPd, Cu<sub>2</sub>Pd, and Cu<sub>3</sub>Pt to study the relation between magnetism and the superlattice previously found\* in the CuAu series. The effects of various heat treatments on magnetic susceptibility, elec. resistance and elasticity are tabulated and discussed in connection with the results of other investigators. The magnetic superlattice effect indicates that the at. susceptibility of mixed-crystal alloys is not a purely additive property of the dissolved atoms. The common valence electron system furnishes a definite contribution and probably the source of the magnetic superlattice effect should be sought in the changes in configuration produced in this system by the transformations in the superlattice. III. Magnetic atomic moments of the transition metals in dilute mixed crystal solutions. Eckhart Vogt. *Ibid.* 771-90.—The results of several investigations on a series of alloys of the transition metals are tabulated and discussed in connection with the most recent theories. Because of the strong reciprocal action between ion moments, the transition elements, when pure, as a rule show either ferromagnetism, or paramagnetism independent of temp. But in dil. mixed-cryst. solns. in the diamagnetic noble metals, to a first approximation, they exhibit the properties of free or almost

free moments. When there are fewer than 10  $d$ -electrons, there occurs a paramagnetism that follows the Curie-Weiss law. The effects of various modifications of the  $d$ -10 shell are considered. Linde's observations on the increase in elec. resistance of the noble metals, produced by addns. of the transition metals, confirm the deductions from magnetic data on the effect of the no. of electrons in the  $d$ -shell. Sardron's work on ferromagnetic satn. and Neel's on paramagnetism show that Pd enters the Ni lattice with a moment equal to that of Ni itself. W. W. Stiffler

**Fluctuations of the molecular field and the equation of the magnetic state of nickel.** L. Neel. *Compt. rend.* 197, 1310-12(1933).—The equation of the magnetic state of Ni can be interpreted completely by assuming that the no. of magnetic electrons varies with the magnetization, being 0.83 per atom for no magnetization and 0.61 per atom at satn. The shape of the isothermal near the Curie point is explained by making a distinction between the mol. field at a short distance, with considerable fluctuations, and the mol. field at a great distance with negligible fluctuations. Without giving the math. details of its derivation, a rather complicated equation is set forth which involves these assumptions and expresses  $\sigma$ , the intensity of magnetization of Ni as a function of the temp., the abs. satn., the mol. field and various other const. The mol. field itself is expressed as  $H_m = 2400\sigma$ . The values of  $\sigma$  calcd. by this equation between 100° and 288°K. agree remarkably well with the observed values. Although this equation appears essentially different from the  $T^{3/2}$  law of approach, given by wave mechanics, the difference is really negligible. W. W. Stiffler

**Absolute magnetic susceptibility of water and its dependence upon temperature.** Hermann Auer. *Ann. Physik* 18, 593-612(1933).—Accurate data on the magnetic susceptibility of pure  $H_2O$  and its variation with temp. are increasingly important because many at. moments are detd. in aq. solns. By means of an improved app. designed to minimize the exptl. errors of the Quincke method,  $\chi_a$  is found to be  $(0.72183 \pm 0.00048) \times 10^{-4}$  at 20°. Results are given for the abs. susceptibility at 13 temps. from 1° to 70°. The temp. coeff.,  $(\frac{1}{\chi_a} \frac{d\chi_a}{dT})$  decreases continuously from  $2.9 \times 10^{-4}$  at 5° to  $0.62 + 10^{-4}$  at 70°. The results are compared with those of other observers. W. W. Stiffler

**Molecular orientations in  $p$ -diphenylbenzene crystals.** K. S. Krishnan and S. Banerjee. *Nature* 132, 968-9(1933); cf. *C. A.* 27, 3373.—The crystal structure can be detd. from the principal diamagnetic susceptibilities of the mol. S. Bradford Stone

**Experimental determination of the magnetic susceptibility of the free radical  $C_2H_5O_2N$  and the comparison with the theory by van Vleck.** Franz Galavics. *Helv. Phys. Acta* 6, 555-64(1933).—The molar magnetic susceptibility of di- $p$ -anisyl nitrogen oxide,  $(CH_3O_2C_6H_4)_2N:O$ , was detd. as a function of temp. in  $(CH_3)_2CO$  soln. and found at 19° to be  $1.28 \times 10^{-4}$  after subtraction of the diamagnetism. This agrees with van Vleck's calcn. if the paramagnetism is attributed to  $S = 1/2$  and the high-frequency elements are neglected. Egon Bretscher

**Liquid insulators.** J. B. Whitehead. *Trans. Electrochem. Soc.* 65, 12 pp.(preprint)(1934).—Dielec. loss in insulating liquids is in large measure a conduction phenomenon. In certain liquids there is evidence of decaying charge and discharge currents similar to those occasioned by dielec. absorption in solids. It is suggested that this is due to the presence of polarized mol. aggregates or ionic dipoles of large size, and with relaxation times of the order  $10^{-3}$  sec. C. G. F.

**Research on the amorphous state. II. Electrical conductivity of amorphous substances in the softening interval.** P. P. Kobeko and I. G. Nelidov. *Physik. Z. Sowjetunion* 4, 516-30(1933); cf. following abstr.—The elec. conductivities of phenolphthalein, brucine, tartaric acid, glycerol, citric acid, EtOH, rosin, sugar and sugar with 10% water were measured over a range of temps. including the softening temp. In all cases the elec. cond. varied

inversely with the temp. Deviations of the homeopolar liquids and the amorphous substances are due to their higher softening temps.

Howard A. Smith

**Research on the amorphous state. III. Dielectric constants of amorphous substances in the softening interval.** P. P. Kobeko and B. Kuvshinskii. *Physik. Z. Sowjetunion* 4, 680-94(1933); cf. preceding abstr.—Brucine, phenolphthalein, cane sugar and 90% EtOH were studied in the temp. interval between the m. p. and the temp. of vitrification ( $T_g$ ). Changes in the static and dynamic polarization consts. are assoc. with a change in the relaxation time, and with a change in the no. of rotating dipoles. This is explained by the loss in rotary motion of the mol. as  $T_g$  is approached. A departure from the Debye model above  $T_g$  is due to assocn. Below  $T_g$  the regular variation of the dielec. const. with frequency, which is analogous to that of compact cryst. bodies, cannot be connected with the internal friction. Dielec. loss below  $T_g$  is very low. Cond. is unaffected in this temp. region. In the region in which the static dielec. const. changed rapidly the potential distribution remained linear. **IV. Electrical conductivity of mixtures in the softening interval.** P. P. Kobeko and I. G. Nelidov. *Ibid.* 695-702.—In amorphous substances and mixts., the elec. cond. and the temp.  $T$  are connected by the equation  $\log_{10} \rho = (A - K) + (KT_g/T)$ , or  $\rho = Ae^{B/T}$ , where  $\rho$  is the resistance,  $T_g$  is the temp. of vitrification, and  $A$ ,  $B$  and  $K$  are consts. Values of  $T_g$ ,  $A$ ,  $B$  and  $K$  are given for EtOH, glycerol, citric acid, sugar; molar mixts. of glycerol with EtOH, citric acid and sugar; 1 mol. of glycerol with 2 mols. EtOH; and for a mixt. of 5 components. The  $\log_{10} \rho$  plotted against  $(1/T_g - 1/T)10^3$  is linear for values of the second term between 0 and 1.2. The  $T_g$  of a mixt. lies between that of its components. **V. Relation between the temperature coefficient of the electrical conductivity and the viscosity in amorphous substances.** *Ibid.* 703-8.—The relation between viscosity  $\eta$  and temp.,  $\log \eta = A' + B'/T$ , is linear and is similar to the relation between elec. cond. and temp. Values of  $T_g$ ,  $B$  and  $B'$  are given for 94% EtOH, PrOH, lutidine, 1:1 and 1:2 molar mixts. of glycerol and EtOH, tributyrin, citric acid, glycerol, glycerol-citric acid and glycerol-sugar solns., triacetyl, Rochelle salts, betol, piperine, sugar, sugar + 10% H<sub>2</sub>O, rosin, salicin, brucine and phenolphthalein.

Gerald M. Petty

**The determination of the valency angles of the oxygen and sulfur atoms and the methylene and sulfox groups, from electric dipole moments.** G. C. Hampson, R. H. Farmer, and L. E. Sutton. *Proc. Roy. Soc. (London)* A143, 147-68(1933).—The polarizations were measured and dipole moments calcd. for Ph<sub>3</sub>CH<sub>3</sub>, (*p*-BrC<sub>6</sub>H<sub>4</sub>)<sub>3</sub>CH<sub>3</sub>, Ph<sub>3</sub>O, *p*-BrC<sub>6</sub>H<sub>4</sub>OPh, (*p*-BrC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>O, (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>O, *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>OPh, (*p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>O, *p*-BrC<sub>6</sub>H<sub>4</sub>Me, Ph<sub>3</sub>S, *p*-ClC<sub>6</sub>H<sub>4</sub>SPh, (*p*-ClC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>S, (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>S, Ph<sub>3</sub>SO, *p*-ClC<sub>6</sub>H<sub>4</sub>(SO)Ph, (*p*-ClC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>SO and (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>SO. The angles between the Ph groups in Ph<sub>3</sub>CH<sub>3</sub>, Ph<sub>3</sub>O, Ph<sub>3</sub>S and their derivs. are 115° ± 5, 142° ± 8 and 118° ± 8, resp. The angles for anisoles and phenols are estd. at 150° and 137° and the moments of the O-Me and O-H links at 2.33 and 2.37 Debye units, resp. For Ph<sub>3</sub>SO and its derivs., the angles are about 115°, and the moment of the S → O link is 2.63.

L. E. Steiner

**Interpretation of electric polarization coefficients.** Frank R. Goss. *J. Chem. Soc.* 1933, 1341-5.—The dielec. const. for C<sub>6</sub>H<sub>6</sub> was detd. by a heterodyne method at 20°, 40° and 60°. From these data, the at. and electronic polarizations were calcd. The temp. coeff. of total polarization for liquid C<sub>6</sub>H<sub>6</sub> is the same as that for the electron polarization, the at. polarization is const. and the dipole moment is zero.

E. J. Rosenbaum

**Electric moments of cyclic 1,1-dicarboxylic esters in relation to the valency-deflection hypothesis.** E. Harold Farmer and N. J. H. Wallis. *J. Chem. Soc.* 1933, 1304-9.—The elec. moments were measured by a sensitive heterodyne method. The values found are: cyclopropane-1,1-dicarboxylic Et ester,  $2.40 \times 10^{-18}$  e. s. u.; cyclobutane-1,1-dicarboxylic Et ester,  $2.22 \times 10^{-18}$  e. s. u.; cyclopentane-1,1-dicarboxylic Et ester,  $2.14 \times 10^{-18}$  e. s. u.;

cyclohexane-1,1-dicarboxylic Et ester,  $2.23 \times 10^{-18}$  e. s. u. The change from one ring to another apparently disproves the Thorpe-Ingold hypothesis of valency deflection. This disagreement may be due to changes in the moment of the carboxyl group or to rotation of the carboxyl group about the C—C bond.

E. J. Rosenbaum

**Absorption of electromagnetic energy in ionized gases during the process of working.** M. A. Bouch-Bruevich. *J. Tech. Phys. (U.S.S.R.)* 2, 375-88(1932).

**Study of the motion of gases in heating stoves according to the system of V. E. Grum-Grzhimallo.** M. A. Mikheev. *J. Tech. Phys. (U.S.S.R.)* 3, 504-8(1933).—Regularity of gas circulation was in accord with the theory.

F. H. Rathmann

**Effect of the change of composition on ignition region of methane-oxygen mixtures.** M. B. Neumann and A. I. Serbinov. *Physik. Z. Sowjetunion* 4, 433-42(1933); cf. C. A. 26, 6139.—Between compns. of 3 and 37% CH<sub>4</sub> in O<sub>2</sub> there exist 3 ignition limits at temps. between 635° and 680°. Argon added to CH<sub>4</sub>-O<sub>2</sub> mixts. does not change the time lag of ignition but extends the compn. of the lower and the higher limits at 650°. The change of the lower limit by such addns. follows Semenov's law.

Howard A. Smith

**Flame speeds during the "inflammation" of moist carbon monoxide-oxygen mixtures.** Wm. A. Bone and J. Bell. *Proc. Roy. Soc. (London)* A143, 1-15(1933).—The max. initial "uniform" flame speed for CO-O<sub>2</sub> mixts., ranging in compn. (CO/O<sub>2</sub>) from 55/45 to 4/1, which were ignited at the open end of a horizontal glass tube (the other end being closed) occurred at the compn. 3/1 for the mixts. satd. with H<sub>2</sub>O at 15°, and at the compn. 7/3 for the mixts. with H<sub>2</sub>O vapor at 4.8 mm. Almost anhyd. mixts. showed a const. initial flame speed of about 35 cm./sec. If the mixt. is ignited near the closed end, rather than at the open end, the flame speed is 15-30 times greater, but it has no fundamental significance.

L. E. Steiner

**A stationary flame and its utilization.** Mataka Kurokawa. *J. Fuel Soc. Japan* 12, 1346-57(1933)(in English 125-8).—To maintain a steady flame at the orifice of a burner the ignitable gas and air, mingled by diffusion, must flow upward at a rate just balancing that at which the flame is propagated downward. If it is assumed that combustion takes place at the conical boundary surface between the flame and a theoretical air, and that neither thermal decompn., nor partial ignition occurs in the

flame, the following relation exists,  $v = \frac{(1 + \alpha)Q}{\pi \sqrt{L^2 + r^2}}$ , in

which  $v$  is the velocity of ignition under the theoretical air mixt.,  $Q$  the quantity of gas issuing from the orifice,  $\alpha$  the theoretical air vol. for complete combustion of unit vol. of gas,  $L$  the length of the flame and  $r$  the radius of the orifice. When the supply pressure of gas is  $h$ , the sp. gr.  $S$ ,

and the orifice const.  $K$ ,  $Q = K\pi r^2 \sqrt{\frac{h}{S}}$ . Therefore,

$L = K(1 + \alpha)r \sqrt{h/v} \sqrt{S}$ , when  $r$  is much less than  $L$ .

Experimentally, the relation holds within certain limits. The velocity of flame propagation was detd. by Corsinglia (C. A. 26, 1752) and found inversely proportional to the square root of the sp. gr. Moreover, since the velocity  $v$  may be considered the velocity of the gas and air mixt. produced by diffusion and gas flow from an orifice, the same relation may be derived from kinetic theory. For this reason, the product  $v \sqrt{S}$  is const. This relation is expressed in a straight-line equation,  $H = A + BL$ , in which  $A$  and  $B$  are consts.  $A$  and  $B$  were detd. with a

modified type of Payman's app. (C. A. 19, 571) for 5 varieties of gas and  $H$  was calcd. Gases rich in hydrocarbons give a comparatively satisfactory result, while gases contg. much inert or H<sub>2</sub> do not.

F. I. Nakamura

**The collision areas of 1,3,5-mesitylene and of the most highly branched heptanes.** W. A. Everhart, W. A. Hare and Edward Mack, Jr. *J. Am. Chem. Soc.* 55, 4894-8(1933).—Viscosity data, Sutherland consts. and collision areas for 1,3,5-mesitylene and 2,2,3-trimethyl-

butane are tabulated for a wide temp. range. The collision areas agree excellently with the shadow-graphically computed values of the models made to scale. A type of space isomerism similar to that found in biphenyl is predicted for 2,2,3-trimethylbutane and for hexamethyl-ethane. M. McMahon

Diffusion coefficients of bromine-argon, bromine-methane, bromine-hydrogen chloride, and bromine-nitrous oxide. John E. Mackenzie and Harry W. Melville. *Proc. Roy. Soc. Edinburgh* 53, 255-9(1933).—The diffusion coeffs. of  $\text{Br}_2\text{-Ar}$ ,  $\text{Br}_2\text{-CH}_4$ ,  $\text{Br}_2\text{-HCl}$  and  $\text{Br}_2\text{-N}_2\text{O}$  were detd. by a visual method. The results agree with measurements by a photoelec. method. I. J. P.

Dalton's law and the paradox of Gibbs. B. Kedrov. *J. Phys. Chem. (U.S.S.R.)* 1, 433-7(1930).—A theoretical investigation of the limits of application of Dalton's law. G. Faerman

The specific gravity of acetone-water mixtures. W. Young. *J. Soc. Chem. Ind.* 52, 449-50T(1933).—The percentage of  $\text{Me}_2\text{CO}$  in  $\text{Me}_2\text{CO-H}_2\text{O}$  mixts. is tabulated for each 0.002 interval in the sp. gr.  $d_4^{20}$  of pure  $\text{Me}_2\text{CO}$  was 0.79061. A. M. Brant

The constitution of liquids. P. Bogdan. *J. chim. phys.* 30, 581-627(1933).—By following the reasoning of van't Hoff, numerical values were obtained for  $K$  in the expression  $\gamma^{1/3} = K(O - T)$ . A parallelism is established between  $K$  and the dielec. const.  $E$ . Mol. assocn. in the liquid state increases  $\gamma$  and  $K$ . The rule of Stefan was established by several methods. Independently of the theory of van der Waals the expression  $\lambda = 2RT \log \frac{p}{p^0}$  was developed for the heat of evapn. W. J. P.

Partial vapor pressures and refractivities of mixtures of benzene with nitrobenzene, phenol, benzyl alcohol or *p*-dichlorobenzene. A. R. Martin and C. M. George. *J. Chem. Soc.* 1933, 1413-16.—Of the mixts. of  $\text{C}_6\text{H}_6$  and its polar derivs. studied, the vapor pressures and refractivities of the  $\text{PhCH}_2\text{OH}$  and  $\text{PhOH}$  solns. show the greatest deviations from ideal solns. Of the others, *p*- $\text{C}_6\text{H}_4\text{Cl}_2$  is slightly assocd. The results are discussed from the point of view of dipolar and van der Waals forces. H. F. Johnstone

Density discontinuities at the critical temperature. C. A. Winkler and O. Maass. *Can. J. Research* 9, 613-29 (1933); cf. Tapp, Steacie and Maass, *C. A.* 28, 14<sup>a</sup>.—A technic for measuring  $d_s$  in various parts of a one- or two-component system, raised above its crit. temp., is described. Propylene and Me ether were the 2 media examd. The following generalizations regarding aberrations from the continuity of state were found for both. When either liquid was heated above the temp. at which the visible meniscus disappeared, the  $d$ . below this point of disappearance was greater than that above. The  $d$ . was uniform throughout each portion, undergoing a relatively sharp change in the small region where the meniscus was last seen. After 1 hr. of temp. equil., the difference in  $d$ . between top and bottom became const. and remained unaltered for 6 hrs. Const. stirring or temp. fluctuations of the order of 0.02° do not alter this  $d$ . difference. A decrease in the vol. available for the medium increases the  $d$ . difference between the top and bottom, a continuous relation existing between available space and  $d$ . difference. With decrease in available space, the  $d_s$  of both upper and lower portions of the medium increase, the  $d$ . of the lower more rapidly than that of the upper. These results were reproducible quantitatively in the expts. carried out to date. The  $d$ . difference for a fixed available space decreases with rise in temp. and is measurable up to at least 10° above the crit. temp. J. W. Shipley

Density of propylene in the liquid and vapor phases near the critical temperature. C. A. Winkler and O. Maass. *Can. J. Research* 9, 610-12(1933); cf. *C. A.* 27, 5226.—The  $d$ . of propylene in the liquid and vapor phases was measured over the range 66-92° by a refined dilatometer method and at the higher temps. at the same time by a float method. Good agreement was found between the 2 methods; the latter being preferable in the neighborhood

of the crit. temp. It was found that at temps. below the crit., no variation in vapor  $d$ . accompanied a change in the relative vol. of the liquid. J. W. Shipley

Barometric formula for real gases and its application near the critical point. R. Ruedy. *Can. J. Research* 9, 637-40(1933); cf. preceding abstrs.—According to the theory of the continuity of liquid and gaseous states, as expressed in van der Waals equation, pronounced  $d$ . differences may exist in a short column of fluid maintained, throughout its length, at the crit. temp. The point in the tube at which the  $d$ . of the contents has decreased a given percentage from the crit. value is higher the larger the ratio of the crit. temp. to the mol. weight. For substances like Ne the variations are so large that a measurable sepn. of isotopes may be expected at or near the crit. point; for other substances the computed results are at least of the magnitude found by expt. Also, in order to obtain, at or near the crit. point, a column of gas of uniform  $d$ . a temp. gradient must be allowed to exist along the column. J. W. Shipley

Systems with mixed dimensions. D. Vorländer. *Trans. Faraday Soc.* 29, 899-902(1933).—On combining a surface with a line, a system of "mixed dimensions" is obtained. The predominance of one dimension is of importance for the mol. nature of liquid-crystals. L. Waldbauer

Polymorphism of liquid crystals. D. Vorländer. *Trans. Faraday Soc.* 29, 913-14(1933).—The idea that liquid crystals exist in only 2 types is erroneous. The existence of substances with 3 and 4 liquid-cryst. phases is demonstrated. L. Waldbauer

A simple arrangement to demonstrate liquid crystals. G. van Iterson, Jr. *Trans. Faraday Soc.* 29, 915-19 (1933).—The general principle is that of the Lehmann crystn. microscope. The prepn. is warmed to a temp. slightly higher than that required for observation and cooled by a jet of air. Transformation temps. can be maintained for an unlimited time. L. Waldbauer

Forces causing the orientation of an anisotropic liquid. V. Fredericksz and V. Zolina. *Trans. Faraday Soc.* 29, 919-30(1933); cf. *C. A.* 26, 2356-7.—Expts. on *p*-azoxy-phenetole and anisaldazine in a magnetic field suggest that the orientation of the liquid is detd. by the orientation of the mols. and swarms in contact with the glass, and also by the interaction between the mols. or swarms within the liquid. The orienting action of the magnetic field depends on the diamagnetic properties of the substance. Kast's x-ray results are attributed to the motions of an anisotropic liquid. The motion is caused by the elec. anisotropy of the liquid together with electrostriction. Expts. on the elastic deformation of an anisotropic liquid indicate a change of orientation by mech. means. Under certain conditions it seems likely that resonance occurs. Intense excitation produces a semblance of boiling. L. W.

New arguments for the swarm theory of liquid crystals. L. S. Ornstein and W. Kast. *Trans. Faraday Soc.* 29, 931-44(1933).—In a swarm all the mols. are arranged in parallel; the no. of mols. being of the order 10<sup>4</sup>. The swarms are anisotropic, optically, diamagnetically and dielectrically. In nematic swarms, the mol. anisotropies are additive; in cybotactic swarms, they are largely canceled out. L. Waldbauer

Effect of a magnetic field upon the nematic state. H. Zocher. *Trans. Faraday Soc.* 29, 945-57(1933).—Mol. orientation is taken to vary continuously from one position to another within the substance because of Brownian motion and convection currents. L. Waldbauer

Magnetic properties of mesomorphic substances: analogies with ferromagnetics. G. Poëx. *Trans. Faraday Soc.* 29, 958-72(1933).—Nematic substances, smectic substances, crystn. in a magnetic field, diamagnetism and mol. structure are considered. A normal liquid corresponds to a paramagnetic substance, and a nematic one to a ferromagnetic substance; a transition point exists between the 2, analogous to the Curie point. Satn. is more difficult with smectics than with nematics, pointing to an arrangement in the former case on parallel surfaces (focal, conic or planar structures). L. Waldbauer

Inclination of molecules in some crystalline-fluid substances. Karl Herrmann. *Trans. Faraday Soc.* 29, 972-8(1933).—In Tl stearate, the angle at which the mols. slope is  $47^\circ$  for the liquid crystal, and  $37^\circ$  for the solid. In Tl oleate the angles are  $53^\circ$  and  $34^\circ$ , resp. L. W.

Rotating molecules and the liquid crystalline state. T. Malkin. *Trans. Faraday Soc.* 29, 977-82(1933).—It is suggested that the mols. in the liquid cryst. state are rotating about their long axes. This is typical in the  $\alpha$ -form of the esters of long-chain acids. L. Waldbauer

Alterations in the nature of a fluid from a gaseous to liquid crystalline conditions as shown by x-rays. G. W. Stewart. *Trans. Faraday Soc.* 29, 982-90(1933).—Much larger mol. groups are present in liquid crystals than in liquids, but the semi-ordered arrangement is nearly alike for both. Cybotactic groups are found in either condition; the liquid cryst. state is presumably composed of companies of mols. or of cybotactic groups. L. W.

Arrangement of chain molecules in liquid *n*-paraffins. A. Müller. *Trans. Faraday Soc.* 29, 990-3(1933); cf. C. A. 26, 3159.—Discussion of Stewart's theory of cybotactic structure. The diffraction ring in *n*-paraffins is due to assemblies of mols.; the av. distance of nearest approach (near the m. p.) is between 4.5 and 5 Å.

L. Waldbauer

Anisotropic melts: a study in change of state. F. I. G. Rawlins. *Trans. Faraday Soc.* 29, 993-4(1933).—The liquid cryst. condition is much more general than is usually supposed. The process of sublimation is discussed. L. Waldbauer

Study of crystalline orientation by electron diffraction. J. J. Trillat. *Trans. Faraday Soc.* 29, 995-1002(1933).—Cryst. orientation of metals, structure and orientation of various thin layers, and surface structure of liquids are discussed. In general, only a very small amt. of material is necessary, and electron analysis gives information about very thin layers. L. Waldbauer

Anomalous viscosity in mesomorphic melts. Wo. Ostwald. *Trans. Faraday Soc.* 29, 1002-5(1933).—These melts exhibit strong structural viscosity, resembling gelatin or rubber sols. L. Waldbauer

Viscosity of liquid crystals. R. O. Herzog and H. Kudar. *Trans. Faraday Soc.* 29, 1006-8(1933).—The experimentally detd. viscosity was traced back to the translational and rotational motions of the mols. This was applied to liquid crystals with some success. The values for  $\eta(\eta - \omega)$  are smaller for the amorphous phase than for the anisotropic phase.  $\eta$  is the sp. vol. and  $\omega$  the ratio of van der Waals vol. const. at the m. p. to the mol. wt. L. Waldbauer

Lyotropic mesomorphism. A. S. C. Lawrence. *Trans. Faraday Soc.* 29, 1006-15(1933).—(1) Crystalloidal mesoforms of soap, (a) anhyd., (b) plus water, (2) anisotropic soap sols.—the true colloidal mesoform, and (3) structure in crystalloidal systems are discussed. In anomalous flow, the center of the tube (max. velocity) is also a region of anomalous flow, this flow being caused by the structure of the soln. Near the walls, the travel is faster than that given by the parabolic relationship, because elastic forces come into action. L. Waldbauer

Paracrystallinity. F. Rinne. *Trans. Faraday Soc.* 29, 1016-32(1933); cf. C. A. 27, 4456.—A detailed discussion of liquid crystals under the heads of: method of formation, miscibility, inclusion of natural org. objects in the paracryst. group and notes on nomenclature. L. W.

Liquid crystals produced by evaporation or cooling of an aqueous solution of tartrazine. Paul Gaubert. *Compt. rend.* 197, 1436-8(1933).—Tartrazine does not give liquid crystals at high temps., but does so at room temps. Tartrazine crystallizes in small acicular orthorhombic crystals, has neg. elongation, is very refractive and strongly birefringent. The anhyd. crystals do not melt and can be heated to  $300^\circ$  without decompn. They are sol. in cold  $H_2O$  and in all proportions in hot water. When a drop of a soln. of tartrazine (satd. by heat at  $50^\circ$ ) is placed on a slide, crystals form around the edges of the drop. Some isolated birefringent regions exist in the middle of an isotropic soln. By protecting with a cover

glass to prevent evapn. the phenomenon is of longer duration. The properties of these birefringent regions are similar to those of the solid crystals. Convergent light shows that the isotropism is not due to a new orientation normal to the optic axis and that the liquid is very isotropic. H. E. Mesmore

Crystalline phases of some substances studied as liquid crystals. J. D. Bernal and D. Crowfoot. *Trans. Faraday Soc.* 29, 1032-49(1933).—Liquid crystals seem to require the following conditions for their formation: (1) the mols. must be geometrically anisotropic either rod-shaped, flat or lath-shaped; (2) not more than 1 group capable of providing intense fields must be present in the mol.; (3) mols. should contain such moderately active

appears fundamental for cholesteric types. Such compds. are optically neg. although their optical activity is probably irrelevant from a structural standpoint. L. W.

Application of x-rays to the study of elastic strain in crystalline substances. A. P. Komar. *J. Tech. Phys.* (U. S. S. R.) 2, 519-28(1932); cf. C. A. 27, 2877.—A review. F. H. Rathmann

The interpretation of the asymmetrical asterism of Laue diagrams of deformed crystals of sodium chloride. A. Komar. *Physik. Z. Sowjetunion* 4, 563-4(1933).—The differences in the lengths of the tails of symmetrically located spots are measured for several thickness of deformed crystals. These indicate that slipping occurs principally along one of the possible slip planes with a simultaneous bending of the individual slip layers.

Victor Hicks

The crystal structure of NdAl. Charles W. Stillwell and Elmer E. Jukkola. *J. Am. Chem. Soc.* 56, 56-7(1934).—The compd. NdAl has the CsCl type of lattice with  $a_0 = 3.73 \pm 0.01$  Å. The ratio of the no. of valence electrons to the no. of atoms is 3:2 if the valence of Nd is assumed to be zero. Victor Hicks

A chamber for the precise determination of the lattice constants of crystals. P. A. Palibin. *J. Tech. Phys.* (U. S. S. R.) 3, 645-52(1933).—X-ray diagram photographs are given for the structure of Al by means of Fe and Cu K lines. F. H. Rathmann

X-ray study of arsenical struvite. R. Salvia. *Anales soc. españ. fis. quim.* 31, 822-4(1933).—Struvite,  $NH_4MgAsO_4 \cdot 6H_2O$ , pyramidal-rhombic,  $a:b:c = 0.568:1:0.912$ ,  $d_1 1.932$ , was used to form Weissenberg diagrams of a revolving crystal to show abs. dimensions of the elementary crystal. It was necessary to double the Schulten values (*Bull. soc. franç. minéral.* 26, 95(1903); 27, 107(1904)) for the axial relations  $a/b$  and  $c/b$ . The lattice is  $T_1$  (simple parallelepipeds). The no. of mols. in the fundamental lattice is 2. The group frequency is  $C_1^2D$ .

E. M. Symmes

Lattice dimensions of some solid solutions in the system  $MgO-Al_2O_3$ . G. L. Clark, E. B. Howe and A. E. Badger. *J. Am. Ceram. Soc.* 17, 7-8(1934).—The lattice dimension of  $MgO \cdot Al_2O_3$  is  $a_0 = 8.064 \pm 0.002$  Å. The lattice dimension of solid solns. of this spinel with  $\alpha-Al_2O_3$  decreases progressively with increase of  $Al_2O_3$ . C. H. K.

The crystal structure of  $CaSO_4 \cdot CO(NH_2)_2$ . Sterling B. Hendricks. *J. Phys. Chem.* 37, 1109-22(1933).— $CaSO_4 \cdot CO(NH_2)_2$  crystallizes in a face-centered ionic triclinic lattice with  $a_0 = 14.74$ ,  $b_0 = 14.98$ ,  $c_0 = 6.47$  Å;  $\alpha = 91^\circ 26'$ ,  $\beta = 90^\circ 22'$ ,  $\gamma = 86^\circ 42'$ . The space group is either  $P1$  or  $P\bar{1}$ . The at. parameters are given graphically. Optically,  $a:b:c = 0.9836:1:0.8645$ . The crystals are highly anisotropic, with  $n_g = 1.523$ ,  $n_o = 1.583$ ,  $\gamma = 1.615$ ;  $2V$  calcd. is  $70.0^\circ$ . Victor Hicks

Theory of recrystallization. E. F. Bakhmetev, A. A. Bocharov, G. S. Zhdanov and Ya. S. Umanakli. *J.*

**Tech. Phys. (U. S. S. R.)** 2, 161-72(1932).—Nuclei, recuperation, energy distribution and polycrystallinity are discussed.

**Supra-crystallinity of *p*-azoxybenzoic acid.** D. Vörländer. *Trans. Faraday Soc.* 29, 902-6(1933).—When the mol. structure breaks down more easily than the cryst. structure, the mols. in the crystal are more firmly combined with one another than are the atoms in the mol., and there is the highest possible degree of crystallinity. A no. of azoxy compds. are discussed.

**The relationship between the densities of some salts in the solid and the liquid state. Determination of the diameters and densities of molecules of salts and of the atoms of alkali metals.** A. E. Makovetskii. *J. Phys. Chem. (U. S. S. R.)* 4, 423-30(1933).—The ds. of solid alkali halide salts were obtained by calcn. from data for d. of salts in the liquid state. On this basis empirical relationships are found.

**Contact measurements at low temperatures.** R. Holm and W. Meissner. *Z. Physik* 86, 787-91(1933).—The contact resistance of Cu, Au and Ni is about  $1-50 \times 10^{-9} \Omega$  and independent of temp. It obeys Ohm's law.

**Superconductivity and the Hall effect.** B. Lazarev. *Physik. Z. Sowjetunion* 4, 567-8(1933).—In superconducting metals the product of Hall's const. and the cond. ( $R_H$ ) is small and for nonsuperconducting metals it is large. In the Tl-Bi alloys with Bi contents up to 63% ( $\text{Bi}_4\text{Tl}_4$ )  $R_H \cong 20$  while above 65% Bi  $R_H \cong 120$ . In the Pb-Bi system up to 18% Bi (solid soln.)  $R_H \cong 10$  and the product is much higher above this amt. of Bi.

**Hall effect and the internal photoelectric effect in cuprous oxide.** I. Kikoin and M. Noskov. *Physik. Z. Sowjetunion* 4, 531-50(1933).—The elec. cond. and Hall const. at room temp. and at liquid-air temp. are, resp.,  $3.7 \times 10^{-10} \Omega^{-1} \text{ cm.}^{-1}$  and  $0.96 \times 10^7 \text{ abs. e. m. units}$ ; and  $2.8 \times 10^{-12} \Omega^{-1} \text{ cm.}^{-1}$  and  $0.94 \times 10^{11} \text{ abs. e. m. units}$  for  $\text{Cu}_2\text{O}$  when not illuminated. The cond. at liquid-air temp. illuminated is  $1.28 \times 10^{-10} \Omega^{-1} \text{ cm.}^{-1}$ . The spectral distribution of the internal photoelec. current presents a max. at 4600 Å. The electron concn. at equil. when illuminated is  $8 \times 10^4$  electrons per cc. The free electron paths at room and liquid-air temps. are  $4.4 \times 10^{-7} \text{ cm.}$  and  $2.3 \times 10^{-7} \text{ cm.}$ , resp. Electron mobilities at room and liquid-air temps. are 36 and 120 cm. per sec., resp.

**Preparation of thin metallic layers by means of cathode sputtering.** O. G. Keiko. *J. Tech. Phys. (U. S. S. R.)* 3, 653-6(1933).—Diagrams show app. used to prep. thin layers of Cu, Ag, Ni, Pt, Cd, Pb, Sn, Bi and mixts. of Cu + Ag, Cu + Ag + Cd in presence of 0.1-0.2 mm. of  $\text{H}_2$ , A,  $\text{N}_2$ , Ne or He.

**Preparation and properties of thin lead sulfide films with special reference to their detector action.** II. Gerhard Brückmann. *Kolloid-Z.* 65, 148-61(1933); cf. C. A. 28, 389<sup>b</sup>.—PbS mirror films are transparent at 300  $\mu$ , while at 40  $\mu$  there is a strong change in reflection and absorption. Interference colors are not observable when a glass substrate is used. At 60  $\mu$ , there is a transition to a gray-blue color. The Haidinger law of complementary colors was found valid for the films. Above 200  $\mu$ , with increasing thickness, reflection from the surface side increases slowly, probably because of grain coarsening. For anomalous films, in which mirroring has been disturbed, the reflection is nil, transparency poorer than for the same thickness of normal mirrored films, and the films have a higher dispersity. Detector action increases rapidly with film thickness to 100  $\mu$ , above which it increases very slowly, similar to the curves of sp. cond. and  $\pi$  curves of metals. At 0.10  $\mu$ , the current-voltage characteristic curves are similar to that of sensitive galena crystals. On polished substrate surfaces, there is no relation for detector action on various metal substrates for equal thicknesses because prepn. details and grain size seem more important. Etched surfaces cause an orienting effect and better film reproducibility is obtained. Above 200  $\mu$  where grain size increases, detector action increases. Where the grain size is so thick that reflection shows interference

detector action is at a max. Polishing of the film surface has no effect. No difference was found for films prepd. from ordinary and from highly purified reagents. Treatments intended to sulfurize the surface did not increase detector action. Aging effects were absent, and removal of any  $\text{PbSO}_4$  coating of the films by NaOH or  $\text{NH}_4$  citrate showed no effect. Addn. of  $\text{Tl}_2\text{S}$  by direct occlusion to 10% diminished the effect, while Th B occlusion caused no change. The electron flow was from metal contact to PbS film except for polished Pb, Sn and Ag substrates. With Ag, current flowed in both directions; with Pb and Sn, direction was reversed. Flow was normal when the surfaces of these metals were etched or sand-papered prior to film formation. For graphite point contact, the flow was always from film to C. A combination of the theories of van Geel, Ogawa and Zwickler is advanced as the basis of a theory of contact detectors.

**Pseudocrystalline structure of water.** R. H. Fowler and J. D. Bernal. *Trans. Faraday Soc.* 29, 1049-56(1933).—The two facts upon which the theory is based are: water is not an ideal close-packed liquid, and the water mol. is asymmetrical. The following continuous scheme is deduced: water I "tridymite-like" (light, viscous); water II "quartz-like" (heavy, semiviscous); water III "liquid-ammonia-like" (light, nonviscous). There is no difference of mol., but different arrangements of the same mol. exist in small regions of vol.

**Cyclopentanone and cyclohexanone.** D. Vorländer. *Trans. Faraday Soc.* 29, 910-12(1933).—Values of the birefringence show that the directional stability of mol. movement is more than twice as great in cyclopentanone as in cyclohexanone.

**The Wiedemann-Franz constant, heat conductivity and thermoelectric forces of tellurium.** C. Hawley Cartwright. *Ann. Physik* 18, 656-78(1933).—A new exptl. method is described for measuring these quantities and tested with Au, Pt and Pb. Te with less than 0.01% impurities in the form of single crystals and polycryst. materials was tested at room temp. and liquid- $\text{O}_2$  temp. The departure of the Wiedemann-Franz const. from its normal value is explained by the assumption that heat cond. is a sum of terms, one due to cond. electrons and one due to mutual attraction of atoms. For good conductors the atomic term is very small but with semiconductors it is much larger. Thermoelec. forces and the Wiedemann-Franz const. for thin films of sublimed Te were measured.

**Some physical properties of silicon and ferrosilicon.** Ch. Bedel. *Ann. chim.* 20, 439-519(1933).—A sample of Si prepd. from ferrosilicon revealed some microscopic porosity and contained 99.86% Si, as compared to industrial Si, which contains 98.4% Si and exhibits Fe silicide regions. Si was etched with a mixt. of 9 parts  $\text{H}_2\text{O}$ , 30 alc. to 1 of KOH and showed cryst. structure clearly. With only 10 parts alc. ferrosilicons as well as Si are etched. The following data for the d. of Si were obtained: Si from Al, d. =  $2.326 \pm 0.0033$ ; Si from Zn, d. =  $2.329 \pm 0.0030$ ; Si, powdered and washed with HF, d. =  $2.333 \pm 0.0004$ ; fused Si, d. =  $2.307 \pm 0.0008$ ; Si, crushed but not washed with HF, d. =  $2.331 \pm 0.0014$ ; Si, crushed and washed with HF, d. =  $2.331 \pm 0.0046$ ; powd. Si, washed with HF, d. =  $2.330 \pm 0.0023$ . Ferrosilicons contg. 10.41, 50.59 and 85.86% Fe, and pure Fe gave ds. 2.53, 4.792, 6.755 and 7.859, resp. The formation of  $\text{SiFe}_2$  and  $\text{SiFe}$  caused an increase in the detd. ds., while compds. contg. less Si than  $\text{Fe}_2\text{Si}_4$  caused less variation from the theoretical. Some compds. of Fe and Si showed distinct magnetic susceptibility, while pure Si is diamagnetic. The coeff. of sp. magnetization for  $\text{SiFe}$  is  $163.70 \times 10^6$  and for  $\text{Si}_2\text{Fe}$  is  $112.28 \times 10^6$ . For a 56.86% Si alloy it is  $10.80 \times 10^6$ . From 65.48% Si to pure Si the values are  $1.63 \times 10^6$  to 0.0. Thermal treatment of samples of ferrosilicon has a marked effect upon their magnetic properties. The elec. resistance of Si increases while current flows from 21.85 to 30.52 ohms after 8 hrs. Interruption in the current causes an abrupt increase in resistance. Electrode pressure causes variations in the

resistance; hence a dielec. substance (adsorbed gas layer) must exist between the electrodes and the Si. The temp. coeff. of elec. resistance changes markedly at about 200°. This change confirms Koenigsberger and Schilling's detn. of the transition of  $\alpha$ -Si to  $\beta$ -Si at 215°. Si contg. 1.38% Fe shows a min. in resistance at about 210°; the coeff. changes from neg. to pos. at 210°. Amorphous Si showed soly. of 7-13% in HF. Si from Ag was 33-68% sol., from Zn and not powdered 12-15%, from Zn, powdered, 18-60%, from Zn and washed with HCl 23-6%, and from Zn, fused, and powdered 8-19%. Forty-two % HF showed least soly. action on Si, corresponding to 2HF.3H<sub>2</sub>O. Thirteen % HF, or HF.7H<sub>2</sub>O, exhibited the max soly. B. believes the HF dissolves only SiO<sub>2</sub> formed by oxidation (atm. or otherwise). H. E. Messmore

**Adsorption of gases by glass walls. IX. Nitric oxide.** M. Crespi. *Anales soc. españ. fis. quim.* 31, 825-9 (1933).—Adsorption of pure, dry NO on glass walls was detd. by using the same app. and technic as for N<sub>2</sub>O (C. A. 26, 5812). NO gas was prepd. by the action of Hg on a soln. of NaNO<sub>2</sub> in concd. H<sub>2</sub>SO<sub>4</sub> satd. at 40°. The correction for detn. of gas d. by the Regnault method, with various flasks and various pressures, is  $-3 \times 10^{-6}$  g. for 1000-ml. flasks under ordinary conditions and  $-5 \times 10^{-6}$  for 600-ml. flasks at 0.33 atm. pressure. E. M. S.

**A study of the absorption of gases by magnesium and calcium.** V. P. Saraev. *J. Tech. Phys.* (U. S. S. R.) 2, 442-9 (1932).—Mg absorbs only ionized N<sub>2</sub> or H<sub>2</sub>. At higher temps. Mg gives off absorbed N<sub>2</sub>, Ca absorbs more. Absorption by Ca is not proportional to ionization.

F. H. Rathmann

**The adsorption of nitrogen by iron synthetic-ammonia catalysts.** P. H. Emmett and Stephen Brunauer. *J. Am. Chem. Soc.* 56, 35-41 (1934); cf. C. A. 27, 2372.—The rates of adsorption of N<sub>2</sub> by promoted and by pure iron catalysts were measured over the temp. range 273° to 450°. The energy of activation of the adsorption process is about 16,000 cal. Isotherms at 400° and 450° indicate a heat of adsorption of about 35,000 cal. Isotherms taken at -189° are linear with respect to pressure between 100 and 760 mm. P. H. Emmett

**The sorption of vapors by activated, highly evacuated sugar charcoal over long periods of time.** James W. McBain and R. F. Sessions. *J. Am. Chem. Soc.* 56, 1-4 (1934).—Sorption isotherms of various vapors on highly purified and evacuated charcoal reach satn. values at very low pressures; furthermore, they change only a few % during runs lasting several years, provided the charcoal-vapor system is kept sealed. P. H. Emmett

**Studies on adsorption. The relation of water held by charcoal at zero pressure to the ash content.** L. J. Burrage. *J. Phys. Chem.* 37, 1095-101 (1933); cf. C. A. 27, 4981.—The ash content of several charcoals was detd. by a method that prevented loss of ash due to sublimation. The ash content cannot account for the quantity of water held by charcoal at zero pressure. It is suggested that the ash plays no part in the retention of water at zero pressure, but that the latter is held in a quasi-chem. manner by the active centers and C<sub>2</sub>O<sub>2</sub> complex. P. T. Newsome

**Surface condensation.** N. Fuchs. *Physik. Z. Sowjetunion* 4, 481-7 (1933).—The Frenkel theory postulating a sharply defined crit. temp. for condensation is criticized. Recent exptl. results point to the significance of surface discontinuities. This latter conception can be satisfactorily explained by the general Gibbs-Volmer theory. Howard A. Smith

**Spectrographic adsorption measurements with metal ion solutions on powder surfaces.** E. Berl and B. Schmitt. *Kolloid-Z.* 65, 264-7 (1933).—The concns. of very dil. solns. were detd. after adsorption by cstn. of intensity of last lines. The last lines are those few lines that at the highest dilns. of salt solns. still appear when the soln. is vaporized in an arc lamp. From 10 to 12 g. of solid of detd. dispersity was shaken with 10-20 cc. of 0.01% soln., and after adsorption the solid was sepd. by centrifuging. Expts. with Cu, Cd, Pb and Zn ion solns. with sphalerite, galena, CaCO<sub>3</sub>, BaSO<sub>4</sub>, SiO<sub>2</sub>, CaF<sub>2</sub>, and pyrite confirmed

<sup>1</sup> Fajans' rule qualitatively. Freshly ground pyrite adsorbs Cu completely from 0.001% soln., incompletely from 0.01%. Quant. measurements of Cu ion adsorption on sphalerite indicate a dependence on initial concn. and increase with fineness. Arthur Fleischer

**Relation between adsorption, solubility and nature of solvent. III.** Naoyasu Sata and Katuzo Kurano. *Kolloid-Z.* 65, 283-90 (1933); cf. C. A. 24, 4201; 26, 4741.—Adsorption of benzoic and picric acids by "Carbo medicinalis Merck" from 0.01 M solns. in binary mixts. of H<sub>2</sub>O, EtOH, Me<sub>2</sub>CO, Et<sub>2</sub>O, PhNO<sub>2</sub>, PhMe, C<sub>6</sub>H<sub>6</sub>, and CCl<sub>4</sub> was detd. at 25°. Soly. and adsorption curves are antibiotic except for picric acid in Me<sub>2</sub>CO mixts. In Me<sub>2</sub>CO, the absorption max. is at 4500 Å., behavior in this solvent being anomalous. Arthur Fleischer

**Monomolecular films of the polyesters.** Sanford A. Moss, Jr. *J. Am. Chem. Soc.* 56, 41-3 (1934).—The polymeric acid and neutral ethylene succinates form a regular series of stable unimol. films on dil. acid substrates similar to vapor expanded films of fatty acid esters. It appears that the mol. chains are flexible and can be closely packed before immersion or compression occurs. The closeness of approach was 5.85 Å.; the value 5.25 Å. was obtained from x-ray data. Reuben Roseman

**Colloidally divided arsenic dust as a condensation aerosol.** A. Winkel and G. Jander. *Kolloid-Z.* 65, 290-4 (1933); cf. C. A. 27, 3128.—As<sub>2</sub>O<sub>3</sub> aerosols, 73 mg. to 520 mg. per cu. m., were prepd. by cooling rapidly a gas stream contg. As<sub>2</sub>O<sub>3</sub> vapor obtained by passing over the oxide at 190° to 250°, and filtering out the dust particles. Below 100 mg. the aerosol is homogeneous, while from 100 to 500 mg., homogeneity is reached after sedimentation. The time required increases with concn. The particle size at given times is a linear function of concn. A. P.

**Determination of size and charge of fog droplets.** N. Fuchs and I. Petryanov. *Kolloid-Z.* 65, 171-4; *J. Phys. Chem.* (U. S. S. R.) 4, 567-72 (1933).—The principle of the Wells and Gerke method (cf. C. A. 13, 424) was combined with that of Millikan-Ehrenhaft so that the charge and size were simultaneously obtained from photographs. Special precautions for good photographs are use of intensive illumination, careful adjustment of the system and photographic app., grounding of cuvette and one electrode, and adjustment of fog concn. The method is not applicable below 0.3  $\mu$ , where Brownian movement becomes too large, or above 40  $\mu$ , where Stokes' law fails, but which is above the limit for sizes found in fogs. A mineral-oil fog, droplets 1.2 to 2.6  $\mu$ , revealed no relation between size and charge. Arthur Fleischer

**Studies in emulsions. I.** Joseph B. Parke and Hugh Graham. *J. Chem. Soc.* 1933, 1214-17.—The systems (a) C<sub>6</sub>H<sub>5</sub>-Na oleate-H<sub>2</sub>O, (b) tetrahydronaphthalene-Na oleate-H<sub>2</sub>O, (c) C<sub>6</sub>H<sub>5</sub>-sulfonated fish oil-NaOH-H<sub>2</sub>O, and (d) tetrahydronaphthalene-sulfonated fish oil-NaOH-H<sub>2</sub>O were examd. for viscosity, cond., and appearance under the microscope. Systems (a) and (b) were of the oil-in-water type throughout and the viscosity decreased continuously with increase in content of H<sub>2</sub>O. Systems (c) and (d) were water-in-oil and the viscosity increased with the water content up to 23 and 27%, resp., at which points the systems changed suddenly into oil-in-water types and the viscosity increased enormously, after which the viscosity decreased sharply with further increase in water content. F. L. Browne

**Electrostatics of colloids.** Ya. K. Suirkin. *J. Phys. Chem.* (U. S. S. R.) 1, 455-67 (1930).—A lecture. G. Faerman

**The action of electric waves on colloids.** E. Wilke and R. Müller. *Kolloid-Z.* 65, 257-60 (1933).—The changes in As<sub>2</sub>S<sub>3</sub> sol on exposure to high-frequency electro-magnetic alternating fields are presented as typical of the behavior of mastic, Berlin blue, Congo red, Night blue, hemoglobin, and Ag sols. The velocity of reaction depends on the energy in the oscillating circuit, wave length and sensitization by added electrolytes. Momentary changes are detd. by following the changes in cataphoresis and cond.; slow reaction (after-effects) by

changes in viscosity, color and flocculation. Viscosity changes of  $\text{As}_2\text{S}_3$  are slight with a min. at 180 m. Flocculation and color show max. at this wave length.

Arthur Fleischer  
Optics of white sols. III. Optical relations in coagulation. Torbjörn Caspersson. *Kolloid-Z.* 65, 301-7(1933); cf. *C. A.* 28, 950.<sup>2</sup>—Application of Mie's theory of light absorption and of Smoluchowski's coagulation equations leads to a very complicated expression for the change of absorption on coagulation or increase in particle size. From a series of calcd. curves for various wave lengths, definite initial particle sizes, and known  $\kappa$ s, the change of particle size on coagulation can be detd. from the exptl. absorption coeff.

Arthur Fleischer  
The capillary rise of hydrosols and of solutions of dyes. I. Effect of concentration and electrolytes. Augustin Bouteir and Marius Peyraud. *Compt. rend.* 197, 1218-20(1933).—Capillary rise when strips of ash-free filter paper were dipped into the sols. was detd. in a satd. atm. With low concns. (0.1 g./l.) neg. semicollodial dyes rise more rapidly than pos. dyes, but at concns. from 1 to 2 g./l. the velocities are about the same and may be reversed. The rise of neg. colloids and dyes is retarded by electrolytes; the effect is independent of the anion but increases as the valence of the cation increases. The rise of pos. colloids is retarded by  $\text{Na}_2\text{SO}_4$  and  $\text{Na}_2\text{PO}_4$ , is barely affected by  $\text{NaCl}$ , but  $\text{HCl}$ ,  $\text{BaCl}_2$ ,  $\text{AlCl}_3$  and  $\text{ThCl}_4$  accelerate; the latter effect varies with the valence of the cation and reaches a max. with increased concn.

E. G. Vanden Bosche  
Measurements of isotherms of specific wetting. A. B. Taubman. *J. Phys. Chem.* (U. S. S. R.) 1, 562-71 (1930).—A study of the effect of saponin sols. of various concns. on the wetting of paraffin by water and the rate of change of surface tension on the boundary: saponin soln.-air. In measuring the angle of contact on the boundary soln.-air on a paraffin wall with change of concn. of the saponin a change from an obtuse to an acute angle as a result of the adsorption of saponin on the interface is observed. Beginning with a concn. of saponin of 0.01%, paraffin is wet by a water soln. It was assumed that the Rebiner equation for the kinetics of adsorption was applicable. (Cf. Rebiner, *J. Russ. Phys.-Chem. Soc.* 56, 530(1924).)

G. Faerman  
The determination of combined water in disperse systems. I. Refractometric and polarimetric methods. A. V. Dumanskii. *Kolloid-Z.* 65, 178-84(1933).—Part of the  $\text{H}_2\text{O}$  content of a colloidal system is present in a combined state, oriented and under a high pressure, and characterized by a lower vapor pressure, absence of freezing on cooling, and lower solvent activity than ordinary water. For easily filtering systems, sugar is added, thoroughly mixed with the colloidal system, filtered, and sugar detd. in the filtrate by refractometric or polarimetric measurements. Powdered sand,  $\text{BaSO}_4$ , talc and  $\text{Al}_2\text{O}_3$ , previously dried at 105°, showed 0.041, 0.015, 0.030 and 0.069 g. of combined water per g. of material by the refractometer, and 0.034, 0.018, 0.029, 0.056, resp., by the polarimeter. The following were obtained for potatoes: raw 0.567, frozen 0.344, dried 0.540, boiled 1.506 g. per g. of dry substance; for sugar beets, 5.4% combined against a total water content of 71.6%.

Arthur Fleischer  
Colloidal solutions of sulfur from sulfur nitride. S. A. Voznesenskii. *J. Phys. Chem.* (U. S. S. R.) 1, 510(1930). The reaction of sulfur nitride with alkali in anhyd. media gives colors in the order: red, blue, yellow, milk-white. The rate of color change varies with diln. The obtained sol is hydrophylic and consists of the particles  $[\text{S}_2\text{-O}_2, \text{H}_2\text{O}, \text{S}_4]^- + \text{H}^+$ .

F. H. Rathmann  
The reaction of ethylene oxide with solutions of earth- and heavy-metal halides. A new method for the preparation of sols and reversible gels of metal-oxide hydrates. Walter Ziese. *Ber.* 66B, 1965-72(1933).—The halides of Al, Cr, Fe, Th and Zn in dil. soln. react slowly with ethylene oxide to form sols or gels of the metal-oxide hydrates and ethylene halohydrin, which can be sepd. from the soln. by extn. (with  $\text{Et}_2\text{O}$ ) or distn. If not more than 90% of the metal halide is converted to the hydroxide,

1 sols are formed which can be dried, and then redissolved in  $\text{H}_2\text{O}$  or concd. alc. or glycerol sols. If less than 5% of the original halide remains unconverted, the sol is unstable and a gel is slowly formed; an excess of the ethylene oxide forms gels, after some hrs., which show the phenomena of "humming," syneresis and dehydration. For  $\text{ZnO}$  and  $\text{MnO}$  the sol phase is unstable, unless a protective colloid is present, and gels are quickly formed. Propylene oxide and epichlorohydrin may be substituted for the ethylene oxide.

L. E. Steiner  
The stability toward rupture of adsorbed films on the air-saponin boundary of aqueous solutions. N. M. Lubman. *J. Phys. Chem.* (U. S. S. R.) 1, 721-7(1930); cf. *C. A.* 27, 216.—By the method of a spinning float the stability of an adsorbed film of saponin soln. of varying concns. and the speed of its formation were studied.

G. Faerman  
Existence of micelles in aqueous solutions of saponin. Wm. Kleinberg. *Proc. Soc. Exptl. Biol. Med.* 31, 113-14 (1933).—In sols. of surface-active substances, there are certain crit. concns. in which the static surface tension is at a min. and these minima occur when the mols. in the surface layer form regular patterns. In aq. sols. of saponin, well-marked minima occurred at concns. of 1:12, 500, 1:24,500 and 1:37,500. By the method of du Nouy (A. C. S. Monograph Series No. 27, 1921) the dimensions of the saponin mol. would be  $6.3 \times 10^{-8}$  cm.,  $3.2 \times 10^{-8}$  cm. and  $2.1 \times 10^{-8}$  cm., which are about 10 times the expectation for the saponin mol. The dimensions must be those of agglomerates, in orderly arrangement, capable of orienting themselves in 3 different ways corresponding to their length, breadth and thickness. C. V. Bailey

Colloidal solutions by hydrolysis of ceric sulfate. A. Janek and A. Schmidt. *Kolloid-Z.* 65, 295-7(1933).—The turbidity of sols formed by pouring Ce sulfate soln. into  $\text{H}_2\text{O}$  at 20°, 45°, 70° and 100° increases with decreasing temp. and the max. turbidity is displaced to higher concn. with decreasing temp. The best sols result when 0.5 to 3.75 cc. of Ce sulfate soln. contg. 1 g. of salt, 60%  $\text{Ce}_2\text{O}_3$ , per 15 cc. is poured into 100 cc.  $\text{H}_2\text{O}$  at room temp.  $\text{Na}_2\text{SO}_4$  addn. clarifies the sol. The particles are negatively charged and are hydrophobic.

Arthur Fleischer  
The behavior of concentrated ferric hydroxide sols in capillary viscometers. A. Rabinerson and G. Fuchs. *Kolloid-Z.* 65, 307-16(1933).—Sols, 7.82 to 20.42 g.  $\text{Fe}_2\text{O}_3$  per 100 cc., were prepd. by peptization of Merck's *Ferrum oxydatum dialysatum*. The 20% sol set to a thixotropic gel in several days. At 20°, sols above 17% showed structure viscosity, which increased with age. Compared to most colloids, the structure viscosity is small. After aging the thixotropic properties of the 17% sol are apparent from the different viscosities obtained by filling the pipet at different rates. The Reynolds no. decreases with increase in  $\text{Fe}_2\text{O}_3$  concn.; for a 17% sol the value is 13 to 16% of that of water. Arthur Fleischer

The correlation between swelling action and permeating power of electrolytes. Margarete von Dellingshausen. *Planta (Abt. E, Z. wiss. Biol.)* 21, 51-97(1933).—A study was made of the effect of neutral salts on the swelling of gels, as influenced by (1) the d. and sp. charge of the gel, (2) the degree of adsorption and the hydrophilic nature of the ion and (3) the concn. of the electrolyte. With permeable homogeneous gels (gelatin, agar) swelling depends on the hydrophilic character of the adsorbed ion; non-adsorbed ions (of the same charge) hinder swelling to an extent dependent on the affinity of the ions for water. An increase in electrolyte concn. favors the swelling of permeable gels and checks the swelling of impermeable gels. Whether the adsorbed ions increase or decrease the swelling of a gel depends also on the hydrophilic character of the gel micelles. With gelatin gels in which the structure of the diffusion path has not been affected the permeation velocity of the cations of chloride sols. corresponds to their mobility in free soln.:  $\text{Al} < \text{Mg} < \text{Ca} < \text{Ba} < \text{Li} < \text{Na} < \text{K}$ . In gels already at swelling equil. with electrolyte sols. the mobility of the cations of chlorides, as detd. by increased swelling, is in the order  $\text{K} < \text{Na} < \text{Li}$  and  $\text{Al} < \text{Mg} < \text{Ca}$ . With lupin-seed husks the swelling effect

of ions in low concn. depends on their permeating power, in high concns. on their degree of free mobility. With Cellophane membranes the swelling-effect curve agreed approx. with the mobility of the ions at the concns. tested. In all gels tested the sp. cond. of the electrolytes was highest at the lowest concns. In a Cellophane osmometer the  $J$ -value for isosmotic solns. was in the order  $KCl < NaCl, LiCl < sucrose$ . Sixty-five references.

K. D. Jacob

**Liesegang rings.** Bruno Kisch. *Kolloid-Z.* 65, 316-19 (1933); cf. *C. A.* 24, 284-5.—Liesegang rings form on evapn. of a solvent, such as  $HOAc$ , from a soln. contg. such salts as  $KCl, NaCl, K_2SO_4, K_2Cr_2O_7$  or  $CuSO_4$  if a solid particle, the central body, is present. The central body may be silica. Aq. solns. of  $K_2Cr_2O_7$  show the same effect when rapidly evapd. Rings of the 2nd order obtained with  $AgNO_3$  diffusing into dichromate gels are not exactly concentric with the 1st-order rings. Light causes a stronger development of the rings. Arthur Fiescher

**The question of the structure of silica gel.** M. V. Polyakov, P. M. Stadnik, M. V. Paritzkil, I. M. Malkin and F. S. Dukhina. *J. Phys. Chem.* (U. S. S. R.) 4, 454-6 (1933).—Drying of  $SiO_2$  gel in vapors of  $C_2H_6, PhMe, xylene, naphthalene$  and  $S_2$  leads to an increase in the general adsorptive activity of  $SiO_2$  gel as measured by  $C_2H_6$ . In this preliminary report a relation is sought between activity of  $SiO_2$  gel and the mol. wt. of the substance in the vapors of which desiccation is produced.

G. Faermann

**The conductance of bases in liquid ammonia.** Wm. W. Hawes. *J. Am. Chem. Soc.* 55, 4422-30 (1933).—The elec. cond. of  $NaNH_2$  and  $KNH_2$  in liquid  $NH_3$  was measured up to dilns. of 36,000 and 52,000 l., resp. Deviation from the simple mass-action theory and the theory of Kraus and Fuoss may possibly be ascribed to the small size of the amide ion.

L. F. Audrieth

**Electric conductivity of cellulose ethers.** B. V. Kuvshinskii. *J. Tech. Phys.* (U. S. S. R.) 3, 634-44 (1933).—Acetyl, ethyl, nitro and benzyl cellulose derivs. were studied.  $H_2O$  increases the cond.  $10^6$  times. Plasticizers also increase it by the same amt.

F. H. Rathmann

**Solubility of inorganic compounds in liquid ammonia.** II. Martin Linhard and M. Stephan. *Z. physik. Chem.* A167, 87-102 (1933); cf. *C. A.* 27, 2865.—The solubilities of the following salts were detd. in liquid  $NH_3$  at  $-0.1 \pm 0.1^\circ$ :  $LiCl, RbCl, CsCl, AgCl, NH_4Cl, RbBr, CsBr, AgBr, NH_4Br, RbI, CsI, AgI, NH_4I, MgBr_2, CaBr_2, SrBr_2, BaBr_2, MgI_2, CaI_2, SrI_2, BaI_2, Ca(NO_3)_2, Sr(NO_3)_2, Ba(NO_3)_2$ . The results are discussed and compared with those obtained in aq. soln.

G. M. Murphy

**Solubility. XIII.** The solubility of iodine in certain solvents. G. R. Negishi, L. H. Donnelly and J. H. Hildebrand. *J. Am. Chem. Soc.* 55, 4793-4800 (1933).—In extension of work previously reported (*C. A.* 23, 1559) the soly. of  $I_2$  in mols. %, was detd. in  $TiCl_4$  ( $0.8633_{10.0} - 4.939_{10.0}$ );  $SiCl_4$  ( $0.1713_{10.0} - 0.8801_{10.0}$ );  $C_2H_5Br$  ( $4.925_{10.0} - 35.26_{10.0}$ ) and 2,2,4-trimethylpentane ( $0.5900_{24.0} - 0.8711_{10.0}$ ). Violet "regular" solns. are formed in each case. The relation between soly. and internal pressure and applicability of an equation by Scatchard are discussed.

E. R. Schierz

**The solubility of hydrogen in water at  $0^\circ, 50^\circ, 75^\circ$  and  $100^\circ$  from 25 to 1000 atmospheres.** R. Wiebe and V. L. Gaddy. *J. Am. Chem. Soc.* 56, 76-9 (1934); cf. *C. A.* 26, 4228, 5245; 27, 2615.—The soly. shows a min. within the exptl. range similar to that of  $N_2$  in  $H_2O$ . It seems that the existence of minima is a general phenomenon that can be deduced from the known behavior of mixts. and is not necessarily dependent on sp. properties of the solvent or solute.

Reuben Roseman

**The solubility of silver bromate in mixtures of alcohols and water.** Edward W. Neuman. *J. Am. Chem. Soc.* 56, 28-9 (1934).—The solubilities of  $AgBrO_3$  in mixts. of  $MeOH, EtOH, PrOH$  and iso- $PrOH$  with  $H_2O$  were detd. at  $25^\circ$ . The results are incompatible with the Born electrostatic formula, as expressed by Scatchard (*C. A.* 21, 1216).

E. R. Smith

**The solubility of acetyl- $\alpha$ -toluidine in various solvents.**

J. L. Hall, A. R. Collett and C. L. Lazzell. *J. Phys. Chem.* 37, 1087-94 (1933).—The solubilities of acetyl- $\alpha$ -toluidine in  $MeOH, EtOH, PrOH, iso-PrOH, BuOH, iso-BuOH, Me_2CO, CHCl_3, C_2H_6, Et_2O$  and  $H_2O$  were detd. over the temp. range  $25^\circ$  to  $110^\circ$ . The calcd. molal heats of fusion varied from 5500 to 5900 cal. P. T. N.

**The solubility of the hydrates of nickel chloride in water.** Erich Boye. *Z. anorg. allgem. Chem.* 216, 29-32 (1933).—The soly. of  $NiCl_2$  from the cryohydric point ( $-45.3^\circ$ ) to the b. p. of the satd. soln. ( $+117.9^\circ$ ) was detd. The phase diagram shows 4 hydrates, the transition points of which are: ice +  $NiCl_2 \cdot 7 aq. - 45.3^\circ$ ;  $NiCl_2 \cdot 7 aq. + NiCl_2 \cdot 6 aq. - 33.8^\circ$ ;  $NiCl_2 \cdot 6 aq. + NiCl_2 \cdot 4 aq. - 28.8^\circ$ ;  $NiCl_2 \cdot 4 aq. + NiCl_2 \cdot 2 aq. - 64.3^\circ$ . H. H. Rowley

**Limitations of solubility method for determining dissociation constant.** W. V. Bhagwat and S. S. Doosaj. *J. Indian Chem. Soc.* 10, 477-90 (1933).—Dissoen. consts.

were detd. for the weak acids: formic, acetic, citric, benzoic and salicylic, by adding their Na salts to satd. solns. of the sparingly sol. acids: benzoic, salicylic and cinnamic, and using the formula,  $K_2 = K_1 - a(c - b + a)/(b - a)^2$ , in which  $K_2$  is the required dissoen. const.,  $K_1$  is the known dissoen. const. of the sparingly sol. acid whose soly. in water is  $a$  and whose soly. is  $b$  in the Na salt soln. when the salt concn. is  $c$ . The values of the const. are fair when the concn. of Na salts is varied from 0.0 to 0.8-2.5  $N$ . The value of  $K_2$  is affected by both degree of ionization and hydrolysis. With diln. the former decreases the no. of acid mols.,  $(b - a)$ , while the latter increases the soly.,  $(b - a)$ . The change of  $K_2$  with diln. is detd. by the relative importance of increase in ionization and increase in hydrolysis. For acids not monobasic the formula must be made:  $K_2 = nK_1 - a(nc - b + a)/(b - a)^2$ , where  $n$  is the basicity of the acid. The formula is absolutely correct when  $K_2 = K_1$ . When  $NaCl$  is added to one of the sparingly sol. acid const. value of  $K_2$  is found. It cannot be called a dissoen. const. for  $HCl$ , but it can be used in calcs. of the soly. of the acid in other concns. of  $NaCl$ .

F. E. Brown

**The solution of metals in acids.** Maria Schunkert. *Z. physik. Chem.* A167, 19-28 (1933).—Addn. of albumin, agar, dextrin, gelatin, casein, starch and saponin lowers the rate of evolution of  $H$  in the action of concd. and dil.  $H_2SO_4$  on  $Fe$  and  $Zn$ . Methyl violet and methylene blue lower the rate of soln. of  $Fe$  in concd.  $H_2SO_4$  but raise the rate for  $Zn$  in dil.  $H_2SO_4$ . The activity is proportional to the adsorption of the compd. Highly ionized salts either raise or lower the rate.

G. M. Murphy

**Comparison of extraction formulas.** Carroll W. Griffin. *Ind. Eng. Chem., Anal. Ed.* 6, 40-1 (1934).—The variables in 2 extraction formulas are compared. The limits are evaluated for the case of finite and infinite vol. of extracting liquid.

G. M. Murphy

**The effect of concentration on the compressions of aqueous solutions of certain sulfates and a note on the representation of the compressions of aqueous solutions as a function of pressure.** R. E. Gibson. *J. Am. Chem. Soc.* 56, 4-14 (1934).—Exptl. measurements of the compressions up to 1000 bars of various solns. of 11 sulfates were made over the whole range of concn.; for those sulfates not greatly hydrolyzed in soln. the bulk compressions of solns. of the same molality are approx. the same. A deviation function,  $A$ , giving the difference between the sp. compression of pure  $H_2O$  and  $H_2O$  in any soln., is expressible by the equation  $A = am + bm^2$ . Tait's equation, modified by a procedure suggested by a hypothesis of Tammann, represents very accurately the vol.-pressure relations in salt solns. The melting curve of pure  $C_2H_6$  between 500 and 1000 bars is given by the equation  $P = 518.8 + 37.4(t - 20) + 0.104(t - 20)^2$ , where  $P$  is the pressure in bars and  $t$  the temp.

Reuben Roseman

**The specific effect of the solvent in electrolytic dissociation.** D. J. G. Ives. *J. Chem. Soc.* 1933, 1360-5.—The increase in cond. of aq. solns. of  $Cu$  malonate when pyridine is added to the soln. is due to the breaking down of the solvated sheath of the  $Cu$  ion in the aq. solns. The behavior of this class of electrolyte is detd. in general by

the electron-accepting tendency of the cation and the coordinating tendencies of the anion and of the solvent. The effect of the solvent change is small in the case of the malonates of Zn and Ni.

H. F. Johnstone

The electrical properties of sea water for alternating currents. R. L. Smith-Rose. *Proc. Roy. Soc. (London)* A143, 135-46 (1933).—The elec. properties of sea water under a. c. conditions, particularly at radio frequencies, were investigated. The sp. cond. of sea water obtained from the English Channel was found to increase from  $3.9 \times 10^{10}$  at 500 cycles to  $5.4 \times 10^{10}$  e. s. u. at a frequency of 10,000 kilocycles/sec., corresponding to resistivity values of 23 and 16.5 ohm-cm., resp. In detg. the current flowing, it is concluded that the dielec. const. has a negligible influence compared with the effect of the cond. The value of the dielec. const. is probably about 80. Between 0° and 40° the mean temp. coeff. of cond. is about +2.7%/°C. A sudden decrease in cond. occurs at -2°, and the coeff. has a much smaller value below this transition point.

Allen S. Smith

The effect of dissolved electrolytes on the boundary tension of water. W. G. Eversole and Dallas S. Dedrick. *J. Phys. Chem.* 37, 1205-14 (1933).—A specially designed app., employing the drop-vol. method, was used to det. the interfacial tensions, at 40.00°, of the following systems: aq.  $\text{CH}_3\text{COONa}$ -mineral oil, aq.  $\text{HCOONa}$ -mineral oil, aq.  $\text{CH}_3\text{COONa}$ -toluene, and aq.  $\text{HCOONa}$ -toluene. The interfacial tension of aq.  $\text{CH}_3\text{COONa}$ -mineral oil decreased hyperbolically with increasing salt concn. from 0 to 6 molal. In the other 3 systems, however, the surface tension passed through a min. as the salt concn. increased, the value at higher salt concns. often being greater than at zero concn. The effect of these salts is explained on the basis of the Langmuir theory of mol. orientation and the increased interionic attraction in the interface due to the dielec. const. gradient in the interfacial layer.

Don Brouse

The effect of sodium acetate on the interfacial tension of the benzene-water system at 40°. Dallas S. Dedrick and Maurice H. Hanson. *J. Phys. Chem.* 37, 1215-21 (1933).—"At very low concns., the interfacial tension of aq.  $\text{CH}_3\text{COONa}$ -benzene systems decreases markedly with increasing concn. of the salt. After passing through a decided min. at about 0.1 molal, the interfacial tension increases with a small increase in concn. It then passes through a max., the value of which is greater than the initial tension between benzene and water, and finally decreases hyperbolically as the soln. becomes more nearly satd." The theory of Eversole and Dedrick (cf. preceding abstr.) is extended to include the boundary effects of strong electrolytes at higher concns.

Don Brouse

The cryoscopic behavior of alcohol in aqueous solution. Andre Berner. *Ber.* 66B, 1917-21 (1933).—Dil. solns. of alc. in  $\text{H}_2\text{O}$  are normal in f.-p. behavior, contrary to the opinion of Beiser and Pringsheim. The f.-p. lowering of an alc.-insulin soln. in  $\text{H}_2\text{O}$  is the sum of the lowerings of the alc. and insulin in sep. solns.

L. E. Steiner

The molecular-weight determinations of carbohydrates. Max Ulmann and Kurt Hess. *Ber.* 66B, 1975-7 (1933).—The normal b. p. rise is obtained for cane sugar if the sugar is not dried at too high temp. and if the boiling in the b. p. app. is stopped while the sugar is added. The sugar may be dried at room temp. or with boiling  $\text{CHCl}_3$ .

L. E. S.

The partial pressure of water vapor and oxides of nitrogen over a solution of nitrosylsulfuric acid in sulfuric acid. A. V. Tikhonov. *J. Chem. Ind. (Moscow)* 1933, No. 8, 58-60.—The pressures are given at 3 concns. of  $\text{H}_2\text{SO}_4$  and over a wide variety of temps. and concns. of  $\text{N}_2\text{O}_5$ .

H. M. Leicester

Water vapor equilibria on vanadium and its oxides. Masami Kobayashi. *Science Repts. Tôhoku Imp. Univ.*, 1st Ser. 22, 1240-55 (1933).—See C. A. 28, 24°. G. G.

The partial pressures of water in equilibrium with aqueous solutions of sulfuric acid. Edward M. Collins. *J. Phys. Chem.* 37, 1191-1203 (1933).—Based upon a redetn. of aq. partial pressures over aq. solns. of  $\text{H}_2\text{SO}_4$ , a table of relative vapor pressures is compiled from which

can be ascertained the aq. partial pressures between 0 and 70%  $\text{H}_2\text{SO}_4$  for any temp. from 20° to 140°. The heats of vaporization of water from solns. of the above range of concn. and temp. are tabulated.

Don Brouse

Individuality of the osmotic conduct of the alkali halides. G. Damköhler and J. Weinzierl. *Z. physik. Chem.* A167, 71-86 (1933); cf. C. A. 25, 2350.—The cryoscopic method previously described was used to measure f. p. lowering of LiBr, NaBr, KBr and CsBr soln. The method of prepg. the ice and the thermocouple were improved. The Haber-Loewe interferometer was used to measure concn. but it was found necessary to place the instrument in a thermostat in order to get reproducible results. Temp. coeffs. of interferometer readings are given for the salts named.

G. M. Murphy

Velocity of permeation of electrolytes through a membrane. Shinnosuke Matsuura. *Sci. Repts. Hiroshima Higher Tech. School* 2, 67-187 (1933) (in English).—Largely a review of C. A. 24, 3692; 25, 3542; 26, 4994-5; 27, 11, 1261.—Correction: the following relations hold for the permeation of a single electrolyte through a membrane: (1)  $(1/t) \log (C_0 - C_\infty)/(C - C_\infty) = \lambda A (V - v)/2.3 V v = k$ ; (2)  $(1/t) \log (c_0 - c_\infty)/(c - c_\infty) = \lambda A (V + v)/2.3 V v = k$ ; (3)  $C_\infty = c_\infty = (C_0 V + c_0 v)/(V + v)$ , where  $C_0$  is the initial concn. of the inside soln. (I),  $c_0$  is that of the outside soln. (III),  $C$  the concn. of I at time  $t$ ,  $c$  that of II at time  $t$ ,  $C_\infty$  and  $c_\infty$  are the concns. of I and II at time  $\infty$ ,  $V$  and  $v$  the initial vols. of I and II,  $A$  is the surface area of the membrane and  $k$  a const. when  $V$ ,  $v$  and  $A$  are const.

W. C. Fernelius

Accelerated and retarded diffusion in aqueous solution. James W. McBain and Charles R. Dawson. *J. Am. Chem. Soc.* 56, 52-6 (1934).—The principles governing the acceleration or retardation of all ions in the presence of other ions, whether diffusion with or against them or present in uniform concn. throughout, are discussed. These are illustrated by expts. with KCl and HCl. Collision effects of diffusing columns modify the results at higher concns. High rates of diffusion were found for all constituents in expts. in which glycine diffused against HCl. In the case of Cl ion in dil. soln. the increase was as much as five-fold, although the Cl ion was not reacting.

E. R. Smith

The Kohlrausch theory of migrating boundaries. Jnanendra Nath Mukherjee. *Kolloid-Z.* 65, 297-301 (1933); cf. C. A. 23, 558, 1549.—The principles to be observed in detg. transport nos. by the moving-boundary method, as previously deduced by M., are shown to be valid.

Arthur Fleischer

The dissociation constants of glycine at various temperatures. Benton B. Owen. *J. Am. Chem. Soc.* 56, 24-7 (1934); cf. C. A. 25, 634-5.—The acid and basic dissoc. consts. and heats of dissoc. of glycine were detd. in aq. soln. from 10° to 40°, and from 10° to 45°, resp. At 25°,  $K_A = 4.47 \times 10^{-3}$ ,  $K_B = 6.04 \times 10^{-4}$ ,  $\Delta H_A = 1159$  cal.,  $\Delta H_B = 2765$  cal.

E. R. Smith

Spectroscopic investigation of the dissociation relations of mercuric halides in solution. Hans Fromherz and Kun-Hou Lih. *Z. physik. Chem.* A167, 103-28 (1933).—Absorption curves are given for aq. solns. of  $\text{Hg}(\text{ClO}_4)_2$ ,  $\text{HgO}$ ,  $\text{HgCl}_2$ ,  $\text{HgBr}_2$ , and  $\text{HgI}_2$ ; mixts. of  $\text{HgCl}_2$  with LiCl and KCl;  $\text{HgBr}_2$  with LiBr and KBr;  $\text{HgI}_2$  with KI; and abs.-alc. solns. of  $\text{HgBr}_2$ ,  $\text{HgI}_2$ ,  $\text{HgBr}_2 + \text{NaBr}$  and  $\text{HgI}_2 + \text{NaI}$ . In all concns. in aq. soln. the halides are unionized and show no assocn. In alc. soln. the max. are displaced to the red compared with the aq. soln. and are lowered by diln. In the alkali halide solns. complex salts are formed for which the degree of assocn. is detd. The ultra-violet frequencies of the compd.  $\text{HgX}_2$  and  $\text{HgX}_2$  show a simple relationship similar to Raman frequencies.

G. M. Murphy

The use of the equation of Henglein for solutions and mixtures. V. A. Kireev. *J. Gen. Chem. (U.S.S.R.)* 3, 622-7 (1933); cf. C. A. 27, 3654.

E. J. C.

Determination of acidity in ethyl alcohol by velocity of acetal formation. Alden J. Deyrup. *J. Am. Chem. Soc.* 56, 60-4 (1934).—The rate of formation of  $\text{MeCH}(\text{OEt})_2$  is suitable as a measure of acidity in abs.-alc. soln. HCl,

HBr, HI and HClO<sub>4</sub> are completely ionized strong acids; HNO<sub>3</sub> and picric acid are weak acids of about the same strength in this solvent. The effect of change of electrolyte concn. and solvent on the dissocn. consts. of a no. of weak acids and bases was detd. The inhibition of the reaction by traces of H<sub>2</sub>O can be ascribed to its basic character. Catalysis in the presence of CaCl<sub>2</sub>, Ca(NO<sub>3</sub>)<sub>2</sub>, and LiCl is due to traces of strong acids. R. Roseman

The temperature coefficients of the electromotive force of the cell Cd (metal), CdSO<sub>4</sub>, Cd (saturated amalgam). W. George Parks and Victor K. La Mer. *J. Am. Chem. Soc.* 56, 90-1 (1934); cf. *C. A.* 28, 30<sup>2</sup>.—From e. m. f. measurements of cells, Cd/CdSO<sub>4</sub> 0.5M/Cd(s, satd. with Hg) at 0°, 10°, 20° and 30°, using various types of annealed Cd electrodes,  $E_t \times 10^3 = 5538 - 14.8t - 0.385t^2 + 0.0075t^3$ . These data were used for calcn. of free energy, entropy and heat content changes for the transfer of Cd to Cd satd. amalgam and for the same thermodynamic properties for Cd(s) + PbSO<sub>4</sub>(s) = CdSO<sub>4</sub> + Pb(s). L. P. Hall

The magnesium electrode in ether solution and the free energy of formation of magnesium bromide. Geo. A. Scherer and Roy F. Newton. *J. Am. Chem. Soc.* 56, 18-20 (1934).—Exptl. data are given for the e. m. f. of the cell Mg(s), satd. ether soln. of MgBr<sub>2</sub>·2(C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>O, Hg<sub>2</sub>Br<sub>2</sub>(s), Hg(l), and for the vapor pressures of the mono- and di-ethers of MgBr<sub>2</sub>. From these and other data, the authors calc. for MgBr<sub>2</sub>(s),  $\Delta F_{298}^\circ = -114.0$  kg.-cal. per mol. F. D. Rossini

Modern theory of overvoltage. O. A. Esin. *Uspekhi Khim.* 2, 493-516 (1933); cf. *C. A.* 28, 397<sup>2</sup>.—Intermediate compds., surface tension, intermediate discharge of ions, and quantum-theory considerations are discussed. F. H. Rathmann

The oxidation-reduction potential of the system hypoxanthine = uric acid. Sabine Filitti. *Compt. rend.* 197, 1212-14 (1933).—Hypoxanthine (I), in the presence of xanthine-oxidase, reduces the whole series of oxidation-reduction indicators, including  $\gamma, \gamma'$ -bipyridyl dimethochloride; uric acid (II) oxidizes the leuco derivative of this indicator. The equil. potential for the above indicator, diastase and an equimol. mixt. of I and II, is  $-0.410$

For C<sub>5</sub>H<sub>4</sub>ON<sub>4</sub> + 2H<sub>2</sub>O = C<sub>5</sub>H<sub>4</sub>O<sub>2</sub>N<sub>4</sub> + 2H<sub>2</sub>, the normal potential at 38°, the free energy and the heat of the reaction are  $-0.031$  v., 2861 cal. and  $-1700$  cal., resp.

E. G. Vanden Bosch

Decomposition pressures of nitrates and sulfates. II. Vanadyl sulfate and lead nitrate. Bernhard Neumann and August Sonntag. *Z. Elektrochem.* 39, 799-806 (1933).—The decompn. of VOSO<sub>4</sub> into V<sub>2</sub>O<sub>5</sub>, SO<sub>3</sub> and SO<sub>2</sub> begins at 410° and  $p_{\text{SO}_2}$  reaches 1 atm. at 610°. The reaction is reversible. The heat of formation of the sulfate from its elements is estd. from the vapor-pressure data to be 314.2 Cal. The decompn. of Pb(NO<sub>3</sub>)<sub>2</sub> begins at approx. 250°. Because of the further decompn. of N<sub>2</sub>O<sub>5</sub>, the reverse reaction takes place very slowly. The decompn. occurs in steps with the successive formation of 4 PbO·2Pb(NO<sub>3</sub>)<sub>2</sub>, 5PbO·Pb(NO<sub>3</sub>)<sub>2</sub>, and PbO. The calcd. heats of formation of these compds. are 448.1, 391.1 and 322.9 Cal., resp.

H. F. Johnstone

A method for the direct determination of the dissociation pressure of metallic oxides. A. Kapustinskii and L. Shamovskii. *Z. anorg. allgem. Chem.* 216, 10-16 (1933).—A method is described for the direct detn. of heterogeneous chem. equil. between metals and gases by measurement of the electron emission. The dissocn. equil. of NiO was investigated and the value 106.3 kg.-cal. for the heat of formation of NiO calcd.

H. H. Rowley

Calculation of chemical equilibria in gaseous reactions. A. V. Frost. *Uspekhi Khim.* 2, 445-74 (1933).—Theoretical and review. Equilibria are calcd. by application of the third law and by application of statistical methods, and compared with exptl. values. The effect of isotopes is considered. Entropies as detd. by spectroscopic and sp.-heat data are compared. F. H. Rathmann

The thermal decomposition of solids. W. E. Garner, A. S. Gomm and H. R. Hailes. *J. Chem. Soc.* 1933, 1393-8.—The decompn. of solids begins at nuclei on either the external or the internal surfaces of a crystal. The reaction

spreads uniformly from these nuclei only within the individual grains composing the crystal and from grain to grain only at a few points on the boundaries. The rate of the reaction in its early stages follows a branching mechanism, while in the final stages it follows the first-order law.

H. F. Johnstone

The chain theory and oxidation processes. N. N. Semenov. *Uspekhi Khim.* 2, 590-621 (1933); cf. *C. A.* 26, 5482; 27, 889.—A review of work done to show the kinetics and chain nature of the combustion of S, P, H<sub>2</sub>, PH<sub>3</sub>, CO, etc., and the effect of vessel shape and size, of pressure, of admixtures, and of light. F. H. R.

Oxidase-like oxidizing action of certain metallic complex salts. IX. The action of some metallic complex salts on the oxidation of diphenylaminesulfonic acid and *N*-methyl-*p*-aminophenol. Yuji Shibata and Kazuo Yamasaki. *J. Chem. Soc. Japan* 54, 1207-14 (1933); cf. *C. A.* 24, 5773.—The change of the Ba salt of diphenylamine-sulfonic acid (I) and *p*-MeNHC<sub>6</sub>H<sub>4</sub>OH (II) by an addn. of complex salts of Co and Cr was studied by measuring the O<sub>2</sub> absorption and the effect of poisons, KCN, NH<sub>4</sub>OH, complex salt of Cr, etc., which have no oxidizing power. The absorption of O<sub>2</sub> by I is not affected by the addn. of complex salts but that of II is decreased by their presence; the stronger the oxidizing power of the salts, the less the O<sub>2</sub> absorption. K. Kitsuta

The slow combustion of ethylene. Wm. A. Bone, A. E. Haffner and H. F. Rance. *Proc. Roy. Soc. (London)* A143, 16-37 (1933).—The reaction between C<sub>2</sub>H<sub>4</sub> and O<sub>2</sub> at 300° and 1 atm., for compns. (C<sub>2</sub>H<sub>4</sub>/O<sub>2</sub>) ranging from 5/1 to 1/2, is homogeneous, and is preceded by an induction period in which aldehyde is formed. Previous addn. of 1% NO or AcH eliminates the induction period, and either (but not ethylene oxide) accelerates the reaction. The 2/1 mixt. is most reactive and the initial stage of oxidation involves, not "peroxidation" but rather "hydroxylation" of the C<sub>2</sub>H<sub>4</sub> to vinyl alc. which forms the other C<sub>2</sub>H<sub>4</sub>O isomers in ratios dependent on the temp. and pressure. H<sub>2</sub>O vapor does not affect either induction or reaction period. L. E. Steiner

The reaction of nitrous oxide with hydrogen atoms. J. K. Dixon. *J. Am. Chem. Soc.* 56, 101-2 (1934); cf. *C. A.* 27, 5.—The reaction H + N<sub>2</sub>O → N<sub>2</sub> + OH must possess considerable activation energy even though it is exothermic and obeys the spin rule. From the data obtained on the formation of H<sub>2</sub>O in the reaction, the approx. lower limit for the activation energy is 10 kg.-cal. Since the reaction is slow, it seems probable that in the relatively fast Hg-photosensitized reaction of H<sub>2</sub> and N<sub>2</sub>O (Taylor and Marshall, *C. A.* 19, 3418 9) the excited Hg transfers most of its energy, which is given up in collision, to the N<sub>2</sub>O (Manning and Noyes, *C. A.* 26, 5848).

Reuben Roseman

The rate of reduction of carbon dioxide by graphite. Martin A. Mayers. *J. Am. Chem. Soc.* 56, 70-6 (1934).—The rate of reduction of CO<sub>2</sub> by graphite was measured in terms of cc. of CO produced per sec. from CO<sub>2</sub> at 1 atm. in contact with 1 sq. cm. of graphite surface. It is given, for temps. between 950° and 1300°, by the equation  $\log A_1 = 5.07 - (38,700/4.575 T)$  and for temps. between 850° and 950°, by  $\log A_2 = 3.40 - (32,360/4.575 T)$ . The significance of the appearance of 2 stages in the oxidation of graphite by CO<sub>2</sub> and its relation to the surface oxide complex are discussed.

Reuben Roseman

The speed of crystallization and the number of nuclei of tin, bismuth and lead. G. Tammann and H. J. Rocha. *Z. anorg. allgem. Chem.* 216, 17-25 (1933).—The speed of crystn. and the number of large nuclei formed were investigated by supercooling the molten metal to various temps. for different periods of time. The number and length of the large crystals were detd. by means of etch figures. With increased supercooling, the speed of crystn. rose to a max. (2 cm./min. for Bi; 5 cm./min. for Pb; 200 cm./min. for Sn). Under the same conditions, the number of large crystals also increased with greater supercooling. The effect of the size of the mold was studied. Only with very small cross sections was there a marked effect on the speed of crystn. and no. of nuclei but with

larger diams., the liberated heat of crystn. kept the metal at its m. p. for considerable time. H. H. Rowley

Kinetics of the reaction of the alkaline earth metals with nitrogen and other gases. II. Kinetics of the reaction of the alkaline earth metals with nitrogen. A. v. Antropoff and K. H. Krüger. *Z. physik. Chem.* A167, 49-53 (1933); cf. *C. A.* 23, 2095.—N begins to react with Sr at 350°; with Ba at 200°. Passivity phenomena are not observed but nitride formation takes place through the whole metal. Results are compared with those obtained with Be, Mg, Ca and Li. III. Effect of sodium and other substances as "exciters" of the reaction between calcium and nitrogen. *Ibid.* 54-61.—The passivity of Ca toward N at 700° is not removed by the action of Na. The latter acts as an "exciter"; after the reaction is started by Na it proceeds more rapidly if the Na is removed from the surface of the Ca and the reaction is slowed up if the Na is not removed. Similar effects are shown by NaOH, Na<sub>2</sub>O<sub>2</sub>, Na<sub>2</sub>O and NH<sub>4</sub>NO<sub>3</sub>. IV. Kinetics of the reaction between calcium and nitrogen in the presence of argon. A. v. Antropoff and H. Klingebiel. *Ibid.* 62-70.—Very small amts. of A cause the reaction between Ca and N to stop. Ca may be activated by treatment with Na or NaOH and will then react 100 times faster than untreated Ca. Spectroscopically pure A was easily prepd. in this way. G. M. Murphy

Remarks on the paper of K. Neumann "The kinetics of the chemical reaction of the process of combustion." (G. A. Varshavskii and L. S. Eigenson. *J. Tech. Phys.* (U. S. S. R.) 3, 659-64 (1933); cf. *C. A.* 26, 5741.—Theoretical. F. H. R.

Kinetics of reactions between colloids. V. A. Kargin. *J. Phys. Chem.* (U. S. S. R.) 1, 691-701 (1930).—Similarly charged sols of UO<sub>3</sub> and V<sub>2</sub>O<sub>5</sub> react with each other forming a colloidal complex UO<sub>3</sub>·2V<sub>2</sub>O<sub>5</sub>. Spectrophotometric measurements of the velocity of reaction indicate zero order with a large period of induction. The reaction takes place between the dissolved portions of colloidal acid, forming a colloidal complex, rather than between particles. G. Faerman

Studies on homogeneous first-order gas reactions. IV. The decomposition of parabutylaldehyde and paraisobutylaldehyde. C. C. Coffin. *Can. J. Research* 9, 603-9 (1933); cf. *C. A.* 26, 5482.—The gaseous decompns. of parabutylaldehyde and paraisobutylaldehyde to butylaldehyde and isobutylaldehyde, resp., are homogeneous and first order over the pressure and temp. range investigated (1.3 to 55 cm. Hg; 215° to 261°). Under these conditions the reactions go to completion at a measurable rate without complications. Within exptl. error the activation energies of these reactions are equal and are approx. the same as that of the paracetaldehyde decompn. This value is between 42,000 and 44,000 cal. per mole. The rates of decompn. of the two parabutylaldehydes are very nearly the same at any temp. At 500° abs. the velocity const. of the iso compd. is about 15% greater than that of the normal and about 100% greater than that of paracetaldehyde. The velocity consts. at any temp. are given by the equations: parabutylaldehyde,  $\ln k = 33.12 - (42,000/RT)$ ; paraisobutylaldehyde,  $\ln k = 34.06 - (42,800/RT)$ . The data are consistent with the idea that, for a series of reactions with the same energy of activation, an increase in the number of contributory internal degrees of freedom of a mol. increases the probability of reaction. J. W. Shipley

The mechanism of gaseous reactions. I. The thermal decomposition of methyl ethyl ether. Wm. Ure and John T. Young. *J. Phys. Chem.* 37, 1169-82 (1933).—The thermal decompn. of MeEtO was studied over the temp. range 457° to 565°. At 457° the process is mainly a unimol. decompn. of the ether into CH<sub>3</sub>CHO and CH<sub>4</sub>. At 565°, the rate-detg. step is the bimol. decompn. of the CH<sub>3</sub>CHO, the primary decompn. of the ether occurring very rapidly by comparison. The mathematical treatment of the process at intermediate temps. is developed. II. Homogeneous catalysis in the decomposition of methyl ethyl ether. *Ibid.* 1183-90.—The addn. of EtI markedly increases the rate of decompn. of MeEtO at

temps. near 500°. The catalytic process consists mainly of the unimol. decompn. of the ether followed by the unimol. decompn. of the CH<sub>3</sub>CHO formed. P. T. N.

Reaction kinetics in films. The hydrolysis of  $\gamma$ -stearolactone. Russel J. Fosbinder and Eric K. Rideal. *Proc. Roy. Soc. (London)* A143, 61-75 (1933).—Surface potentials and pressures were measured for films of  $\gamma$ -hydroxystearic acid and  $\gamma$ -stearolactone. The :CHOH group of the hydroxy acid can be removed from the surface by pressure. Complexes between lactone and substrate are indicated. The kinetics of the hydrolysis of the lactone are explained by the treatment used for sols. L. E. Steiner

Interaction of benzoyl chloride and aniline in carbon tetrachloride and in hexane solution. G. H. Grant and C. N. Hinshelwood. *J. Chem. Soc.* 1933, 1351-7.—The reaction between BzCl and PhNH<sub>2</sub> in CCl<sub>4</sub> and in hexane soln. is approx. bimol., but the velocity consts. show a decrease with diln. The anomalies are greater in hexane than in CCl<sub>4</sub> soln. The reaction is catalyzed by solid particles of PhNH<sub>2</sub>·HCl. In CCl<sub>4</sub> soln. the energy of activation is approx. 8000 cal. In hexane it is approx. 5000 cal. in the early part of the reaction and approx. 500 cal. in the later stages. The rate of the homogeneous part of the reaction is much less than the possible rate of activation. E. J. Rosenbaum

Mechanism of chemical reactions. C. N. Hinshelwood. *J. Chem. Soc.* 1933, 1357-60.—Chem. reactions can be divided into those for which the rate is equal to the rate of activation and those for which the rate is only a small fraction of the rate of activation. The first group can be correlated with the mol. process discussed by Eyring and Polanyi, the second with resonance transitions. In the first group are simple gas reactions and a no. of bimol. reactions in soln. In the second group are unimol. gas reactions, such as gas reactions as that between Na vapor and (CN)<sub>2</sub>, and some bimol. reactions in soln. exemplified by the reaction between BzCl and PhNH<sub>2</sub> (cf. preceding abstract). E. J. Rosenbaum

Freezing points and triple points with water. Walter P. White. *J. Am. Chem. Soc.* 56, 20-4 (1934).—An ice point at atm. pressure, const. to 0.0001° for a day at least, can be made with good com. ice by protecting the bath proper against melting from external sources and by washing the completed bath with thoroughly chilled H<sub>2</sub>O. By repeating the washing occasionally the constancy can be maintained almost indefinitely. The triple point, while convenient and reliable for a short job, is less so than the described "ice point" for continuous work. Reuben Roseman

Phase equilibria in hydrocarbon systems. I. Methods and apparatus. Bruce H. Sage and Wm. N. Lacey. *Ind. Eng. Chem.* 26, 103-6 (1934).—Methods and app. are described for studying these equilibria at pressures up to 200 atms. and temps. from 20° to 100°. W. A. Moore

Transformation of the  $\alpha$ -phase of copper-tin alloys after deformation. S. Konobeyevskii and V. Tarasova. *Physik. Z. Sowjetunion* 4, 571-5 (1933).—The work of Westgren and Phragmen (*C. A.* 23, 587) on the detn. of the phase boundary between the  $\alpha$  and the  $\alpha + \delta$  phases of the Cu-Sn system is criticized because W. and P. disregarded the effects of deformation in the x-rayed samples. The work is repeated; proper annealing preceded by deformation indicates a decreased soly. of  $\alpha$  in  $\delta$  as the temp. is lowered. It is thought that deformation aids heat in reaching equil. by redistributing the components in a metastable state thus increasing the diffusion potential. Howard A. Smith

The boiling of melted reciprocal salt pairs. The system (NaK) (ClI). Ernst Jänecke. *Z. anorg. allgem. Chem.* 215, 49-65 (1933).—From data of Greiner and Jellinek (cf. *C. A.* 27, 4456) it is shown that Roozeboom's graphic method for expressing the relations of vapor pressure and compn. of binary sols. can be applied to boiling mixts. of reciprocal salt pairs. The diagram is a rectangular prism with vapor pressure as ordinates. The liquid-vapor equil. is represented by a surface. E. R. Schierz

System cadmium bromide-ethyl alcohol. Fusao Ichi-

kawa, Ichiro Mori and Toyosaku Murooka. *Science Repts. Tôhoku Imp. Univ.* 1st Ser. 22, 1163-78(1933).—See C. A. 27, 16. G. G.

The system sodium disilicate-sodium fluoride. Harold S. Booth, Bernard A. Starrs and Monroe J. Bahnsen. *J. Phys. Chem.* 37, 1103-7(1933).—"The system, Na disilicate-NaF, has one eutectic at a compn.  $39.5 \pm 0.1$  moles % NaF and at a temp. of  $797 \pm 1.0^\circ$ ." D. B.

Ternary systems: water, pyridine and salts at  $25^\circ$ . P. M. Ginnings, Bailey Webb and Emi Hinohara. *J. Am. Chem. Soc.* 55, 4898-9(1933).—Empirical equations for the solubilities of salts in aqueous pyridine solns. are derived by a procedure previously described (C. A. 27, 2087). M. McMahon

A new relation between viscosity, vapor pressure and density. Frank Hovorka. *J. Am. Chem. Soc.* 55, 4899-4900(1933).—The empirical equation  $S = \eta P^{1/2} d^{1/2}$  where  $\eta$  is viscosity,  $P$  vapor pressure,  $d$  density and  $S$  a const. characteristic of the substance under consideration holds very closely for many org. liquids. M. McMahon

The system sodium carbonate-calcium carbonate-water. C. R. Bury and R. Redd. *J. Chem. Soc.* 1933, 1160-2.—A 2-coördinate diagram suffices to show the temps. and concns. of solns. in equil. with the various solid phases because the concn. of  $\text{CaCO}_3$  in the soln. is too small to measure. The solid phases are ice,  $\text{CaCO}_3$ ,  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ ,  $\text{Na}_2\text{CO}_3 \cdot 7\text{H}_2\text{O}$ ,  $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ ,  $\text{Na}_2\text{CO}_3 \cdot \text{CaCO}_3 \cdot 5\text{H}_2\text{O}$  (gaylussite), and  $\text{Na}_2\text{CO}_3 \cdot \text{CaCO}_3 \cdot 2\text{H}_2\text{O}$  (pirssonite). F. L. Browne

Aqueous solubility of salts at high temperatures. II. The ternary system  $\text{Na}_2\text{CO}_3$ - $\text{NaHCO}_3$ - $\text{H}_2\text{O}$  from  $100^\circ$  to  $200^\circ$ . Wm. F. Waldeck, Geo. Lynn and Arthur E. Hill. *J. Am. Chem. Soc.* 56, 43-7(1934); cf. C. A. 26, 2363.—The system  $\text{Na}_2\text{CO}_3$ ,  $\text{NaHCO}_3$ ,  $\text{H}_2\text{O}$  was studied from  $100^\circ$  to  $200^\circ$  and isotherms were drawn for 5 temps. The isothermally invariant concns. of solns. satd. with 2 salts were detd. at 5 other temps. Trona was found to be a stable double salt up to  $195^\circ \pm 5^\circ$ . Wegscheider's double salt,  $3\text{NaHCO}_3 \cdot \text{Na}_2\text{CO}_3$ , is stable throughout the entire temp. range. The soly. of pure  $\text{NaHCO}_3$  from  $100^\circ$  to  $200^\circ$ , under the natural pressure of the system, was detd. by a method of extrapolation. E. R. Smith

The system:  $\text{CdSO}_4$ - $\text{H}_2\text{SO}_4$ - $\text{H}_2\text{O}$ . Rene Arditti. *Compt. rend.* 197, 1209-11(1933).—When  $\text{H}_2\text{SO}_4$  is poured into a satd. aq. soln. of  $\text{CdSO}_4$ , from about 40-75% acid the salt that ppts. is always  $\text{CdSO}_4 \cdot \text{H}_2\text{O}$ ; at lower concns. of acid the monohydrate is transformed into  $\text{CdSO}_4 \cdot \frac{3}{2}\text{H}_2\text{O}$ , and at higher concns.  $\text{CdSO}_4 \cdot \text{H}_2\text{SO}_4$  is formed. A min. in the property-compn. curve for  $d$ ,  $n$  and viscosity and a max. in the cond.-compn. curve indicate the transition between the 2 hydrates. E. G. Vanden Bosche

Catalytic oxidation of acenaphthene in solution. Roger Duckert. *Arch. sci. phys. nat.* 15, 244-63, 343-71(1933).—Acenaphthene (I) is oxidized by O to naphthalic acid (II) and acenaphthenequinone (III) (II:III = 9:<1). The percentage oxidation of I is (a) at atm. pressure, 0 without and 2 with a catalyst in presence of a solvent, (b) at  $200^\circ$  and 8 kg./sq. cm. initial pressure, in absence of a solvent, <5, (c) at  $175$ - $300^\circ$  and 2-8 kg./sq. cm. with various catalysts in  $\text{H}_2\text{O}$ ,  $\text{AcOH}$ ,  $\text{PhCl}$  or  $\text{C}_6\text{H}_5\text{Cl}$ , 2-24 (best with  $\text{Mn}(\text{NO}_3)_2$  in  $\text{C}_6\text{H}_5\text{Cl}$  at  $300^\circ$  and 3-5 kg./sq. cm.). Catalysts investigated are oxides and nitrates of various metals, oxides of N, etc. Decompn., always considerable, is very great in case (b). The article includes a good bibliography and a discussion of the sepn. of II and III from much I and resin. W. C. Fernelius

Effect of catalysts on the reaction between olefins and hydrogen sulfide. H. R. Duffey, R. D. Snow and D. B. Keyes. *Ind. Eng. Chem.* 26, 91-3(1934).—The effect of various catalysts and of temp. upon the conversion of propylene to mercaptan was detd. Some catalysts promote polymerization and decompn. The best catalysts found for the conversion of propylene were  $\text{H}_3\text{PO}_4$  on activated charcoal, Ni on kieselguhr and bentonite. The max. conversion ranged from 17% at  $200^\circ$  and space velocity 2 to about 9 at  $300^\circ$  and space velocity 23. Ni on kieselguhr proved the best catalyst for the conversion of

ethylene, 22% being converted at  $250^\circ$  and space velocity 3. W. A. Moore

Catalyzed reaction of hydrogen with water and the nature of overvoltage. J. Horiuchi and M. Polanyi. *Nature* 132, 931(1933).—The inertia in the electrolytic formation of  $\text{H}_2$  from  $\text{H}_2\text{O}$  which must be overcome by overvoltage, for the case of a Pt electrode, is not attributed to the reaction of  $\text{H}_2$  with Pt to form adsorbed atoms but is ascribed to the transition of adsorbed H atoms to H ions. This conclusion was reached after comparing the rates of ionization of the different solns. with which the Pt electrode was used. With the rate in pure  $\text{H}_2\text{O}$  as unity, the approx. rates in other solns. were as follows: in  $\text{N HCl}$  0.7; in  $\text{N H}_2\text{SO}_4$  0.2; in 0.25  $\text{N KOH}$  0.4; in  $\text{C}_2\text{H}_5\text{OH} + 2\%$   $\text{H}_2\text{O}$  0.4; in  $\text{C}_2\text{H}_5\text{OH} + 2\%$   $\text{H}_2\text{O} + 0.25 \text{ N KOH}$  less than 0.02. Calvin Brous

Catalytic decomposition of vapors of hydrogen peroxide. V. A. Roiter and S. S. Gaukhman. *J. Phys. Chem.* (U. S. S. R.) 4, 465-8(1933).—A comparison of activity of decompn. of  $\text{H}_2\text{O}_2$  in the liquid and the vapor states, on smooth and on platinized Pt, on  $\text{MnO}_2$  and on  $\text{PbO}_2$  shows that the catalytic activity in both cases changes in the same order. The reaction for both the liquid and vapor states of  $\text{H}_2\text{O}_2$  is unimol. The assumption is made that the film of water capable of forming on the pores of the catalyst at a pressure of about 0.1 mm. and room temp., is sufficient for the mechanism of the catalyst in vapor and soln. to be the same. Similar conditions may have a place in the majority of technical catalytic processes. G. Faerman

Effect of the sorption of gases on the catalytic activity of catalysts for the decomposition of hydrogen peroxides. II. V. A. Roiter and I. G. Shaffan. *J. Phys. Chem.* (U. S. S. R.) 4, 461-4(1933); cf. preceding abstract.—Low pressure (below 0.1 mm.) for a period of several days reduces the catalytic activity of platinized Pt for the catalysis of  $\text{H}_2\text{O}_2$ . The previous observation of the authors (*Trudii 3 Fizik-Khimich. Konferentsii*) explained the poisoning of the catalyst by volatile admixts. in the  $\text{P}_2\text{O}_5$ . Expt. showed that removal of adsorbed gases from platinized and smooth Pt increases the activity of the catalyst. Readsorption again decreases activity. As this effect was observed even in low vacuum it follows that the activation lies in the removal of the gases from the inactive centers. The authors see in this proof that in the catalytic process there takes part not only centers with large energy of adsorption but also the remaining surface of the Pt. F. H. Rathmann

The transition point of carbon tetrachloride as a fixed point in thermometry. The melting point. Heats of transition and fusion. Herrick L. Johnston and Earl A. Long. *J. Am. Chem. Soc.* 56, 31-5(1934).—The following temps. and heats of transition and fusion, resp., of  $\text{CCl}_4$  (impurity <  $10^{-3}$  mol. %) were measured in a modified Nernst vacuum calorimeter:  $-47.66^\circ \pm 0.05^\circ$ ,  $1080.8 \pm 3.0$  cal. mol.<sup>-1</sup>;  $-22.87^\circ \pm 0.05^\circ$ ,  $577.2 \pm 1.0$  cal. mol.<sup>-1</sup>. A value of the transition temp. in accord with the above was detd. by using a suspension of solid  $\text{CCl}_4$  in methanol. The transition in solid  $\text{CCl}_4$  is sharp and reproducible, and a simple procedure is outlined for employing this temp. as a satisfactory secondary fixed point for calibrating thermometric instruments. F. D. Rossini

Determination of the specific heat of aqueous solutions of phosphoric acid. M. M. Popov, S. M. Skuratov and N. N. Feodosiev. *Z. physik. Chem.* A167, 42-8(1933).—The true sp. heat of  $\text{H}_3\text{PO}_4$  was detd. in aq. soln. from 0 to 89.72% and from  $20.5^\circ$  to  $22.0^\circ$ . The mean sp. heat between  $20^\circ$  and  $100^\circ$  was detd. from 0 to 60% and is given by  $C = 1.0109 - 0.00709x$ , in which  $x$  is the concn. in percentage. From 60 to 89.72% the mean sp. heat is given from  $20^\circ$  to  $t_b$ , where  $t_b$  is a temp. near the b. p. of the soln. G. M. Murphy

The heat capacity and entropy of potassium chlorate form  $13^\circ$  to  $300^\circ\text{K}$ . The entropy of chlorate ion. Wendell M. Latimer, Philip W. Schutz and J. F. G. Hicks, Jr. *J. Am. Chem. Soc.* 56, 88-9(1934).—Measurements of  $C_p$  from  $14^\circ$  to  $293^\circ\text{K}$ . gave for  $\text{KClO}_3$  (c),  $S_{298.1}^\circ =$

34.17  $\pm$  0.02 cal. deg.<sup>-1</sup> mol.<sup>-1</sup>. These and other data yield for  $\text{ClO}_2^-$  (aq., hypothetical 1 molal),  $S_{298.1}^\circ = 39.3$  cal. deg.<sup>-1</sup> mol.<sup>-1</sup> and  $\Delta F_{298.1}^\circ = 3.7$  kg.-cal. mol.<sup>-1</sup>.

F. D. Rossini

Exact measurement of the specific heats of metals at higher temperatures. XII. Specific heat of metallic rhenium. F. M. Jaeger and E. Rosenbohm. *Proc. Acad. Sci. Amsterdam* 36, 786-8(1933); cf. C. A. 27, 3389.—The sp. heat of Re was measured with a metal calorimeter for the temp. range of 0-1200°. The values at  $t^\circ$  may be expressed by the formula  $c_p = 0.03256 + 0.6625 \times 10^{-4} t$ , the mean value between 0° and 20° being 0.03262. The value of  $3R$  for the at. heat is surpassed at -66°.

Morris Muskat

Method of determining heat of solution. M. M. Popov, K. G. Chomyakov, N. N. Feodosiev and P. K. Shirokikh. *Z. physik. Chem.* A167, 29-34(1933).—An adiabatic calorimeter is described. The results are the same as those obtained with an ordinary calorimeter. The heat of soln. of KCl in 200 moles of  $\text{H}_2\text{O}$  at 20° is -4.367  $\pm$  0.1% kg.-cals.

G. M. Murphy

Heats of solution and dilution of potassium and ammonium phosphates. K. G. Chomyakov, S. Yavorovskaya and P. K. Shirokikh. *Z. physik. Chem.* A167, 35-41 (1933).—Heats of soln. and diln. were detd. for  $\text{KH}_2\text{PO}_4$ ,  $\text{NH}_4\text{H}_2\text{PO}_4$  and  $(\text{NH}_4)_2\text{HPO}_4$ . The integral heats of soln. are expressed by an interpolation formula showing the dependence on concn. Soly. was detd. by investigating the dependence of the d. of the soln. on the concn.

G. M. Murphy

Heats of solution of sugars in water. B. Clifford Hendricks, Warren H. Steinbach, Jr., Royce H. LeRoy and A. G. Moseley, Jr. *J. Am. Chem. Soc.* 56, 99-101 (1934).—The following calorimetric detns. are reported for the heat of soln. at  $t^\circ$  in  $n$  mols. of water, in cal. per g.:  $d$ -galactose, 21.7°, 2500 $\text{H}_2\text{O}$ , -21.4;  $\beta$ - $d$ -glucose, 21.6°, 2500 $\text{H}_2\text{O}$ , -5.65;  $d$ -glucose, 25.2°, 3333 $\text{H}_2\text{O}$ , -14.5;  $d$ -glucose hydrate, 25.07°, 3333 $\text{H}_2\text{O}$ , -25.2;  $\alpha$ -methyl- $d$ -glucoside, 25.4°, 3333 $\text{H}_2\text{O}$ , -3.13;  $\alpha$ -methyl- $d$ -mannoside, 25.0°, 2500 $\text{H}_2\text{O}$ , -11.0. Heats of mutarotation for  $d$ -galactose and  $d$ -glucose are zero, and proposed as pos. for  $\beta$ - $d$ -mannose and  $\alpha$ - $d$ -fructose.

F. D. Rossini

Heats of solution and heats of reaction in liquid ammonia. I. Charles A. Kraus and John A. Ridderhof. *J. Am. Chem. Soc.* 56, 79-86(1934).—A liquid  $\text{NH}_3$  calorimeter operating at -33.4° is described. For exothermal reactions the heat effect is measured by the amt. of  $\text{NH}_3$  vaporized. Exptl. data are given for the heats of soln. in liquid  $\text{NH}_3$  at -33.4° of the following solid substances:  $\text{NaNO}_3$ ,  $\text{NaBr}$ ,  $\text{NaI}$ ,  $\text{KNO}_3$ ,  $\text{KBr}$ ,  $\text{KI}$ ,  $\text{NH}_4\text{Cl}$ ,  $\text{NH}_4\text{NO}_3$ ,  $\text{NH}_4\text{Br}$ ,  $\text{NH}_4\text{I}$ ,  $\text{LiNO}_3$ ,  $\text{AgNO}_3$ ,  $\text{AgI}$ ,  $\text{Na}$ . The heats of the following reactions at -33.4° were measured:  $\text{NH}_4\text{Br} + \text{NaNH}_2 = \text{NaBr-am} + 2\text{NH}_3(l)$ ;  $\text{NH}_4\text{Br} + \text{KNH}_2\text{-am} = \text{KBr-am} + 2\text{NH}_3(l)$ ;  $\text{PbBr}_2\text{-am} + 6\text{Na} = 2\text{NaBr-am} + \text{Na}_4\text{Pb}$ ;  $\text{PbBr}_2\text{-am} + 2\text{Na} = 2\text{NaBr-am} + \text{Pb}$ ;  $\text{PbBr}_2 + 2\text{Na-am} = 2\text{NaBr-am} + \text{Pb}$ ;  $4\text{Na} + 9\text{Pb} = \text{Na}_4\text{Pb}_9\text{-am}$ ;  $2\text{Na-am} + \text{S} = \text{Na}_2\text{S}$ ;  $2\text{Na-am} + 2\text{S} = \text{Na}_2\text{S}_2$ ;  $2\text{Na} + \text{Te} = \text{Na}_2\text{Te}$ ;  $2\text{Na-am} + \text{Te} = \text{Na}_2\text{Te}$ ;  $\text{Na}_2\text{Te} + \text{Te} = \text{Na}_2\text{Te}_2\text{-am}$ ;  $\text{Na}_2\text{Te}_2 + \text{am} = \text{Na}_2\text{Te}_2\text{-am}$ ;  $\text{Na}_2\text{Te}_2\text{-am} + 2\text{Te} = \text{Na}_2\text{Te}_4\text{-am}$ . The foregoing data yield among other things values for the heats of formation of  $\text{NH}_3(l)$ ,  $\text{NaI}$ ,  $\text{Na}_2\text{S}$ ,  $\text{Na}_2\text{S}_2$ ,  $\text{Na}_2\text{Te}$ ,  $\text{Na}_2\text{Te}_2$  and the heat of neutralization in liquid  $\text{NH}_3$  of  $\text{KNH}_2$  with  $\text{NH}_4\text{Br}$ . II. Charles A. Kraus and Ralph F. Prescott. *Ibid.* 86-8.—Improvements in the liquid  $\text{NH}_3$  calorimeter are described and exptl. data are given for the heats of soln., in liquid  $\text{NH}_3$  at -33.4°, of the following solid substances:  $\text{AgNO}_3$ ,  $\text{Hg}(\text{CN})_2$ ,  $\text{PbI}_2$ ,  $\text{Pb}(\text{NO}_3)_2$ ,  $\text{NaClO}_3$ ,  $\text{NaBr}$ . F. D. R.

The heat of formation of cadmium oxide, cadmium hydroxide and zinc oxide. G. Becker and W. A. Roth. *Z. physik. Chem.* A167, 1-15(1933).—A new method for completely burning a pure metal in a calorimeter is described. Indirect measurements from heats of diln. serve as a check on the results. The most probable results from calorimetric and other available data give for the heat of formation for  $\text{CdO}$  and  $\text{ZnO}$ , resp., at const. pressure and 20°, 62.2  $\pm$  0.2 and 83.2  $\pm$  0.2 kg.-cals.

The heat of soln. of  $\text{Cd}(\text{OH})_2$  is 133.41 kg.-cals. at 20°. The heat of hydration of  $\text{CdO}$  is 4.0 kg.-cals. The following results were also obtained at 20°:  $\text{HCl}(10.058\text{H}_2\text{O}) \rightarrow \text{HCl}(200\text{H}_2\text{O}) + 1.136 \pm 0.001$  kg.-cals.,  $\text{HCl}(10.184\text{H}_2\text{O}) \rightarrow \text{HCl}(200\text{H}_2\text{O}) + 1.121 \pm 0.001$  kg.-cals.,  $\text{HCl}(10.309\text{H}_2\text{O}) \rightarrow \text{HCl}(200\text{H}_2\text{O}) + 1.101 \pm 0.001$  kg.-cals.

G. M. Murphy

The heats of formation of columbium and tantalum pentoxides. G. Becker and W. A. Roth. *Z. physik. Chem.* A167, 16-18(1933).—The heats of formation at const. pressure and 20° for  $\text{Cb}_2\text{O}_5$  and  $\text{Ta}_2\text{O}_5$  are, resp., 463.1  $\pm$  0.7 and 484.5  $\pm$  0.5 kg.-cals. The d. of Ta detd. with a Mohr balance at 19.6° is 16.64. G. M. Murphy

The energy of dissociation of water by symmetrical vibrations and the products of this dissociation. Michel Magat. *Compt. rend.* 197, 1216-18(1933).—From spectrum analyses carried out by Mecke (cf. C. A. 27, 3399) the heat of disson. of  $\text{H}_2\text{O}$  into 2 H and O is calcd. to be 269  $\pm$  3 Cal. Activated rather than normal O atoms are obtained, with the energy of activation given as 45.2 Cal.

E. G. Vanden Bosch

The thermodynamic constants of chlorine monoxide. Don M. Yost and Robert C. Felt. *J. Am. Chem. Soc.* 56, 68-9(1934).—The vapor pressure of  $\text{Cl}_2\text{O}$  over its solns. in  $\text{CCl}_4$  was measured at 0° and 25°, the consts. of Henry's law being  $p_{\text{mm}}/N = 662$  and 1830, resp., where  $N$  is the mol. fraction of  $\text{Cl}_2\text{O}$ . Combination of these with other data yields for  $\text{Cl}_2(g) + \frac{1}{2}\text{O}_2(g) = \text{Cl}_2\text{O}(g)$ ,  $\Delta F_{298.1}^\circ = 21.21$  kg.-cal. mol.<sup>-1</sup>. If  $\Delta H_{298.1}^\circ$  is taken as 18.26, then for  $\text{Cl}_2\text{O}(g)$   $S_{298.1}^\circ = 67.9$  cal. deg.<sup>-1</sup> mol.<sup>-1</sup>. F. D. Rossini

### 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR.

- The cooling of a radioactive sphere. Arnold N. Lowan. *Phys. Rev.* 44, 769-75(1933).—The problem of the cooling of a radioactive sphere is studied mathematically and its solution is applied to a discussion of the thermal history of the earth. Bernard Lewis
- Experimental demonstration of Einstein's radiation recoil. R. Frisch. *Z. Physik* 86, 42-8(1933).—A very fine beam of Na atoms is excited with light from a Na lamp. As the emission of the resonance light is accompanied with an impulse the beam is broadened on irradiation. Egon Bretscher
- Electromagnetic mass. Max Born and L. Infeld. *Nature* 132, 970(1933).—By means of a recent modification of the Maxwell field equations, it is shown that the mass appears as self energy. This justifies the suppression of the corresponding terms, occurring in the quantum-mech. treatment of the interaction of several bodies. The Dirac wave equation is the adequate expression for the quantum-mech. motion of the electron in external fields. S. Bradford Stone
- Generation of electrons from collisions of two electrons. Various mechanisms for annihilation of positive electrons. Francis Perrin. *Compt. rend.* 197, 1302-4(1933).—An electron having a kinetic energy of more than  $6\text{ mc}^2$ , incident upon a static electron can give rise to 4 electrons. (The 2 original plus a pos. and a neg.) Annihilation by combination of a low-velocity pos. and neg. electron can ensue with emission of 2 photons, each with an energy of  $h\nu = mc^2$  or, in the presence of a nucleus, a single photon of twice that energy. This energy may be divided between the photon and projected electron with equal and opposite momentum, or between a pair of electrons ejected in opposite directions. Gregg M. Evans
- Problems of quantum valence. Yu. B. Rumer. *J. Phys. Chem.* (U. S. S. R.) 4, 668-73(1933).—Light and heavy elements of the third group are considered from the viewpoint of almost degenerated states. F. H. R.
- The breakdown of Coulomb's law for the hydrogen atom. E. C. Kemble and R. D. Present. *Phys. Rev.* 44, 1031-2(1933).—The fact that all the doublets of light  $H_2$  are about 3% narrower than predicted by relativistic fine structure theory is attributed to the breakdown of Coulomb's law near the nucleus. By means of Schrödinger functions the displacements of energy levels as functions of  $a$ , the distance to which the field is Coulomb, were found giving results in agreement with expt. For the observed narrowing  $a = 5 \times 10^{-13}\text{ cm}$ . L. Goldman
- The electronic structure of inorganic complexes. Wm. A. Noyes. *J. Am. Chem. Soc.* 55, 4889-93(1933).—An explanation of the ionic charges of inorg. complexes based on Sidgwick's assumptions in "The Electronic Theory of Valency" (C. A. 22, 544) is given. The sharp distinction between "potentially polar" covalences and fully polar or ionic valences is emphasized. M. McMahon
- A convenient proton source. E. S. Lamar and Overton Lühr. *Phys. Rev.* 44, 947-8(1933).—A low-voltage arc is described. The current removed through a slit in the cathode is 80-90% proton current when the neg. voltage on the cathode is 100 v. with respect to the anode. A mechanism for the disocc. of H depending on the thermal equil. between high-speed ions and mols. is given. L. Goldman
- Electron attachment and negative-ion formation in oxygen and oxygen mixtures. Norris E. Bradbury. *Phys. Rev.* 44, 883-90(1933).—A direct method is employed to det. the probability of electron capture in  $O_2$  and  $O_2$  mixts. The principle of the method lies in the analysis of a mixed current stream at 2 points along its path by means of wire grids which permit only the ionic fraction of the current to pass when a high-frequency field is applied between adjacent wire grids. A means of measuring the mobility of the electrons is also possible. The probability of the attachment has been detd. for  $O_2$ , air and mixts. of  $O_2$  with rare gases. The probability is a marked function of the electronic energy, decreasing with increase in electronic energy. In  $O_2$  and in all mixts. of  $O_2$ , however, there is an increase in the probability that attachment will occur at approx. 1.6 v. electronic energy. This can be explained as being due to the appearance of low-energy electrons following inelastic impacts with  $O_2$  mols. The energy at which these inelastic impacts begin is correlated with the first excited level of the  $O_2$  mols. which is 1.62 v. above the ground state. B. L.
- Influence of argon admixture on the neon discharge. Ya. S. Vuigodskii and B. N. Klyarfeld. *J. Tech. Phys.* (U. S. S. R.) 3, 610-13(1933).—Curves show that 2.5% A lowers light emission 30-70%, depending on the current used. F. H. Rathmann
- Potential of ionization and formation of the hydrogen molecule. J. Savard. *Compt. rend.* 197, 397-9(1933); cf. C. A. 28, 694<sup>a</sup>. A comparison of the results of the calcs. of Hylleraas (C. A. 26, 1859-60) with the exptl. value of the ionization potential of the H mol. and atom. W. C. Fernelius
- Some properties of ionized gases in high-frequency fields. V. I. Bunimovich. *J. Tech. Phys.* (U. S. S. R.) 1, 445-80(1931).—The pos. column of a Hg arc in a const. high-frequency field ( $1.7-2.8 \times 10^9$  Hertz) shows resonance at 3 values of the ionization d. The Langmuir-Tonks-Gutton theory (cf. C. A. 24, 3429, 4457; 25, 5078) of electronic vibration is superfluous and wrong in principle. F. H. Rathmann
- Emission of secondary electrons from electrodes placed in an electric discharge in mercury vapor. S. D. Gvozdover. *J. Tech. Phys.* (U. S. S. R.) 3, 587-95(1933). F. H. Rathmann
- Space-charge increase in gaseous discharge. N. A. Kaptzov. *J. Tech. Phys.* (U. S. S. R.) 2, 200-17(1932).—The v. Hippel-Franck theory is extended and Rogowski's short time values for discharges are explained. F. H. Rathmann
- Ionization of the rare gases by slow alkali ions. Otto Beeck. *Ann. Physik* 18, 414-16(1933).—Corrections are given for previously published work: Mouzon (C. A.

26, 5831) and O. Beeck and J. C. Mouzon (*C. A.* 26, 905). Curves showing the ionization of Ne, A, Kr and Xe by alkali ions are given. The curves of Mouzon for Ne and A are also given and agree with those of B. except for  $K^+$  ions in A. Because of the different types of app., this shows that there was no scattering of primary ions through a large angle ( $> 20^\circ$ ) except in the case of  $K^+$  ions in A.

Helen S. Hopfield

**Atomic constants deduced from secondary cathode ray measurements.** H. R. Robinson, J. P. Andrews and E. J. Irons. *Proc. Roy. Soc. (London)* A143, 48-60 (1933).—Energies of the secondary cathode rays expelled from Au, W, Ag and Cu by the  $K$  series x-rays of Cu were measured, and compared with the energies expected from x-ray spectroscopic data. The results are consistent with the observed Compton shift and with recent work on electron diffraction, rather than with accepted values of  $h$  and  $e$ .

L. E. Steiner

**Polarization of electrons.** G. P. Thomson. *Nature* 132, 1006 (1933).—The diffraction rings of scattered electrons reported by Rupp (*C. A.* 27, 3663) were obtained. However, they were not asym., as claimed by Rupp.

Gerald M. Petty

**Diffraction of fast electrons.** M. Kosman and A. Alichanian. *Physik. Z. Sowjetunion* 4, 551-6 (1933); cf. *C. A.* 27, 3391.—The p. d. from a Lange-Marx impulse generator was used on a cold cathode discharge tube to produce high-voltage electrons which were diffracted by an evapd. Ag film. The De Broglie wave length of the electrons is 0.0136 Å., corresponding to an energy of 530 kv.

Howard A. Smith

**Reflection of electrons from liquid mercury.** Robert B. Brode and Edward B. Jordan. *Phys. Rev.* 44, 872-5 (1933).

Bernard Lewis

**Electron diffraction by hydrocarbons.** H. R. Nelson. *Phys. Rev.* 44, 717-19 (1933).—Thin films of petrolatum, paraffin and tap grease were prepd. (1) by evapn. from a heated filament onto a metal surface, (2) by allowing an ether soln. to evap. from a water or metal surface leaving the hydrocarbon film and (3) by smearing the greases on metal surfaces. When 25-50-kv. electrons were reflected at grazing incidence from these films the diffraction patterns consisted of rows of spots similar to an x-ray single crystal rotation picture. The resolving power of all but the smeared films is much better than has been reported previously. Observed reflections are in good agreement with the structure of normal hydrocarbon crystals found by Müller (*C. A.* 23, 30). The patterns indicate films are largely, if not completely, cryst., with the long axes of individual crystals perpendicular to the plane of the film.

Bernard Lewis

**Electron scattering in methane, acetylene and ethylene.** A. L. Hughes and J. H. McMillen. *Phys. Rev.* 44, 876-82 (1933).—The scattering coeffs. for elastic collisions between electrons and mols. of  $CH_4$ ,  $C_2H_2$  and  $C_2H_4$  have been measured over the following ranges: For  $CH_4$ , 10 to 625 v.,  $10^\circ$  to  $150^\circ$ , and for 800 v.,  $10^\circ$  to  $50^\circ$ ; for  $C_2H_2$ , 10 to 100 v.,  $10^\circ$  to  $150^\circ$ ; for  $C_2H_4$ , 10 to 225 v.,  $10^\circ$  to  $150^\circ$ . Total absorption coeffs. due to elastic scattering were computed by integration. For 100 v. and above, the scattering coeffs. of electrons by the mols. with 2 C atoms were far smaller than the coeff. for  $CH_4$  with 1 C atom, but for 10-v. electrons the scattering was much less in  $CH_4$  than in the other gases. Evidence for interference effects between the electron waves scattered by individual atoms was indicated by the presence of max. in the curves for the ratios of the scattering coeffs. for  $C_2H_4$  and  $CH_4$  (also for the pair  $C_2H_2$  and  $CH_4$ ) expressed as functions of scattering angles. Provided the assumption is made that the scattering is done by H atoms alone, fairly satisfactory agreement between expt. and calcn. (computation by the formula for intensity of resultant waves emitted by a mol.) was obtained for the ratio for  $C_2H_4$  and  $CH_4$ . Presumably the slow electron does not penetrate enough to come under the influence of the C atom. In order to obtain satisfactory agreement with  $C_2H_4$ , however, it was necessary to assume that the C atoms exerted their full effect.

Bernard Lewis

**Orientations in thin evaporated metallic films by the method of electron diffraction.** K. R. Dixit. *Phil. Mag.* 16, 1049-64 (1933).—The orientations in thin films of Ag, Al and Zn were studied from room temp. nearly to the m. p. of the metal. This orientation does not depend on the nature of the base, provided the surface is smooth and amorphous. Orientation is produced in thin films,  $10^{-6}$  cm. thick, more easily than in thick films. Each orientation is strongest at some definite temp. If the first layer of the deposit is considered as a two-dimensional gas, it is possible to calc. the temp. at which each orientation should occur. Calcd. and exptl. temps. are in agreement.

E. J. Rosenbaum

**Electron diffraction by mechanically worked surfaces.** H. Raether. *Z. Physik* 86, 82-104 (1933); cf. *C. A.* 28, 964.—Electron diffraction is used to study the phys. state of the surface of metals and insulators after mech. treatment. The surface is treated with emery paper, rouge and a polishing steel. Debye-Scherrer rings are obtained which increase in intensity with perfection of polish. Highly polished metals give the same rings and have therefore identical lattice constns. A monoatomic metal layer of 2.8-2.9 Å. thickness is assumed to cover the surface (steel, Cu, Ni, Au, Sn, Zn, Cd, Pb and hematite were studied). NaCl,  $CaCO_3$ ,  $CaF_2$ , FeS, and graphite give partly powder diagrams or plane lattice spectra. A highly polished surface may possess a fibrous structure.

Egon Bretscher

**Observations with the help of an electron microscope on the migration of the emitting substance on oxide cathodes.** E. F. Richter. *Z. Physik* 86, 697-709 (1933).—Lines are drawn on a BaO cathode and their image is focused on a photographic plate or fluorescent screen by means of an elec. or magnetic electron lens. In the course of formation the pattern is found to reverse, e. g., the lines which were previously not emitting and therefore dark, become active. This is shown to be due to a migration of Ba metal, which detrs. the electron emission (and not the oxide).

Egon Bretscher

**Photoelectric investigation of the temperature dependence of the work function for electrons from a nickel surface covered with atomic barium.** R. Suhrmann and R. Deponte. *Z. Physik* 86, 615-34 (1933).—See *C. A.* 27, 5632.

Egon Bretscher

**The effect of temperature on the energy distribution of photoelectrons. I. Normal distribution.** Lee A. DuBridge and R. C. Hergenrother. *Phys. Rev.* 44, 861-5 (1933).—An exptl. test has been made of DuBridge's (*C. A.* 27, 3663) theory of the distribution of normal energies of photoelectrons. By use of a modified parallel-plate method of analysis, photoelectrons were ejected from a strip of Mo foil maintained at any desired temp. Current-voltage curves for temps. from  $300^\circ$  to  $965^\circ K$ . show good agreement with theory. Values of  $V$  max. at  $0^\circ K$ . can be detd. These were found to fit the Binstein equation at any fixed temp. For a fixed wave length the values of  $V$  max. are independent of  $T$ , as required by theory.

Bernard Lewis

**The effect of temperature on the energy distribution of photoelectrons. II. Total energies.** Walter W. Roehr. *Phys. Rev.* 44, 866-71 (1933).—The expts. were carried out to test DuBridge's (*C. A.* 27, 3663) theory of the total energy distribution of photoelectrons. Photoelectrons were released from an outgassed Mo filament placed at the center of a large collecting sphere. Current-voltage curves were obtained for filament temps. from  $300^\circ$  to  $1000^\circ K$ . The effect of temp. on the tails of these curves is pronounced and shows excellent agreement with theory. The derived energy-distribution curves are also in general agreement with theory, and show at room temp. a most probable energy much closer to the max. energy than obtained by other investigators. Analysis of the theoretical curves shows that the temp. effect has probably not introduced appreciable errors in the detn. of  $h$  by the photoelec. method.

Bernard Lewis

**Photoelectric yields in the extreme ultra-violet.** Carl Kenty. *Phys. Rev.* 44, 891-7 (1933).—The photoelec. yields for various surfaces (Ni, W, Mg, W-O and con-

stantan) illuminated by the extremely short wave radiation given out by the pos. columns in He, Ne and A, resp., have been detd. The effect of the extremely short wave radiation was sepd. from that of the complete radiation by the use of a quartz disk which, when inserted, cut off all radiations below 1500 Å. The yields obtained (in electrons per 100 quanta) range from 11 in the case of constantan and He, to 0.14 in the case of Mg (surprisingly) and Ne. The yields for well-degassed Ni, for He, Ne and A were 4.4, 1.6 and 0.6, resp.; those for the other surfaces except Mg varied with the gas in the same general way. Thus the max. in the yield for most ordinary metal surfaces probably lies on the short side of 584 Å. W-O gave greater yields than W (except in A) and in general undegassed metals gave yields several times greater than well-degassed ones. The size of the yields suggests that the photoelec. emission from probe and cathode surfaces in the rare gases may be of considerable importance.

Bernard Lewis

The emission of electricity from columbium. H. B. Wahlén and L. O. Sordahl. *Phys. Rev.* 44, 1030 (1933).—Cb yields pos. ions of the metal when vaporization is appreciable. Values for the work functions of the electron and pos. ion are given.

L. Goldman

The magnetic moment of the proton. Alfred Landé. *Phys. Rev.* 44, 1028-9 (1933).—It is shown that nuclei of odd at. no. and odd mass no. have mech. and magnetic moments due to the orbit and spin of one proton. For a series of such nuclei the magnetic moment is calcd. with Goudsmit's formula—giving a magnetic moment of about 2 magnetons for the proton. The values of the orbital quantum no. assigned to the proton in the series of nuclei indicate that the proton circles around inside or on the surface of the neutron shells.

L. Goldman

The electronic atomic weight and  $e/m$  ratio. R. C. Gibbs and R. C. Williams. *Phys. Rev.* 44, 1029 (1933).—The at. wt. of the electron was found from a measurement of the interval between corresponding components of the  $H^{\alpha}$  and  $H^{\beta}$  lines, the at. wts. of  $II^{\alpha}$  and  $H^{\beta}$  reported by Bainbridge, Houston's value for  $\nu(H^{\alpha})$ , and the relation that the ratio of the wave numbers for such a transition is the same as the ratio of the corresponding Rydberg nos. The at. wt. of the electron is found to be  $(5.491 \pm 0.002) \times 10^{-4}$ .

L. Goldman

The Heisenberg theory of atomic nuclei. H. Mandel. *Physik. Z. Sowjetunion* 4, 646 50 (1933) (in German).

Gerald M. Petty

Wave-statistical theory of radioactive disintegration. K. C. Kar and A. Ganguli. *Phil. Mag.* 16, 1097-1109 (1933).—A model of the nucleus is considered which consists of a hard core surrounded by a spherical shell filled with circulating neutral He atoms. Theoretical values of the disintegration consts. agree with exptl. data.

E. J. Rosenbaum

Heights of nuclear potential barriers. E. Watson Pollard. *Phil. Mag.* 16, 1131-41 (1933).—Heights of potential barriers are estd. from  $\alpha$ -particle scattering and from the min. energies of  $\alpha$ -particles required for nuclear disintegration. The height of the barrier of the 7 light elements for which data are available is a linear function of the at. no. This is confirmed by a calcn. based on the Heisenberg nuclear theory, provided the no. of protons equals the no. of neutrons. The barrier heights from disintegration by protons are lower than those for  $\alpha$ -particle disintegration, but the linear relation between height and at. no. is valid.

E. J. Rosenbaum

Atomic disintegration and cosmic radiation. E. Rupp. *Z. Ver. deut. Ing.* 77, 1277-9 (1933).—Review.

A. B. F. Duncan

Energy distribution in cosmic rays. W. G. Pollard. *Phys. Rev.* 44, 703-6 (1933).—Examm. shows that the energy band of cosmic ray particles has probably preserved the energy distribution with which it was originally emitted, despite traveling through space for  $5 \times 10^{14}$  years. A Maxwell distribution in energy corrected for relativity is applied to functions which approximate Lemaitre's and Vallarta's curves for the latitude effect and fairly good agreement with Compton's observations

is obtained when 16.7% of the radiation has the Maxwell distribution, the remainder being composed of particles unaffected by the earth's magnetic field. These results are applied to Lemaitre's theory of the radioactive origin of the radiation. The distribution found has many features which suggest such an origin, although the recent findings indicating that there are more pos. than neg. electrons in the rays seem to discredit such a theory.

Bernard Lewis

The presence of neutrons in cosmic radiation. Pierre Auger and G. Monod-Herzen. *Compt. rend.* 197, 1406-7 (1933).—In testing the freedom of Wilson cloud chambers from contamination by radioactive matter 1076 pairs of plates were taken with a 10-cm. chamber and 400 plates with an 8-cm. chamber, both contg. H at normal pressure. Twenty tracks were observed to come from the walls and could be attributed to the radioactivity of the wall materials. In addn. 3 tracks of a different origin were found. One track of the first series was due to a fast nucleus and showed accompanying tracks of ejected electrons but having their origin in the midst of the gas, and 2 short tracks lying entirely in the gas. The second series showed another short track lying entirely in the gas. These tracks are similar to those which neutrons produce in H, and it is possible that the tracks observed here are due to neutrons emitted by the Cu and Pb covers of the chambers under the influence of cosmic rays.

M. M.

Cloud photographs of cosmic-ray "Stösse." Gordon L. Locher. *J. Franklin Inst.* 216, 673-82 (1933); cf. *C. A.* 28, 966<sup>4</sup>.—Photography of cloud tracks of the disintegration products of Stösse as a means of investigating the origin and source of energy of the ejected particles has been undertaken with a modification of the method of Blackett and Occhialini (*C. A.* 27, 2874). The exptl. arrangement is described. It is believed that neutrons are generated, or liberated, in cosmic-ray Stösse but it is impossible to tell from what material they arise. Their energy and ionization characteristics are unknown.

Allen S. Smith

Collisions of neutrons with light nuclei. H. N. Feather. *Proc. Roy. Soc. (London)* A142, 689-709 (1933); cf. *C. A.* 27, 4730. —Cloud chamber photographs were taken of tracks, in O and O-H mixts. and in  $C_2H_2$ -He mixts., produced by collisions of O and C nuclei with neutrons from a Po-Be source. The range distribution curves for elastic collisions were obtained. A criterion for the assignment of observed tracks to the atoms responsible is discussed; it is based on the linear d. of ionization in the tracks of different atoms. Eight disintegrations of O nuclei have been observed but only 1 of a C nucleus. The deficiency of the present knowledge of range-velocity relations is emphasized.

E. J. Rosenbaum

Conservation laws and  $\beta$ -emission. G. Beck. *Nature* 132, 967 (1933).—The energy of the continuous  $\beta$ -ray spectrum varies between the limits  $mc^2$  and  $\Delta E$ , where  $\Delta E$  is the energy difference of the 2 nuclei. A generalized expression for the conservation law is supported by data on the branch decompn. of Ra C and Act C. U Z appears to be a deriv. of an unknown U isotope.

S. B. S.

Reversed fine structure of the  $\alpha$ -rays. A. Polessitak. *Nature* 132, 969 (1933).—The fine structure of the  $\alpha$ -rays indicates that the following element will emit groups of  $\alpha$ -rays with energies greater than the normal value, an effect described as reversed fine structure. The calcd. intensity of the reversed fine structure group from Act A is close to the limiting sensitivity of present methods.

S. Bradford Stone

Excitation of the boron nucleus to proton emission by polonium  $\alpha$ -radiation. Franz Heidenreich. *Z. Physik* 86, 675-93 (1933).—The yield of proton emission from B on bombardment with  $\alpha$ -rays from Po is studied as a function of the primary energy of the  $\alpha$ -particles. Three H-groups are found. The 1st has a max. range of 14 cm., the 2nd 30 cm. and the last 76 cm. The yields are 4 and 0.4 protons per  $10^4$   $\alpha$ -particles, for the 2nd and 3rd groups, resp. The intensity of the 2nd group agrees with the nuclear  $\gamma$ -radiation emitted at the same time.

Egon Bretcher

**Disintegration of fluorine nuclei by neutrons and the probable formation of a new isotope of nitrogen ( $N^{14}$ ).** Wm. D. Harkins, David M. Gans and Henry W. Newton. *Phys. Rev.* 44, 945-6(1933); cf. *C. A.* 28, 405<sup>7</sup>.—In the decompn. of difluorodichloromethane by neutrons in a Wilson cloud chamber the energy and momentum relations (values given) show that the F nucleus captures a neutron and forms  $N^{14}$  and a He atom. Energy for decompn. by neutron capture is given for N, F, O and Ne. L. Goldman

**The production of positives by nuclear  $\gamma$ -rays.** Leo Nedelsky and J. R. Oppenheimer. *Phys. Rev.* 44, 948-9 (1933).—The probability of internal absorption of  $\gamma$ -rays from a nucleus by pair formation is computed for light elements. Results check with the value of Curie and Joliot for the no. of positives produced by bombardment of Be but not of Al (*C. A.* 27, 5635<sup>7</sup>). L. Goldman

**Chemical detection of artificial transmutation of the elements.** V. Sokolov and M. Gurevich. *Nature* 132, 679(1933); cf. F. A. Paneth and P. L. Gunther, *C. A.* 27, 3394.—The gas produced by artificial disintegration of elements was collected by means of app. of very high precision. The disintegration of Al by  $\alpha$ -rays revealed the formation of greater quantities of H than were shown by the scintillation method. Bombardment of LiI with  $\beta$ -rays gave traces of He; of NaI with  $\beta$ -rays gave traces of He and Ne. KI gave no rare gases but emitted small quantities of H even without the action of  $\beta$ -rays. Helen S. Hopfield

**Two modifications of hydrogen.** Yu. Khariton. *Uspekhi. Fiz. Nauk.* 10, 95-110(1930).—Review of ortho- and para-H. F. H. Rathmann

**Isotope report. The chemical elements and atom species according to isotope investigations (Report on the work from the end of 1932 to the end of 1933).** Otto Hahn. *Ber.* 67A, 1-8(1934); cf. *C. A.* 27, 895. G. G.

**Separation of hydrogen isotopes by diffusion through palladium.** L. Harris, W. Jost and R. W. B. Pearse. *Proc. Natl. Acad. Sci.* 19, 991-4(1933).—The diffusion of H through Pd under a 100-fold decrease in pressure gave an enrichment in  $H^2$  of 10 times in a single step. Conclusions: The diffusion is an at. process and there is an activation factor favorable to the lighter isotope. J. B. Austin

**Heavy hydrogen in contact with normal water.** M. L. Oliphant. *Nature* 132, 675(1933).—A mixt. of  $H^2$  with pure He, stored over water in an aspirator, after 6 weeks had the same total H content, but less than  $1/20$  of the original  $H^2$  remained. The loss was proved not to be due to leakage or soln.; hence it is thought that there was an exchange between the  $H^2$  mols. and the H of the water until the concn. of  $H^2$  was the same in the liquid as in the gas. Helen S. Hopfield

**The isotopic fractionation of water.** Edward W. Washburn, Edgar R. Smith and Mikkel Frandsen. *J. Chem. Physics* 1, 288(1933); cf. *C. A.* 28, 706<sup>7</sup>. E. R. S.

**The magnetooptic method and the isotopes of radioactive elements.** V. P. Ruskov. *Uspekhi Fiz. Nauk.* 13, 762-7(1933).—A review, with a discussion of the significance of the existence of various isotopes in radioactive disintegrations. F. H. Rathmann

**The magnetic deflection of the isotopic hydrogen molecules and the magnetic moment of the deuteron.** I. Estermann and O. Stern. *Z. Physik* 86, 132-4(1933); cf. *C. A.* 28, 34<sup>3</sup>.—The nuclear magnetic moment of the  $H^2$  isotope seems to be smaller than that of  $H^1$  though the nuclear spin is twice that of  $H^1$ . Egon Bretscher

**A redetermination of the half period of thorium.** Hans Jesefeldt. *Z. Physik* 86, 605-10(1933).—The discrepancy between old detns. of the half life of Th due to Geiger and Rutherford (*C. A.* 5, 1232) and new measurements by Knisch (*C. A.* 25, 3913) is decided in favor of G. and R. The new values are:  $T_{1/2} = 1.3 \times 10^{10}$  years, 1 g. Th emits  $4.7 \times 10^4$   $\alpha$ -particles per hr. Egon Bretscher

**Study of Th C'.** C. Chamié. *Compt. rend.* 197, 1037-9 (1933).—Th C' is sepd. from Th C by recoil in an elec. field. The half-life period of the purified product is 3.1 min. The decay curve shows an anomaly at the beginning which

may be due to the fine structure of  $\alpha$ -rays from Th C. J. B. Austin

**Fractional crystallization of radium-bearing barium chloride.** Mme. Branca Edmee Marques. *Compt. rend.* 197, 1314-15(1933); cf. *C. A.* 27, 3665.—The function  $\lambda = \log [Ra]_0/[Ra]_\infty + \log [Ba]_0/[Ba]_\infty$ , in which  $[Ra]$  is the concn. of Ra ions in soln. and subscripts 0 and  $\infty$  mean before and after crystn., resp., is calcd. In slow crystn.  $\lambda$  is const. but in rapid crystn.  $\lambda$  decreases as the concn. increased. Gregg M. Evans

**Radium and uranium from Great Bear Lake ore.** Anon. *Can. Chem. Met.* 17, 251-2, 253(1933).—Ra and U have recently been extd. from the ores of the Great Bear Lake region. The ore is crushed, roasted, pulverized to 35-mesh, boiled with HCl, filtered on a stoneware filter, and washed with water. The residue contg. the Ra is treated with satd. NaCl soln. to dissolve the  $PbCl_2$ . A certain amt. of Ba must be present before boiling with  $Na_2CO_3$  to convert both Ba and Ra to carbonate. Filtering leaves the carbonates along with the  $SiO_2$ . The carbonates are dissolved in HCl and Ba and Ra repptd. as sulfates. The sulfate mixt. contains 2-10 mg. Ra/kg. The sulfates are again converted to carbonate, washed, dissolved in HBr and the soln. is purified by the use of  $Ba(OH)_2$ . Ra and Ba bromides are sepd. by fractional crystn. U is recovered as Na salt, recovery beginning at the point where the HCl leach gives the U in soln. W. H. Boynton

**Radioactivity of zinc.** Hans Fiesefeldt. *Z. Physik* 86, 611-14(1933).—Contrary to Ziegert (*C. A.* 22, 4365) no natural radioactivity is found with very pure Zn. Egon Bretscher

**Experimental study of the widths and shapes of the  $K_\alpha$  x-ray doublet from Ca (20) to Ni (28).** Lyman G. Parratt. *Phys. Rev.* 44, 695-702(1933). Bernard Lewis

**Fine structure of the absorption spectra of x-rays.** A. Venderovich. *Uspekhi Fiz. Nauk* 13, 752-61(1933).—A review. The strength of the chem. bond in compds. can be detd. by a study of x-ray spectra. The strength of a given bond for a given element varies from compd. to compd. F. H. Rathmann

**The photographic action of ultra-soft Röntgen rays.** M. Renninger. *Z. Physik* 86, 382-6(1933).—The half breadth of the C  $K_\alpha$  line is detd. from photographic spectrograms with the help of a photometer. The half breadth is found to increase with the height of max. of the line. Explanation is lacking. Egon Bretscher

**Absolute measurements of the scattering intensity of Cu  $K_\alpha$  radiation in argon.** Gerhard Herzog. *Helv. Phys. Acta* 6, 508-54(1933).—See *C. A.* 27, 5637.

**Methods for evaluation of röntgenograms.** N. D. Borisov. *J. Tech. Phys. (U. S. S. R.)* 2, 501-4(1932). F. H. Rathmann

**Röntgen spectroscopic experiments on orientation of palmitic acid on mineral surfaces.** E. Berl and B. Schmitt. *Kolloid-Z.* 65, 261-4(1933).—With monochromatic Cu  $K_\alpha$  radiation and the rotating-crystal method,  $d_1$  obtained for palmitic acid was 35.7 Å, in good agreement with previous work. Films, showing good interference patterns, were deposited satisfactorily on glass surfaces from 60% alc. soln.; from 40% soln. the lines disappeared. Orientation on glass, mica and gypsum surfaces is due to the formation of a unimolecular Na or Ca soap layer. Acidification of such a surface prevents formation of this soap layer and explains the weak, diffuse lines obtained on a quartz substrate. Films formed on metal foils, especially by deposition from  $AcOH$ , showed sharp patterns contg. the metal soap lines as well as those of the acid. Films on sphalerite, pyrite, calcite and cerussite gave no soap pattern. Arthur Fleischer

**Absorption spectra resulting from the excitation of the inner electrons.** I. General. H. Beutler. *Z. Physik* 86, 495-515(1933); cf. *C. A.* 27, 227.—Absorption spectra of metal vapors in the region 600-1200 Å. are studied. Beyond the ionization threshold line absorption is found again, because of the excitation of electrons of a shell below the valency electron. A general diffuseness of the

excited terms is due to the transition of the atom into an ion with emission of the valency electron. Selection rules for this process are stated. The limits of the new terms are identical with the excited states of the spark spectra. Approx. values of the new terms can be obtained from the arc spectrum of the next element in the periodic system. The  $\text{He}_2$  continuum and a vacuum grating spectrograph were used. The spectrum is called  $I^1$  if the shell below the valence shell is involved. II. The mercury spectrum between 1190 and 600 Å. due to excitation of the  $(5d)^{10}$  shell of Hg  $I^1$ . *Ibid.* 710-18.—Absorption spectra of Hg with the He or A continuum as light sources give lines belonging to the following transitions:  $(5d)^{10} (6s)^1 1S_0 \rightarrow (5d)^9 (6S)^4 m P^1 P_1$  or  $D_1$  or  $(5d)^9 (6S)^3 m f^1 P_1$  or  $P_1$ . The lowest term,  $(5d)^9 (6S)^3 6P^1 P_1$ , lies below the normal series limit. This series  $m^1 P_1$  converges to  $\text{Hg}^{+2} D_{5/2}$ . The terms near the normal absorption limit are very diffuse. E. Bretscher

Interpretation of the spectra of the hot stars. Bengt Edlén. *Z. Astrophys.* 7, 378-90(1933).—Unobserved lines of C III, C IV, N IV, N V, O IV, O V and O VI, which fall in the spectral region of astrophysical importance, have been calcd. from known terms, and the results are used to identify the emission lines appearing in the spectra of hot Wolf-Rayet stars and to interpret the stellar conditions responsible for their appearance. C. C. Kiess

A preliminary table of lines in the spectrum of  $\delta$  Cephei. C. J. Krieger. *Astrophys. J.* 79, 98-139(1934).—Wave lengths of 380 absorption lines in the spectrum of  $\delta$  Cephei are presented together with their chem. origins. C. C. Kiess

The hydrogen line widths in 5 K Draconis. Ralph Van Arnam. *Astrophys. J.* 79, 140-2(1934).—From measurements of the contours of  $H_\beta$ ,  $H_\gamma$  and  $H_\delta$  in the spectrum of 5 K Draconis no correlation was found between the intensity of the emission lines and the widths of the absorption lines. This evidence supports the view that the emission and absorption lines originate at different levels in the star. C. C. Kiess

Series in the spark spectrum of radium, Ra II. Ebbe Rasmussen. *Z. Physik* 86, 24-32(1933).—The spectrum of Ra II is obtained from 11000 to 1880 Å. The ground term is  $81842.31 \text{ cm}^{-1}$  and the ionization potential 10.099 v. Egon Bretscher

Arc spectrum of silicon in the red and infra-red. C. C. Kiess. *Bur. Standards J. Research* 11, 775-82(1933) (Research Paper No. 624).—Wave lengths have been measured for 130 new lines in the arc spectrum of Si between 6125 Å. in the orange and 11290 Å. in the infra-red and beyond the longest previously recorded line. Most of these new lines appear in absorption in the solar spectrum. Many of them have been classified as combinations between new triplet and singlet terms arising from configurations  $contg.$  the  $4p$ ,  $4f$  and  $5f$  electrons and terms known from Fowler's analysis of Si I (C. A. 23, 3161). C. C. Kiess

The arc spectrum of sulfur. K. W. Meissner, O. Bartelt and L. Eckstein. *Z. Physik* 86, 54-76(1933). Egon Bretscher

The spark spectrum of sulfur S II. O. Bartelt and L. Eckstein. *Z. Physik* 86, 77-81(1933). Egon Bretscher

The arc spectrum of sulfur in the ultra-violet. J. E. Ruedy. *Phys. Rev.* 44, 757-60(1933).—A Schüler tube with a water-cooled Al cathode with He gas for maintaining the discharge was attached to a vacuum spectrograph employing a 1.5-m. grating of 15,000 lines per in. The S spectrum was excited by vaporizing some S in the tube while the discharge was in operation. The wave length range photographed was 0-2600 Å., and in the region 1050-2400 Å. many new lines were observed and classified. It was thus possible to establish the low singlet terms of the arc spectrum and some of the higher terms built on the doublet P and D states of the ion as well as some higher members of the series built on the quartet S of the ion. Bernard Lewis

Asymmetries of pressure-broadened spectral lines. Henry Margenau. *Phys. Rev.* 44, 931-4(1933). B. L.

Pressure effects of nitrogen on potassium absorption lines. Wm. W. Watson and Henry Margenau. *Phys. Rev.* 44, 748-52(1933).—Pressure effects on the first 3 doublets of the principal series of the K absorption spectrum have been produced by  $\text{N}_2$  up to 80 atm. pressure. The 4045 and 3446 Å. pairs show shifts of the absorption max. to the red and half-widths more than twice as large as those for the resonance lines. In the range of  $\text{N}_2$  pressures above "relative density" 10, both the shifts and half-widths increase more rapidly than linearly with density. The  $^3P_{1/2}$  components exhibit this departure from the linear relation more markedly than the  $^3P_{1/2}$  components. Possible explanations of these variations are suggested. Quant. results are summarized in the figures and tables. Bernard Lewis

Absorption of light near the mercury resonance line 1850 Å. I. M. Frank. *Physik. Z. Sowjetunion* 4, 637-45 (1933) (in German).—The absorption of the Al line at 1854.62 Å. by Hg is proportional to the thickness of Hg vapor, and is 0.53 at  $306^\circ$  for a layer of Hg 16 mm. thick. Absorption decreased with increase in temp. The absorption is due to scattering of the light by the Hg atom because of the close proximity to the 1849.6 Å. line of Hg. Gerald M. Pettit

Quenching of light from flames produced by various chemicals. C. D. Child. *Phil. Mag.* 16, 1141-50(1933).—

The quenching effect of a variety of salts and acids on the light of a flame sprayed with a soln. of a salt of Ca, Sr, Na or K was studied. With flames of the alk. earth salts, the effect of a quenching substance depends on both its pos. and neg. constituents. With alkali salt flames the effect of all added substances is about the same. The behavior of the alk. earth salts is explained by assuming that equil. is reached in the flame, so that the no. of uncombined metal atoms depends on the nature and of the acid radicals present. E. J. Rosenbaum

Determination of the excitation function of some terms of the mercury atom. Richard Seiler. *Z. Physik* 83, 789-805(1933).—The energy loss of electrons on diffusion through Hg vapor is used to obtain the probabilities of excitation as a function of the electron energy. The max. probability for the transition  $1S_0 \rightarrow 2^3P_1$  lies between 6.4 and 7 v., 4-5% of the gas kinetic collisions being effective. Two maxima are found for  $1S_0 \rightarrow 2^1P_1$ , at 7 and 18-20 v. resp. The yields are 1% for the former and 3% for the latter. Egon Bretscher

Theory of the Stark effect in variable time fields. D. I. Blokhintzev. *Physik. Z. Sowjetunion* 4, 501-15(1933) Howard A. Smith

The positive-ion excitation of mercury vapor. Ernest J. Jones. *Phys. Rev.* 44, 707-10(1933).—Hg vapor was bombarded with  $\text{Li}^+$  and  $\text{K}^+$  ions, the resulting spectra were photographed with a quartz spectrograph and the plates photometered to give an approx. intensity-velocity curve. Voltages used ranged from 150 to 1500 v. The results indicate that the velocity rather than the energy is the important factor to be considered in the mechanism of the collision process. A preference seems to exist for the excitation of levels of higher L values. The spark lines 2827, 2280 and 2224 Å. appear at 1000 v for  $\text{Li}^+$  ions. A powerful source of pos. ions has been developed. Bernard Lewis

Doppler effect in spectra of positive rays of uniform velocity in argon, neon and helium. Anna I. McPherson. *Phys. Rev.* 44, 711-16(1933). Bernard Lewis

Configuration interaction in complex spectra. C. W. Ufford. *Phys. Rev.* 44, 732-9(1933).—The electrostatic energies and magnetic splitting are calcd. for the terms of  $nd^2n's$ ,  $nd^3$  and  $ndn's^2$  from quantum mech. considerations of the electrostatic interaction between the terms in Russell-Saunders coupling of the electron configurations. The values are compared with those observed in Ti II and Zr II. The latter agrees particularly well, especially if the observed  $^3D$  terms are arranged. Bernard Lewis

Characteristic values of the two-minimum problem and quantum defects of f states of heavy atoms. Ta-You Wu. *Phys. Rev.* 44, 727-31(1933). Bernard Lewis

**Relative multiplet transition probabilities from spectroscopic stability.** E. U. Condon and C. W. Offord. *Phys. Rev.* 44, 740-3(1933).—The relative multiplet transition probabilities are given for the transitions  $p^2\ ^3P^o \rightarrow p^2\ ^3P$ ,  $d^2\ ^3P^o \rightarrow d^2\ ^3P$ , and  $p^2\ ^3P^o \rightarrow p^2\ ^3P$ . Bernard Lewis

**Relative intensity tables for spectrum lines.** H. E. White and A. Y. Ellason. *Phys. Rev.* 44, 753-6(1933).—Relative intensities for a large no. of multiplets have been calcd. from well-known theoretical formulas. These intensities have been tabulated for future reference in making analyses of spectra. The tables are grouped under each resultant spin, from singlets  $S = 0$ , to octets  $S = 7/2$  and include all probable values of  $L$  and  $J$ . It is shown how the same tables apply to  $jj$ -coupling, to hyperfine structure and to related multiplets. B. L.

**Variation in spectra of some gases in relation to the discharge frequency in Geissler tubes.** A. V. Savel'ev. *J. Tech. Phys.* (U. S. S. R.) 3, 622-9(1933).—Photographs of the spectra of Ne, He and H are shown.

F. H. Rathmann  
**Wave lengths of the red lines of neon and their use as secondary standards.** C. V. Jackson. *Proc. Roy. Soc. (London)* A143, 124-35(1933).—To det. definitely whether the Ne lines can be used as secondary standards the wave lengths of the red lines of Ne have been compared with the primary standard by means of a Fabry-Perot interferometer of resolving powers ranging from 70,000 to 800,000. Results: With resolving powers greater than about 250,000, the Ne lines have const. wave lengths showing a systematic difference of 0.0001 Å. and a mean accidental difference of  $\pm 0.0002$  Å. from the values of Burns, Meggers and Merrill (*C. A.* 13, 1419). With lower resolving powers the apparent wave lengths become systematically lower until const. values are reached at about 100,000. The Ne lines form satisfactory secondary standards for use with app. of low resolving powers when corrections, which are given, are applied to the standard. Conditions are given for exciting lines accurately reproducible in wave length and free from self-reversal.

Allen S. Smith  
**The line absorption of sodium vapors of the  $D$  lines.** W. Zehden. *Z. Physik* 86, 555-82(1933).—The  $f$  value of each  $D$  line (isolated by Wood's method) is detd. from measurements of the "line absorption"  $f_{D_1} = 0.207$ ,  $f_{D_2} = 0.532$ . Qual. agreement with the value from measurements of the magneto-rotation is obtained if the hyperfine structure is taken into account.  $1/2$  and  $3/2$  are assumed for the nuclear spins of Na. Directions for sealing Suprax glass plates to tubes are given. E. B.

**Sodium glow-lamp.** F. H. Newman. *Phil. Mag.* 16, 1109-14(1933).—Na was added to A- or Ne-filled bee-hive lamps by electrolyzing through the glass walls. When the lamp is lighted, the A lines disappear leaving only intense and narrow  $D$  lines of Na, suitable for calibration. Ne lines do not disappear entirely.

E. J. Rosenbaum  
**Width of spectral lines in gases.** V. Veiskopf. *Uspekhi. Fiz. Nauk.* 13, 552-92(1933).—The Hg 2537 and the Na  $D$  lines were measured for width in H<sub>2</sub>, He, A, Ne, N<sub>2</sub>, O<sub>2</sub>, CO<sub>2</sub> and CO.

F. H. Rathmann  
**Analysis of Zeeman patterns.** Russell A. Fisher. *Phys. Rev.* 44, 724-6(1933).—A method for the representation and analysis of Zeeman patterns is explained. B. L.

**Relation between fine structure of spectral lines and the rotation of the nucleus.** S. Frish. *Uspekhi. Fiz. Nauk.* 10, 570-80(1930).

F. H. Rathmann  
 **$Li$  fine structure and wave functions near the nucleus.** John A. Wheeler and G. Breit. *Phys. Rev.* 44, 948(1933).—The fine structure of the  $(1s2p^2P)$   $P$  level of  $Li^+$  was calcd. theoretically. In the formula for the energies of the triplet  $j = 0, 1, 2$ :  $E_j = [-3(C + D), 2(D - C), 0]$  the computed values of  $C$  and  $D$  are  $-0.334$  and  $-1.040$  cm.<sup>-1</sup> as against the observed values of  $0.016$  and  $-1.033$  of Schüller (*C. A.* 25, 1734). L. Goldman

**Nuclear moments of sodium and potassium.** S. Frish. *Physik. Z. Sowjetunion* 4, 557-62(1933).—A review of the spectroscopic work on the magnetic moments.

Howard A. Smith

**The nuclear spin and magnetic moment of sodium from hyperfine structure.** L. P. Granath and C. M. Van Atta. *Phys. Rev.* 44, 935-42(1933).—The hyperfine structure of the Na  $D$  lines from a liquid-air-cooled Schüller tube was observed with a Fabry-Perot interferometer. Each line has 2 resolvable components; the sepns. are: for  $D_2$  ( $\lambda 5890$ ),  $0.0555$  cm.<sup>-1</sup>, for  $D_1$  ( $\lambda 5896$ ),  $0.0612$  cm.<sup>-1</sup>. The total hyperfine structure splitting for the  $3^2S_{1/2}$  state is  $0.0583$  cm.<sup>-1</sup>, for  $3^2P_{1/2}$ ,  $0.0050$  cm.<sup>-1</sup> and for  $3^2P_{3/2}$ ,  $0.0083$  cm.<sup>-1</sup>. Relative intensity measurements are consistent with a nuclear spin of  $3/2$ . The nuclear magnetic moment is calcd. as  $2.7/1840$  Bohr magnetons.

Bernard Lewis

**The magnetic moments of the rubidium isotopes.** D. A. Jackson. *Z. Physik* 86, 131(1933).—By combination of J.'s results (*C. A.* 27, 3139) with those of Kopfermann (*C. A.* 27, 4733) the isotope shift for Rb<sup>85</sup> and Rb<sup>87</sup> is found to be 0.

Egon Bretscher

**The hyperfine structure intensities of the  $2^1S_1$ - $2^3P_{0,1,2}$  triplet in optically excited mercury vapor.** M. L. Pool and S. J. Simmons. *Phys. Rev.* 44, 744-7(1933).—The hyperfine structures of the Hg lines 5461, 4358 and 4047 Å. in fluorescence emission were obtained in the 2nd order of a 30,000-line, 21-ft. grating. The ratio of the intensity of the central component to the intensity of any one of the other components was found greater than a similar ratio for the emission from the excited arc. This anomalous increase in intensity of the central component in fluorescence may be accounted for by making use of the absorption coeff. of the components of 4047 Å. B. L.

**Hyperfine structure in the tantalum arc spectrum.** Edwin McMillan and Norman S. Grace. *Phys. Rev.* 44, 949-50(1933).—The intervals and no. of components in the lines  $\lambda 5997.24$  and  $\lambda 6020.69$  in the arc spectrum of tantalum show that the nuclear spin is  $7/2$ . The level scheme for  $\lambda 6020.69$  is shown. L. Goldman

**Measurement of the light emission in the argon and mercury spectrum on excitation with electron collisions.** Otto Fischer. *Z. Physik* 86, 646-66(1933).—The excitation functions of the violet lines of the spark spectrum and the blue lines of the spark spectrum of A are detd. at low pressure. The intensity ratio in the blue part of the A spectrum is measured with the help of a W ribbon lamp as light source for comparison. A new method is developed for detg. the abs. yield  $A$  of excited atoms by direct comparison of the light emission with the standard W lamp.  $A$  is found in the case of Hg 4358 to be  $7.9/1000$ . This agrees with the value obtained by Hanle and Schaffernicht by a totally different method (cf. *C. A.* 24, 1283).

Egon Bretscher

**The natural width of neon lines in the visible spectrum.** I. Statement of the problem, theoretical foundation of the method of investigation and discussion of the available results. Wilhelm Schutz. *Ann. Physik* 18, 705-20(1933). II. Description of apparatus and methods of measurement, quantitative results. Horst Shillbach. *Ibid.* 721-45.

W. F. Meggers

**The intensity of the visible neon lines of the positive column as a function of the current strength.** Wilhelm Schutz. *Ann. Physik* 18, 746-54(1933). W. F. Meggers

**Infra-red region of the spectrum.** M. A. Levitskaya. *J. Tech. Phys.* (U. S. S. R.) 2, 351-70(1932).—A review. F. H. Rathmann

**The inert gas molecules.** K. G. Emelius and O. S. Duffendack. *Phys. Rev.* 44, 945(1933).—Band spectra in helium show that the mol. is formed from a normal and a metastable atom and is further excited by an electron. Heavier inert gases do not give band spectra because of the lower metastability of mols. having a larger no. of electrons. L. Goldman

**The action of light on vapors of rubidium iodide.** Remark on the publication of Manohar S. Desai. G. H. Visser and A. C. S. van Heel. *Z. Physik* 86, 694-6(1933).—Priority claim and criticism of D.'s paper (*C. A.* 28, 45).

Egon Bretscher

**Influence of nitrogen and carbon dioxide upon the absorption spectrum of mercury vapor.** R. W. Wood and M. W. Straub. *Phys. Rev.* 44, 1030(1933).—The history

of the effect of chemically inert gases on the absorption spectrum of Hg is given. For added N a broad absorption band on the short-wave side of the resonance line appeared when the width of the pressure-broadened Hg-line was less than 10 Å, its distance from the line was about 8 Å, the excess energy being 0.014 v. Similar data are given for admixed CO. L. Goldman

A new band system in nitrogen. Joseph Kaplan. *Phys. Rev.* 44, 947(1933); cf. *C. A.* 27, 24, 25.—A new band system was discovered in the N afterglow corresponding to some of the  $\epsilon$ -series of Vegard in the luminescence of solid N and in the aurora borealis. The electronic energy of the upper state is 6.41 v. and the initial level is probably a new electronic level. L. Goldman

Further analysis of the  $N_2^+$  bands. Allen E. Parker. *Phys. Rev.* 44, 914-18(1933).—The  $\Delta v = 3$  sequence of the  $^2\Sigma - ^2\Sigma N_2^+$  bands has been photographed in the second and third orders of a 21-ft. grating. Rotational analyses have been made of the (4,7), (5,8), (6,9) and (7,10) bands. The  $B$  values obtained fit well the expressions previously given for  $Bv'$  and  $Bv''$ . The perturbation in the (5,8) band has been investigated. The present data on the perturbing  $^2\Pi$  state are discussed. Additional measurements in the (13,15) band are also given. Bernard Lewis

Light of the night sky and active nitrogen. Joseph Kaplan. *Nature* 132, 1002-3(1933); cf. *C. A.* 27, 898.—The afterglow of the  $N_2$  tube has been photographed in the visible region. It is made up of the bands  $v = 18, 19, 20$ , etc.; they are emitted by  $N_2^+$ . It is possible to reproduce completely the light of the night sky in the  $N_2$  afterglow. Gerald M. Petty

Nuclear spin of phosphorus from band-spectrum analysis. Muriel F. Ashley. *Phys. Rev.* 44, 919-28(1933).—The emission spectrum of  $P_2$  has been photographed in the 1st and 2nd orders of the 21-ft. grating. A strong alternation in intensity is observed in the successive rotational lines of many bands. The intensity ratio is found to be 3:1; hence the nuclear spin of P is  $1/2$ . A fine-structure analysis was made of the (6,22), (6,23) in addn. to the (8,27), (8,28) and (9,28) bands previously reported by Herzberg (*C. A.* 27, 1572). Only  $P$  and  $R$  branches are present. The transition involved is  $^2\Sigma \rightarrow ^2\Sigma$ . The odd levels of the ground state have the greater statistical weight. The following mol. consts. are obtained:  $\tilde{\nu}_0 B_0' = 0.2415 \text{ cm.}^{-1}$ ,  $B_0'' = 0.3058 \text{ cm.}^{-1}$ ;  $\alpha' = 0.00164$ ;  $\alpha'' = 0.00165$ . Bernard Lewis

Spectroscopic detection and structure of the PN molecule. J. Curry, L. Herzberg and G. Herzberg. *Z. Physik* 86, 348-66(1933); cf. *C. A.* 28, 411<sup>1</sup>.—The emission spectrum of  $N_2$ -contg. P vapors is analyzed. The configuration is a  $\Pi \rightarrow ^2\Sigma$  transition. The formula for the zero lines is given. The at. distances are 1.4869 and 1.542 Å. for the ground and the excited states, resp. The energy of dissocn. from the ground state is about 7.8 v. (extrapolated). The PN mol. is compared with a series of other diatomic mols. Egon Bretscher

Spectrum of  $O^+H^+$ . Herrick L. Johnston and David H. Dawson. *Phys. Rev.* 44, 1031(1933); cf. *C. A.* 27, 2380.—Five hundred lines distributed in 8 bands in the spectrum of  $OH^+$  were studied. Corrections necessary in calcg. isotope shifts are given. L. Goldman

New bands in the electronic band spectrum of neutral OH. Katherine Chamberlain and Harold B. Cutter. *Phys. Rev.* 44, 927-30(1933); cf. *C. A.* 27, 3880.—With a very rapid flow of  $H_2O$  vapor a discharge tube and high-frequency excitation, it was possible to bring out portions of 2 new bands in the spectrum of neutral OH. These have been identified as the (3,0) and (3,1) bands. Faint lines have also been found between the lines of the  $^{18}R_{11}$  singlet series of the 3064 Å. band. These lie where approx. calcs. indicate that the  $^{18}R_{11}$  branch of the (0,0) band of the isotope  $OH^+$  should fall. The singlet series  $^{18}R_{11}$  of the (2,0) band appears on the plates. There is also a group of 9 lines extending from 2539 to 2565 Å. This may be a portion of the (4,1) band but it has not been found possible to establish this definitely. Bernard Lewis

The  $\lambda$  3240 band of NH. R. W. B. Seares. *Proc. Roy. Soc. (London)* A133, 142-20(1933); cf. *C. A.* 27, 3880.—A band at 3240 Å. observed near the 3360 Å. band of NH in the spectrum of a heavy-current discharge tube contg. N and H is also attributed to NH. Its occurrence in other sources contg. N and H was investigated. Analysis of the band photographed under high dispersion showed that it possessed the intensity distribution and no. of "missing lines" characteristic of a  $^1\Pi \rightarrow ^1\Delta$  transition.

The narrow doubling occurring in each of the  $P$ ,  $Q$  and  $R$  branches is attributed to  $\Delta$ -doubling of the  $^1\Pi$  levels. Rotational term differences are obtained and rotational consts. calcd. The relation of the electronic levels of the mol. NH to the lowest levels of the atom N is discussed. Wave lengths are tabulated. Allen S. Smith

New  $O_2^+$  bands. Dissociation energy of  $O_2^+$  and ionization potential of  $O_2$ . R. S. Mulliken and D. S. Stevens. *Phys. Rev.* 44, 720-3(1933).—Three new bands are reported in the 1st neg. and several in the 2nd neg. system of  $O_2^+$ . The numbering of the vibrational levels of the normal state of  $O_2^+$ , hitherto in doubt, is definitely established. The observed ionization potentials,  $I$ , of  $O_2$  at 12.5 and 16.1 v. are discussed. From the known  $O_2^+$  energy levels it is shown that the dissocn. energy  $D$  of  $O_2^+$  cannot be less than 6.0 v.; by extrapolation from the known levels 6.54 v. is obtained. The latter value would require 12.11 v. as the ionization potential of  $O_2$ . It is suggested that  $D = 6.45 \pm 0.1$  v. and  $I = 12.2 \pm 0.1$  v. as a reasonable compromise between the ionization potential and the band spectrum data. B. L.

The band spectrum of bismuth oxide. Chandrasekhar Ghosh. *Z. Physik* 86, 241-8(1933).—Four band systems are found between 4300 and 6700 Å. Egon Bretscher

A band system of ionized aluminum hydride. W. Holst. *Nature* 132, 1003(1933); cf. *C. A.* 27, 5246.—The AlH band at 3600 Å. has been analyzed. It belongs to a  $^2\Pi_2 \rightarrow ^2\Sigma$  transition, and is attributed to  $AlH^+$ . New bands have been found at 2700 and 3380 Å. Gerald M. Petty

The infra-red spectrum of heavy ammonia. S. Silverman and J. A. Sanderson. *Phys. Rev.* 44, 1032(1933).—The observed and calcd. values for the bands of the infra-red absorption of  $NH_3$  agree. The structures of the envelopes of the 4 bands are similar to the corresponding frequencies of  $NH_3$ . L. Goldman

The rotation oscillation spectrum of methane. II. Vedder and R. Mecke. *Z. Physik* 86, 137-56(1933).—The  $CH_4$  spectrum is studied in the region from 7000 to 11,000 Å. The absorbing column was 20 m. at 5 atm  $CH_4$  pressure. Seven bands were found. All the 23 bands observed up till now can be reduced to the following 4 normal oscillations:  $\nu(a) = 3015 - 15v$ ,  $\nu(s) = 2945 - 50(v_s + v_a)$ ,  $\delta(a) = 1320 - 15(v_s + v_a)$ ,  $\delta(s) = 1530 - 10(v_s + v_a)$ . The rotational structure has not yet been analyzed. Egon Bretscher

The absorption spectra of lead oxide and lead sulfide. R. S. Sharma. *Bull. Acad. Sci. United Provinces Agra and Oudh Allahabad, India* 3, 17-22(1933).—For  $PbO$  2 regions of continuous absorption were observed beginning at 3000 and 2240 Å. Similarly,  $PbS$  exhibits 2 continuous absorption bands beginning at 3500 and 2450 Å. In each case the first absorption band represents the photochem. dissocn. of the mol. into 2 free atoms; the second absorption band represents the dissocn. of the mols. with the O and S atoms in the metastable  $^1D_2$  state. C. C. Kies

The absorption spectra of the vapors of the lower chlorides of elements of the fifth group of periodic table. Hrishikesh Trivedi. *Bull. Acad. Sci. United Provinces Agra and Oudh Allahabad, India* 3, 29-30(1933).—The trivalent chlorides of P, As, Sb and Bi have bands of continuous absorption in the ultra-violet with long-wave limits at 2957, 3468, 3256 and 3656 Å., resp. The corresponding energies are greater than  $1/2$  but less than  $3/4$  the heats of dissocn. calcd. from thermochem. considerations. The trichloride mol. probably dissocn. into a Cl atom and a dichloride of the metal. C. C. Kies

Quenching of iodine fluorescence by iodine and argon.

James F. Kochler. *Phys. Rev.* **44**, 761-8(1933).—Fluorescence was excited monochromatically in  $I_2$  below 0.8 mm. pressure, by the Hg green and yellow lines and measured by photographic photometry with a spectrograph. Absorption measurements were made under similar conditions with 2 compensating photoelec. cells. Beer's law holds here. Argon does not alter the absorption of  $I_2$ . The ratio of probability that an excited mol. will lose all energy in an I collision to probability of radiation is evaluated per unit time. The ratio exceeds unity for pressures of about 0.05 mm. The yellow excited series is quenched more than the green by both  $I_2$  and A. The complex nature of A quenching is discussed. B. L.

The magnetic extinction of the fluorescence of diatomic molecules of sulfur. J. Geuard. *Compt. rend.* **197**, 1102-4(1933); cf. *C. A.* **28**, 708<sup>6</sup>.—The extinction by a magnetic field of the fluorescence of  $S_2$  vapor excited by Hg radiation was studied for wave lengths from 2894 to 5132 Å. and a field strength of 40,000 gauss. The effects are more complex than those previously observed for I and Te. Besides multiplets which showed strong extinction, others were but slightly affected while some were increased in intensity. The extinction is more marked for the shorter exciting wave lengths. Van Vleck's theory of magnetic predissocn. does not seem to be applicable to  $S_2$ . Morris Muskat

The molecular spectra of some indium and gallium halides. A. Petrikain and J. Hochberg. *Z. Physik* **86**, 211-30(1933).—The absorption and emission spectra of  $InCl$ ,  $InCl_2$ ,  $InBr$ ,  $GaCl_2$ ,  $GaBr_2$  and  $GaI$  are studied. The bi and trivalent compds. give at high temp. continuous spectra, the univalent, two band systems, both of singlet character. Egon Bretscher

The absorption of iodine vapor in the presence of foreign gases. Ion I. Agarbiacan. *Compt. rend.* **197**, 1198-9(1933); cf. *C. A.* **27**, 4480. Absorption bands of  $I_2$  mixed with  $O_2$  or  $N_2$  (at pressures of from 1 mm. to 1 atm.) are intensified but no new bands appear; apparently excited mols. of  $I_2$  are rendered less active during collision. E. G. Vanden Boche

Rotational structure of the Raman band (0000)  $\rightarrow$  (020  $\pm$  2) in linear symmetrical molecules  $YX_2$ . J. Rud Nielsen. *Phys. Rev.* **44**, 911-13(1933).—In connection with an attempt to interpret 2 faint lines in the Raman spectrum of  $CO_2$  (Langseth and Nielsen (*C. A.* **27**, 1272)) the intensities have been calcd. of the rotational lines associated with the transition (0000)  $\rightarrow$  (020  $\pm$  2) in linear symmetrical mols.  $X-Y-X$ . The results agree with the more general formulas recently obtained by Placzek and Heller (*C. A.* **27**, 4171). Bernard Lewis

The diffusion of light and molecular rotation in liquids. A. Rousset. *Compt. rend.* **197**, 1033-5(1933).—The polarization factor of scattered light is detd. spectroscopically for  $\lambda$  4358 with several slit widths ( $s$ ) for  $CaH_2$ ,  $CS_2$ ,  $HIOAc$  and  $SO_2$ . Conclusions: The mols. do not make complete rotations but change their orientation with variable speed. The forces that promote assocn. oppose certain rotations. J. B. Austin

The Raman effect in ammonia and some other gases. Charlton M. Lewis and Wm. V. Houston. *Phys. Rev.* **44**, 903-10(1933).—The Raman rotation spectra of polyatomic mols can be interpreted in terms of the polarizabilities of the mols., without explicit knowledge of the electronic states. This point of view makes possible the calcn. of the relative intensities of all rotation lines to be expected. The spectrum of gaseous  $NH_3$  shows the calcd. intensity relations when a suitable shape is assumed for the mol. Measurements tend to support the flat pyramid inferred from infra-red data. The larger moment of inertia is  $2.79 \times 10^{-40}$  g. sq. cm.  $CH_4$  shows no pure rotation band in spite of the presence of a vibration-rotation band which has not been interpreted.  $C_2H_4$  gives a pure rotation band which indicates a moment of inertia of about  $300 \times 10^{-40}$  g. sq. cm with alternating intensities as in  $H_2$ . Bernard Lewis

The Raman effect of solutions of ammonium nitrate in nitric acid. Louis Médard and Thérèse Petitpas. *Compt. rend.* **197**, 1221-2(1933).—The addn. of  $NH_4NO_3$

to  $HNO_3$  increases the values of the frequencies of the Raman rays ( $n_1, n_2, \dots, n_8$ ) previously found for  $HNO_3$ ; the  $n_1$  and  $n_2$  values are most easily affected by diln. For solns. of  $NH_4NO_3$  in  $HNO_3$  the frequencies of the  $NO_2$  ion are 728, 1053 and 1339  $cm^{-1}$ . E. C. V. R.

The multiplicity of some Raman frequencies of the nitrate group found in nitrates with more than one valence. Z. Ollano and G. Prongia. *Nuovo cimento* **10**, 306-15(1933).—The Raman frequencies 1440, 1030, 980 and 720  $cm^{-1}$  of the nitrate group have been studied in solns. of  $LiNO_3$ ,  $NaNO_3$ ,  $KNO_3$ ,  $NH_4NO_3$ ,  $AgNO_3$ ,  $HgNO_3$ ,  $Mg(NO_3)_2$ ,  $Mn(NO_3)_2$ ,  $Ba(NO_3)_2$ ,  $Ca(NO_3)_2$ ,  $Cd(NO_3)_2$ ,  $Pb(NO_3)_2$ ,  $Al(NO_3)_3$ ,  $Ce(NO_3)_3$ ,  $La(NO_3)_3$ ,  $Bi(NO_3)_3$ . In all the univalent salts the lines are single. In the bivalent salts the lines 1440 and 720  $cm^{-1}$  are very wide, probably double. In the trivalent salts these lines are clearly double with a sepn. of 30-40  $cm^{-1}$ . The duplicity, which corresponds to oscillations of the elec. moment of the nitrate group in a direction perpendicular to the axis of symmetry, is attributed to the existence in soln. of ions of the type  $[M(NO_3)]^+$  in which the metal ion lies on the axis of symmetry. J. B. Austin

The Raman effect in aluminum salts. A. da Silveira. *Compt. rend.* **197**, 1035-7(1933).—The Raman displacements in  $cm^{-1}$  for satd. solns. of  $Al(NO_3)_3$  and of  $Al_2(SO_4)_3$  are as follows, where the intensities are marked as  $f$ —very faint,  $f$ —faint,  $m$ —medium,  $s$ —strong,  $ss$ —very strong:  $Al(NO_3)_3$ : 396  $f$ , 446  $f$ , 537  $f$ , 627  $f$ , 721  $m$ , 819  $f$ , 1052  $ss$ , 1241  $f$ , 1312  $m$ , 1414  $s$ , 1530  $f$ , 1639  $f$ ;  $Al_2(SO_4)_3$ : 270  $f$ , 396  $f$ , 461  $m$ , 527  $f$ , 612  $m$ , 686  $f$ , 981  $ss$ , 1109  $f$ . The possible origins of these lines are discussed. J. B. Austin

The Raman spectra of some substituted cycloolefins. Marcel Godchet, Etienne Canals and Germaine Cauquil. *Compt. rend.* **197**, 1407-9(1933); cf. *C. A.* **27**, 2023. As a whole the Raman spectra of the substituted cycloolefins are similar to those of the unsubstituted compds. Thus the strong line in the region of 1200  $cm^{-1}$  is found in the substituted compds. as well as in the unsubstituted compds., and the same is true except for minor details of the line at 1440  $cm^{-1}$ , characteristic of the  $CH_2$  group. Furthermore, for both sets of compds. there is found a group of fine lines, beginning at 132  $cm^{-1}$ , which are distributed over the spectrum. The main differences lie in the splitting into a doublet in the case of the substituted compds. of the line, previously single, at about 800  $cm^{-1}$  which is characteristic of the C—C bond, and a small shift toward longer wave lengths of the line at 1600  $cm^{-1}$ , characteristic of the double bond. Morris Muskat

The complete Raman spectrum of benzene from 5100 Å. to 4100 Å. P. Grassmann and J. Weiler. *Z. Physik* **86**, 321-37(1933).—The Raman spectrum of benzene is obtained with high dispersion (10.8-16.6 Å./mm. for 4560 and 4260 Å., resp.). Forty-one Raman frequencies are found; 18 are new. Most of them are combinations of 10 fundamental frequencies. The line for 984  $cm^{-1}$  is attributed to  $C^{13}$ . Egon Bretscher

Change from aromatic to metallic electrons in organic compounds. A. R. Ubbelohde. *Nature* **132**, 1002(1933).—A study of the elec. polarizability, magnetic susceptibility and dielec. strength of compds. which contain several condensed aromatic rings should yield data of importance to the theory of metallic conduction. Gerald M. Petty

The absorption spectra of biphenols in alkaline media. Albert Saint-Maxen and Emile Dureuil. *Compt. rend.* **197**, 1411-13(1933).—The intensities in the absorption spectra of hydroquinone, pyrocatechol and resorcinol in the range of 5800-2200 Å. were detd. when these compds. were in pure water and in alkali media. The results were: (1) The absorption spectrum of the hydroquinone in alk. media becomes similar to that of quinone; (2) the nature of the alkali has little effect on the spectra; (3) the alk. medium changes the spectrum only when the biphenol can change to a quinone form. M. M.

Raman spectrum of fluorobenzene. N. Gopala Pai. *Nature* **132**, 968(1933).—The Raman frequency, 1220

cm.<sup>-1</sup>, appears to be characteristic of the C—F bond.

S. Bradford Stone

**Molecular light scattering by binary mixtures.** Richard Gans, H. A. Stuart and Wilhelm Müller. *Z. Physik* 86, 765-77 (1933).—The fact that the degree of depolarization of light is generally much smaller in the gaseous state than in the liquid is partly due to the necessity of taking d. and temp. into account to obtain the mol. anisotropy, partly to real assocn. in the liquid state. The degrees of depolarization of light is detd. for the following mixts.: benzene-hexane, CCl<sub>4</sub>-benzene, nitrobenzene-hexane, nitrobenzene-CCl<sub>4</sub>, toluene-AcOH, MeOH-CS<sub>2</sub>. E. B.

**Photoelectric measurements of magnetic rotatory dispersion in the ultra-violet.** G. Bruhat and A. Guinier. *Compt. rend.* 197, 1028-30 (1933).—The magnetic rotatory dispersion is detd. for H<sub>2</sub>O, heptane, heptene and heptene between  $\lambda$  5893 and  $\lambda$  2804. Also in *J. phys. radium* [7], 4, 691-714 (1933). J. B. Austin

**Remarkable optical properties of the alkali metals.** Clarence Zener. *Nature* 132, 968 (1933).—By treating the electrons as free, it is possible to calc. the approx. values of the crit. wave lengths at which the alkali metals become transparent to ultra-violet. S. Bradford Stone

**The absorption of thin films of copper, silver and gold in the visible and ultra-violet region.** Alexander Smakula. *Z. Physik* 86, 185-94 (1933). The curves of transparency of Ag, Au and Cu have band character. Only Ag has at 320 m $\mu$  a min. of absorption, while Au and Cu have none in the ultra-violet. Egon Bretscher

**Preparation of light filters from gelatin and Soviet produced dyestuffs.** V. Ginzburg and B. Levin. *J. Tech. Phys.* (U. S. S. R.) 2, 1053-67 (1932).—Graphs show the absorption curves of 40 different aniline dyes. F. H. Rathmann

**The theory of phosphorogens.** A. A. Guntz. *Compt. rend.* 197, 1030-3 (1933).—A statement of the present status of the theory as based on recent work of Coustalet (*C. A.* 27, 3070). J. B. Austin

**The appearance and disappearance of color in pressed rock crystals.** Magdalene Huberfeld. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse, Abt. IIa*, 142, 135-54 (1933).—This work is similar to that of Smakula, *C. A.* 24, 5613. The absorption spectrum of pressed rock-salt crystals has been photographed before and after radium irradiation and the changes have been analyzed. A simple expression is given to describe the behavior of the absorption max. at 470 m $\mu$ . Disappearance of color is more rapid when the form alteration is greater; the excitation decreases during the process. In the pressed as well as the unpressed salt, about one quantum is required to liberate one electron. Albert L. Henne

**Additive coloring of alkali halide crystals. III. Spectrophotometric results.** Ernst Rexer. *Z. Physik* 86, 1-13 (1933); cf. *C. A.* 26, 5807. The influence of tempering on the absorption spectrum of colored rock salt and KCl crystals is studied with specimens from various sources. The max. absorption is independent of the metal inserted into the crystals lattice (Na, Li, K, Sr, Ba). These absorption regions are not changed by temp. if the crystal has previously been tempered at about 700°, though they disappear with ordinary crystals at 450°. E. B.

**Thermoluminescence spectra of fluorites. II. Division of the bands in thermoluminescence spectrum of fluorite into two groups.** Eiichi Iwase. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 23, 22-33 (1933); cf. *C. A.* 28, 9741.—Thermoluminescence is destroyed by continued heating but is restored by exposure to x-rays. After luminescence is restored 1 group of bands appears at low and the other only at high temp. Low-temp. bands are absent in some natural crystals but after exposure to x-rays they appear. The relative intensities and frequencies of bands are related in one colorless sample. A. B. F. Duncan

**The light absorption of p-nitrosodimethylaniline.** J. F. H. Custers and C. J. Dippel. *Z. Physik* 86, 516-20 (1933).—The light absorptions of an aq. soln. of p-ONC<sub>6</sub>H<sub>4</sub>N(CH<sub>3</sub>)<sub>2</sub> and the hydrochloride are detd. The

addn. of HCl to the base changes the ultra-violet spectrum considerably. The HCl salt is useful as a light filter, cutting off in a layer of depth 0.623 cm. (1/1000 m.) the region between 300 and 470 m $\mu$  and allowing the passage of half the intensity at 254 m $\mu$ . The soln. is only advantageous if the light intensity is not too great, as the absorption spectrum is changed by long irradiation with ultra-violet light. Egon Bretscher

**Some chemical reactions involving active nitrogen.** R. H. Ewart and W. H. Rodebush. *J. Am. Chem. Soc.* 56, 97-8 (1934); cf. Willey, *C. A.* 21, 2093.—When N and HBr at low pressures are passed through an electrodeless discharge NH<sub>2</sub>Br and Br are formed and a yellow to orange afterglow is noticed in the tube if traces of water vapor are present, but the afterglow is absent if the N is free from O or O compds. and dry. With HI an intense brilliant blue color is obtained but no afterglow is present with HCl. Plausible suggestions are made to explain these phenomena. Oden E. Sheppard

**Luminescence in the reaction of alkali metals with sulfur and selenium.** A. Seidel. *Physik. Z. Sowjetunion* 4, 565-6 (1933).—Chemiluminescence in the low-pressure reaction of Na and K with S and Se were observed at temps. of 300° and above. The Na reaction displays the D lines with a continuous background while the spectra of the various K reactions are continuous but are differentiated by the intensity distribution. H. A. S.

**Evidence for the formation of active hydrogen.** A. B. Van Cleave and A. C. Grubb. *Nature* 132, 1001 (1933).—A previous study of active H (*C. A.* 25, 3917) showed no evidence for the formation of SiH<sub>4</sub> as proposed by Hiedemann (*C. A.* 27, 2865). The authors again find no evidence for SiH<sub>4</sub> or for at. H. This active H has spectrographic and chem. properties that do not point to at. H. Active H and H<sup>+</sup> seem to be present in about the same proportions. Gerald M. Petty

**Photographic-photometric method for the measurement of the absorption of solutions in the visible region.** W. F. Beyer. *Z. Physik* 83, 806-13 (1933).—The absorptions of solns. of (Co(NH<sub>3</sub>)<sub>6</sub>)Cl<sub>2</sub> and (Co(NH<sub>3</sub>)<sub>5</sub>Cl)Cl<sub>2</sub> are detd. with the König-Martens spectro-photometer and with a combination of a spectrograph, a rotating sector, and a Moll's microphotometer. The measurements of these compds. by Samuel (*C. A.* 25, 5096) disagree with B.'s results. Egon Bretscher

**Photochemistry and fluorescein dyes.** H. F. Blum and C. R. Spealman. *J. Phys. Chem.* 37, 1123-33 (1933).—A study was made of the possible source of the peroxide formed when fluorescein dyes are irradiated in aq. solns. It is concluded that the peroxide is probably H<sub>2</sub>O<sub>2</sub> formed from H<sub>2</sub>O and O<sub>2</sub>. It is suggested that the bleaching of the dyes by light is an oxidation of the dye by the H<sub>2</sub>O<sub>2</sub>, this reaction requiring activation of the dye mol. by light. P. T. Newsome

**Influence of the kind of chemical binding of triatomic molecules on photochemical processes, the structure of the solution, the boiling point and other properties.** A. Butkov. *Physik. Z. Sowjetunion* 4, 577-605 (1933) (in German).—Absorption spectra of PbCl<sub>2</sub>, PbBr<sub>2</sub> and PbI<sub>2</sub> in aq. soln. and in the vapor state, and CdI<sub>2</sub>, ZnI<sub>2</sub>, HgI<sub>2</sub> and HgBr<sub>2</sub> in aq. and EtOH soln. and in the vapor state were studied. A relation between the b. ps. of salts of the MX<sub>2</sub> type and the ionization potential of the metals is shown: in the order of increasing polarity of the chem. bond they are HgX<sub>2</sub>, TeX<sub>2</sub>, BeX<sub>2</sub>, ZnX<sub>2</sub>, CdX<sub>2</sub>, PbX<sub>2</sub>, MgX<sub>2</sub>, CaX<sub>2</sub> and SrX<sub>2</sub>. The ionization potential of Ti is 10.3 v. In weakly polar triatomic mol., such as HgX<sub>2</sub>, at least one of the diatomic products is found to occur in the excited state; in strongly polar mol. these may occur in the unexcited state. The thermodynamically calculated dissociation energies of PbX<sub>2</sub> disagree with the law of Kimura and Uchida. Data are presented in 11 figures and 16 tables. Gerald M. Petty

**Chemical decompositions by radiations.** G. Harker. *Chem. Eng. Mining Rev.* 26 (?), 103-4 (1933).—A brief discussion of the effects of  $\alpha$ -,  $\beta$ -,  $\gamma$ - and x-rays. W. H. Boynton

The acceleration of the decomposition of solids by the

emission from radium. W. E. Garner and C. H. Moon. *J. Chem. Soc.* 1933, 1398-1400.—The thermal decompn. of crystals of  $\text{BaN}_2$  is accelerated by the emission from Ra. The effect is due to an acceleration of the growth of the nuclei and not to an increase in their no. No action of the stimulus could be observed unless the temp. was sufficiently high for thermal decompn. to occur. The decompn. of Hg fulminate is unaffected by the presence of Ra.

H. F. Johnstone  
The action of penetrating radiation from radium on substances in solution. G. Guéhen. *Arch. phys. biol.* 10, 292-303(1933); cf. Kailan, *C. A.* 26, 1191.—Solns. of  $\text{AgNO}_3$ ,  $\text{Na}_2\text{C}_2\text{O}_4$ , fumaric acid and maleic acid irradiated by a prepn. contg. 83 mg. Ra E were unaffected as far as could be detd. by comparing absorption curves (usually in the ultra-violet) detd. by use of the spectrophotometer with those of non-irradiated solns. Solns. were irradiated 180-524 days. Small differences in the absorption curves of irradiated and non-irradiated solns. of  $\text{KMnO}_4$ ,  $\text{K}_2\text{Cr}_2\text{O}_7$ ,  $\text{CaI}_2$ ,  $\text{KI}$ ,  $\text{BzONa}$ , succinic acid and malonic acid were observed.

Oden E. Sheppard  
Ion yield in the decomposition of ammonia by  $\alpha$ -rays. Harry Essex and Dorothea FitzGerald. *J. Am. Chem. Soc.* 56, 65-7(1934).—A direct method for detg. ion yields for reactions induced by  $\alpha$ -radiations is used to study ammonia decompn. The ion yield for the ammonia decompn. by this new method is 1.09 at 22° and 1 atm. pressure.

Oden E. Sheppard  
A few photochemical reactions in solution. L. Farkas. *physik. Chem.* B23, 89-99(1933).—The quantum yield for the following photochem. reactions was studied:

1 hydrolysis of  $\text{CH}_3\text{CICO}_2\text{H}$ , the decompn. of  $\text{AcOH}$ ,  $\text{AcONa}$ ,  $\text{AcOAg}$ ,  $\text{EtCO}_2\text{H}$ ,  $(\text{CH}_3\text{CO}_2\text{H})_2$ , and the decompn. of hexane sensitized by  $\text{NH}_3$ . G. M. Murphy

Photochem. reactions in the series of *o*-nitrobenzylidene acetal derivs. (Tanasescu, Macovski) 10.

COLIN G. FINK

High-frequency induction furnaces. C. A. Adams, J. C. Hodge and M. H. Mackusick. *Elec. Eng.* 53, 194-205 (1934).—An illustrated outline of the theory of the elec. induction furnace and of the application of that theory to the operating characteristics and limitations of such furnaces. Outstanding metallurgical advantages obtained from the use of the induction furnaces are: freedom from contamination of the melt, the high temps. obtainable, and the circulation of the molten charge by the electromagnetic forces within it. A good bibliography is included.

W. H. Boynton  
Preparation of ferro-chromium in the electric furnace. W. Boynton. *Compt. rend.* 197, 1417-19(1933).—A special elec. furnace, with graphite electrodes, was designed to contain 300 k. w. with a voltage drop of 100-120 per arc. The electrodes do not dip into the material to be reduced. Chromite contg. 51.2%  $\text{Cr}_2\text{O}_3$  and 16.5%  $\text{FeO}$  was mixed with 16% C and reduced to ferro-chromium contg. Fe 80.3, Cr 40.1 and C 0.3%. Twenty-three % of the Cr was reduced. When the chromite was mixed with 28% granular C a ferrochrome resulted contg. Fe 24.5, Cr 69.7 and C 6.2%; 95% of the Cr was reduced. Preps. were made contg. intermediate quantities of C and reduced Cr. At 1700° C the metal oxidized slowly, at 1900° C rapidly and above 1900° C  $\text{O}_2$  dissolved in the molten metal to form CO which was expelled with explosive violence.

H. E. Messmore  
Electro-metallurgical progress in 1933. S. Wernick. *Ind. Chemist* 10, 13-15(1934).

E. H.  
Cast iron and its production. M. V. Healey. *Elec. Eng.* 53, 120-3(1934).—A brief description of cast iron and a comparison of the cupola and the elec.-furnace processes. In the latter, the production of iron of any compn. with accurate control is possible while the cupola produces only a high-C iron (3% or more C). Cupola cast iron is coarse-grained and non-uniform, while the superheating in the elec. furnace dissolves this suspension and permits the production of a fine-grained uniform material. Elec.-furnace control is pos., yet flexible in operation.

W. H. Boynton  
Rocking indirect arc electric furnaces. E. L. Crosby.

*Elec. Eng.* 53, 132-8(1934).—The elec. furnace of the rocking type with indirect arc can now be used in the production of castings of various types of iron and steel with accurate control. This permits many new cast irons with properties vastly superior to the cast iron produced by any other means. Several photomicrographs illustrate the improved structure of iron from these furnaces.

W. H. Boynton  
Electrolytic preparation of sodium perborate. I. Fumikazu Kawamura. *J. Electrochem. Assoc. (Japan)* 1, 262-7(1933).—In the electrolysis of aq. solns. of  $\text{Na}_2\text{B}_4\text{O}_7$  and  $\text{Na}_2\text{CO}_3$  at 10-12° with 3 amps. current concn. and about 8.6 amps./sq. dm. anode c. d., smooth Pt electrodes give the highest current efficiency; Sn, Cu, Ni, etc., though inferior to Pt, can be used as cathode, and the current efficiency is about the same. Next to Pt, graphite is best as anode. Addn. of  $\text{KCl}$ ,  $\text{H}_2\text{SiF}_6$  and  $\text{Na}_2\text{SiO}_3$  to the electrolyte gives good results; the current efficiency is raised with an increase in concn. of  $\text{Na}_2\text{CO}_3$  and  $\text{Na}_2\text{B}_4\text{O}_7$ .

K. Konda  
Mechanism of the oxygen electrode. T. P. Hoar. *Proc. Roy. Soc. (London)* A142, 628-46(1933).—The processes occurring at an O electrode were studied. The irreversibility is explained in terms of an impervious oxide film contg. cracks and pores. By extrapolating cathodic and anodic polarization curves, a value of  $1.20 \pm 0.03$  v. at 25° is obtained for the reversible O potential referred to a H electrode in the same soln. The results indicate that the total electrode process is  $\text{O}_2 + 2\text{H}_2\text{O} + 4e \rightleftharpoons 4\text{OH}^-$ . The rate of the reverse reaction is very small.

E. J. Rosenbaum  
Silver electrodes. Friedrich L. Hahn. *Z. anal. Chem.* 95, 337-8(1934); cf. W. Hiltner, *C. A.* 28, 4287.—Priority claim.

W. T. H.  
The kinetics of electrode processes. III. The behavior of platinum and gold electrodes in sulfuric acid and alkaline solutions containing oxygen. G. Armstrong, F. R. Himsforth and J. A. V. Butler. *Proc. Roy. Soc. (London)* A143, 89-103(1933); cf. *C. A.* 27, 1828.—The expts. support the view that on the anodic polarization of Pt in  $\text{H}_2\text{SO}_4$  or alk. solns. a single layer of ad-

sorbed O atoms is formed. On cathodic polarization the reduction of the adsorbed layer occurs simultaneously with depolarization by dissolved O in soln. The formation of a definite oxide begins at +1.27 v. when Au electrodes are polarized in dil.  $H_2SO_4$ . The efficiency of oxide formation decreases from 100% to a const. value of about 0.9% as electrolysis proceeds. The behavior of Au and Pt is similar in alk. solns. Reducing agents such as  $K_4Fe(CN)_6$  and hydroquinone are able to reduce the oxide, the rate of reduction by the latter being proportional to its concn.

Allen S. Smith

**The application of x-rays in the field of electrodeposition.** N. Promisel. *Metal Ind.* (London) 43, 437-41 (1933).—A review of recent work on electrodeposition based on x-ray studies and summary of problems of practical importance that may be solved by this method.

H. F. Johnstone

**Hidden sources of defects in degreasing of materials.** R. Justh. *Oberflächentechn.* 10, 271-2(1933).—Unsatisfactory results in plating are often due to the degreasing process applied immediately before plating. Passivation of the surface produced in degreasing should be removed by rinsing 1 min. in 5% HCl or 2-5%  $H_2SO_4$  and subsequently rinsing in clean water. Brittle deposits might be due to electrolytic degreasing which had been carried out too long and at too high current densities; this is particularly the case for Ni-Cr plating. Electrolytic degreasing should be done for 1.5 min. max., at 6 to 8 v. max. In most degreasing processes it is advisable that the pieces should not be dried after degreasing and be plated as soon as possible. An acid treatment of cold-deformed parts before plating is recommended to obtain an absolutely clean metallic surface on which the deposit adheres firmly. Treatment by various solns. is described.

M. Hartenheim

**Purification of substances by electrodialysis.** Albert L. Elder, Russell P. Easton, Harold E. Fletcher and Floyd C. Peterson. *Ind. Eng. Chem., Anal. Ed.* 6, 65-6 (1934).—Quick purification of acid casein to an ash content of 0.069% was obtained. Tartrates were removed from grape juice. Galactose and arabo-galactose were purified to 0.01-0.02% ash content; this procedure is therefore suitable for purification of these sugars. Cellophane membranes were used.

A. L. Elder

**Reduction of self-discharge in the lead storage battery.** Yagoro Kato and Risaburo Takase. *J. Electrochem. Assoc.* (Japan) 1, 268-73(1933).—Self-discharge, a frequent phenomenon with Pb-Sb alloy grids, is due to the evolution of H on Sb deposited on the cathode and to H on the grid itself contg. Sb. The grid proposed by K. and T. consists of a Pb alloy contg. Sn or Cd (or further, a small quantity of Ba, Mg, etc.) but no Sb. Since the H overvoltage of Sn, Cd or their Pb alloy is almost that of Pb, H is not evolved and there is no self-discharge. This grid is  $H_2SO_4$ -proof and its tensile strength is equal to that of Pb alloy with 5-6% Sb.

K. Konda

**The alkaline storage battery. IV. The alkali zincate battery with nickel-mesh cathode.** 2. Shosaburo Tanaka and Kohei Iwasa. *J. Electrochem. Assoc.* (Japan) 1, 253-6(1933); cf. C. A. 28, 714<sup>4</sup>.—The falling off of Zn, because of the formation of an ion-concn. cell during storage, cannot be prevented. The porous Fe plate or Ni-Fe plate is, however, very effective and prevents also the formation of the deposit at the lower end of the anode. Amalgamation is most effective for the preliminary treatment of the anode. KOH soln. (6.7 N) contg. ZnO in a wt. ratio KOH/ZnO = 12-15 is the best electrolyte.

K. Konda

**A new galvanic cell.** A. Thielemann. *Z. Elektrochem.* 39, 783-91(1933).—A study of the  $MnO_2$ -Pb cell. The most efficient cell, contg. 2 N  $HNO_3$ , produced 0.1 amp. for 7 hrs. with a decrease of only 0.2 v. from the original 1.5 v. These cells contained a corrosion inhibitor, such as rhodinal or glycine developer, or  $(NH_4)_2S$  to protect the Pb. Polarization was due primarily to consumption of the acid. Cores contg. a binding material composed of  $Mg(NO_3)_2$ ,  $NH_4NO_3$  and graphite gave the best results.

H. F. Johnstone

**Dry cells of standard sizes. II.** Saburo Makino. *J. Electrochem. Assoc.* (Japan) 1, 257-61(1933); cf. C. A. 28, 714<sup>4</sup>.—Exptl. results are given on the characteristics of dry cells as detd. by the (Japanese) Research Committee for Standard Instruments of Telegraphy and Telephony.

K. Konda

**Electrolysis of underground metallic structures.** M. Horioka, et al. *J. Inst. Elec. Eng. Japan* 53, 943-55 (1933).—Photographs and results are given of tests on joints and on conduits of alloys of Pb with Sb, Zn, Sn and Cd. The effect of the  $CO_3^{--}/Cl^-$  ratio in soil is considered. Means of protection is given. C. F. Bonilla

**Measurement of small alternating-current voltages by means of cuprous oxide detectors.** K. B. Karandeev. *J. Tech. Phys.* (U. S. S. R.) 2, 412-24(1932).— $Cu_2O$  acts as a rectifier at as low as  $10^{-4}$  v. F. H. Rathmann

**The mechanism of rectification in copper sulfide-magnesium rectifiers.** Michel Anastasiades. *Compt. rend.* 197, 1307-9(1933).—The rectification of the Elkon  $CuS$ -Mg rectifier is attributed to the formation of  $Cu_2S$  at point contacts which are welded by arcs formed between the  $CuS$  and Mg. The resultant contact in which the rectification takes place has the composite form given by:  $Pb-CuS-Cu_2S-Mg$ .

Morris Muskat

**Power-loss phenomena in liquid dielectrics.** W. Jackson. *Proc. Roy. Soc.* (London) A142, 603-20(1933).—Dielec. loss measurements were made on benzene, toluene, chlorobenzene and nitrobenzene in the frequency range  $2 \times 10^6$  to  $2 \times 10^8$  cycles per sec. The loss can be accounted for in terms of ionic conduction, since small amounts of water are present. A preliminary application of a steady voltage has an "elec. cleaning" action which lowers the loss.

E. J. Rosenbaum

**Heterogeneous chemical reactions in the silent electric discharge. VIII.** Susumu Miyamoto. *J. Chem. Soc. Japan* 54, 1223-32(1933); cf. C. A. 27, 5353. —The reactions between  $H_2$  and the following 8 substances under silent discharge have been studied:

Substance	Reaction products
(1) $Cu(NO_3)_2 \cdot 3H_2O$	$CuO$ , $Cu$ , $NO$ , $NO_2$ , $NH_4NO_3$ , $NH_3$ , $NH_4NO_2$ , $NH_4NO$
(2) $Zr(NO_3)_4 \cdot 5H_2O$	$NH_4NO_3$ , $ZrO_2$ , $NH_4NO_2$ , $NO_2$ , $NO$
(3) $TiNO_3$	$TiNO_2$ , $TiOH$ , $Ti$ (metallic), $NH_3$ , $NO$
(4) $UO_2(NO_3)_2 \cdot 6H_2O$	$NH_4NO_3$ , $U(NO_3)_4$ , $U(OH)_4$ , $NO_2$ , $NH_4NO_2$
(5) $Fe(NO_3)_3 \cdot 6H_2O$	$NH_4NO_3$ , $Fe(OH)_3$ , $NH_4NO_2$ , $NO_2$ , $NO$
(6) $Cr(NO_3)_3 \cdot 9H_2O$	$NH_4NO_3$ , $Cr(OH)_3$ , $NH_4NO_2$
(7) $CaSO_3 \cdot 2H_2O$	$CaS$ , $H_2S$
(8) $Na_2SO_3$	$H_2S$

T. Katsura

**Determination of the value of a gas for tungsten lamps by means of the observation of tungsten sputtering.** A. P. Stvolin. *J. Tech. Phys.* (U. S. S. R.) 2, 1031-52 (1932).—Traces of  $O_2$  or  $H_2O$  cause oxide formation between  $1400^\circ$  and  $2600^\circ$ .  $N_2$  and still more A catalyze the reaction.  $H_2O$  yields  $W_2O_6$ ;  $O_2$  yields  $WO_3$ . Pressure increases oxide formation.

F. H. Rathmann

**Stansel, N. R.: Industrial Electric Heating.** New York: John Wiley & Sons, Inc. 444 pp. \$5. Reviewed in *Nature* 132, 557(1933).

**Jahrbuch des Forschungs-Instituts der Allgemeinen Elektrizitäts-Gesellschaft.** Bd. III, 1931-32. Berlin: J. Springer. 205 pp. Cf. C. A. 24, 4984.

**Zinc-carbon primary cell.** Heinrich Rehm.

- 4,003, Sept. 13, 1933 (Cl. 21b. 10.02). Addn. to 489,800 (C. A. 24, 2062). Details of the arrangement of the depolarizing mass are given.
- Storage batteries.** Le Carbone. Fr. 754,802, Nov. 1-1, 1933. A battery having multiple electrodes is provided with 2 series of chambers; one series allows for the expansion of the electrolyte while the other, in communication with the exterior, allows for the respiration of the depolarizing electrodes, the 2 series having no communication with one another.
- Storage batteries.** James Veith. Fr. 755,188, Nov. 21, 1933. See Swiss 161,659 (C. A. 28, 4193).
- Apparatus for making carbon rods for dry batteries.** Autom. Spezial-Maschinen G. m. b. H. Ger. 585,503, Oct. 4, 1933.
- Storage-battery electrode.** Karl Ackermann (to I. G. Farbenind. A.-G.). U. S. 1,940,385, Dec. 19. Neg. electrodes for use with alk. electrolytes and of substantially uniform porous structure are formed of Fe and strips of an Fe-Ni alloy.
- Electrode for storage batteries.** Max Schneider. Ger. 585,601, Oct. 5, 1933. Details of an electrode made from Pb and Pb paste are given.
- Wood separators for storage batteries.** Eugene A. Giard (to Vesta Consolidated Inc.). U. S. 1,940,714, Dec. 26. Wood separators are treated with hot caustic alkali soln. to dissolve alkali-sol. constituents without dissolving substantial quantities of lignin, neutralized with acid such as  $H_2SO_4$  and the resulting liquor contg. pptd. and dissolved substances is mixed with the Pb oxides of which the plates are formed and is stated to increase the efficiency of the battery.
- Matted glass wool suitable for manufacture of storage-battery separators.** Edward W. Smith. U. S. 1,938,982, Dec. 12. Various details of app. and operation are described.
- Machine for pasting grids such as storage-battery plates.** Monark Battery Co., Inc. Brit. 398,328, Sept. 11, 1933.
- Filling vent for storage-battery cells.** Joseph L. Woodbridge. U. S. 1,938,989, Dec. 12.
- Filling plug for storage batteries.** Curtis C. Wallace. U. S. 1,938,988, Dec. 12.
- Composition containers such as those for storage batteries.** Leland E. Wells and Edward Fairclough (to Willard Storage Battery Co.). U. S. 1,941,193, Dec. 26. Heated plastic material such as a bituminous compn. is compressed in a mold under relatively low pressure until the resistance of the material stops the compression; the walls of the article are then partially cooled, and the article is further compressed under heavy pressure. App. is described.
- Kerr cell.** Vladimir K. Zworykin (to Westinghouse Elec. & Mfg. Co.). U. S. 1,939,532, Dec. 12.
- Electrolytic condenser.** Allgemeine Elektrizitäts-Ges. Ger. 586,902, Oct. 27, 1933 (Cl. 21g. 10.02). The electrolyte consists of a mixt. of  $CuS$  and  $Cu_2S$ .
- Dry electrolytic condenser.** Süddeutsche Apparate-fabrik G. m. b. H. Ger. 589,321, Dec. 6, 1933 (Cl. 21g. 10.02). The electrolyte corresponds in compn. to  $NH_4$  glycerophosphate or to a mixt. thereof with glycerol.
- Electrodeposition of aluminum.** Donald B. Keyes and Sherlock Swann, Jr. (to Ellis-Foster Co.). U. S. 1,939,397, Dec. 12. Articles of metal such as steel to be plated with Al are subjected as cathode to an elec. current in a soln. of an org. compd. of Al such as an Al complex of the Grignard type dissolved in an org. solvent such as ether.
- Apparatus for producing endless metal bands by electrolytic deposition.** Allgemeine Elektrizitäts-Gesellschaft (Franz Pawlek, inventor). Ger. 585,633, Oct. 12, 1933.
- Plating.** Richard Kopf. Ger. 585,708, Oct. 7, 1933. In plating Cr or Cr alloys, acid baths of  $p_H$  value below 2.5 are used. Thus, stainless steel is given a plating of Ni by electrolysis in a bath of  $NiSO_4$ ,  $Na_2SO_4$ ,  $H_2BO_3$ ,  $NH_4Cl$  and  $H_2SO_4$ , of  $p_H$  value below 2.5.
- Metal plating.** Posschl's Apparatebau- und Export-G. m. b. H. Ger. 585,709, Oct. 7, 1933. A device for electrolytic metal plating with a movable anode is described.
- Metal plating.** Paul Fassbender. Ger. 586,639, Oct. 24, 1933 (Cl. 48b. 2). Fused chloride plating baths of soft metals such as Zn are regenerated by dissolving in water and treating with HCl.
- Metal coatings on chromium.** Württembergische Metallwarenfabrik. Fr. 754,483, Nov. 8, 1933. To obtain a metal coating, e. g., of Cu, on Cr or an alloy thereof, such as stainless steel, an abnormally acid bath is used, e. g., one having a  $p_H$  value below 2.5.
- Chromium plating.** Siemens & Halske A.-G. Fr. 754,360, Nov. 6, 1933. Black Cr coatings are obtained by electrolysis with a c. d. of 10-20 times the normal c. d., i. e., about 10,000-20,000 amp. per sq. m. The electrolyte may contain  $AcOH$ .
- Anode for use in electrolytic baths such as fused magnesium chloride.** Pierre Camescasse (to Magnesium Production Co., Ltd.). U. S. 1,941,387, Dec. 26. Anodes are used comprising a lower section of carbon, an upper section of non-conductive refractory oxide which is resistant to the heat of the bath and the liberated gases, and a conducting rod such as iron extending downwardly through the upper section and having its lower end embedded in the lower section (the upper and lower sections being of about equal and uniform cross-sectional area throughout).
- Nickel anodes.** George F. Geiger (to International Nickel Co.). U. S. 1,941,256, Dec. 26. Rolled or cast Ni anodes contg. S 0.002-0.0075% and contg. O corrode with smooth surfaces and substantially no anode sludges. U. S. 1,941,257 relates to a similar addn. of S in small proportion to Ni-bearing material before pouring.
- Cathode drum (with an outer silver layer) for electrolytic apparatus suitable for copper sheet manufacture.** Richard A. Wilkins (to Industrial Development Corp.). U. S. 1,941,376, Dec. 26. Structural features.
- Cell for the electrolytic decomposition of water.** Siemens & Halske A.-G. (Franz Petz, inventor). Ger. 585,596, Oct. 10, 1933.
- Electrolysis of halides.** Wintershall A.-G. Fr. 755,388, Nov. 23, 1933. The cathodes used for electrolysis of fused alkali or alk. earth metal halides, particularly  $MgCl_2$ , are made of steels alloyed with Cr or Ni or both. An example contains Ni 3.5, Cr 0.75, Mn 0.5, Si 0.35 and C 0.1-0.17%.
- Electrolytic production of Carrel-Dakin solution.** Orland R. Sweeney (to Iowa State College of Agriculture and Mechanical Arts). U. S. 1,940,612, Dec. 19. A NaCl soln. of suitable concn. (such as a 2.5% soln.) is passed in a continuous uniform stream with a const. head past a single set of spaced electrodes consisting of a Rh anode and a Pt-Ir cathode (the products of the electrolysis passing the electrodes in the direction of the stream). App. is described.
- Electrothermic reduction of materials such as in producing iron alloys.** Paul L. J. Miguët. U. S. 1,939,913, Dec. 19. In operating an elec. furnace having a vertical electrode, the charge is formed in alternating conducting and non-conducting strata, the former extending from the electrode to the walls of the furnace and the non-conducting strata extending for only a portion of the distance from the electrode to the walls of the furnace. Current is allowed to spread through the conducting strata above the lower end of the electrode to heat the charge laterally.
- Aluminum ware.** Vereinigte Aluminium-Werke A.-G. Ger. 585,728, Oct. 10, 1933. A coating of  $Al_2O_3$  is produced on Al or Al alloy ware to increase its resistance to corrosion by electrolysis. The electrolyte is sprayed on to the ware which forms the anode and the spraying pistol is connected to the cathode.
- Magnesium.** Pierre Camescasse. Ger. 589,403, Dec. 7, 1933 (Cl. 40c. 6.02). See Fr. 732,226 (C. A. 27, 670).
- Stainless steel.** Stainless Steel Corp. Fr. 754,910, Nov. 16, 1933. See U. S. 1,924,153 (C. A. 27, 5259).
- Calcium cyanamide.** K. Hibi. U. S. 1,941,172, Dec. 26. See Japan 93,520 (C. A. 27, 1285).

- Fluorine.** E. I. du Pont de Nemours & Co. Fr. 755,296, Nov. 22, 1933. F is produced by electrolysis of HF in a cell having a non-polarizing anode not appreciably attacked by HF and F, e. g., Ni or an alloy of Ni. The anodic wall between the anode and cathode is gas-tight above the level of the electrolyte but sufficiently permeable below that level to allow the electrolyte to pass. The cathode is made of Fe, Ni, Co, Cu, Cr, Mg or alloys thereof.
- Metallic oxides or hydroxides.** Siemens & Halske A.-G. (Hellmut Fischer and Johannes Fischer, inventors). Ger. 586,585, Oct. 23, 1933 (Cl. 124.1). The prepn. of finely dispersed oxides or hydroxides of metals by electrolysis is described. The prepn. of hydroxides of Al, Cu and Be is described in examples.
- Purifying hydrogen peroxide solutions by electrolysis.** Österreichische chem. Werke G. m. b. H. Ger. 588,267, Nov. 15, 1933 (Cl. 124.16). See Austrian 123,168 (C. A. 25, 4476).
- Acetylene production in the electric arc from other hydrocarbons.** Otto Eisenhut, Robert Stadler and Paul Baumann (to I. G. Farbenind. A.-G.). U. S. 1,941,077, Dec. 26. A gas comprising hydrocarbons such as  $\text{CH}_4$ ,  $\text{C}_2\text{H}_4$ ,  $\text{C}_3\text{H}_4$ , and H is treated in an elec. arc having a consumption of energy of at least 2 kw. per sec. and per cc. of the space filled by the arc. Cf. C. A. 27, 2888.
- Ozone-producing apparatus.** Eugène Royer. Fr. 755,431, Nov. 24, 1933.
- Electric induction furnace.** Ludwig Dreyfus (to Allmänna Svenska Elektriska Aktiebolaget). U. S. 1,941,076, Dec. 26. Structural features.
- Electric induction furnace suitable for melting and refining metals.** Walter O. Krebs (to Youngstown Sheet and Tube Co.). U. S. 1,940,256, Dec. 19. Various structural, elec. and operative details are described.
- Electric induction furnace operations.** Guiliam H. Clamer (to Ajax Electrothermic Corp.). U. S. 1,940,622, Dec. 19. The rate of reaction of treating materials or the rate of admixture of alloying materials is increased by supplying the treating or alloying materials locally to the charge and by abnormally concg. induced stirring current at the locality of treating application. App. is described.
- Coreless induction furnace.** Heraeus-Vacuumschmelze A.-G. and Wilhelm Rohn. Ger. 589,283, Dec. 5, 1933 (Cl. 214.18.03). Addn. to 572,445 (C. A. 27, 2888).
- Electrically heated open-hearth furnace for reducing iron ore, etc.** Doherty Research Co. Ger. 586,593 (Cl. 186.21.02).
- Electrode-fused bath furnace for producing metals.** Allgemeine Elektrizitäts-Gesellschaft. (Hermann Blomberg, inventor). Ger. 586,651, Oct. 24, 1933 (Cl. 186.5.40).
- Plant for feeding electric furnaces for carbide manufacture, etc.** Gustav Hilger. Ger. 585,150, Oct. 3, 1933. Addn. to 439,153 and 435,596.
- Electric resistance device and insulator.** Charles O. Terwilliger (to Ward Leonard Elec. Co.). U. S. 1,938,674, Dec. 12. An insulating refractory support comprising talc and phosphate such as apatite, clay and flint carries a metallic resistive conductor and an overlying fused insulating coating. Various details and examples are given.
- Spark-plug electrodes.** Taine G. McDougal (to A C Spark Plug Co.). U. S. 1,940,314, Dec. 19. Electrodes are made of stainless steel contg. Cr and a stable sulfide such as Zr sulfide 0.4%, which serves to increase resistance to corrosion, with or without 0.4% of Ba, which offsets the increase in sparking voltage.
- Slagging molten metal pools in electric induction furnaces.** Guiliam H. Clamer (to Ajax Electrothermic Corp.). U. S. 1,939,023, Dec. 12. Various details of furnace operation are described.
- Cleaning precious metals such as silver.** Carl Mann. U. S. 1,941,040, Dec. 26. A bath of  $\text{NaHCO}_3$  soln. is used contg. a Zn electrode and a catalyst of activated carbon.
- Annealing metals.** Wilhelm Hammer. Ger. 587,296, Nov. 2, 1933. A protective atm. of wood-distn. products is maintained in an elec. annealing furnace by continuously feeding wood to the furnace and removing wood charcoal therefrom.
- Apparatus for electrical conductivity tests of materials such as insulation on wire.** Donald S. Bond, Calvin S. Fuller and Charles L. Erickson (to Bell Telephone Laboratories, Inc.). U. S. 1,938,684, Dec. 12. Various elec. and mech. details are described.
- Treating gases electrically.** Siemens-Lurgi-Cottrell Elektrofilter-G. m. b. H. für Forschung und Patentverwertung. Brit. 398,724, Sept. 21, 1933. In the elec. pptn. of suspended particles from gases, particularly from those contg. dust of poor cond., the polarity of the electrodes is changed at such intervals (from 0.2 sec. upward) that positively and negatively charged layers of dust are deposited alternately on the electrodes, the formation of a highly charged layer of badly conducting dust thereon being thus prevented.
- Electrofiltration of gases.** Siemens-Schuckertwerke A.-G. (Hans Wachter, inventor). Ger. 588,040, Nov. 11, 1933 (Cl. 12e. 5). Hot gases, e. g., blast-furnace gases, are deionized before electrofiltration by cooling a part of the gases nearly to the dew point and mixing the cooled gases with the uncooled gases.
- Apparatus for preventing deposition of dust on discharge electrodes of electrofilters.** Siemens-Schuckertwerke A.-G. (Richard Heinrich, inventor). Ger. 565,152, Oct. 17, 1933 (Cl. 12e.5).
- Electrostatic dust depositors.** Fumivorite et dépoussiérage industriel. Fr. 42,851, Nov. 15, 1933. Addn. to 719,354 (C. A. 26, 3191).
- Electrical precipitation apparatus.** Société industrielle d'applications électriques. Brit. 398,394, Sept. 14, 1933.
- Apparatus (with adjustable curtains) for gas-flow control as in electrical precipitation apparatus.** Charles H. Weiskopf (to International Precipitation Co.). U. S. 1,941,287, Dec. 26. Structural and mech. details.
- Mercury-arc rectifiers.** Aktiengesellschaft Brown, Boveri & Cie. Brit. 398,528, Sept. 8, 1933.
- Mercury-arc rectifiers.** The General Electric Co., Ltd. and Enrico Gallizia. Brit. 399,195, Sept. 25, 1933.
- Oxidized copper plates for use in rectifiers.** Allgemeine Elektrizitäts-Ges. (Walter Krauss, inventor). Ger. 587,284, Nov. 1, 1933. A Cu plate is coated with an aq. sludge of  $\text{Cu}_2\text{O}$  and then heated for a short time in the air.
- Electrodes for arc lamps.** National Carbon Co., Inc. Fr. 754,526, Nov. 8, 1933. The electrodes are composed of charcoal having a core of volatilizable material, the core contg. at least 2 of the metals: Fe, Mn, Ti and Cr. The core preferably contains only about 55% of volatilizable material, the rest being charcoal and a binder such as an alkali silicate.
- High-pressure metal-vapor arc lamps.** Quarzlampen-G. m. b. H. Brit. 399,317, Oct. 5, 1933.
- Arc discharge lamps.** The British Thomson-Houston Co. Ltd., Royal F. Strickland, Harold D. Blake and Stuart McLean. Brit. 398,290, Sept. 14, 1933.
- Discharge lamps.** Hans J. Spanner (to The British Thomson-Houston Co., Ltd.). Brit. 398,799, Sept. 19, 1933. A lamp of the type described in Brit. 397,162 (C. A. 28, 4241) and provided with an activated cathode having on its surface, in addn. to force electron-active metals the work-function of which is less than 3 v., substances which are poor conductors of heat and electricity as described in Brit. 356,234 (C. A. 27, 3150), has the following dimensions: the distance between the electrodes is approx. 10 times the diam. of the tube; the inner radius curvature at the apex is approx. twice the diam. of the tube; the direct distance between the electrodes is approx., but not less than,  $\frac{1}{2}$  the distance measured along the center of the tube. Conveniently the tube is parabolically shaped and constructed of borosilicate glass 1 mm. thick. In addn. to Hg, it may contain A at 3 mm. pressure and be provided with a starting strip as described in 356,234. In 398,815, Sept. 19, 1933, divided on 398,799, the lamp

of the type described in 397,162 with a cathode of the type described in 356,234 is supplied with alternating voltage and has at least 2 discharge paths and at least 3 electrodes, so connected that the currents in the paths are phase-displaced relatively to each other. In 398,824, Sept. 19, 1933, divided on 398,799, a source of light comprises 2 lamps of the type described in 397,162 provided with cathodes of the type described in 356,234 connected in parallel and the starting voltage of 1 lamp is greater than both starting and normal running potentials of the other. If 1 has a filling of A in addn. to metal vapor the other may be given a higher starting potential by adding J, Ne or He to the filling.

**Discharge lamps.** Anton Lederer. Brit. 398,829, Sept. 19, 1933. In d. c. elec. gaseous discharge lamps of the kind described in Brit. 364,088 (C. A. 27, 2069) and 371,372 (C. A. 27, 2392) the anode is formed of rods or wire so as to have a small total surface area and surrounds the electron-emissive electrode or its imaginary extension so as to provide a substantially uniform, or at least sym., elec. field around said electrode.

**Discharge lamps.** Claude-Lumière (Soc. anon. pour les applications des gaz rares à la lumière, procédés Georges Claude). Brit. 398,830, Sept. 22, 1933. Addn. to 393,308 (C. A. 27, 5658). The open hollow electrode coated with a dielec. on the edge of its rim only, described in 393,308, is covered with material, e. g., an alk.-earth metal or an oxide, peroxide or suboxide of a rare earth, which gives rise to a cathodic drop of less than 20 v.

**Cathode glow-discharge lamp.** Patent-Treuhand-Ges. für elek. Glühlampen m. b. H. Ger. 585,348, Oct. 2, 1933. A cathode glow-discharge lamp, having electrodes

coated with an alkali or alk. earth metal, is filled with a mixt. of A and N contg. more A than N but more than 5% of N, the pressure of the mixt. being more than 6 mm., e. g., 10-12 mm. Manufg. details are given.

**Discharge lamps for television receivers.** Compagnie pour la fabrication des compteurs et matériel d'usines à gaz. Brit. 398,860, Sept. 18, 1933. Addn. to 384,086 (C. A. 27, 4963).

**Means for utilizing electron lamps as generators and amplifiers of oscillations.** Telefunken Ges. für drahtlose Telegraphie m. b. H. Fr. 755,004, Nov. 18, 1933.

**Thermionic lamps.** Compagnie des lampes. Fr. 755,-136, Nov. 20, 1933.

**Electric lamps.** George Sperti (to General Foods Corp.). Brit. 398,840, Sept. 18, 1933. An outer bulb transparent to visible and ultra-violet light contains 3 resistances in series circuit across the terminals and 2 electrodes connected to the circuit so that, on passage of current, an arc forms between the electrodes in Hg vapor or other ionizable medium in the bulb, the arc being in parallel with 1 resistance and in series with the other 2. One or all of the resistances are incandescent to correct the color of the light from the arc and they are protected from the Hg vapor by an inner evacuated bulb or sheath sealed to the ends of the electrodes, which may be of  $ZrO_2$  or other refractory oxide that becomes conductive when hot. The sheath may be of glass or quartz and the outer bulb of quartz or of such glass, or so coated, that wave lengths above 3000 Å. are transmitted and shorter wave lengths cut off.

**Miners', etc., electric lamps.** Ernest A. Hailwood. Brit. 397,904, Sept. 4, 1933.

## 5—PHOTOGRAPHY

E. P. WIGHTMAN

**The Gaspar process of color photography.** K. Jacobson. Brit. J. Phot. Colour Suppl. 27, 29-31 (1933); Phot. Abstracts 13, 254.—Color prints are produced on triple-coated paper. The top coat is sensitive to blue, the next to green, and the bottom one to infra-red, a compromise made necessary because of the absorption of red light by an overlying blue layer. Printing is done from a pos. color transparency, and the time of exposure is similar to that for gaslight paper. Development and fixation are as usual. Next, dye images are produced in the 3 coatings through the agency of the Ag image, either by the production of dyes from such substances as leuco esters or by the destruction of dyes already in the coatings, the latter method being preferable. For the production of 2 color motion-picture films the material used is a pos. film coated on both sides, one side being dyed orange-red and one blue-green. Printing is done on both sides, and after development and fixation the dye images are produced as described, the whole process taking 12-15 min. The prepn. of 3-color films is stated to be not much more complicated.

**Gaspar color process.** L. N. Cox. Brit. J. Phot. Colour Suppl. 27, 37-8 (1933); Phot. Abstracts 13, 254.—A description is given of the production of a 2-color film from 2-color selection negatives on double-coated pos. stock. Thiocarbamide is stated to be one of the reagents by which the dyes are destroyed in accordance with the disposition of the Ag image.

**Retouching in Ives' polychrome color process.** F. E. Ives. Brit. J. Phot. Colour Suppl. 27, 38-9 (1933); Phot. Abstracts 13, 229.—The process lends itself to retouching, because the reds can be reduced by rubbing with a brush charged with  $H_2O$ , and the yellows by similar treatment with 70% alc. The addn. of K citrate to the  $H_2O$  increases the speed with which the red is removed, while alc. contg. K citrate removes both colors. Various dyes are mentioned which may be used for strengthening tints. Before they are applied, the paper should be wetted with dil.  $AcOH$ , and then blotted. The cyan-blue toned base print should not require alteration if

correctly made, and retouching by the above method is only necessary to compensate for incorrect balancing of exposures and ds., or to make modifications to suit individual tastes.

**A review of color printing and the use of photography in color-printing processes.** A. J. Bull. Phot. J. 74, 14-19 (1934).

**Use of thiourea in photography.** L. Houben. Photo-Revue 45, 179-80, 199-200 (1933).—A soln. contg. thiourea and  $K_2CO_3$  is suggested as a substitute for the sulfide soln. used in sepia toning. Its use is stated to be more convenient and the warmth of tone may be controlled by adjusting the concns. of thiourea and carbonate. A review is given of the uses of thiourea in other toning processes, and in procedures for intensification and reduction.

**Study of development.** M. Lucas. Rev. franç. phot. cinémat. 14, 320-4 (1933).—A study of contrast control was made to choose a method by which negatives of const. contrast can be obtained with subjects of varying contrasts. L. measures the subject contrast, calcs. the  $\gamma$  for the desired compression of contrast and then, from a curve, decides upon the degree of diln. of his stock developer soln. which will give that  $\gamma$ . The time of development is const. He finds that the diln. of the developer does not affect either latitude or speed but only time for a given  $\gamma$ . The presence of small concns. of bromide shortens the useful part of the curve for low gammas with higher development concns. but has no such effect with considerably dil. developers. At high gammas the bromide effect disappears. In the choice of emulsions on the basis of latitude, 3 classes of emulsions are recognized: those having latitudes, resp., (a) 10, (b) 40-50 and (c) 100-200.

**Fine-grain development.** H. Funk. Z. wiss. Phot. 32, 83-96 (1933); Phot. Abstracts 13, 203.—Grain sizes in various com. emulsions, with metol-hydroquinone and some fine-grain com. developers, have been estd. by (a) visual examn. of enlargements of photographs of a test object, (b) statistics of av. grain diams., (c) densitometric

curves for 8 wave lengths of light with varying development times and (d) measurement of grain variation with a recording photometer. Results by (a) are inconclusive. The difficulties and errors of methods (b) and (c) are discussed. The finest grain was obtained with Perutz Special film and Agfa 12 or Agfa 15 developer.

**Fine grain and fine-grain development.** E. Stenger and R. Mutter. *Phot. Ind.* 31, 712, 736, 760-1, 777(1933); cf. *C. A.* 27, 4182.—An investigation was made of the metol-hydroquinone-borax developer with respect to the effect of variations in the concns. of each of the constituents on the time of appearance of the image, the d. developed in a given time and the graininess of the developed image. Conclusion: In this developer the hydroquinone has no effect either on the rate of development or on the graininess. H. Parker

**Negative development in unshielded candle-light.** Lüpke-Cramer. *Phot. Rundschau* 70, 412(1933).—Tests made with about 20 color-sensitive films and plates are said to show that all are sufficiently desensitized by a preliminary bathing (2.5 min.) in pinakryptol green (1:5000) to permit subsequent development to be carried out in unshielded candle-light. P. W. Vittum

**The photographic development of slip lines on deformed silver chloride crystals.** G. Tammann and G. Bandel. *Z. anorg. allgem. Chem.* 214, 403-6(1933).—AgCl sheets which after bending are developed under special conditions show black lines under the microscope. These are Ag specks 0.5 to 2.0  $\mu$  in diam. arranged at edges of glide lines in the crystals. The effect is explained by assuming the presence of impurities. AgBr being considerably more brittle does not give such a noticeable effect although undoubtedly it occurs. Photomicrographs are included which demonstrate clearly the results. R. H. Lambert

**Comparison of fine-grain developers.** B. H. Casebolt. *Camera Craft* 40, 457-61(1933).—Several fine-grain developers from the literature are compared by 20 $\times$  enlargements. Odell's phys. developer gives fine grain but is difficult to use. *p*-Phenylenediamine with sulfite gives fine grain but requires a long development time and increased exposure. *p*-Phenylenediamine with glycine and sulfite is said to give fine grain with much shorter development times. H. Parker

**Structure and developing properties of the naphthalene series.** R. B. Forster and H. T. Hanson. *Phot. J.* 73, 466-70(1933); *Phot. Abstracts* 13, 202.—Nietz's rules regarding the developing properties of reducing agents are summarized and the effect of the position of the "active" groups on the developing function is qualitatively investigated in 11 types of naphthalene compds. The prepn. and purification of these substances are considered. Detailed results are given of the action of these substances without the addn. of alkali.

**Theory of the persulfate reducer.** Mate Mudrovčić. *Phot. Korr.* 69, 182-4(1933).—The superproportional reducing properties of the persulfates are explained by certain workers (Schuller, Stenger and Heller) as a catalytic phenomenon. Opposed to this theory, L.-C. and others view the action as best explained by a dispersoid theory. M. uses colloidal Ag in gelatin in a wide range of concns. and the data appear to support the catalytic theory. He reconciles previous results. L. E. Meulendyke

**Standardized determination of sensitivity.** J. Eggert. *Phot. Ind.* 31, 599 600(1933).—Details are given for the standardized procedure for German manufacturers for the sensitometric testing of negative materials. The light source, sensitometer, filter, developing solns., etc., are precisely defined. C. E. Meulendyke

**Sensitivities with Nitra light.** C. Emmernann. *Phot. Rundschau* 70, 424-6(1933).—Using daylight and Nitra light of equal optical intensity, E. has detd. the speeds for 2 panchromatic emulsions, one orthochromatic and one not dye-sensitized. His speed values for the Nitra light are much lower than those claimed for the films.

P. W. Vittum

**Tests on the selenium toning bath.** II. E. van Beugen.

*Focus* 20, 670-3(1933); cf. *C. A.* 27, 2642.—Working details. C. E. Ives

**Preparation of a slow positive chloride emulsion.** R. Namias. *Il prog. fot.* 11, 363-4(1932); *Phot. Abstracts* 13, 200.—Improved quality and gradation were obtained when, in the prepn. of a slow gelatin-AgCl emulsion for development papers, the gelatin was added partly to the AgNO<sub>3</sub> soln., and partly to the NaCl soln. The 2 solns., (a) NaCl 2 g. [this probably should be 20 g.], gelatin 60 g., H<sub>2</sub>O 500 cc.; and (b) AgNO<sub>3</sub> 10 g., gelatin 10 g., H<sub>2</sub>O, 250 cc., are mixed at 40°, and the emulsion is used without ripening or washing. It can be preserved for several days by adding 100 cc. of pure alc.

**Formation of silver in the photographic film under the influence of x-rays.** P. Günther and H. Tittel. *Z. Elektrochem.* 39, 646-55(1933); *Phot. Abstracts* 13, 221.—At wave lengths 0.245 Å, 0.63 Å, 1.09 Å and 1.54 Å, 920, 363, 210 and 148, resp., atoms of Ag were liberated per absorbed quantum, agreeing approx. with the values of Eggert and Noddack (*C. A.* 23, 565). The Ag was detd. potentiometrically. The secondary electron energy was calcd., and at each wave length approx. 1000 kg cal. was shown to be necessary to form 1 g.-atom of Ag.

**Tests on gelatin-bromide plates 30 years old.** K. Kieser. *Phot. Ind.* 31, 276(1933); *Phot. Abstracts* 13, 221.—Sensitometric and photographic tests have been made on 2 plates (of brand now extinct) which had been stored for 30 years in their original wrappings, without any special precautions. The fog d. was 0.76, and the speed 12° Scheiner; on one of the plates a negative was obtained which was of good quality except for heavy marginal fog.

**Scientific control of radiographic results.** C. Weyl, S. R. Warren, Jr., and D. B. O'Neill. *Radiology* 21, 516 55 (1933).—For comparisons of x-ray films, intensifying screens and the output of radiographic machines, W., W. and O'Neill suggest the use of an Al stepladder with a densitometer for the measurement of film ds. Pinhole radiographs should be made of focal spots at frequent intervals. Uniformity of degree of development should be maintained by close control of the temp. and time of development, as well as by a suitable test for the effect of exhaustion. R. B. Wilsey

**Photoactivity of dichromated colloids.** H. Mills Cartwright and Hywel Murrell. *Nature* 132, 603-4(1933).—In the photogravure process gelatin-coated paper is sensitized by immersion in a soln. of K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>. The addn. of alkali to the dichromate bath increases the contrast of the image. A theoretical explanation follows. F. U.

Cellulose acetate compns. [for photographic films] (U. S. pat. 1,941,262) 23.

**Color photography.** Dürkoppwerke A.-G. Ger. 587,479, Nov. 3, 1933. See Brit. 389,843 (*C. A.* 27, 5263).

**Color photography.** Dürkoppwerke A.-G. Brit. 397,884, Sept. 1, 1933. In producing color photographs by printing from 2 complementary negatives onto opposite sides of a film coated on both sides the negatives are obtained by single exposure of a bipack and are accurately focused and brought into register on a ground-glass screen and copied by projection on the double-coated film. Weak transparencies are made which are weakly colored in complementary colors and provided with a reflecting support for viewing. To produce a 3-color picture the colored transparency is bathed with a chromate soln. and exposed from 1 side, the unhardened portions on the other side being then colored with an acid pigment. The negatives are produced on a bipack comprising a front plate, mainly sensitive to green and slightly sensitive to blue, and a rear, red-sensitive plate, which may be partly sensitive to green, an orange filter being placed between the plates or coated on the rear of the front plate. A yellow filter dye is added to the front emulsion or exposure is made through a yellow filter. The 2 negatives are each mounted in a projection app. and focused and

registered on opposite sides of a ground-glass screen, registration being facilitated by projection through red and green filters. When registered, the screen is replaced by a double-coated film having an intermediate screening layer which is removed in the developer. The exposed film is developed in a hardening developer, *e. g.*, pyrocatechol without sulfite, mordanted in a permanganate bath and colored by suitable basic pigments, *e. g.*, pyronin B for the red side and thionin blue for the blue. After clearing in a bath of K metabisulfite, the picture is washed a few min. in an  $(\text{NH}_4)_2\text{CrO}_4$  bath, dried and exposed to strong light from the red side; a yellow acid dye is then washed into the unhardened portions of the blue side. The finished film is mounted on white paper or is coated on the rear with a white pigment which may be lightly colored with blue or yellow to obtain different tone effects.

**Color cinematography.** Carl Alstrup. Brit. 399,013, Sept. 28, 1933. Cinematographic films, colored in series and especially adapted for being directly projected with natural color effects, are characterized by the different colors being present in the substance of the raw film before applying the emulsion.

**Photographic diazotype processes.** Kalle & Co. A.-G. Brit. 398,671, Sept. 21, 1933. Sensitive films contg. only the diazo compd. are developed by the vapors of aromatic amines. The supports may be paper, films or glass plates and films sensitized in the mass may be used. Metallic salts, lake-forming salts, hygroscopic substances, *e. g.*, glycerol,  $\text{CaCl}_2$  and stabilizers, *e. g.*, org. acids, thiourea, may be added to the layers. In examples cellulose foil is impregnated with (1) diazodiphenylamine sulfate (I), glycerol (II) and citric acid, (2) the  $\text{ZnCl}_2$  double salt of diazo-*p*-aminodiethylamine, glycol and tartaric acid (III), and (3) tetrazodanisole, a gelatin layer on a nitro-cellulose film is sensitized with the  $\text{ZnCl}_2$  double salt of diazo-*p*-aminoethylbenzylaniline, II and III and a cellulose hydrate film is sensitized with I, resorcinol and glucose. Suitable developers are *m*-toluylenediamine,  $\alpha$ -naphthylamine, *m*-aminophenol, dimethylaniline and *o*-anisidine. Development may be effected by placing the exposed papers in contact with dry film impregnated with the amines, by exposing the papers to vapors of the amines produced in heated vessels or by passing them between felt-covered rollers impregnated with the developer. Cf. C. A. 27, 5264.

**Photographic reversal process.** Merrill W. Seymour (to Eastman Kodak Co.). U. S. 1,939,231, Dec. 12. For producing a reversed photographic image, a photosensitive Ag halide film is exposed to a light image, developed in an ordinary non-staining developer, subjected to a 2nd controlled exposure to white light, then developed in a developer which produces a dye image assocd. with a Ag image, both Ag images and any remaining Ag halide being then removed. Cf. C. A. 27, 2642.

**Photographic materials.** Heinz Gossler. Ger. 587,334, Nov. 2, 1933. Compds. in which Ag replaces H in an  $-\text{NH}$  group, and which are readily sol. in acids but scarcely sol. in alkalies or weak acids, are used for prep. photographic paper, etc., of relatively low sensitiveness. Development is effected in a weak alk. bath. Suitable compds. are Ag derivs. of imidazoles, triazoles, tetrazoles and guanidine. The use of compds. liable to split off S is excluded.

**Photographic materials.** Kalle & Co. A.-G. (Wilhelm Krieger and Walther Spietschka, inventors). Ger. 589,471, Dec. 7, 1933 (Cl. 57b. 12.04). Light-sensitive layers comprising a diazo compd. and an azo-dye component are coated on the sensitive side with a lacquer, *e. g.*, a cellulose ester or ether lacquer. The coating protects the film against moisture but does not obstruct the action of the gaseous  $\text{NH}_3$  used for development.

**Photographic emulsions.** I. G. Farbenind. A.-G. Ger. 587,333, Nov. 2, 1933. Gelatin-silver halide emulsions are sensitized with dyes of the formula below, in which Y and Z are O, S, Se,  $-\text{CH}\cdot\text{CH}-$  or  $-\text{CR}_2$ , R is an alkyl group, any of the positions 1 to 8 is substituted by a thio- or seleno-alkoxy or -aryloxy group, X is an acid residue such as Cl, Br, I,  $\text{SO}_4$  or  $\text{ClO}_4$ , and *n* is an odd no.

The dyes may be prep. by standard processes for the manuf. of polymethine dyes. Particulars of the sensitizing action of specific dyes are given.

**Photographic emulsions.** I. G. Farbenind. A.-G. Fr. 755,228, Nov. 21, 1933. Emulsions are sensitized by polymethine dyes substituted in the  $\text{C}_5\text{H}_5$  rings by thioalkyl, thioaryl, selenoalkyl or selenoaryl groups. Examples are given of the prep. of the following: 1,1'-diethyl-5,5'-di(methylthio)-, 1,1'-diethyl-5,5'-di(methylseleno)- and 1,1'-diethyl-5,5'-di(methylthio)-0,0'-dimethoxybenzothiocarbocyanine, 1,1'-diethyl-6-(ethylseleno)-0'-methylbenzothio-pseudocyanine and 1,1'-diethyl-5,5'-di(methylseleno)benzothio-meso-methyl (and ethyl)-carbocyanine.

**Hardening photographic films.** I. G. Farbenind. A.-G. Ger. 585,920, Oct. 12, 1933. Addn. to 538,713 (C. A. 26, 2129). Photographic films, especially gelatin films, are hardened by treatment with derivs. of dialdehydes with the aldehyde group transformed to groups of the type  $-\text{HCOXOY}$ , where X and Y are H or an acid residue. Thus, a gelatinous film contg. Ag halide emulsion is hardened by treatment with glyoxal- $\text{NaHSO}_4$  soln.

**Regenerating photographic fixing baths.** Karl Kieser. Ger. 589,204, Dec. 4, 1933 (Cl. 57b. 13.04). After Ag has been removed in known manner, the bath is freed from sol. iodides or bromides by addn. of a sol. salt of Ti, *e. g.*,  $\text{Ti}_2\text{SO}_4$ .

**Cinematographic materials.** Reinhold Kupfer. Ger. 589,137, Dec. 4, 1933 (Cl. 57b. 5.01). A support for pictures to be shown by episcopic projection is made from an Al-Ni or Al-Cu-Ni alloy contg. small proportions of Ag, Th and V or Pd. Typical alloys contain Cu + Ni 2-5, Ag 0.2-1, Th 0.02-0.2 and V or Pd about 0.1%, the remainder being com. Al. The alloys have good reflecting properties and can be rolled to form very thin films.

**Colored images.** I. G. Farbenind. A.-G. Fr. 755,177, Nov. 21, 1933. Colored images are prep. from Ag images by incorporating in the film, either before or after the formation of the Ag image, an azo dye which may be reduced by hyposulfite and is only regenerated slowly by the action of O, treating the film after formation of the image by an acid soln. contg. a reducing agent and an agent forming a complex Ag compd., and afterward fixing the image obtained.

**Coloring silver images.** Robert Kaufhold, Matylda Lamezan-Salins, Anna Hardtmuthová, Anna Hardtmuthová, Jr., Frantisek Hardtmuth, Jr., Marie Princezna de Rohan, Bedrich H. Frankensdorf and Jan H. Frankensdorf (trading as "Koh-I-Noor" Pencil Factory L. & C. Hardtmuth). Brit. 398,644, Sept. 21, 1933. In coloring Ag images, 1 or more layers of colored pigment are applied thereto, the layers are coated with a layer of (colored) colloid and the product is bleached, washed and fixed, the pigment being retained in those parts where the colloid is hardened by the bleaching bath in the presence of the Ag image. The colors may be applied by colored chalks, powd. pigment, ground colored metals or other pigment in which no colloid is present and may be applied over each other, side by side or intermingled. The colloid may be uncolored gelatin or gelatin contg. dark particles. A suitable bleaching bath consists of  $\text{CuSO}_4$ , chromic acid and KBr or NaCl. In a modification, pigments, mixed with a suitable oil, *e. g.*, linseed, are applied in dots and dashes, the Ag image is bleached in the uncolored areas, the oil is removed, the pigment being left *in situ*, a layer of gelatin is applied and the product is bleached as before.

**Photographic film.** Edwin E. Jelley (to Eastman Kodak Co.). U. S. 1,939,213, Dec. 12. A support such

as a film or plate carries a colloid layer in which is incorporated a Ca org. salt such as the benzoate, lactate or acetate having a soly. in water greater than 1% and less than 30%, which serves to facilitate obtainment of either a mat or clear coating according to the ingredients of the developer used, etc.

**Photographic films.** W. M. Still & Sons Ltd. and Andrew G. Adamson. Brit. 398,226, Sept. 11, 1933. In producing film supports such as described in Brit. 378,394 (C. A. 27, 2893) the rubber layers are slightly vulcanized before application of the varnish, *e. g.*, by passage through H<sub>2</sub> vapor at 60–70°F., to increase the resistance to moisture, the tensile strength and the flexibility. The resistance to moisture may be further increased by adding about 2% of a mineral oil or fatty substance, *e. g.*, petroleum jelly, to the rubber coating soln. The tackiness of the rubber layers being removed by the vulcanization, proper adhesion of the varnish layers is insured by adding 10% of a rubber solvent to the varnish coating liquid. In 398,288, Sept. 14, 1933, the core of such film supports is rendered more resistant to moisture by adding K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> to the casting soln. and exposing the core to light after casting. Less CH<sub>2</sub>O is required when dichromate is used. The casting soln. may also contain a trace of glycerol.

**Photographic films.** Deutsche Celluloid-Fabrik. Fr. 754,507, Nov. 8, 1933. Films are made by coagulating in baths composed of water and an aliphatic alc., solns. of cellulose derivs. the solvents of which are formed by mixts., the constituents of which are not in themselves solvents for the cellulose deriv. used and one constituent is miscible in all proportions with water. Thus, acetylcellulose is dissolved in a mixt. of CH<sub>2</sub>Cl<sub>2</sub> 62, MeOH 5 and alc. 10 parts and coagulated in a bath contg. MeOH 75 and water 25 parts. Other examples are given.

**Photographic films.** W. M. Still & Sons Ltd. and John L. Howell. Fr. 754,635, Nov. 10, 1933. Non-inflammable films comprise a layer of gelatin, forming a core, contg. K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, and coated on each side with a thin layer of rubber and an exterior layer of celluloid, collodion or other varnish which takes the sensitive emulsion. About 2% of a satd. soln. of K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> is added to the soln. of gelatin from which the core is made.

**Film manufacture from materials such as cellulose acetate or nitrate.** Samuel E. Sheppard and Leon W. Eberlin (to Eastman Kodak Co.). U. S. 1,942,840, Jan. 9. Particles of material such as an emulsion of cellulose acetate or nitrate are sprayed on a smooth surface such as a hot plate or drum and the film formed is simultaneously rendered transparent and adhesive with a cement contg. a volatile solvent such as acetone and a plurality of the resulting layers are laminated together.

**Photographic film base.** Kenneth C. D. Hickman (to Eastman Kodak Co.). U. S. 1,939,171, Dec. 12. A non-balation film comprises a supporting layer, a photographically sensitive layer on one face of the support, and a layer of a water-sol. cellulose deriv. such as cellulose aceto-lactate and a light-absorbing material such as a dye or pigment on the other face of the supporting film.

**Cinematograph films.** Fernseh A.-G. Brit. 398,858, Sept. 22, 1933. The proportion of light reflected by a cinematograph film is made large by including metal in the light-sensitive film or by coating the light-sensitive emulsion on metal foil, *e. g.*, Al. Alternatively, the picture strip may be metallized after development.

**Coating photographic and cinematographic films.** I. G. Farbenind. A.-G. (Max Hagedorn and Eugen Gühring, inventors). Ger. 585,411, Oct. 3, 1933. The films are treated with solns. of non-albuminous colloids in non-solvents for the film material and of such diln. that a single application yields a coating less than 200 mμ thick. Examples are given.

**Film blanks for imbibition printing.** Bertha S. Tuttle (to Technicolor, Inc.). U. S. 1,939,738, Dec. 19. A film of solidified gelatin emulsion contg. a hardening agent such as (NH<sub>4</sub>)<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> is formed and is simultaneously or successively treated with a sufficiently concd. acid soln. such as HOAc to effect the acidification and facilitate

subsequent uniform penetration of an acid dye, and the film is hardened by light or heat or both.

**Color film.** George E. Baxter. U. S. 1,939,947, Dec. 19. A photographic film comprises a body of material on one face of which is an emulsion, the outer face of the emulsion having a picture image in relief and the emulsion being sensitive and of such character as to act as a filter. Various details of toning solns., etc., are described.

**Printing colored pictures.** Anton Jasmatzi. Ger. 585,262, Sept. 30, 1933. A colored gelatin wash-out relief is treated to convert the dye into a water-insol. compd. and, after washing, is printed on gelatinized paper contg. a reagent capable of combining with the insolubilized dye. Thus, a relief image colored with a salt of an acid dye may be treated in a weak acid bath, to ppt. the insol. dye acid, and then washed and printed on gelatinized paper which has been pretreated with alkali or in which Na<sub>2</sub>PO<sub>4</sub> has been incorporated. The gelatinized paper also contains Cu(CNS)<sub>2</sub>, a thiophenol, a phosphotungstomolybdic acid, BaCO<sub>3</sub>, or other compd. capable of combining with the dye to form a water-insol. compd. In prepg. wash-out reliefs for use in the process, the exposed layer is treated in an alk. bath before development, whereby the absorption of the dye by the tanned image is facilitated.

**Photographic prints.** N. V. Philips' Gloeilampenfabrieken. Fr. 754,578, Nov. 9, 1933. Prints are obtained from negatives using a luminous source emitting ultra-violet rays, by means of a sensitive material contg. an inorg. colorless oxidant, *e. g.*, HNO<sub>3</sub> or a salt thereof, and an org. cyclic amino compd., *e. g.*, aminophenol or benzidine. This mixt. gives a colored oxidation product with ultra-violet rays but is practically insensitive to the visible part of the spectrum. After exposure the paper is washed in a solvent for the org. compd. but in which the colored substance produced is insol.

**Colored photographs.** Anton Jasmatzi. Ger. 586,815, Oct. 27, 1933 (Cl. 57b. 14.02). See Fr. 749,922 (C. A. 28, 425<sup>1</sup>).

**Colored gelatin relief images.** Douglas A. Spencer, Humphrey D. Murray and Lealie W. Oliver (one-half to Douglas A. Spencer and Humphrey D. Murray and one-half to John E. Thornton). U. S. 1,939,026, Dec. 12. For the production of positive cinematograph films having relief images in colored colloid thereon, the surface of the film is coated with a thin layer of hot liquid or plastic soln. of a transparent emulsoid and a transparent pigment and the coated set film is passed through a soln. contg. a bleaching agent to transform the metallic Ag of the Ag image to a salt and a hardening agent to harden the colored colloid layer on the bleached Ag image; the bleached hardened film is treated with hot water until surplus non-hardened gelatin not required in the bleached image has been dissolved and washed away, and the film is treated in a fixing bath to fix the bleached Ag image, and finally is washed and dried.

**Preparing motion pictures by dye transfer.** Charles B. K. Mees (to Eastman Kodak Co.). U. S. 1,939,219, Dec. 12. An uncoated motion picture film support has a hydrolyzed surface which is mordanted and dyed with a plurality of dye images without any substantial diffusion of the dye.

**Recording designs, etc., by heat-induced chemical reactions.** Samuel E. Sheppard and Waldemar Vanselow (to Eastman Kodak Co.). U. S. 1,939,232, Dec. 12. A film of material contg. a substance such as Ag oxalate capable of darkening under the influence of heat is treated with a substance such as NH<sub>4</sub>CNS which catalyzes the darkening reaction, thus producing a substantial proportion of free metal and the film is heated to develop an image.

**Metal printing blocks.** Kodak-Pathé. Fr. 755,414, Nov. 25, 1933. The photographic reliefs on colloids such as gelatin, from which the blocks are to be obtained, are coated with a very thin layer of an org. liquid having a b. p. higher than the temp. of the alloy at the time of molding. Isoamyl or butyl phthalate, quinoline, isopropyl lactate, anisaldehyde, cinnamaldehyde and decalhydronaphthalene are mentioned.

## 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

**Rhodonitrites of ammonium, potassium, rubidium, cesium, thallium, barium and lead.** A. Ferrari and C. Colla. *Atti accad. Lincei* 18, 45-52 (1933).—The rhodonitrites of  $\text{NH}_4$ , K, Ba, Cs, Tl, Rb and Pb have been prepd. by treating Na rhodionitrite with excess of salts of the above metals. Only the compds. of  $\text{NH}_4$ , K and Ba have been previously described. They are all white compds., except the Tl salt, which is yellow. Their x-ray structures have been detd. by the powder method with Fe anticathode. The sides of the elementary cells have been detd. as follows:  $(\text{NH}_4)_2\text{Rh}(\text{NO}_2)_2$ ,  $\text{K}_2\text{Rh}(\text{NO}_2)_2$ ,  $\text{Rb}_2\text{Rh}(\text{NO}_2)_2$ ,  $\text{Cs}_2\text{Rh}(\text{NO}_2)_2$ ,  $\text{Tl}_2\text{Rh}(\text{NO}_2)_2$ :  $a = 10.91$ ,  $b = 10.63$ ,  $10.83$ ,  $11.30$  and  $10.91$  Å., resp. The compds. of Ba and Pb have been found to be anhyd.;  $\text{H}_2\text{O}$  found in compds. dried at lower temps. is zeolitic in nature. The structure is cubic or pseudo-cubic with sides  $\text{Ba}[\text{Rh}(\text{NO}_2)_2]_2$ ,  $a = 10.70$ , and  $\text{Pb}_2[\text{Rh}(\text{NO}_2)_2]_2$ ,  $a = 10.53$  Å.

A. W. Contieri

**The mutual action of the chlorides and bromides of phosphorus.** II. A. Renc. *Roczniki Chem.* 13, 509-18 (French 519) (1933).—Analysis of the clear red liquid showed the X (halogen) to P ratio to be greater than 1. Further sepn. of crystals from the liquid by cooling with  $\text{CaCl}_2$  (approx.  $-54^\circ$ ) showed the liquid had the compn.  $\text{PX}_3$ . Crystals analyzing very closely to  $\text{PCl}_2\text{Br}$  were obtained when the following reagents were used in the indicated mol. ratios:  $\text{PCl}_3 + 2.5\text{PBr}_3$ ;  $\text{PBr}_3 + 0.5\text{PCl}_3$ ;  $\text{PBr}_3 + \text{PCl}_3$ ; they were also obtained from 3 g.  $\text{PCl}_3$ - $\text{Br}_2$  + 2.94 g.  $\text{PCl}_3$  + 2.84 g.  $\text{PBr}_3$ .  $\text{PCl}_2\text{Br}$  and  $\text{PClBr}_2$  were also obtained. C. T. Ichniowski

**Four crystalline hydrates of sodium metasilicate.** Chester L. Baker, H. Teynham Woodward and Adolf Pabst. *Am. Mineral.* 18, 206-15 (1933).—Crystals of the 9, 8, 6 and 5 hydrates of  $\text{Na}_2\text{SiO}_3$  were prepd. The crystals are very hygroscopic and are carbonated quickly on exposure to air. The chem. analyses agree closely with the theoretical values. Phys. and crystallographic data not given. A. M. Brant

**The formation of silicon carbide.** Kurt Arndt and Ewald Hausmann. *Z. anorg. allgem. Chem.* 215, 66-74 (1933). Anthracite, charcoal or petroleum coke was heated with  $\text{SiO}_2$  to form SiC. With inadequate  $\text{SiO}_2$ , conversion of the C particles was incomplete and they retained their form. Anthracite proved to be most satisfactory. Reduction of  $\text{SiO}_2$  by C begins at  $1600^\circ$ . Microscopic needles and filaments of SiC result, which can be sepd. by burning off excess C and removing  $\text{SiO}_2$  with  $\text{HF}$ . The size of crystals increases with increasing temp. and the filaments disappear. The crystals do not grow by longer heating. At  $2250^\circ$  the crystals are decompd. to form graphite, which retains the form of the SiC crystals. The existence of "Siloxicon" is questioned; it probably was a mixt. of SiC and  $\text{SiO}_2$ . Foster Dee Snell

**The reduction of alumina with carbon.** W. D. Treadwell and A. Gyger. *Helv. Chim. Acta* 16, 1214-25 (1933).

The equilibria in the system  $\text{Al}_2\text{O}_3$ -C were studied up to  $1900^\circ$ . The method used consisted of circulating A through the mixt. maintained at const. temp. and analyzing the gas for CO by means of a hot-wire gage. With fast heating the formation of Al rather than  $\text{Al}_2\text{C}_3$  is favored. A *microchem. method for the detn. of Al and  $\text{Al}_2\text{C}_3$*  in a fused reaction mixt. is described. The Al is detd. by reduction of  $\text{FeCl}_3$  in a current of  $\text{CO}_2$  with slow addn. of HCl soln. so that no  $\text{H}_2$  is evolved. The carbide is detd. by treatment with HCl soln. and measurement of the vol. of  $\text{H}_2$  and  $\text{N}_2$  evolved. H. F. Johnstone

**Conditions for the fixation of  $\text{HSbO}_3$  by some aromatic monoacid-monoalcohols.** Duquenois. *Compt. rend.* 197, 1335-6 (1933).—Compds. similar to those previously described (cf. C. A. 28, 1054 and Volmar and Betz, C. A. 27, 5019) are obtained from  $\text{H}_2\text{SbO}_3$  and an equimol. mixt. of one of the following acids and its neutral salt: mandelic acid, K salt,  $\beta$ -phenyllactic acid, Na and K

salts; benzilic acid, Na, K and  $\text{NH}_4$  salts. No compd. is formed from  $\beta$ -phenylhydracrylic acid. H. A. B.

**Haüy-Bravais lattice and other crystallographic data for sodium molybdo-tellurate.** J. D. H. Donnay and J. Mélon. *Am. Mineral.* 18, 225-47 (1933).—The method of detg. the axial elements is described, and crystallographic and optical data are given. This new compd.  $(3\text{Na}_2\text{O} \cdot \text{TeO}_3 \cdot 6\text{MoO}_3 \cdot 22\text{H}_2\text{O})$  is biaxial, optically neg.;  $n_\alpha = 1.577$ ,  $n_m = 1.602$ ,  $n_\beta = 1.683$ ;  $2V = 50.75^\circ$ . The crystals belong to the holohedral class of the triclinic system. A. M. Brant

**Fusion diagrams of the systems  $\text{NaOH}$ - $\text{NaNO}_2$  and  $\text{KOH}$ - $\text{KNO}_2$ .** N. Martin Retortillo and E. Moles. *Anales soc. españ. fis. quim.* 31, 830-9 (1933).—Fusion diagrams of the systems  $\text{NaNO}_2$ - $\text{NaOH}$  and  $\text{KOH}$ - $\text{KNO}_2$  were prepd. In the former, the formation of the Jänecke compds.  $\text{NaNO}_2 \cdot 2\text{NaOH}$  and  $\text{NaNO}_2 \cdot \text{NaOH}$  (C. A. 24, 2685) was confirmed. In the latter system, the formation of the compd.  $\text{KNO}_2 \cdot 2\text{KOH}$  in the dry way is shown for the first time. All these compds. can be written as salts of the hypothetical orthonitric acid, e. g.,  $\text{Na}_2\text{NO}_3 \cdot \text{H}_2\text{O}$ ,  $\text{Na}_2\text{HNO}_4$  and  $\text{K}_2\text{NO}_4 \cdot \text{H}_2\text{O}$ . E. M. Symmes

**Compounds of bivalent metallic selenates with aniline.** Chung-Hsi Kao and Tsing-Lien Chang. *J. Chinese Chem. Soc.* 1, 116-19 (1933).— $\text{CuSeO}_4 \cdot 5\text{H}_2\text{O}$ ,  $\text{ZnSeO}_4 \cdot 6\text{H}_2\text{O}$  and  $\text{CdSeO}_4 \cdot 2\text{H}_2\text{O}$  unite with  $\text{PhNH}_2$  at room temp.;  $\text{CoSeO}_4 \cdot 5\text{H}_2\text{O}$  does so at  $80^\circ$ , and  $\text{NiSeO}_4 \cdot 6\text{H}_2\text{O}$  at  $100^\circ$ , while  $\text{MnSeO}_4 \cdot 5\text{H}_2\text{O}$  not at all. The compds. produced all have the formula  $\text{M}^{++}\text{SeO}_4 \cdot 2\text{C}_6\text{H}_5\text{NH}_2$ . W. H. A.

**The oxidation of hypophosphoric acid by bromine.** Bruno Blaser and Paul Halpern. *Z. anorg. allgem. Chem.* 215, 33-43 (1933); cf. Nylén and Stelling, C. A. 27, 3891.—The rate of oxidation of  $\text{H}_2\text{P}_2\text{O}_6$  by  $\text{Br}_2$  depends largely on the  $p_H$ , with a max. at  $p_H$  8. The resulting curve agrees with a composite curve of the oxidizing strength of  $\text{Br}_2$  solns. with variation in  $p_H$  and the reducing strength of  $\text{H}_2\text{P}_2\text{O}_6$ . This is not altered in the max. range by traces of Cu or by addn. of gluc., which alter the rate of oxidation at other parts of the curve. The acid shows little reducing action; its ion is a strong reducing agent, indicating that the acid and its ion have different structures. The possibility of a chain reaction is also suggested. Foster Dee Snell

**Dichromic acid.** E. Carrière and H. Sendras. *J. chim. phys.* 30, 628-33 (1933).—Dichromic acid is prepd. by the action of HCl on  $\text{K}_2\text{CrO}_4$ . Cond. detns. suggest the formula  $\text{H}_2\text{Cr}_2\text{O}_7$ , as first proposed by Ostwald (*Z. physik. Chem.* 2, 78 (1888)) rather than  $\text{H}_2\text{CrO}_4$ , as suggested by Walden (*Z. physik. Chem.* 2, 71 (1888)). W. J. P.

**The constitution of hyponitrous acid and nitramide.** A. Hantzsch. *Ber.* 66B, 1566-8 (1933); cf. C. A. 28, 9854 and Hunter and Partington, C. A. 27, 2671.—The inability of nitramide to give  $\text{NH}_3$  and  $\text{NO}_2^-$  upon hydrolysis with alkali, its non-formation from  $\text{RNO}_2$  and  $\text{NH}_3$ , and its weak but distinctly acid character are in harmony with the structure  $\text{HN} \cdot \text{NO} \cdot \text{OH}$ . Hyponitrous acid is a weak dibasic acid, the mono- and di-metallic salts of which are, resp., neutral and alk. in  $\text{H}_2\text{O}$ . Its alkyl esters are O-esters. A comparison of the properties of hyponitrous acid with those of other N compds. leads to the anti-structure  $\text{HO} \cdot \text{N} \cdot$ . W. C. Fernelius

N.OH

**Complex iron compounds of  $\alpha$ -pyridylhydrazine.** Bruno Emmert and Oskar Schneider. *Ber.* 66B, 1875-8 (1933).—Although the inner complexes of  $\alpha$ - $\alpha'$ -dipyridyl with  $\text{Fe}^{++}$  salts are oxidized only with difficulty, formation of the  $\alpha$ -pyridylhydrazine complex with  $\text{FeCl}_3$  can only be accomplished in the absence of air, in which the  $\text{FeCl}_3$  complex is formed. H. F. Johnstone

**Some inner complex salts of bivalent iron.** Bruno Emmert and Hermann Grottschneider. *Ber.* 66B, 1871-4 (1933); cf. C. A. 25, 3586.—Complex salts of bibenzoylmethane with Fe and  $\text{NH}_3$ , pyridine, piperidine, nicotine,

and ethylenediamine were prepd. These complexes are deep blue, or green, insol. in  $H_2O$  but sol. in org. reagents. The  $NH_2$  complex evolves  $NH_3$  when heated to give the diketone Fe (bivalent). The latter does not absorb NO but solns. of the pyridine complex absorb the gas, mol. for mol., with dissoen. of the pyridine. The bivalent Fe compds. are all oxidized by air to the red diketone trivalent Fe. With  $FeSO_4$ , acetylacetone and  $o-C_6H_4-(NH_2)_2$  undergo a condensation to form *dimethyl-(benzohexapladiazine)-ferrous sulfate*. H. F. Johnstone

The influence of the strength of bases on the formation of aluminotartrate complexes. Pariselle. *Compt. rend.* 197, 1214-16 (1933).—Whereas NaOH or KOH, together with tartaric acid and Al salts, forms complex tartrates (cf. C. A. 20, 3321),  $NH_4OH$  also forms aluminotartaric acid but the diammonium tartrate is only incompletely formed and there is not a rapid drop in  $\alpha$ . With piperidine results are similar, but with the still weaker pyridine bases no complex is formed and at higher concns. of bases values for  $\alpha$  are neg. E. G. Vanden Bosche

Some complexes which form benzidine and metallic salts. J. Barceló. *Anales soc. españ. fis. quim.* 31, 852-80 (1933).—Prepn. and properties of several benzidine (Bzd) complexes are given, those not heretofore described being  $(HgBzd)(CN)_2$ ,  $(CdBzd)SO_4$ ,  $(ZnBzd)SO_4$  and  $(AgBzd)NO_3$ . E. M. Symmes

Compounds formed by triethanolamine with certain metallic salts. A. Tettamanzi and B. Carli. *Gazz. chim. ital.* 63, 566-70 (1933).—When pure, anhyd.  $N(C_2H_4OH)_3$  (I) reacts with concd. aq. solns. of metal salts, the reaction is different from that described by Jaffe (cf. C. A. 27, 4189). Basic salts are not formed, but cryst. complex compds. composed of 1 mol. of inorg. salt and 2 mols. of org. base are formed. Thus when heated, concd. aq.  $NiCl_2$  and I form the compd.  $NiCl_2 \cdot 2N(C_2H_4OH)_2$  (II), lustrous light blue; its aq. solns. are of the green color of Ni salts. The compd.  $CdSO_4 \cdot 2N(C_2H_4OH)_2$  and  $CaCl_2 \cdot 2N(C_2H_4OH)_2$  (III) are prepd. similarly. Hot aq. solns. of III are opalescent. No ppts. are obtained directly with  $SrCl_2$  and  $MgCl_2$ , but when the reaction liquors are evapd., there are obtained, after purification, the compds.  $SrCl_2 \cdot 2N(C_2H_4OH)_2 \cdot 3H_2O$  and  $MgCl_2 \cdot 2N(C_2H_4OH)_2$  (IV). Under no conditions was a complex compd. of I and  $BzCl_2$  obtained. The constitution of these new compds. may be accounted for in at least 2 ways. The 6 OH groups of 2 I mols. are united by secondary valences of the O atoms to the central metal atom, similarly to the complex glycol and glycerol compds. of Grün, thus:

In this case the compds. are interposition compds. Alternately it is possible that the I units are united through their N atoms by secondary valences to the metal atom, in which case the compds. would be simple addn. compds., thus:

The blue color of II, which resembles the color of Ni amines, is in favor of the 2nd hypothesis, whereas the tendency of Mg to unite by secondary valences to N would suggest that the 1st hypothesis is at least valid for IV. C. C. Davis

Alcoholysis of some metal salts brought about by triethanolamine. F. Garelli and A. Tettamanzi. *Gazz. chim. ital.* 63, 570-5 (1933); cf. preceding abstr.—Unlike the reaction of anhyd. triethanolamine (I) with  $NiCl_2$ ,  $CdSO_4$ ,  $CaCl_2$ ,  $SrCl_2$ , and  $MgCl_2$ , its reaction with  $CoCl_2$ ,  $CoBr_2$ ,  $Cu(SCN)_2$ ,  $Co(SCN)_2$ ,  $CdCl_2$ ,  $ZnCl_2$  and  $ZnSO_4$  involves double decomp. with the formation of compds. in which 1 or more metal atoms replace the H atoms of the

OH groups in I. The products are thus mixed *halide alcohols*. The mobility of the H in the OH groups of I was previously demonstrated by Knorr (*Ber.* 30, 910 (1898)). At room temp. aq.  $CoCl_2$  and I ppt. slowly the compd.  $ClCoOC_2H_4N(C_2H_4OH)_2$  (II), lustrous violet-purple. The reaction is:  $CoCl_2 + 2I \rightarrow II \times N(C_2H_4OH)_2 \cdot HCl$ , with the evolution of heat. Aq. solns. of II turn pink (color of cobaltous solns.), and then blue on addn. of concd. HCl. Boiling aq. solns. of II ppt. an olive-green compd., probably a basic chloride. Aq.  $CoCl_2$  and I (2 mols.) concd. *in vacuo* ppt. the compd.  $BrCoOC_2H_4N(C_2H_4OH)_2$ , intense lustrous violet color. It is also pptd. directly on addn. of I to a soln. of  $CoCl_2$  and  $NaBr$ . In water it decomp. like II. Aq. KSCN added to aq.  $CoSO_4$  and I ppts. the compd.  $NCSCoOC_2H_4N(C_2H_4OH)_2$  (III), intense opaque violet. The mother liquor is a viscous colloidal soln. contg.  $N(C_2H_4OH)_2 \cdot HSCN$  (IV), so that the reaction is:  $Co(SCN)_2 + 2I \rightarrow III + IV$ . In water III decomp. like II. Similarly KSCN,  $CuSO_4$  and I yield the compd.  $NCSCuOC_2H_4N(C_2H_4OH)_2$ , light green. IV is also formed as before. Aq.  $CdCl_2$  (4 g.) and I (6 g.) ppt. overnight the compd.  $(ClCdOC_2H_4)_2NC_2H_4OH$  (V), formed by the reaction:  $2CdCl_2 + 3I \rightarrow V + N(C_2H_4OH)_2 \cdot 2HCl$ . It hydrolyzes in hot water. Aq.  $ZnCl_2$  and I ppt. the compd.  $ClZnOC_2H_4N(C_2H_4OH)_2$ . Aq.  $ZnSO_4 \cdot 7H_2O$  (5.74 g.) and I (6 g.) ppt. a compd. contg. Zn 37.38-36.87, SO<sub>4</sub> 16.75 and N 2.80%, probably of the constitution:

formed by the reaction:  $3ZnSO_4 + 3I \rightarrow VI + 2N(C_2H_4OH)_2 \cdot H_2SO_4$ . The expts. show that I has a much greater alcoholyzing power than have ordinary alcs. with the same salts. This indicates that the union of 3 alc. mols. by ammonia N increases the mobility of the H of the OH groups, thus conferring on the OH groups themselves an acid character almost as great as that of phenolic OH groups. The only compds. approaching these are those formed from pyrocatechol and from  $o-HOOC_6H_4CO_2H$ , described by Weinland (C. A. 14, 2308) and Rosenheim (C. A. 26, 932). C. C. Davis

Asymmetric quaternary arsonium compounds and attempts to separate them into the optically active components. Gilni Kamai. *Ber.* 66B, 1779-83 (1933).  $MeEtAsI$  with  $PhMgBr$  in a  $N_2$  atm. gives a 96% yield of *methyl ethyl phenyl arsine* (I),  $b_p$  89-90.5°,  $d_4^{20}$  1.2161,  $n_D^{20}$  1.5665. This forms *methyl ethyl phenyl benzyl arsonium chloride* (non-crystallizable) and *iodide* (m. 140°) with the benzyl halides. In the same way  $Et-n-PrAsI$  (I) gives 97.4% *ethyl-n-propyl phenyl arsine*,  $b_p$  120°,  $b_{ref}$  245°,  $d_4^{20}$  1.1431, which also forms the corresponding *benzyl arsonium chloride*, m. 156°. With the *p*-tolyl Grignard reagent, (I) gives 80% *ethyl-n-propyl-p-tolyl arsine*,  $b_p$  127-8°,  $d_4^{20}$  1.1198,  $n_D^{20}$  1.5448; the corresponding *benzyl arsonium iodide* m. 119-20°. With the naphthyl Grignard reagent (I) gives 74% *ethyl-n-propyl- $\alpha$ -naphthyl arsine*,  $b_p$  181°,  $d_4^{20}$  1.2169, which also forms the *benzyl arsonium iodide* (II), m. 154-5° and with  $\pi$ -bromoacetophenone 8 gives the corresponding *phenacyl arsonium bromide*, m. 136-7°. With the exception of II, the salt of the arsonium base formed by treatment of the halide with the Ag salt of *d*- $\alpha$  and *d*- $\pi$ -bromocamphorsulfonic acids did not crystallize. The *d*- $\alpha$  salt of II was fractionally crysld. into 3 portions for which the m. ps. were 137°, 135-6° and 120-6°, resp., and in aq. soln.  $[\alpha]_D^{25}$  values were 49.71°, 45.49° and 44.6°, resp. With KI soln., the first fraction formed the arsonium iodide for which in acetone  $[\alpha]_D^{25}$  was 9.11. The *d*-component racemized quickly. H. F. Johnstone

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

**X-ray crystal analysis of unstable precipitates.** Pierre Jolibois and Georges Poureticr. *Compt. rend.* 197, 1322-3 (1933).—Pptd. yellow  $\text{HgI}_2$  is identical with that obtained by heating the red form. G. M. E.

**Gravimetric and polarigraphic determination of total alkalinity.** Vladimir Majer. *Z. anal. Chem.* 92, 401-5 (1933).—A math. discussion of the errors involved in attempting to est. the total alk. by weighing the anhyd. chlorides or sulfates and a comparison of the resulting errors with the error of the polarigraphic method. The sulfate and chloride methods give results that agree substantially if not over 5% of the minor constituent is present. The polarigraphic method agrees with the sulfate method when the substance analyzed does not contain more than 10% of the minor constituent. W. T. H.

**Separation of alkaline earths.** Otozo Funakoshi. *J. Chem. Soc. Japan.* 54, 1215-22 (1933).—To a soln. contg.  $\text{Ba}^{++}$ ,  $\text{Sr}^{++}$  and  $\text{Ca}^{++}$  which is 0.06-0.2 N in  $\text{HCl}$  add warm, 10%  $(\text{NH}_4)_2\text{SO}_4$  soln. slowly. After 24 hrs. add 21%  $\text{NH}_4\text{OAc}$  soln. and filter off the  $\text{BaSO}_4$ . T. Katsurai

**Qualitative analysis without hydrogen sulfide.** L. A. Munro. *Can. Chem. Met.* 17, 240 1 (1933).—A brief outline of Brockman's scheme, and a comparison with the normal  $\text{H}_2\text{S}$  pptn. method. R.'s scheme gives better identification for 4 ions ( $\text{Hg}^+$ ,  $\text{Hg}^{++}$ , As and Ni), equal accuracy for 8 ions and less satisfactory for 9. It is, however, much more rapid. W. H. Boynton

**Comment on the paper by C. Mahr entitled "A new volumetric method for determining bismuth."** G. Spacu and P. Spacu. *Z. anal. Chem.* 95, 336-7 (1933); cf. Mahr (C. A. 27, 5023) and Spacu (C. A. 26, 4766).—Priority claim. W. T. H.

**Iodometric determination of copper, iron, zinc and aluminum in the presence of one another.** R. Lang and J. Feiler. *Z. anal. Chem.* 93, 161 72 (1933).—Neutralize the  $\text{Cl}^-$ -free soln. contg. 3-5 cc. of concd.  $\text{H}_2\text{SO}_4$  with  $\text{NH}_4\text{OH}$  and bring to a vol. of 50-60 cc. The total content of Cu, Fe, Zn and Al may amount to about 0.5 g. Cool the soln., add 2 g. of  $\text{KIIF}_2$  and 2-3 g. of  $\text{KI}$ . Titrate with 0.1 N  $\text{Na}_2\text{S}_2\text{O}_3$  to a starch end point. In this way Cu alone is detd. If less than 12 cc. of thiosulfate is needed in this titration, a known amt. of Cu must be added and titrated to give sufficient  $\text{Cu}_2\text{I}_2$  to catalyze properly the Fe reaction. To det. the Fe, add 10-15 cc. of 5 N  $\text{H}_2\text{SO}_4$ , about 3 g. of  $\text{H}_2\text{BO}_3$  crystals and 1 g. of  $\text{KCNS}$ . In this way the  $\text{FeFe}^{+++}$  complex, which was formed in the Cu detn. to prevent interference of the  $\text{Fe}^{+++}$ , is decompd. and a second titration with  $\text{Na}_2\text{S}_2\text{O}_3$  now serves to det. Fe. Now add a small salt spoonful of  $\text{Na}_2\text{SO}_3$ , heat to boiling and filter. To the filtrate add a still warm soln. of  $\text{HPO}_3$  dissolved in a little water and some  $\text{Br}_2$  water or  $\text{I}_2$  soln. to oxidize the sulfite and  $\text{Fe}^{++}$ . Heat to boiling, cool to room temp. and remove any starch iodide color by the cautious addn. of 0.1 N  $\text{Na}_2\text{S}_2\text{O}_3$ . Then, after adding 0.2 M  $\text{K}_3\text{Fe}(\text{CN})_6$ , titrate the Zn with  $\text{Na}_2\text{S}_2\text{O}_3$ . A quantity of  $\text{Fe}(\text{CN})_6^{---}$  equiv. to the Zn is reduced by the  $\text{I}_2$  present with liberation of  $\text{I}_2$  equiv. to the Zn. Now dil. to exactly 200 cc., allow the Zn ppt. to settle, filter and det. the Al in the filtrate as follows: To 100 cc. of soln. add 1 g. of Rochelle salt and 5 g. of  $\text{NH}_4\text{Cl}$ , make slightly ammoniacal and add a little  $\text{Na}_2\text{SO}_3$ . Heat to boiling and ppt. the Al by adding 2% 8-hydroxyquinoline soln. Add dropwise 1 cc. of concd.  $\text{NH}_3$  soln. and allow to stand 1 hr. on the water bath. Filter and wash the ppt. with hot water. Dissolve it in hot 15-20%  $\text{HCl}$  by vol. Add a few drops of 1% indigo soln. and sufficient  $\text{Br}^-$ - $\text{BrO}_3^-$  soln. to impart a pale straw color, add  $\text{KI}$  and starch and titrate with 0.1 N  $\text{Na}_2\text{S}_2\text{O}_3$  soln. The utility

of this scheme of analysis is shown by the results obtained in the analysis of a sample of Devarda's alloy and of a zinc alloy. The results of 43 test analyses are given.

W. T. H.

**Comparative investigations on the colorimetric determination of potassium.** F. Alten, H. Weiland and B. Kurnies. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 171-82 (1933).—The cobaltinitrite colorimetric methods of I. v. Wrangell (C. A. 27, 3278), (II) Herzner (cf. C. A. 25, 5185) and (III) Tischer (cf. C. A. 25, 5641) were investigated. I, in which indole and  $\text{H}_2\text{SO}_4$  were used, was tested by measuring both the red color and extinction; the former is too fugitive and the latter exhibits proportionality only between 10 and 300  $\gamma$   $\text{N}_2\text{O}_5/100$  ml. In alc. soln. the results were poor. II, developing color with the well-known Griess-Ilosvay reagent ( $\alpha$ -naphthylamine and sulfanilic acid), was the most satisfactory method. Jander and Faber (cf. C. A. 22, 3370) are confirmed in that  $\text{K}_2\text{Co}(\text{NO}_2)_6 \cdot \text{Na}_2\text{Co}(\text{NO}_2)_6$  pptd. from  $\text{NaCl}$ -satd. soln. is more uniform in  $\text{NO}_2:\text{K}_2\text{O}$  ratio than the  $\text{K}_2\text{NaCo}(\text{NO}_2)_6$  obtained by most procedures, and pptn. by this method is recommended. The procedure is described in detail. Eleven references. C. J. S.

**Spectrographic determination of silicon in iron.** G. Scheibe, H. Hammerschmid and G. Linner. *Arch. Eisenhüttenw.* 7, 354 (1933).—To avoid falsification of results when the spark has to pass through the layer of slag formed by the spark the latter is produced in a H atm. which prevents formation of slag. M. H.

**The determination of sodium as tri-uranyl magnesium sodium acetate.** F. Alten, H. Weiland and E. Hille. *Z. Pflanzenernähr., Düngung Bodenk.* 32A, 129-40 (1933).—Kahane's (cf. C. A. 24, 3457) claim that the triple acetate dried at  $120^\circ$  retains 6  $\text{H}_2\text{O}$  is confirmed; the dried ppt. contains 1.536% Na. For removal of interfering elements,  $\text{BaCl}_2$  is recommended in preference to  $\text{Ca}(\text{OH})_2$ ,  $\text{UO}_2(\text{OAc})_2$  for  $\text{P}_2\text{O}_5$ , and tartaric acid in preference to  $\text{EtOH}$  for  $\text{K}_2\text{O}$ . The alc. reagent specified by K. is not useful in the presence of a large amt. of impurity. Procedures for estg.  $\text{Na}_2\text{O}$  in crude and refined  $\text{K}_2\text{O}$  salts, plant ash and soil exts., and recovery of  $\text{UO}_2$  salts from residues are described. Eight references. C. J. S.

**New micro-analytical methods for elementary analysis, for determining halogens and nitrogen and for the identification of organic substances.** Vladimir Staněk and Tibor Nemes. *Z. anal. Chem.* 95, 244-60 (1933).—The substance is oxidized in a test tube by a mixt. of  $\text{KIO}_3$  and concd.  $\text{H}_2\text{SO}_4$  at  $170-190^\circ$ .  $\text{I}_2$  is liberated, C is oxidized to  $\text{CO}_2$  which is absorbed and weighed, H forms water and N is left as  $\text{NH}_4\text{HSO}_4$  in the test tube. S gives  $\text{H}_2\text{SO}_4$ ; Cl and Br escape as  $\text{HCl}$  and  $\text{HBr}$  uniting in each case with H. The liberated  $\text{I}_2$  escapes as such and consumes 0.5 atom of O. By the reduction of the  $\text{KIO}_3$  in concd.  $\text{H}_2\text{SO}_4$ , the I remains in the soln. as  $\text{I}_2\text{O}_5$  which upon diln. is changed to  $\text{I}_2\text{O}_4$  and  $\text{I}_2$ ; the latter can be distd. off with steam and absorbed by Ni as  $\text{NiI}_2$  and can be detd. by the mercurimetric method. The reduction power of the substance analyzed is measured by the  $\text{I}_2$  collected. The requisite app. is shown, the exact manipulation described, the computations are explained and the results of numerous analyses tabulated. The results agree well and serve to characterize many substances.

W. T. H.

**Determination of fluorine. I. Precipitation of the fluorine ion as lead chlorofluoride.** Joseph Fischer and Hans Peisker. *Z. anal. Chem.* 95, 225 35 (1933).—Starck's method for detg. F as  $\text{PbClF}$ , gives good results only as a result of a compensation of errors. The  $p_K$  at which the pptn. takes place is of importance. A suitable reagent can be prepd. by shaking 12 g. of pure  $\text{PbCl}_2$  with 1 l.

of water for an hr. but the undissolved salt must not be used in prep. fresh reagent as it is already somewhat contaminated with basic salt. This reagent, because of the appreciable soly. of  $\text{PbCl}_2$ , must be used in liberal excess, 300 cc. for detg. 30-100 mg. of  $\text{F}^-$ . If this large vol. is unsuitable, a soln. of  $\text{PbCl}_2$  and  $\text{Pb}(\text{NO}_3)_2$  can be used; dissolve 20.5 g. of  $\text{Pb}(\text{NO}_3)_2$  and 15 g. of  $\text{KCl}$ , or 3.3 g. of  $\text{NH}_4\text{Cl}$ , in 1 l. of water. Of this last reagent, use 200 cc. To 100 cc. of soln. contg.  $\text{F}^-$  add methyl orange and neutralize with 0.5 *N*  $\text{HNO}_3$  to a distinct pink with methyl orange. Add 2-3 drops of the acid in excess. The proper end point is hard to det. when considerable  $\text{F}^-$  is present. While rotating the soln. add 300 cc. of the first reagent or 200 cc. of the second from a large pipet. Allow to stand 1 hr. and decant carefully through a filtering crucible. To the ppt. add 4 cc. of water, allow to stand 1 min. and then decant off all the liquid. Wash the ppt. and transfer it to the crucible with the aid of as little as possible (30-50 cc.) of a satd. soln. of  $\text{PbCl}_2$  in water. Drain as dry as possible with suction and heat for 30 min. at  $150^\circ$ . The ppt. contains 7.280% of  $\text{F}$ . The results are usually within 0.5% of the truth. Numerous expts. under varying conditions are described.

W. T. H.

**Method of exact analysis of electrolytic hydrogen.** V. V. Shishkin and B. P. Karnaukh. *Khimstroi* 5, 2475-7 (1933).—The detn. of  $\text{H}_2$  by combustion is made with accuracy of 0.01% in a specially designed app. as illustrated.

Chas. Blanc

**Rapid colorimetric method for the detection and determination of small quantities of oxygen in gases.** H. R. Ambler. *Analyst* 59, 14-15 (1934).—The method is based on the color imparted by  $\text{O}_2$  to an alk. soln. of pyrogallol; the color is compared with that of an  $\text{I}_2$  soln. of known strength.

W. T. H.

**Determination of phosphorus in titaniferous material.** Gunnar Hørgård. *Z. anal. Chem.* 95, 329-30 (1933).—The results obtained in the analysis of 68 samples show that the influence of Ti in preventing complete pptn. of  $\text{H}_2\text{PO}_4$  by the usual treatment with  $\text{NH}_4\text{molybdate}$  increases with quantity of Ti present. The effect of the Ti is not serious until 2.2 mg. of Ti is present in 100 ml. of soln. but when 35.2 mg. of Ti is present it is very difficult to effect complete pptn. When not over 17.6 mg. of Ti is present, the error can be overcome by using sufficient  $\text{HNO}_3$  and  $\text{NH}_4\text{NO}_3$  but if too much acid is present, the pptn. becomes incomplete. With 11 mg. of Ti, the presence of 6-7 ml. of concd.  $\text{HNO}_3$  together with the  $\text{HNO}_3$  in the reagent suffices for complete pptn. provided 10 g. of  $\text{NH}_4\text{NO}_3$  is added in addn. to that present in the  $\text{NH}_4\text{molybdate}$  reagent. The  $\text{HNO}_3$  and  $\text{NH}_4\text{NO}_3$  can be replaced by  $\text{HCl}$  and  $\text{NH}_4\text{Cl}$ .

W. T. H.

**Determination of iodine-bromine numbers by the rapid method.** L. W. Winkler. *Z. anal. Chem.* 93, 172-5 (1933).—An improved procedure for carrying out the rapid method is the following: Dissolve 0.08-0.15 g. of fat in 2-3 cc. of pure  $\text{CCl}_4$  and to the soln., add 0.1 g. of finely-powd.  $\text{NaOAc} \cdot 3\text{H}_2\text{O}$  and 0.5 g. of  $\text{HgCl}_2$ . While rotating the contents of the vessel (50-cc. Erlenmeyer flask) run in 0.1 *N*  $\text{Br-AcOH}$  from a buret until the liquid is a pale yellow color and is not bleached during 2-3 min. The nos. obtained in the examn. of over 20 oils are given and the results agree satisfactorily with those obtained with  $\text{KBrO}_3$  soln.

W. T. H.

**Analysis of magnesium alloys.** L. C. Nickolls. *Analyst* 59, 16-18 (1934).—To det. Al in the presence of considerable Mg, it is recommended to use  $\text{Na}_2\text{S}$  as the precipitant. Dissolve 1 g. of alloy in 6 *N*  $\text{HCl}$  and a little  $\text{HNO}_3$  or  $\text{Br}_2$ . Ppt.  $\text{SiO}_2$  by evapg. to dryness. Take up in 100 ml. of hot water contg. sufficient  $\text{HCl}$  to dissolve  $\text{Mg-OC}_2$  and add 20 g. of  $\text{NH}_4\text{Cl}$ . Filter off  $\text{SiO}_2$  and sat. with  $\text{H}_2\text{S}$  to remove metals of the Cu-Sn group. Filter and add  $\text{NH}_4\text{OH}$  until the soln. becomes dark green and a ppt. is formed. Dissolve carefully in as little  $\text{HCl}$  as possible but without removing the dark tint of  $\text{FeS}$  completely. Add 5 ml. of 6 *N*  $\text{Na}_2\text{S}$  and sat. with  $\text{H}_2\text{S}$ . Filter and wash the ppt. with dil.  $\text{NH}_4\text{NO}_3$  soln. Dissolve the ppt. in 20 ml. of  $\text{HCl}$  and a little  $\text{Br}_2$ , ppt. with  $\text{NH}_4\text{OH}$ ,

filter, weigh the ignited ppt. and correct for small quantities of Fe and Mn. Det. Ni in the filtrate with dimethylglyoxime and Zn in the filtrate from the Ni by treatment with pyridine thiocyanate. If much Mn, Ni or Zn is present, the procedure is modified somewhat. Before adding the  $\text{Na}_2\text{S}$ , the  $\text{HCl}$  is added only till the  $\text{FeS}$  color begins to fade: this takes care of Mn and Zn but if much Ni is present, merely add  $\text{NH}_4\text{OH}$  to the  $\text{H}_2\text{S}$  filtrate until a permanent black ppt. is formed, then 2-3 drops more. The soln. is then ready for the  $\text{Na}_2\text{S}$  treatment. With very large quantities of Zn, Mn and Ni, it is best to make a double pptn. with  $\text{Na}_2\text{S}$ . The results given show merely that the Al values are good; no data are given concerning the other detns.

W. T. H.

**Determination of chloride in the presence of bromide and iodide.** M. Shchigol. *Z. anal. Chem.* 92, 420-5 (1933).—Take 2 g. of the mixt. of alkali salts in a 100-cc. measuring flask. In 10 cc. of the soln. det.  $\text{I}^-$  by Kolthoff's method which consists in adding 1 drop of 0.1 *N*  $\text{KIO}_3$  soln. and a few drops of 4 *N*  $\text{H}_2\text{SO}_4$  whereby the soln. assumes a pale yellow tint due to free  $\text{I}_2$ . Starch indicator soln. and then 5-10 cc. of  $(\text{NH}_4)_2\text{CO}_3$  soln. are added. Thereupon the soln. is titrated slowly with shaking until a pure yellow ppt. of  $\text{AgI}$  is obtained. In a second 10-cc. portion det. the total halogen content by the argentometric method of Volhard, in the presence of 10 cc. of toluene. To a third 10-cc. portion in a 100-cc. measuring flask, add 35-40 cc. of 2%  $\text{NH}_3$  soln. and just sufficient  $\text{AgNO}_3$  to ppt. all of the halogen present. In this way practically all of the  $\text{Br}^-$  and  $\text{I}^-$  will be pptd. as  $\text{AgX}$  salt but the  $\text{Cl}^-$  will remain as sol.  $\text{Ag}(\text{NH}_3)_2\text{Cl}$ . Fill with water to the 100-cc. mark, mix, filter and take 50 cc. of the filtrate. Add 3-4 g. of  $\text{Na}_2\text{CO}_3$  and 15-20 cc. of arsenite soln. (8 g.  $\text{As}_2\text{O}_3$  and 21 g. of  $\text{Na}_2\text{CO}_3$  and 71 g. of water.) Heat and boil 20-25 min. whereby a yellow ppt. of  $\text{Ag}_3\text{AsO}_3$  is formed which by continual boiling begins to darken on account of  $\text{Ag}$  pptg. Cool, filter through a double filter and wash thoroughly with water. Dissolve the ppt. in 20 cc. of hot, concd.  $\text{HNO}_3$ , add  $\text{KMnO}_4$  soln. to a faint red coloration, remove the color with  $\text{FeSO}_4$  soln. and titrate to a pale pink color with 0.1 *N*  $\text{NH}_4\text{CNS}$  soln. This gives the  $\text{Ag}$  equiv. to the  $\text{Cl}^-$  present. For each  $\text{Cl}^-$  present 2  $\text{Ag}$  are pptd.

W. T. H.

**Microchemical titration of iodide, eventually in the presence of other halides.** Vladimír Staněk and Tibor Nemes. *Z. anal. Chem.* 95, 240-4 (1933); cf. C. A. 27, 2307.—The mercurimetric method for titrating halide with Na nitroprusside as indicator can be applied to the microchem. detn. of  $\text{I}^-$  in case not more than 30 mg. of  $\text{I}^-$  is present in 200 cc. of soln. By combining this mercurimetric titration with Winkler's method of transforming the  $\text{I}^-$  into  $\text{I}_2$  with  $\text{CCl}_4$  as indicator, it is possible to det.  $\text{I}^-$  in the presence of other halides. Since the presence of Na nitroprusside is not harmful, the 2 titrations can take place in the same soln.

W. T. H.

**The determination of nitrate in plants and soils.** Cecil Treschow and E. K. Gabrielsen. *Z. Pflanzenernähr. Düngung Bodenb.* 32A, 357-76 (1933).—The 2,4-xylenol colorimetric method of Blom and T. (cf. C. A. 23, 1994) was reinvestigated to eliminate sources of error and adapt it to direct detn. of  $\text{NO}_3^-$ . The  $\text{KMnO}_4\text{-H}_2\text{O}_2\text{-(COOH)}$  oxidation of org. matter originally specified is one source of error, as certain N compds. are oxidized to  $\text{HNO}_3$ . Expts. with fresh plant materials with and without added  $\text{NO}_3^-$  gave very consistent indications with quant. recovery of  $\text{NO}_3^-$  when no oxidation treatment was employed. Another important error is due to decompn. of nitroxylnol by org. matter on standing prior to distn. To avoid this, the nitration period should not exceed 30 min.; if the detns. must stand longer, diln. with 2-5 vols.  $\text{H}_2\text{O}$  will prevent loss for 48 hrs. Expts. with soils revealed a source of error common to most methods, viz., "negative loss," attributed to preferential absorption of pure  $\text{H}_2\text{O}$  rather than  $\text{NO}_3^-$  in soln. by the soil. Soils low in humus and not too poor in  $\text{NO}_3^-$  can be examd. by a direct method, avoiding this error. **Method for plant materials.**—Into a 300-ml. boiling flask measure 25 ml. 66 vol. %  $\text{H}_2\text{SO}_4$  and 0.1 ml. 2,4-xylenol, then add the sample of fresh plant

material, 0.1–1 g. Stopper and shake well, and leave at room temp. 15–30 min. for nitration. Dil. with 100 ml.  $H_2O$ , add pumice stone and connect to a 30-cm. condenser with Hopkins bulb. Distil rapidly into a 100-ml. flask contg. 25 ml. 0.2  $N$  NaOH until the flask is nearly filled. (Observe that no drops of yellow nitroxylenol are left in the condenser. Cool to 20°, make to vol. and compare the color with a suitable standard in a Dubosc-type colorimeter. If the plant material is dry, moisten thoroughly before adding to acid reagent. By this procedure, 100 analyses per day with  $\pm 2\%$  accuracy on up to 0.05 mg.  $NO_3^-$  per sample are possible. *Method for soils.*—(a) When the sample contains less than 300 mg. humus, weigh 5–10 g. freshly sifted fine earth into a 1-l. boiling flask, add 10 ml.  $H_2O$ , pour in quickly 100 ml. 66 vol. %  $H_2SO_4$  with 0.1 ml. 2,4-xylenol, stopper, shake and let stand 10 min. At the end of this nitration period, add 200 ml.  $H_2O$ , connect to the usual Kjeldahl app. and distil. (b) For soils high in humus and low in  $NO_3^-$ , weigh 50–100 g. fresh sample into 300-ml. Erlenmeyer flask, add 1%  $KAl(SO_4)_3 \cdot 12H_2O$  soln. to make the dry soil:liquid ratio as nearly as possible 1:1. Shake vigorously and frequently for 30 min., then filter. Add exactly 10 ml. soil ext. to a 1-l. flask contg. 100 ml. acid reagent, shake and observe if a yellow color appears quickly. If not, cool to 20°, add 10 ml. more soil ext. and so on until color appears, if more than 30 ml. soil ext. is added, corresponding  $H_2SO_4$  must also be added, as acid concn. must be 55–66 vol. % for nitration. Allow nitration to proceed at room temp. for 10 min. after the last addn., dilute and distil. The xylene used in this method is the  $OH:CH_3:-CH_3 = 1:2:4$  compd. listed by Kahlbaum. The former directions for the use of 5-nitro-2,4-xylene as standard for colorimetric comparison are repeated, with the statement that theoretical results are obtained if known sources of error are eliminated. C. J. Schollenberger

Nitron as a precipitant for nitrates. J. h. Heck and M. G. Mellon. *Analyst* 59, 19 25(1934).—In pptg.  $NO_3^-$  as nitron nitrate in solns. of various salts under varying conditions, there is no serious entrainment of other metallic cations or of precipitant. The reproducibility of the results was found satisfactory. On the assumption that the nitrate present is equiv. to the amt. of metal in the nitrates studied, the method was found to be reliable. W. T. H.

Gas volumetric determination of lead dioxide. A. P. Kuchkov and W. K. Ilyuchin. *Z. anal. Chem.* 93, 180–8 (1933). Attempts to analyze  $PbO_2$  and  $Pb_2O_3$  by heating with  $HNO_3$  and  $H_2C_2O_4$  and measuring the  $CO_2$  evolved over Hg led to low results indicating that some  $Pb(C_2O_4)_2$  was probably formed in the decompn. flask and escaped the reduction. A reagent was prepd. by dilg. 250 cc. of concd.  $HNO_3$  with an equal vol. of water and mixing this with 500 cc. of a mixt. of 300 cc. of water and 200 cc. of 1%  $H_2O_2$ . This reagent was satd. with  $O_2$  at the temp. at which the analysis was made. When 2.5 3 g. of  $Pb_2O_3$  was treated with 25 cc. of the acid soln. of  $H_2O_2$  in a suitable app. the  $CO_2$  evolved corresponded closely with the stoichiometric value. The results of 27 expts. compared with those obtained by a modified Diehl-Topf method recommended by the U. S. Bur. Standards indicated that the results obtained by the latter method are a little too low. W. T. H.

Osmium tetroxide as catalyzer for the oxidation of arsenous acid by permanganate and ceric sulfate. Karl Gku. *Z. anal. Chem.* 95, 305–10(1933).—If 3 drops of a soln. which is 0.01 molar in  $OsO_4$  and 0.1  $N$  in  $H_2SO_4$  are added to a soln. contg. about 0.1 g. of  $As_2O_3$  in 0.5–1  $N$   $H_2SO_4$ , the trivalent  $As$  can be titrated with  $KMnO_4$ ; the products are quinquevalent  $As$  and bivalent  $Mn$ . In the absence of catalyst the  $MnO_4^-$  is not reduced. If the  $H_2SO_4$  is replaced by 0.5  $N$   $HCl$ , the titration succeeds only when it takes place very slowly.  $Ce^{++++}$  and trivalent  $As$  do not react appreciably in the presence of  $H_2SO_4$  at room temp. If a little of the  $OsO_4$  soln. is added, the reduction of the yellow  $Ce^{++++}$  to colorless  $Ce^{+++}$  takes place smoothly. Three drops of 0.01 molar ferrous-phenanthroline indicates the end point. For this indica-

tor, which has been called the "phenolphthalein of oxidimetry," the trivial name *ferroin* is proposed for the red form and the name *ferriin* for the oxidized, colorless form. The effect of the  $OsO_4$  on this indicator is curious. The colorless form is not affected by either arsenious acid or ceric sulfate but if the soln. contains an excess of arsenious acid and then a little  $Ce^{++++}$  is added, the addn. of this oxidizing agent causes the reduction of the indicator to the red form. In 0.5–2  $N$   $H_2SO_4$ , therefore, a soln. of arsenious acid can be titrated with  $Ce(SO_4)_2$  if ferroin is used as indicator and  $OsO_4$  as catalyzer. For the reverse titration, it is necessary to add an excess of  $As_2O_3$  soln. and titrate back with  $Ce(SO_4)_2$ . These titrations, however, do not succeed in the presence of  $HCl$ . W. T. H.

Microchemical determination of carbonic acid in carbonates. Wilhelm Reich-Rohrwig. *Z. anal. Chem.* 95, 315–23(1933).—Excellent results were obtained in detg.  $CO_2$  in samples of various carbonates weighing 8–40 mg. The method is the same in principle as that used on the macro scale and here also the use of asbestos impregnated with NaOH proved the most satisfactory absorbent for  $CO_2$ . The original paper should be consulted for details concerning the interesting app. and the necessary technique. W. T. H.

Comparative investigations on the colorimetric and nephelometric estimation of phosphoric acid. F. Alten, H. Weiland and H. Loofmann. *Z. Pflansenernähr. Düngung Bodenk.* 32A, 33–50(1933).—The  $SnCl_2$ -Mo blue colorimetric methods of (I) Denigès (*C. A.* 15, 218), (II) Atkins (*C. A.* 18, 3093) and (III) Zinzadze (*C. A.* 24, 5255) and the  $C_6H_5NHNH_2$ -strychnine Mo red method of (IV) Terada (*C. A.* 19, 225) were investigated by use of the Leitz universal colorimeter for absolute measurements, and the strychnine-Mo nephelometric method of (V) Rauterberg (*C. A.* 26, 2141) with the Zeiss step photometer. None of the methods proved entirely satisfactory with respect to speed of development, constancy and freedom from interference by salts, etc. Colorimetric methods III and IV are best for detn. of 0.05–0.7 mg.  $P_2O_5$ /100 ml. soln. III is unaffected by less than 10 mg. and IV by less than 8 mg. citric acid/100 ml.  $K_2SO_4$  up to 400 mg./100 ml. did not affect IV. V is adapted to the estn. of 0.002–0.04 mg.  $P_2O_5$ . With less than 10  $\gamma$   $P_2O_5$ , the turbidity remains unchanged for several hours, but with larger amounts pptn. takes place proportionally more quickly. Up to 10 mg. of the usual salts have but slight effects. With all methods, the use of freshly prepared reagents is advisable; some authors' claims that reagents are good indefinitely were disproved. Twenty-four references. C. J. Schollenberger

Determination of silicic acid in silicates by difference. G. T. Galfayan and V. M. Tarayan. *Z. anal. Chem.* 92, 417–20(1933).—Moisten 0.5–1.0 g. of the finely powd. silicate in a Pt crucible with 15–20 drops of 18  $N$   $H_2SO_4$ , add 5–7 cc. of HF and evap. on the water bath. Evap. off excess  $H_2SO_4$  by careful heating on the water bath. Add a few more drops of  $H_2SO_4$  and again evap. to fumes. To the dry mass add 3–4 g. of  $NaPO_3$  (prepd. by heating  $NaNH_4HPO_4 \cdot 4H_2O$  to const. wt.) and heat the contents of the crucible carefully at first but eventually at a high heat to a const. wt. From the loss in wt. experienced by this treatment, subtract the loss in wt. which the original material experiences upon ignition and call the difference  $SiO_2$ . By the treatment with  $NaPO_3$ , sulfates of the alkali and alk. earth metals are changed to orthophosphates. W. T. H.

Phenanthroline-ferrous iron. II. Oxidation potentials at high acidities and the determination of vanadium. Geo. H. Walden, Jr., Louis P. Hammett and Sylvan M. Edmonds. *J. Am. Chem. Soc.* 56, 57–60(1934); cf. *C. A.* 25, 5863; 27, 3680.—Potentials relative to each other in 1, 3 and 5  $M$   $H_2SO_4$  and referred to a quinhydrone electrode also in 1, 3 and 5  $M$   $H_2SO_4$  were measured for the  $Fe^{+++}/Fe^{++}$ ,  $VO_3^+/VO^{++}$ ,  $VO^{++}/V^{+++}$  systems and for the oxidimetric indicator, phenanthroline-ferrous ion. In 5  $M$   $H_2SO_4$  V can be quantitatively reduced and the end point of the titration detd. with this indicator. L. P. Hall

**Analysis of salt cake.** Anon. *Paper Trade J.* 97, No. 18, 33-5(1933).—A description of the tentative standard methods of the Tech. Assoc. of the Pulp & Paper Ind.

A. Papineau-Couture

**Finger-print detection.** Henry L. Brose. *Analyst* 59, 25-7(1934).—Technical details are described for detecting finger-prints which have been left on multicolored objects, such as check-patterned cigaret cases. In one method the details of the print are isolated from the object by dusting with phosphorescent ZnS powder and the powder pattern is photographed after it has been rendered luminous by a source of ultra-violet light. In the second method, continuous illumination of the object by means of fluorescent light makes it possible to make the desired photograph.

W. T. H.

**Reactions and reagents for the detection of organic compounds.** II. Edwin Egriwe. *Z. anal. Chem.* 95, 323-7 (1933); cf. C. A. 26, 4709.—**Glyceric acid.**—To 1 drop of the soln. to be tested add a few ml. of a 0.01% soln. of naphthoresorcinol in 96%  $H_2SO_4$ ; and heat on the water bath for 30-50 min.; a blue coloration results with as little as 0.05 mg. of glyceric acid. **Lactic acid.**—Two tests are described which depend on the formation of  $AcH$  and its condensing with phenols. Place 1 drop of the soln. to be tested in a small dry test tube, add 1 ml. of 96%  $H_2SO_4$  and heat 2 min. at  $85^\circ$ , cool under the water tap to  $28^\circ$  and add a little solid *p*-hydroxybiphenyl. Shake to mix the ingredients and allow to stand 10-30 min. A violet coloration results with as little as 0.1 mg. of lactic acid. To another drop of the soln. in a dry test tube, add a small crystal of *p*-hydroxybiphenyl together with a little 96%  $H_2SO_4$ . Heat to  $85^\circ$  for 2 min. and look for a bluish fluorescence which is best observed against a background of black paper. **Pyroracemic acid.**—The above tests for lactic acid can serve for the detection of pyroracemic acid because it is easily reduced to lactic acid by reduction with Mg in  $H_2SO_4$  soln. Place 1 drop of the soln. to be tested in a small dry test tube, add some Mg powder and moisten with a small drop of concd.  $H_2SO_4$ . After the Mg has all dissolved, add a crystal of the reagent and a little 96%  $H_2SO_4$ . If a brown coloration results, it signifies an incomplete reduction of the pyroracemic acid and the test should be repeated with a fully reduced soln. After adding the acid, heat 2 min. at  $85^\circ$  and look for the violet coloration. As little as 0.01 mg. of pyroracemic acid gives a distinct test. **Tartaric acid.**—A green fluorescence characteristic of tartaric acid can be obtained by heating with concd.  $H_2SO_4$  contg.  $\beta, \beta$ -binaphthol.

W. T. H.

**Short-cut method of hydrocarbon analysis.** II. Application to analysis of stabilizer bottoms. R. Rosen and A. E. Robertson. *Ind. Eng. Chem., Anal. Ed.* 6, 12-18 (1934); cf. C. A. 25, 4817.—Application to stabilizer bottoms of the method described in the previous paper for the analysis of stabilizer gas and reflux is described. Routine sample of stabilizer bottoms can be analyzed by means of graphs prepd. from the distn. curves obtained by this short-cut method from synthetic samples covering the range of compns. normally found for stabilizer bottoms. Correction charts are given for use with these graphs when necessary. The method applied to stabilizer bottoms checks microfractionation analysis within 0.5% on the  $C_7H_{16}$ , 1% on the  $C_8H_{18}$  and 2% on the  $C_9H_{20}$  and  $C_{10}H_{22}$  plus heavier-hydrocarbon fractions.

**Determination of sulfur in benzene.** H. A. J. Pieters, J. Roessingh van Irterson and S. J. H. Spronck. *Chem. Weekblad* 30, 756-62(1933).—Investigation of the various methods for the detn. of S and S compds. in benzenes with recommendations for minor improvements.

E. Schotte

**The gas volumetric method for the determination of amino nitrogen according to Van Slyke in glycooll and peptides containing glycine.** O. Gerngross and W. Descke. *Ber.* 66B, 1813-14(1933).—The high values given by the Van Slyke method with glycine (10% above the theoretical) and glycylglycine (34% above the theoretical) are not due to gases absorbed by alk.  $KMnO_4$  ( $CO_2$ ) and only a fraction of 1% of  $CO$  could be detected by means of  $NH_3$ - $CuCl$  and of  $N_2O$  by combustion with

<sup>1</sup> H in a Drehschmidt capillary. The excess of gas evolved must, therefore, consist largely of  $N_2$ , and treatment with some appropriate absorbent will not serve to give correct results.

C. A. R.

**Glycerol complexes in volumetric analysis.** Hermann Wagner. *Z. anal. Chem.* 95, 311-15(1933).—The sulfates of Co, Ni, Cu and Zn unite with 3 mols. of glycerol to form sol. complexes. The free  $H_2SO_4$  in a plating bath can be easily titrated to a methyl orange end point with  $N NaOH$  if 30 ml. of neutral glycerol is added to prevent interference of the  $Cu^{++}$ . At the end point the indicator turns yellow and a slight turbidity appears. To det. Zn in a plating bath, it is recommended to destroy cyanogen complexes by evapg. to fumes under a good hood, remove  $NH_4$  salts if necessary by boiling with  $K_2CO_3$ , filter off the  $ZnCO_3$ , dissolve the ppt. in a measured vol. of stand. acid and titrate the excess with  $NaOH$  after adding 30 ml. of neutral glycerol. In the absence of  $NH_4$  salt it is best to ppt. the Zn by adding  $Na_2CO_3$  until a slight, permanent turbidity results, then add 2 drops of phenolphthalein indicator soln. and sufficient  $Na_2CO_3$  soln. to impart a pink color. In this way the basic Zn carbonate ppt. is formed free from excess alkali carbonate. Cd can be detd. as recommended for Zn except that the pptn. of carbonate must take place in the cold. Results obtained by these methods in the hands of 9 different operators are given and show good agreement.

W. T. H.

**A color test for glycerol.** K. Täufel and H. Thaler. *Z. anal. Chem.* 95, 235-9(1933).—Evap. a few cc. of the soln. to dryness, mix the residue with 2 g. of a 40%  $CaO$  paste and again evap. to dryness. Moisten with water, evap. to dryness and repeat these last 2 operations. Pulverize the residue with a glass rod and moisten the brittle mass with a little abs. alc. Ext. 3 times with 3-4 cc. portions of abs. alc. and evap. the alc. soln. to dryness on the water bath. Add 3 cc. of a mixt. of equal parts abs. alc. and ether, filter and wash the residue with 3 cc. more of the mixt. Carefully distil off the alc. in a small distg. flask of Jena glass. To the residue add a little pumice powder and about 15 drops of cryst.  $H_3PO_4$ . Fan with a small flame and heat for about 5 min. when the boiling will be practically over. To the few drops of distillate add 1 drop of 3%  $H_2O_2$  followed at once by 1 cc. of concd.  $HCl$ . Cool under the water tap and shake vigorously for 1 min. Then, to destroy the excess peroxide, add 1 drop of 10%  $KI$  soln. and remove the liberated  $I_2$  by cautious treatment with  $Na_2S_2O_3$  soln. To this soln. add 0.5 cc. of 15% phloroglucinol in ether and shake. A red color should result within 30 min. The test depends on the formation of acrolein which in turn is converted to epihydrinaldehyde that gives a red color with phloroglucinol. The test serves to detect glycerol in wine, vinegar, etc.

W. T. H.

**Determination of coumarin and melilotic acid in *Melilotus officinalis*.** Zofia J. Kanevska and Alexandra M. Fedorova. *Z. anal. Chem.* 93, 176-80(1933).—In 1863 Zwenger and Bodenbender showed that coumarin in *Melilotus officinalis* is combined with "melilotic acid" and Z. showed that this acid can be formed by reducing coumarin with Na amalgam. Since then no quantitative method seems to have been proposed for detg. these 2 substances. Coumarin, by treatment with a boiling soln. of alkali, is converted into a salt of coumarinic acid which cannot be extd. with ether. Acids, however, decompose the salt very easily and since free coumarinic acid is very unstable, the lactone ring soon closes again and coumarin is formed. By extg. 20 g. of the leaves of the plant with ether for 12 hrs. the coumarin, melilotic acid, etc., are removed. By evapg. off the ether, a thick dark green mass is obtained which yields a soln. of coumarin and melilotic acid when boiled 5 min. under a reflux condenser. By filtering, and repeating the boiling 4 times, all the desired constituents are obtained in aq. soln. If this soln. is boiled with 20 cc. of 10%  $NaOH$  soln., the undesirable impurities can be extd. by shaking the cold, alk. soln. 4 times with 50 cc. of ether. Then, by making acid to Congo red with 20%  $H_2SO_4$ , coumarin and melilotic acid are pptd. To sep. them, add  $Na_2CO_3$  to alk. reaction and ext.

4-5 times with ether. From the filtered ether ext. coumarin can be obtained by evapg. Then by adding 20%  $H_2SO_4$ , set free the melilotic acid, ext. it with 3-4 portions of ether, evapg. off the ether and weigh. Tests with synthetic mixts. as well as the results obtained with leaves of the plant indicate that the method is satisfactory.

W. T. H.

**Acidimetric method for determination of phenol in the melt.** M. M. Shemyakin. *Anilinokrasochnaya Prom.* 3, 403-4 (1933).—Rhodes, Jahnes and Bivans (*C. A.* 21, 3049) studied the production of phenol by fusing Na benzenesulfonate with NaOH and recommended an acidimetric method for detg. the phenol in the melt. A ppt. of  $C_6H_5Br_2OH$  was formed in an aliquot part of the aq. ext., which was filtered off, dissolved in a measured vol. of 0.05 N NaOH and the excess titrated with 0.05 N HCl. Detailed directions are given for carrying out a similar procedure which has been found more accurate than any other method. Stress is laid upon the treatment of the neutralized soln. with  $Br_2$  at  $0^\circ$ , removal of excess  $Br_2$  with  $Na_2S_2O_5$ , washing the ppt. with satd. NaCl soln. and finally with alc. and the use of considerable NaCl in the final soln. of the ppt. in NaOH.

Chas. Blanc

**Polarimetric determination of nicotine in tobacco and in tobacco smoke.** Ernst Toole. *Z. anal. Chem.* 93, 188-94 (1933).—Although Popovici (*Z. physiol. Chem.* 13, 445 (1889); *Chem.-Zig.* 13, 1030 (1889)), Degrazia (*C. A.* 5, 2507) and König (*C. A.* 5, 2876) have testified independently that the polarimetric method for detg. nicotine is sufficiently accurate, some doubt has been cast upon the method by Pyl and Schmitt (*C. A.* 22, 1214) who fear that errors may be introduced by the racemization of the nicotine as a result of heating but the expts. described here indicate that this is not the case under the usual exptl. conditions.

**Gas analysis.** Hilde Bergerhoff née Kiemle. *Ger.* 589,355, Dec. 6, 1933 (Cl. 42f. 4.16). To det.  $SO_2$ ,  $H_2S$ , Cl, HCl and oxides of N in flue gases or air, the gas is forced into a large vessel contg. an absorbent for the gases to be detd., e. g.,  $K_2CO_3$  soln., until a pressure of at least 10 atm. has been attained. The absorbent is then withdrawn and analyzed.

**Detecting and analyzing gaseous fluids.** Paul Malsalez. *Brit.* 398,722, Sept. 21, 1933. Gases, or impurities, e. g., smoke, dust, in gaseous fluids, are analyzed or detected by subjecting to the ionizing action of particles emitted by a radioactive substance in an elec. field, the elec. charges resulting from the dissocn. of the gaseous mols. forming an elec. current which is amplified and measured or operates controlling, signalling, ventilating or other app. App. is described.

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

**Mercury in native silver.** W. H. Newhouse. *Am. Mineral.* 18, 295-9 (1933).—Hg was found to be present in the native Ag from many localities. Ag amalgam richest in Hg was found in deposits with cinnabar or with Co and Ni minerals. The Ag contg. Hg is probably of hypogene origin.

A. M. Brant

**Metallic minerals in anhydrite cap rock, Winnfield salt dome, Louisiana.** Virgil E. Barnes. *Am. Mineral.* 18, 335-40 (1933).—The minerals formed in parallel planes, producing distinct banding in the anhydrite. They are epigenetic and were deposited in the order: As, chalcocite and enargite-chalcopryrite.

A. M. B.

**X-ray study of pyrite or marcasite concretions in the rocks of the Cleveland, Ohio, quadrangle.** Frank R. Van Horn and Kent R. Van Horn. *Am. Mineral.* 18, 288-94 (1933).—Crystallographic observations and x-ray analysis show that these concretions are pyrite.

A. M. B.

**The occurrence of strontianite at Sierra Mojada, Mexico.** Philip Krieger. *Am. Mineral.* 18, 345-50 (1933).—Strontianite as a gang mineral is confined to the Suiza ore body. It is distinctly secondary and assocd. with anglesite and cerussite. Celestite, deposited by ascending hydrothermal solns., was the primary mineral assocd. with the ore deposition.

A. M. Brant

**Topaz from the deposits at Guta-Pisarevka Volodar region, Voluin.** L. A. Krizhanovskii. *Mineral. Suir'e* 8, Nos. 8-9, 14-17 (1933).—The discovery of deposits of topaz and smoky quartz in the pegmatite veins and their properties are described.

Chas. Blanc

**Bavenite: symmetry, unit cell.** C. J. Ksanda and H. E. Merwin. *Am. Mineral.* 18, 341-4 (1933); cf. *C. A.* 26, 5515.—Bavenite is given a new orthorhombic orientation with  $a:b:c = 0.839:1:0.429$ . X-ray data yielded a unit cell  $a_0 = 9.67$ ,  $b_0 = 11.53$ ,  $c_0 = 4.95$  Å., with one mol. of  $2 SiO_2 \cdot Al_2O_3 \cdot BeO \cdot 4 CaO \cdot H_2O$  per unit cell. The d.

6 is  $2.74$ . Optical orientation:  $\gamma = a = Bx_a$ ,  $\alpha = c$ ;  $+2V = 46-58^\circ$ ,  $n_D: \alpha = 1.583-4$ ,  $\beta = 1.585$ ,  $\gamma = 1.590$ . Cleavage (100) is perfect, (001) fair.

A. M. Brant

**Some properties of authigenic tourmaline from Lower Devonian sediments.** Stella West Alty. *Am. Mineral.* 18, 351-5 (1933); cf. *C. A.* 26, 4773.—Detrital grains of tourmaline from the Lower Monroe dolomite, in Monroe Co., Mich., were found to have a secondary authigenic growth of colorless tourmaline at one end. This end was shown to be the antilogous pole of the mineral by pyroelec. tests.  $n_w = 1.628$  and  $n_e = 1.610$  in the colorless portion of the grains.

A. M. Brant

**Brown tourmaline from Frontenac and Renfrew Counties, Ontario.** G. A. Harcourt. *Am. Mineral.* 18, 356-8 (1933).—Optical properties by the double variation method are charted for 2 finds of dark brown tourmaline. Qual. study by quartz wedge spectrograph indicated these to be Mg tourmaline with Cr present in the Frontenac mineral.

A. M. Brant

**Crystal cavities in lavas from the Hawaiian Islands.** Kingsley C. Dunham. *Am. Mineral.* 18, 369-85 (1933).—New chem. analyses are recorded for *nephelite*, *phillipsite*, *chabazite*, *hydronephelite*, *allophane*, *laumontite*, *heulandite* and *philolite*. The optical properties are given for these and other minerals occurring in veins, cavities and amygdulites in lavas at Moiliili quarry, Honolulu, Alexander dam, Kauai and Lanakai Hills, Hawaii. The zeolites are thought to indicate a hydrothermal stage of the lava-magma.

A. M. Brant

**Additional notes on laumontite and thomsonite from Table Mountain, Colorado.** E. P. Henderson and Jewell J. Glass. *Am. Mineral.* 18, 402-6 (1933).—Chem. analyses and optical data are given for golden brown laumontite and the assocd. thomsonite found in vesicular cavities in basalt.

A. M. Brant

Clay minerals and bauxitic minerals. A review and classification based on a statistical method. S. I. Tomkeieff. *Mineralog. Mag.* 23, 463-82 (1933).—Plotting of available analyses on triangular diagrams, and frequency curves for the important ratios, lead to a classification of the clay minerals into 5 groups on the basis of the  $\text{SiO}_2:\text{Al}_2\text{O}_3$  ratio, termed resp., fuller's earth, pyrophyllite, anauxite, kaolinite and bauxitic clay. In addn. there are bentonitic clay minerals, micaceous halloysite, beidellite, montmorillonite, etc. Many supposed species are thought to be mixts., hydration products, or colloidal hydrates of variable compn. No data as to phys., optical, crystallographic or structural features are taken into account.

A. M. Brant  
Corvusite and rilandite, new minerals from the Utah-Colorado carnotite region. Edward P. Henderson and Frank L. Hess. *Am. Mineral.* 18, 195-205 (1933).—Corvusite has a purplish blue black to dark brown color and is massive with a conchoidal fracture. Hardness is 2.5 to 3, and sp. gr. 2.82. The chem. analysis indicates the tentative formula  $\text{V}_2\text{O}_5 \cdot 6\text{V}_2\text{O}_3 \cdot \text{XH}_2\text{O}$ . Rilandite is a compact, dull pitch-like material with a dark brownish black color. It is very brittle with flat conchoidal fracture, hardness 2-3, and streak grayish brown. It is found on the outer surfaces of petrified wood, and its analysis shows 47.50%  $\text{Cr}_2\text{O}_3$ .

A. M. Brant  
The origin of the sand barites of the Lower Permian of Oklahoma. W. A. Tarr. *Am. Mineral.* 18, 260-72 (1933).—The barite concretions and rosetts in the Garber sandstone formation are local in horizontal and vertical distribution. The crystals in the rosetts have various orientations. The Ba is thought to have been derived from Ba silicates, Ba adsorbed in colloids or detrital barite through leaching by chloride waters. After being carried a short distance it was deposited as barite, by reaction with a sol. sulfate, as a cementing material in the sandstone. Analyses show 37-45% sand in these sand-barites.

A. M. Brant  
Origin of tectites. V. S. Dubey. *Nature* 132, 678 (1933); cf. L. J. Spencer, *C. A.* 27, 3899; *Nature* 131, 876 (1933).—The radioactive content of tectites from widely different parts of the earth is nearly const. (Ra content  $1.00 \times 10^{-12}$  per g.) and is very different from that of several kinds of glass. The radioactivity of tectites is approx. the same as that of granites and suggests that tectites may be derived from some mass similar in chem. compn. as well as in radioactivity to the granitic layer of the earth.

Helen S. Hopfield  
Origin of tectites. J. B. Scrivenor. *Nature* 132, 678 (1933); cf. preceding abstr. An argument against Spencer's suggestion that tectites are formed by the fusion of terrestrial material in meteorite craters is the fact that no tectite has been found contg. partially fused rock or sand. His suggestion is supported by the presence of metallic spheres in Darwin glass and tectites from Indochina, and by the presence of Ni in 3 Malayan tectites.

The chemical basis of flotation. I. W. Wark. *Proc. Australasian Inst. Mining Met.* No. 90, 88-123 (1933).—Contact angles between pure minerals and collectors contg.

$\text{CH}_3$  group were  $50^\circ$ ,  $\text{C}_2\text{H}_5$  group  $60^\circ$ ,  $\text{C}_6\text{H}_5$  group  $74^\circ$ , benzyl  $71^\circ$ , etc. W. postulates adsorption leaving the nonpolar group always exposed. Curves of  $p_H$  vs. NaCN concn. show limiting conditions for contact for various minerals. The function of alkali present with NaCN as a depressant is solely to control the cyanide-ion concn., which in turn is the factor detg. whether or not contact can occur. Alden H. Emery

Mechanism of the flotation process. D. L. Talmud. *J. Tech. Phys. (U. S. S. R.)* 3, 540-9 (1933).—Sepn. of  $\text{PbS}$  and  $\text{CaCO}_3$  is discussed to illustrate selective flotation.

F. H. Rathmann  
Oxygen-free flotation. I. Flotation of galena in ab-

sence of oxygen. S. Frederick Ravitz and Robert R. Porter. *Am. Inst. Mining Met. Engrs., Tech. Pub. No. 513, 17 pp.* (1933).—O<sub>2</sub> content of the solns. used was less than 0.8 parts per 100,000,000. Pure unoxidized galena will float completely and rapidly with terpineol soln. alone, even at very low concns., or Na ethylxanthate alone, or in the complete absence of any reagents. The oxidation products on the surface of galena exert an inhibiting effect on its flotation. Explanations are offered. A. H. E.

Flotation of Rammelsberg lead-zinc ore. A contribution to the flotation of complex lead-zinc ores. A. Götze and E. Kraume. *Metall u. Erz* 30, 509-14 (1933).—Collective and selective flotation and the effects of various flotation agents are studied. H. Stoertz

Progress in the realm of ore-dressing technic. H. Madel. *Metall u. Erz* 30, 493-509 (1933).—New developments in grinding, grain-size detn., amalgamation, flotation and magnetic sepn. are discussed. H. S.

Milling methods at the oxide concentrator of the International Smelting Co., Tooele, Utah. J. J. Bean. *Bur. Mines, Information Circ. 6759, 8 pp.* (1933).—Siliceous oxidized Pb ores are concd. by flotation. The flow sheet is described. In Sept., 1930, heads assayed Cu 0.18, Pb 18.43, Fe 7.32, insol. 56.35%, Au 0.0567 oz. and Ag 24.85 oz. per ton. The Pb concentrate assayed Cu 0.36, Pb 47.02, Fe 13.94, insol. 16.73%, Au 0.114 oz. and Ag 58.76 oz. and contained 94.6% of the Pb, 43.7% of the Fe, 74.6% of the Au and 87.7% of the Ag. The tailing assayed Cu 0.08, Pb 1.58, Fe 6.56, insol. 79.69%, Au 0.023 oz. and Ag 4.87 oz. Reagent consumption was Na amylxanthate 1.5, Na<sub>2</sub>S 6.0, Na silicate 4.0, ethylxanthate 1.2 and pentasol (frother) 0.30 lb. per ton. Alden H. Emery

Direct recovery of metals from sulfidic copper ores, with special reference to Mansfeld copper shale. C. Goetz. *Metall u. Erz* 30, 469-80 (1933).—Cu is recovered from Cu shales by heating at temps. of 600-800° in an inert gas and in contact with Fe<sub>2</sub>O<sub>3</sub>. H. Stoertz

Precipitation of copper by nickel mat. Walter Savelsberg. *Metall u. Erz* 30, 445-8 (1933).—In the pptn. of Cu from soln. by Ni mat, the metallic part of the Ni mat is not effective, but the Cu is pptd. as sulfide by the sulfidic part of the mat. X-ray analysis confirms this. H. Stoertz

Separation of cobalt and nickel in aqueous solution for the practical recovery of the individual metals. H. Grotle. *Metall u. Erz* 30, 449-55 (1933).—If the original soln. contains no more than 5 parts of Ni to 100 parts of Co, Co can be pptd. with NH<sub>4</sub>OH + (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. The ppt. will contain no more than 1 part of Ni per 100 parts of Co. H. Stoertz

The application of low-temperature reduction to certain Ontario iron ores. J. R. Gordon and O. W. Ellis. *Can. Mining Inst. Bull. No. 260, 772-4* (1933); cf. C. A. 28, 4367. - Discussion. Alden H. Emery

Reduction of iron ores by means of natural gas. C. Căndea and J. Kühn. *Roczniki Chem.* 13, 482-94 (1933) (in German).—The reducing efficiency of the natural gas (contg. 94% CH<sub>4</sub>) found at Sărmasel (Roumania) on pure Fe<sub>2</sub>O<sub>3</sub>, magnetite, limonite, siderite and hematite was studied. Expts. carried out on Fe<sub>2</sub>O<sub>3</sub>, show that the reduction of this oxide to Fe<sub>3</sub>O<sub>4</sub> begins at 450° and to FeO at 750-850°, while at 850° metallic Fe is obtained. The amt. of C formed in the course of the reaction increases, since the metallic Fe catalytically hastens the decompn. of CH<sub>4</sub> to C and H<sub>2</sub>. It is possible to keep the amt. of C a min. by controlling temp. and rate of flow of gas within narrow limits. The authors modified the course of the reaction so as to obtain Fe with a low C content. A catalyst added to the sample being reduced partially decomposed the CH<sub>4</sub>, yielding a gas enriched by H<sub>2</sub>. The conditions and course of reduction for limonite, magnetite, siderite and hematite were the same as for Fe<sub>2</sub>O<sub>3</sub>, higher temps. being required to attain the same degree of reduction. C. T. Ichniowski

Basic open-hearth bottom-cast practice and iron-oxide control. W. J. Reagan. *Am. Inst. Mining Met. Engrs., Tech. Pub. No. 520, 15 pp.* (1934).—Basic open-hearth bottom-cast ingots can be produced commercially free from cracks, free from excessive pipe, with yields usually greater than that obtained from top-cast ingots, and

with comparative freedom from nonmetallic inclusions. Control of FeO is described; it decreases cost of steel mfg. as a result of greater efficiencies of addns., higher yields and better quality of steel. Alden H. Emery

Can grinding costs be reduced? Byron M. Bird. *Eng. Mining J.* 135, 26-9 (1934).—Over-grinding is responsible for a major portion of grinding costs. Tabling, laundering processes and jigging are discussed in their relation to the liberation of mineral and gang at coarse sizes. A desliming classifier of the vertical current type is needed to reduce the tendency to over-grinding. W. H. Boynton

Chlorine smelting with chloride electrolysis. Edgar A. Ashcroft. *Bull. Inst. Mining Met. No. 351, 1-27* (1933); cf. C. A. 28, 438°. - Discussion. Alden H. Emery

Experiments in flash-roasting. Frank S. Wartman. *Am. Inst. Mining Met. Engrs., Tech. Pub. No. 514, 12 pp.* (1933).—Flash-roasting expts. were made on chalcocite and chalcopyrite in a furnace 2 by 60 in. From 1000° to 1100°, variations in particle size below 100 mesh produced no significant effect on the S content of the calcine provided up draft and excess air were used. At temps. < 1000° or with down draft, the S content was greater with larger av. particle size. From 1000° to 1250°, variations in temp. produced no marked effect. A calcine with higher S was produced below 1000°. Below 700° very little roasting was done. Up draft gave more complete S removal than down draft. At 1100°, with mineral grains finer than 100 mesh, there was little difference in furnace chambers of 2 1/2 or 5 ft. high. At temps. above 1000°, utilization of O<sub>2</sub> was practically complete up to the point at which most of the S was removed. Use of excess O<sub>2</sub> had little effect in reducing S in the calcine. From chalcocite, both Cu<sub>2</sub>O and CuO are formed; from bornite or chalcopyrite, cupric ferrite and CuO are formed. Cuprous ferrite (Cu<sub>2</sub>O.Fe<sub>2</sub>O<sub>3</sub>), d. 5.47, hexagonal, slightly magnetic, black, may be formed by direct union of the oxides at high temps., by using excess Cu<sub>2</sub>O, and quenching. CuO.Fe<sub>2</sub>O<sub>3</sub> occurs in 2 forms. One is cubic, d. 5.3, strongly ferromagnetic, steel-gray in color, and is formed by heating a mixt. of oxides in suitable proportions at 800-900° and cooling rapidly. Heated for some time at 350° it transforms to a tetragonal variety, d. 5.29, brown and feebly magnetic. All are readily sol. in strong HCl and in HCl mixed with H<sub>2</sub>O, less rapidly in strong HNO<sub>3</sub> and H<sub>2</sub>SO<sub>4</sub>, and almost insol. in strong NH<sub>3</sub> and in boiling 8% NaCN. Calcines from chalcocite were leached readily with acid Fe<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>. Presence of Fe results in ferrite formation. Ferrites are practically insol. in all leaching reagent at present regarded as commercially practicable. Formation of ferrites may be prevented by keeping the roaster temp. < 700° and using a very fine feed. Alden H. Emery

Influence of the most important slag formers upon the temperature-viscosity relationship of Mansfeld slags. K. Endell, W. Müllensiefen and K. Wagenmann. *Metall u. Erz* 30, 425-31 (1933).—At 1300° the viscosity of the slag is lowered by addn. of CaO, MgO, K<sub>2</sub>O and is raised by SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub>. Under 1300°, the influence of temp. upon viscosity increases more than the influence of chem. compn., and is very great at lower temps. H. S.

Some metallurgical aspects of the present production of steel and other ferrous castings. R. A. Bull. *Metals & Alloys* 5, 1-4 (1934).—Comments regarding purchase specifications and metallurgical terminology of ferrous castings. Downs Schaeff

Mechanical properties of metals at low temperatures. II. Non ferrous materials. E. W. Colbeck and W. E. MacGillivray. *Trans. Inst. Chem. Engrs.* (London) **1933**, Nov. 29, 13 pp.(preprint); cf. *C. A.* **27**, 5289.—Metals tested were: Cu; Cu-Ni, 80/20, 55/45, 30/70; Ni; Ni-Ag; brass 70/30; Al; Al bronze; Y alloy; solder. It was difficult to generalize on the large no. of results reported except, possibly, the Cu, Ni and their alloys are valuable metals for low-temp. work where ductility is of importance. Greatest improvement in elongation values in the Cu-Ni series is between  $-120^{\circ}$  and  $-180^{\circ}$ . There was marked deterioration of ductility in solder at  $-180^{\circ}$ , probably because of high Sn content. H. E. Sillman

The use of the radioactive isotope of lead, thorium B, in the study of metallurgical problems. G. Tammann and G. Bandel. *Z. Metallkunde* **25**, 153-6, 207-9(1933).—Th B is prep'd. by pptg. an active deposit from the emanation on a metal sample strip connected to the neg. pole of a lighting circuit (220 v.) in a glass vessel covered by Cu connected to the pos. pole. 1.3 mg. radio-Th ppts.  $8 \times 10^{-4}$  mg active deposit in 24-48 hrs., 10% of which is deposited on the metal sample strip; the deposit is chiefly Th B. The metal strip is melted under H<sub>2</sub>, polished (not etched) and laid upon a photographic plate to effect photographic registration of  $\alpha$ -particles. A large no. of such contact radiographs are shown: solid Pb dissolves Th B and thus only a general darkening is obtained; Tl is similar; Mg shows stars which disappear to uniform blackening on annealing the sample; Bi, Sn, Sb, Ag, Au and Cu show deposition of Th B in dendrites, Ni at grain boundaries; Cd shows dendritic structure, which on annealing gives way to uniform blackening because of diffusion, thus showing Th B (and Pb) to be slightly sol. in Cd. Solid soly. of Pb in metals shown in this way is remarkably low; for some metals it is lower than  $10^{-4}$ , though the effect of Pb already present in the sample confuses the point somewhat; previous data showing higher soly. of Pb in thin metals are probably wrong. Th B preferentially dissolves in liquid inclusions and thus offers a means for recognizing them even when submicroscopic, such as oxides, sulfides, and phosphides in Fe and steel. The primary casting structure is also shown, by reason of the concn. of Th B between dendrites and at grain boundaries. This concn. is not affected by any transformation in the solid state, thus offering an unaffected record of the original casting structure, as exemplified by the pearlite transformation in steels and transformations in the systems Ag-Zn ( $\beta$ ), Cu-Zn ( $\beta$ ), Mg-Cd, Au-Cd. Cast Al shows Th B to be between dendrites; Th B dissolves in the included  $Al_2O_3$ . Th B also dissolves preferentially in MgO and thus records this comp'd. in Mg ingots. When liquid Al contg. Th B is shaken with liquid Pb, the Th B migrates entirely to the Pb; a similar parting is shown when Al is shaken with Bi, Tl or Cd, the latter metals taking the Th B; similarly Th B migrates to Pb and Tl from molten Zn. Cast Cd shows Th B at grain boundaries and in dendritic structure; cold rolling elongates these films, and this elongation may be perceived even after lower-temp. recrystn., though high-temp. annealing destroys the record by the progressive soln. of the Th B in solid Cd. R. F. Mehl

The broadening of the Debye-Scherrer lines on the röntgenograms of metals after cold working and annealing. S. Konobeyevskii and I. Seliskii. *Physik. Z. Sowjetunion* **4**, 459-80(1933).—This phenomenon was studied with Cu,

Fe, Al, Zn, Mg and the Al-Zn-Mg alloy "Electron AZM." For Mg, the width of the line is an exponential function of the annealing time for temps. below recrystn. For "Electron," a triplet instead of the  $K_{\alpha}$  doublet is found for high-order lines; this is explained by diffusion of the Al and Zn atoms in the deformed solid-soln. lattice. It is theoretically shown that, in certain temp. intervals, elastic strains can be relieved through a redistribution of the atoms of the components of the solid soln.

Victor Hicks

Can metal surfaces be made passive? H. Hebbingling. *Oberflächentechn.* **10**, 257-8(1933).—The question is discussed to what extent rusting and oxidation of Fe can be prevented by rendering the surface passive and then applying protective coats or paint. According to the theory that metal corrosion is an electrochemical process, rusting of Fe takes place between the potential range of  $-0.2$  v. (subpassive state) and  $+0.4$  v. (subactive state); the state of "superactivity" or "cathodic passivity" is characterized by an interval of  $+0.5$  to  $+0.9$  v., the state of "anodic passivity" from  $-0.2$  to  $-0.9$  v. In the range of these 2 extremes Fe remains absolutely free of rust, in the first case, however, only in the presence of alk. solns. of low concn. A number of expts. which have been made to elucidate this behavior and to decide whether such passivation is indeed the reason for non-rusting are reviewed. Only in the case of Fe embedded in lead peroxide could the existence of a passive layer be proved with certainty. A practically useful treatment of the surface has so far not been developed. M. Hartenhein

Methods of preparation of graphitized metals and alloys. M. P. Slavinskii and A. C. Turnarev. *Metallurg* **8**, No. 4-5, 70-91(1933).—Antifriction bronze contg. graphite was produced by mixing the graphite with the powdered alloy, briquetting under a pressure of 1-3000 kg. per sq. cm., and heating to a temp. between the solidus and the liquidus in a H atm. After furnace cooling the specimens were again pressed to increase their d. and hardness. A 10% Sn bronze mixed with 10% graphite, heated to  $880^{\circ}$  and subjected to 3000 kg. per sq. cm. before heating and 2400 kg. after heating, had a Brinell hardness of 35 and a compressive strength of 24.2 kg. per sq. mm. Satisfactory results were also obtained with a crude copper contg. Sn 5.51, Pb 7.18 and Zn 1.81%. Brass and Al bronze gave poor results because of the small temp. interval between the solidus and the liquidus. H. W. R.

Gases evolved from ferrosilicons under the influence of water. H. Delomenie. *J. pharm. chim.* **18**, 289-92 (1933); cf. Lebeau, *C. A.* **3**, 867; Schut and Jansen, *C. A.* **26**, 2951; Wilmet, *Study and Analysis of Gaseous Mixtures*. Thesis. Paris, 1929.—Powd. samples of ferrosilicon kept under water *in vacuo* for 3 days gave off H, PH<sub>3</sub> and AsH<sub>3</sub>. They were sep'd. by a concd. soln. of Cd-(AcO)<sub>2</sub> which absorbs AsH<sub>3</sub> only. PH<sub>3</sub> was then absorbed by a viscous soln. of H<sub>2</sub>SeO<sub>4</sub> (Wilmet). With samples contg. (I) 20-30% Si, H is evolved chiefly, up to 2000 l. per ton. With (II) 30-60% Si, PH<sub>3</sub> 10-230 l., AsH<sub>3</sub> 5-39 l. per ton, and very little H were given off. With samples (III) above 60% Si, much H, AsH<sub>3</sub> not more than 3 l. and PH<sub>3</sub> 3-60 l. per ton were set free. Formation of H in group I is caused by electrolysis; in II mainly by decompn. of Ca silicide (A) with H<sub>2</sub>O; in III by decompn. of A and action of Ca(OH)<sub>2</sub> and H<sub>2</sub>O on free Si. PH<sub>3</sub> and AsH<sub>3</sub> are formed from phosphides and arsenides notably of Al; they are readily decomposed by H<sub>2</sub>O. A pure alloy of 50% Si remained compact and unaltered in moist air; addn. of these impurities caused disintegration. S. Waldbott

D. Thuesen

The effect of the temperature of liquid hydrogen ( $-252.8^\circ$ ) on the tensile properties of forty-one specimens of metals comprising (a) pure iron 99.85%; (b) four carbon steels; (c) thirty alloy steels; (d) copper and nickel; (e) four non-ferrous alloys. W. J. de Haas and Robert Hadfield. *Phil. Trans. Roy. Soc. (London)* A232, 297-332(1933).—To follow further the changes in the tensile properties of Fe and its alloys observed at the temp. of liquid air,  $-182^\circ$  (described in *Proc. Roy. Soc. (London)* A74, 326(1904)), and to det. whether a regular progression occurs in these changes or whether any critical change of behavior happens on going to lower temps., various samples of Fe and its alloys and of some non-ferrous alloys were tested at the temp. of liquid H<sub>2</sub>,  $-252.8^\circ$ . The app. and method used in the expts. are described in detail. Fe, ordinary steels and most of the alloys of Fe, which at  $-182^\circ$  retained a slight degree of toughness, had lost all ductility at  $-252.8^\circ$ . Alloys comparatively high in Ni, however, still retain remarkable ductility; e. g., an alloy of Fe with 57.5% Ni exhibits an elongation of 35.5% with a tenacity of 73.3 tons per sq. in. Pure Ni is actually stronger, tougher and harder at  $-252.8^\circ$  than at room temp. Similarly, the mechanical properties of Cu and Al improve with the lowering of the temp. to  $-252.8^\circ$ . C in amounts of 0.1 to 0.3% minimizes the tendency of Fe toward increased brittleness and causes its tenacity to increase below  $-182^\circ$ . The effects of low temp. on the mechanical properties are temporary, the various materials recovering their normal condition at ordinary temps.

Mechanical properties of alloy steels at high temperatures. M. Vratzki and I. Frantzevich. *Stal* 3, No. 4-5, 52-68(1933).—Steels of the 3310, 3335, 52,100 and 4130 types were tested for tensile strength, elongation and reduction of area at temp. from 600° to 1200°. At 600° the tensile strengths were 24.6, 27.4, 54.7 and 34.0 kg. per sq. mm., resp., while at 1200° all tested approx. 2.5-3.0. The formula  $R = R_0 e^{-\alpha T}$  is proposed, where  $T$  is

the abs. temp. and the const.  $m$  varies for the  $\alpha$ ,  $\beta$  and  $\gamma$  phases, depending on the internal energy of the space lattice. H. W. Rathmann

The chemical nature of structural transformations in plain and alloy steels. G. Nesselshaus. *Stal* 3, No. 4-5, 46-51(1933).—The theory of hardening and factors to be considered in heat treating are given. N. believes that "temper brittleness" in Ni-Cr steels is due to pptn. hardening. H. W. Rathmann

The influence of a second alloying metal on the properties of copper-alloy steel with special regard to red-brittleness. W. Raedeker. *Mitt. Forschungsinst. Ver. Stahlwerke Dortmund* 3, 173-98(1933).—Improvement in tensile strength of C steel caused by addn. of Cu in small amts., as influenced by further addn. of Ni, Cr, Mo, V, Co and Ti, was investigated. Cu alone of about 1% increases tensile strength by about 7-8 kg./sq. mm. which is only slightly reduced by addn. of Ni, Cr, Mo and V. The greatest difference in strength between temper-hardened and soft-annealed Cu steel is about 14 kg./sq. mm. while with the other addns. it was 14.7. The curve of notch-toughness is shifted, in all steels, to higher values. The temp. of tempering for 1.5 hrs. to the max. of hardness is for both pure Cu steels and alloyed Cu steels 500°; cold-deformation shifts the max. hardness to lower temps. The addnl. metals do not influence segregation velocity of Cu. Red-brittleness occurs in Cu steels only above the m. p. of Cu, and it is necessary that liquid metallic Cu which is formed in the oxidation of steel be present on the steel surface; red-brittleness is also influenced by O diffusing into the steel. Ni can prohibit red-brittleness of Cu steels; on the one hand, it forms with the segregated Cu solid solns. of higher m. p.; on the other, it protects the steel very likely from too strong penetration of O. Cu steels alloyed with Mo, Co, V and 0.9% Ti incline to red-brittleness; steels contg. 1.3% Ti, however, do not. Twenty-seven references. M. Hartenheimer

Preferred orientation produced by cold-rolling low-carbon sheet steels. W. A. Sisson. *Metals & Alloys* 4, 193-8(1933).—An x-ray investigation of the course of changes in crystal fragmentation and orientation during successive stages in the rolling process. D. Schaaf

Constitutional diagram of alloys formed of two alkali metals; sodium-rubidium alloys. E. Rinck. *Compt. rend.* 197, 1404-6(1933); cf. C. A. 27, 5705.—There is no indication of the formation of a compd. Na<sub>2</sub>Rb, analogous to the Na<sub>2</sub>K clearly shown by the solidification curve for Na-K alloys. Morris Muskat

The gray coloring of copper alloys by pickling in arsenic. Georg Gross. *Oberflächentechn.* 10, 267-70(1933).—The process of gray coloring of Cu alloys used for parts of instruments by immersion in a soln. of 83 g. As<sub>2</sub>O<sub>3</sub> and 83 g. FeSO<sub>4</sub> in 1000 g. commercial HCl was investigated with respect to an eventual improvement in compn. and quality of product. The soln. can be applied without having been first heated and cooled again. The coloring velocity increases with temp., but 45° should not be exceeded for a steel-gray color. Instead of commercial also chemically pure HCl can be used. Coloring can be accelerated by repeated rinsing and drying of the ware; the gray tone can be obtained more easily on mat surfaces than on polished. The rapidity of pickling can be increased 50% by using 100 g. HCl, 21 g. FeSO<sub>4</sub>·7H<sub>2</sub>O and 14 g. As<sub>2</sub>O<sub>3</sub> at room temp. A soln. of 11.2 g. FeSO<sub>4</sub>·7H<sub>2</sub>O and 10.3 g. As<sub>2</sub>O<sub>3</sub> in 100 g. HCl reduces coloring time from 25 min. to 10 sec.; it can be used for Zn sheet, brass, tombac, red brass, cast bronze, rolled bronze and Cu sheet to obtain gray tones. M. Hartenheimer

Apparatus for predeterminedly proportioning the flow of materials as in metallurgical processes. Edward M. Hamilton and Selim E. Woodworth (to Hamilton, Beauchamp & Woodworth). U. S. 1,940,946, Dec. 26. Various structural, mech. and operative details are described.

Ores. Fried. Krupp Grusonwerk A.-G. Ger. 585,542, Oct. 10, 1933. In sintering fine ores, etc., with air admission, pure Fe slurry is used entirely or partly as the fuel.

Copper ore flotation separation. Reginald J. Lemmon (to Imperial Chemical Industries Ltd.). U. S. 1,939,068, Dec. 12. Ore in which Cu occurs combined both with O and with S and substantially free from Au and Ag is crushed and subjected to froth concn. in stages in the first of which principally the sulfide values are sepd. (no cyanide compd. being present), while in a succeeding stage a cyanide compd. is present to enhance the floatability of the oxidized Cu compds.

Treatment of ores. Carl Goetz. Ger. 589,448, Dec. 7, 1933 (Cl. 40a. 11.70). Sulfidic or arsenical ores of Cu and other metals are heated in the absence of air and in the presence of Fe or a compd. of Fe to a temp. below the m. p. of the ore. The metals in the ore are liberated, and agglomerate to coarse particles. The ore may be heated for some hrs., first at 600° and then at 800°, in a stream of inert gas, which may be mixed with a combustible gas, with or without steam. Ores contg. a substantial proportion of Fe are treated without further addn. of Fe. Exptl. results are given.

Treatment of ores, etc., containing lead and zinc. Edgar A. Ashcroft. Ger. 588,314, Nov. 15, 1933 (Cl. 40a. 2.60). Sulfide ores or other materials contg. Pb and Zn are heated gradually to about 350° with FeCl<sub>3</sub> and the mixt. is then heated to 750-950° to distill off ZnCl<sub>2</sub> and PbCl<sub>2</sub>.

Treatment of ores, etc. Milo W. Krejci. Ger. 588,315, Nov. 17, 1933 (Cl. 40a. 11.70). See U. S. 1,915,540 (C. A. 27, 4205).

Crushing and amalgamating mills for gold ores. Empire Crushing Mill Proprietary Ltd. (Henry G. Taylor, inventor). Australia 9096/32, Oct. 19, 1933.

Apparatus (with annular grooves on a rotating disk with sloping sides) for recovery of gold and other precious metals from gravel or sand, etc. Drayton A. Silver and Jesse W. Silver. U. S. 1,939,148, Dec. 12. Mech. features.

Separator for recovering particles of gold. John Murray. Australia 8837/32, Sept. 28, 1933.

Treating sulfur-bearing ores and concentrates in reverberatory furnaces. Kenneth M. Simpson (to International Chromium Process Corp.). U. S. 1,940,977, Dec. 26. A charge of material such as a Cu-ore concentrate is introduced to the smelting section of the furnace and smelted by projecting flame in an unobstructed path downwardly from the upper portion of the furnace at high velocity onto the major portion of the entire surface of the charge; the resultant slag and mat is flowed into the settling section of the furnace and there heat of lesser intensity is applied to the surface of the material sufficient to maintain the slag in fluid condition and slag and mat are stratified and sepd. App. is described.

Treating ores such as those of iron and manganese. Grover J. Holt, Richard O. Hocking, Amel E. Matson and Arthur K. Knickerbocker. U. S. 1,939,119, Dec. 12. The ore is comminuted, delimed, thickened, slimes are thickened and then subjected to flotation; concentrates from the flotation are subjected to a second flotation and tailings from the latter are mixed with unthickened slimes.

Upright shaft and associated apparatus for treating iron ore. Louis F. Clark and Carl L. Wallfred (to A. V. Smith Corp.). U. S. 1,940,246, Dec. 19. Mixts. of gas and air are burned in a plurality of combustion chambers mounted on the shaft, to heat the ore; gases from the top portion of the shaft are returned to the combustion chambers to reduce the temps. of the flames therein, the compn. of the atm. in the shaft is suitably controlled; heated ore from the shaft is transferred to a quenching tank and during this transfer is prevented from coming into contact with oxidizing atms.

Roasting oxidic iron ores to produce the magnetic oxide. Bayerische Berg-, Hütten- und Salzwerke A.-G. Ger. 586,866, Oct. 26, 1933 (Cl. 1b. 2). App. is indicated.

Mechanical sintering or roasting apparatus for ores, etc. Metallges. A.-G. Ger. 585,367, Oct. 10, 1933.

Sintering ores such as those of copper and zinc. Thomas H. Bennett (to Matthiessen & Hegeler Zinc Co.). U. S. 1,940,935, Dec. 26. Ore is continuously supplied and is roasted while conveyed along an endless path of travel such as a rotatable table and different layers of the ore are separately removed as the roasting is completed. App. is described. Cf. C. A. 27, 1311.

Roasting ores. Metallgesellschaft A.-G. (Hans Klencke, inventor). Ger. 585,658, Oct. 12, 1933. Addn. to 458,604. Sulfidic ore slurry is mixed with roasted ores prior to roasting thoroughly.

Refining metals. Richard Walter. Ger. 589,256, Dec. 4, 1933 (Cl. 18b. 9). Iron and other metals are deoxidized and desulfurized by treatment in the fused state with an alkali carbonate mixed with 2-40% of CaF<sub>2</sub>.

Refining metals. Arthur Kirchhof. Ger. 575,412, Nov. 28, 1933 (Cl. 40a. 15.01). Fused metals contg. unfused impurities such as oxides are treated with a powd. mixt. of a mineral and an org. substance, *e. g.*, a mixt. of kieselguhr or chalk with glue or horn. The gas evolved from the org. substance carries the impurities to the surface of the melt. The method is particularly useful when the oxides or other impurities are heavier than the fused metals.

Distilling metals. René H. L. Aubert and Charles St. Martin. Fr. 754,894, Nov. 16, 1933. An app. is described with air-tight joints for the rapid distn., under vacuum, of metals such as Zn and Cd.

Purifying light metals. Deutsche Gold- und Silber-Scheideanstalt vormals Roessler. Fr. 754,627, Nov. 10, 1933. Crude light metals or their alloys in the molten state, particularly alkali and alk. earth metals, are purified

by maintaining the bath in an inert atm. at a temp. at which the impurities solidify, and sepg. the impurities by filtration. An app. is described.

**Purifying metallic particles such as copper.** Wm. H. Osborn and Harry H. Stout, Jr. (to Coalescence Products Co.). U. S. 1,938,608, Dec. 12. Metallic particles are treated at an elevated temp. somewhat below their m. p. with a gaseous mixt. of reducing character with respect to oxides of the metallic particles but oxidizing character to carbon, such as a mixt. of steam with about 1-15% H by vol.

**Purifying magnesium.** Edwin O. Barstow and John A. Gann (to Dow Chemical Co.). U. S. 1,940,618, Dec. 19. The molten metal is agitated in a closed vessel with a fluid flux of  $\text{CaCl}_2$  and  $\text{NaCl}$  in the presence of a protective atm. such as S vapor to inhibit oxidation.

**Eliminating impurities from zinc sulfide ores.** Wm. T. Isbell and George F. Weaton (to St. Joseph Lead Co.). U. S. 1,940,912, Dec. 26. For eliminating impurities such as Pb and Cd, the ore is subjected to an oxidizing roast at a temp. above  $800^\circ$  and the dust and fume in the roaster gases is differentially sepd. into portions of relatively coarse and relatively fine particle size, and the relatively coarse portion is returned to the roasting operation.

**Apparatus for obtaining pure zinc by distilling.** The New Jersey Zinc Co. Ger. 585,627, Oct. 12, 1933.

**Refining zinc.** Philip McL. Ginder (to The New Jersey Zinc Co.). Brit. 397,061, Aug. 17, 1933. Zn contaminated with Pb is redist. in a no. of retorts each fitted with a reflux condenser for purifying the Zn vapor from Pb, the purified vapor being led from all the condensers to a common collecting chamber. App. is described.

**Zinc blende.** Xavier de Spirlet. Ger. 585,625, Oct. 6, 1933. Fine granular Zn blende is pretreated ready for roasting by moistening and mixing with 5-15% of the blende which has been roasted and treated with  $\text{H}_2\text{SO}_4$ , and 1-3% powd. clay contg.  $\text{SiO}_2$ . The whole is then briquetted ready for roasting.

**Casting metals.** Vereinigte Stahlwerke A.-G. Fr. 755,973, Nov. 18, 1933. Crystn. in large grains during the solidification of cast metal pieces is avoided by adding to the molten mass a solid material composed of crystals of the same sort as, or isomorphous with, those which form during the solidification.

**Casting iron.** Edouard Mairy. Ger. 585,361, Oct. 2, 1933. Molds for centrifugal casting are lined with Al or an alloy or mixt. contg. Al, e. g., an Al-Fe mixt. contg. 3-10% of Al with or without graphite. The mixt. may be homogenized by heating it to  $400-600^\circ$  in the absence of air.

**Encasing iron with copper or nickel or their alloys.** Tricer Walzwerk A.-G. Ger. 589,298, Dec. 5, 1933 (Cl. 49/ 5). Mech. and manipulative features are described.

**Casting iron and its alloys.** Wilhelm Klepsch. Austrian 135,213, Nov. 10, 1933 (Cl. 31b). Castings having a high resistance to heat, acids and alkalis are made by casting ordinary iron or its alloys in molds to which a decarbonizing agent has been applied in a sufficient amt. to reduce the C content of the surface of the casting to between 0.25 and 2.6%. Thus, the metal may be cast in a mold prepd. from a mixt. of sand and  $\text{Fe}_2\text{O}_3$ , or in a sand mold wetted with NaOH soln. Alternatively, a decarbonizing gas or vapor, e. g., O or vaporized NaOH, may be forced into the mold before, during or after casting. The decarbonizing agent may act during the casting operation or during the annealing of the casting in the mold.

**Castings of aluminum or its alloys.** Helumin-Leichtmetall G. m. b. H. Ger. 587,000, Oct. 28, 1933 (Cl. 40a. 15.60). See Fr. 752,127 (C. A. 28, 734\*).

**Degreasing system suitable for treating metal castings with vapors.** Arthur L. Koch (to Carrier Research Corp.). U. S. 1,938,841, Dec. 12. Various details of app. and operation are described.

**Extrusion and forming dies such as those faced with tungsten carbide.** Jean H. L. De Bats. U. S. 1,939,768, Dec. 19. A die is formed with a body portion of relatively soft metal and having a central aperture provided with a plurality of annular ridges therearound, and a

1 wear-resistant facing formed of material such as W carbide and Co, Ni or Fe on the annular surface and fused and compacted in place. Various details of app. for such die manuf. are described.

**Drawing dies.** Aaron Simons. U. S. 1,939,468, Dec. 12. A die is formed with a casing contg. an interior body material comprising abrasive particles such as  $\text{SiC}$ , W carbide or  $\text{SiO}_2$  held in place by an interstitial metal matrix such as a Cr-Ni alloy.

2 **Mold materials.** Edwin H. Moore. Brit. 399,124, Sept. 28, 1933. Molds for casting easily oxidized metal, e. g., Mg (alloys), are made from sand mixed or sprayed with a  $\text{ZnCl}_2$  soln. A satd. soln. in  $\text{Me}_2\text{CO}$ , mixed with an equal vol. of  $\text{CCl}_4$  may be used.

**Metallurgical furnaces.** Deutsche Babcock & Wilcox Dampfkessel-Werke A.-G. Ger. 589,157, Dec. 4, 1933 (Cl. 31a. 1.70). A channel is described in which flowing molten metal is mixed with added materials, e. g., Si.

**Inclined horizontal ore-reducing furnace suitable for treating iron ores.** Olaf A. Ilougen and Kenneth M. Watson. U. S. 1,938,832, Dec. 12. Various structural, mech. and operative details are described.

**Continuous muffle furnace for melting metal foil.** Ludwig Hilgert and Karl Hilgert. Ger. 588,316, Nov. 23, 1933 (Cl. 40a. 15.60).

**Muffle for zinc smelting.** The New Jersey Zinc Co. Ger. 586,960, Oct. 28, 1933 (Cl. 40a. 40.50).

**Furnace for melting copper.** The American Metal Co. Ltd. Ger. 588,238, Nov. 17, 1933 (Cl. 40a. 30).

**Melting furnace and associated apparatus for refining lead such as that of scrap battery plates.** Philip W. Davis. U. S. 1,938,582, Dec. 12. Various structural and operative details are described.

**Furnace and associated apparatus for treating molten metals as in refining and deoxidizing aluminum.** John Schmeller, Sr. (to Schmeller Holding Co.). U. S. 1,940,021, Dec. 19. Structural and mech. features.

**Dwight-Lloyd sintering apparatus.** Blei- und Silberhütte Braubach G. m. b. H. and Paul Wefelscheid. Ger. 585,626, Oct. 5, 1933 (Cl. 40a. 3.60). Details of the hearth are given.

**Grate for Dwight-Lloyd sintering apparatus.** Blei- und Silberhütte Braubach G. m. b. H. and Paul Wefelscheid. Ger. 586,912, Oct. 27, 1933 (Cl. 40a. 3.60). Addn. to 585,626 (preceding abstr.).

**Rotating furnace for roasting sulfides.** Metallgesellschaft A.-G. (Hans Klencke, inventor). Ger. 586,834, Oct. 27, 1933 (Cl. 40a. 5.01).

**Shaft furnace plant for treating solids with gases.** Aktieselskapet Norsk Staal (Elektrisk-Gas-Reduktion). Ger. 585,543, Oct. 11, 1933.

6 **Blast furnace.** Ignaz Loeser. Ger. 585,808, Oct. 9, 1933.

**Apparatus for regeneratively heating gases as in blast-furnace operation.** Percy H. Royster (to Research Corp.). U. S. 1,940,371, Dec. 19. Various structural and operative details are described.

**Charging scrap metal into blast furnaces.** Joshua K. Clutts. U. S. 1,938,580, Dec. 12. Successive charges of scrap metal are delivered to the furnace in proximity to its vertical axis, and other materials such as fuel and ore are delivered in a surrounding relation to the scrap metal so that the latter is kept from the furnace lining.

**Device for burning lustrous soot from metal surfaces by oxygen.** Gust. E. Rehborn. Ger. 586,673, Oct. 24, 1933 (Cl. 24g. 4.03).

**Metal-heating furnaces.** Ralph Halkett, Henry Alexander Fells and James Brown. Brit. 397,640, Aug. 31, 1933. A gaseous atm. which prevents the formation of scale on metals during heating is produced by cooling neutral combustion products, i. e., contg. no free O or unburnt gas, to remove the  $\text{H}_2\text{O}$ -vapor content. The last traces of  $\text{H}_2\text{O}$  vapor may be removed by addn. of a suitable reagent, e. g., coal gas.

**Furnace suitable for heat-treating or "normalizing" metal sheets.** Henry A. Drefflein. U. S. 1,938,814, Dec. 12.

**Furnaces for heat treatment for metal sheets and trans-**

porting means therein. Alfred Smallwood and John Fallon. Fr. 754,415, Nov. 7, 1933.

Furnace for tempering tools. Allgemeine Elektrizitäts-Gesellschaft (Victor Paschkis, inventor). Ger. 586,653, Oct. 24, 1933 (Cl. 18c. 9.01).

Annealing furnace for iron objects. The Singer Manufacturing Co. Ger. 585,745, Oct. 12, 1933.

Hydrogen furnace for annealing metal blanks. Allgemeine Elektrizitäts-Ges. Ger. 586,977, Oct. 28, 1933 (Cl. 18c. 8.90).

Apparatus (with an inclined hearth) for separating metals of different melting points such as solder from other scrap metal by partial melting and action of gravity. Frank R. Corwin and Leon W. Booton (to Nichols Copper Co.). U. S. 1,940,448, Dec. 19. Various structural, mech. and operative details are described.

Metal bodies. Franz Skaupy. Ger. 586,621, Oct. 23, 1933 (Cl. 48b. 11.01). A suspension of metal powder is sprayed on a core, dried, sintered and the core removed by chem., phys. or mech. means.

Mechanical treatment of metal articles. C. T. Petzold & Co. Austrian 135,668, Nov. 25, 1933 (Cl. 48b.). Addn. to 128,624 (C. A. 26, 5060). The method of Austrian 128,624 is modified by applying, instead of a softer metal coating, a coating of nonmetallic material having lubricating properties, e. g., a coating contg. an oil or fat, talc or graphite. The modified method is useful for articles, the manuf. of which involves only a few mech. treatments, all of which are effected in the cold.

Rolls for working metals, etc. Deutsche Edelstahlwerke A.-G. Ger. 589,124, Dec. 2, 1933 (Cl. 7a. 19). Smooth or collared rolls are made by casting around a steel core an alloy contg. Cr 25-35, Co 45-55, W 15-25 and C 2.5-4%.

Pickling metals. Vereinigte Stahlwerke A.-G. Fr. 755,107, Nov. 20, 1933.  $H_2SO_4$  which has been used for refining petroleum hydrocarbons is dild. with water to 35.40° Bé. and heated to 90° for  $\frac{1}{2}$  to 1 hr., or is heated to the same temp. and for the same time to the same concn. by the introduction of steam and is then used for pickling Fe and steel.

Pickling metals. Imperial Chemical Industries Ltd. Fr. 755,281, Nov. 22, 1933. A quaternary  $NH_4$  compd., e. g., cetyl pyridinium bromide, is added to the pickling acid to reduce the attack of the acid on the metal without preventing the dissolving of the rust.

Pickling stainless steel. Maurice Taylor (to Merrimac Chemical Co.). U. S. 1,939,241, Dec. 12. A bath is used contg. HOAc 40-50,  $HNO_3$  10-15 and HCl 4-8%.

Dies suitable for working sheet metals. Wm. G. Calkins (to Chrysler Corp.). U. S. 1,940,294, Dec. 19. Die parts are formed comprising a compressed mass of sponge-iron particles of a high degree of porosity, particles of Cu fused to the sponge-iron particles to bond them, and a solid lubricant comprising powd. graphite distributed through the mass.

Heat treatments of metal articles. John W. Harsch (to Leeds & Northrup Co.). U. S. 1,940,948, Dec. 26. App. and details of operation are described in which a gas such as air or  $NH_3$  in swirling motion is used as a heat-transfer agent.

Heat-treating magnetic materials. Victor E. Legg (to Electrical Research Products, Inc.). Brit. 397,134, Aug. 16, 1933. Magnetic material comprising Fe, Ni and Co, with or without small amts. of other substances, e. g., Mo or other elements specified in Brit. 323,222, is conditioned by subjecting to an intense magnetic field and then heating to 400-600°, preferably at least 8 hrs. The material may be annealed before subjecting to the magnetic field. In an example a ring of spirally wound tape of an alloy contg. Ni 45, Co 25, Fe 23 and Mo 7% is annealed 1 hr. at 700°, strongly magnetized and heated 48 hrs. at 440°. Cf. C. A. 27, 4763.

Heat-treating alloys. Arnold Tross. Brit. 397,017, Aug. 17, 1933. The lightly heated part of a firebox and the less heated part are made of different alloys or of the same material differently heat-treated to give high resiliency to the former part and high ductility to the latter.

Thus a firebox may be made of an alloy, contg. Cu 98, Ni 0.6-1.5, Si 0.7-0.4 and Fe up to 1%, which is ductile when unhardened and highly resilient when hardened, even when heated. Other suitable alloys are those contg. at least 95% Cu and at least 2 of the following elements: Fe, Si, Ni, Mn, Sn, Cr, Be, Al, Co. The entire box may be hardened by heating, quenching and reheating and then the parts to be of high ductility heated to a red heat or, after heating and quenching only, the parts to be of high resiliency are subjected to a tempering heat. In another method only the parts to be hardened are quenched, the other parts being cooled slowly.

Apparatus for hardening rails. Vereinigte Stahlwerke A.-G. (Arthur Otto, inventor). Ger. 587,785, Nov. 8, 1933 (Cl. 18c. 2.23). Addn. to 550,128 (C. A. 26, 4024).

Vibration treatment of ferrous metals and alloys to effect surface hardening, etc. Georges Mahoux. U. S. 1,939,712, Dec. 19. The metal is subjected to vibrations of the order of ultra-audible sound without establishing a marked differential between the temp. in the surface portions and the temp. in the interior of the material treated. App. is described.

Apparatus for carburizing ferrous metal articles. Adolph W. Machlet. U. S. 1,938,599, Dec. 12. Liquid carburizing gas such as liquid  $C_2H_2$  is supplied through a reducing valve and through a power-driven mixer having a free air intake, to dilute the gas, into an externally heated closed carburizing retort.

Joining thin layers of metal as in forming shims from brass or steel. Norman L. Derby. U. S. 1,940,850, Dec. 26. The flat surfaces of thin metal sheets are cleaned and fluxed, and the loosely superposed sheets are immersed in a bath of solder and the assembled sheets are pressed to leave only a thin film of solder as a connecting layer between the previously assembled metal layers. App. is described.

Centrifugal apparatus for granulating fused metals. Johann Eder. Austrian 135,675, Nov. 25, 1933 (Cl. 48b.).

Apparatus for separating fine metal shavings from liquids. Vogtländische Maschinenfabrik (vorm. J. C. & H. Dietrich) A.-G. Ger. 585,516, Oct. 4, 1933.

Carbides of elements of the tungsten group. Floyd C. Kelley (to General Elec. Co.). U. S. 1,940,308, Dec. 19. A powd. metal such as W is heated together with about 6% of C in powder form, in a suitable receptacle, at an elevated temp. but below the m. p. of the element of which a carbide is to be formed and in the presence of a hydrocarbon gas which at that temp. is in a state of equil. with the C. App. is described.

Removing carbon from rare metals. Fansteel Products Co., Inc. Ger. 585,904, Oct. 12, 1933. C is removed from "high-melting rare metals," especially Ta, by intimately mixing and heating the metal with an oxide of a metal which is volatile below the m. p. of the rare metal, e. g., MgO.

Bonding bronze to ferrous metals in bearing manufacture or the like. Charles R. Short and Roland P. Koehring (to Moraine Products Co.). U. S. 1,939,467, Dec. 12. The ferrous metal is Cu-plated; the bronze structure is pressed against the Cu-plated metal with a thin intervening layer of Sn, and the assembly is heated below the m. p. of Cu to cause the entire thickness of the Sn layer to alloy with both the Cu plating and the bronze.

Jacketing one metal with another. Alfred J. Liebmann (to Crucible Steel Co. of America). U. S. 1,939,628, Dec. 12. A jacket of metal such as Cu is cast around a core of material such as iron which oxidizes at the m. p. of the material of the jacket, while the core is kept below such m. p. to prevent such oxidation; the core and jacket are then heated above the m. p. of the jacket.

Cobalt. Richard Rosendahl. Ger. 585,368, Oct. 6, 1933. An aq. sludge contg.  $Co(OH)_2$ , a higher hydroxide of Mn, and hydroxides of Zn, Ni and Cu is treated with an aq. soln. of a ferric or cupric salt, in an excess of 20-50% over the amt. which is equivalent to the hydroxides of Zn, Ni and Cu present. The latter hydroxides are thus dis-

solved. The residue contg.  $\text{Co}(\text{OH})_2$  and hydroxide of Mn is treated with a reducing agent, e. g.,  $\text{FeCl}_2$  or  $\text{SO}_2$ , to produce a soln. contg. Co and Mn, from which the metals are sepd. in known manner.

**Copper ingots.** Soc. générale métallurgique de Hoboken. Fr. 42,844, Nov. 4, 1933. Addn. to 739,615 (C. A. 27, 2126). The mold used in the process of Fr. 739,615 is cooled at its lower part.

**Lead highly resistant to the action of hot sulfuric acid.** Theodor Wallis and Oskar Falek (to I. G. Farbenind. A.-G.). U. S. 1,939,799, Dec. 19. Soft lead is alloyed with Ni 0.01–0.05 and Se 0.01–0.1%.

**Apparatus (with an atomizer and blades rotated at high speed) for producing pulverized lead from molten lead.** Yoshio Takata. U. S. 1,938,876, Dec. 12. Various structural, mech. and operative details are described.

**Processing magnesium.** Edwin O. Barstow, John A. Gann and John E. Hoy (to Dow Chemical Co.). U. S. 1,940,619, Dec. 19. In order to prevent oxidation, the molten metal is treated in a tilting crucible in which there is also maintained a fluid flux such as  $\text{MgCl}_2$ ,  $\text{KCl}$ ,  $\text{BaCl}_2$  and  $\text{CaF}_2$  which is heavier than the Mg, does not spread over its top surface and substantially prevents the Mg from adhering to the crucible walls, and a protective atm. is supplied over the metal. App. is described.

**Manganese or chromium.** Helge Löfquist. Fr. 755,021, Nov. 18, 1933. Alloys contg. Fe and Mn or Fe and Cr are fused with agents contg. O and S, e. g.,  $\text{FeO}$  and  $\text{FeS}$  so as to form a slag rich in Mn or Cr and having a relatively low m. p. The Mn or Cr is recovered from the slag.

**Platinum, etc.** W. C. Heraeus G. m. b. H. Ger. 586,284, Oct. 19, 1933 (Cl. 40a. 20.50). Addn. to 584,844 (C. A. 28, 1011<sup>9</sup>). In obtaining Pt, Au and similar metals, the method of 584,444 is varied by using an Fe stone contg. at least 3% Cu as the collecting agent. Ores, concentrates, dross, etc., are smelted in the presence of the above stone, the fused Fe collecting the noble metal, which is then recovered by usual methods.

**Molded objects of platinum metals.** W. C. Heraeus G. m. b. H. Ger. 586,622, Oct. 23, 1933 (Cl. 48b. 13). Hard non-corrosive objects are obtained by molding Pt or Pt alloys and surface hardening by a small addn. of Si or B, the latter being added by heating the object in an atm. of  $\text{SiCl}_4$ ,  $\text{SiHCl}_3$  or volatile B compds.

**Tin and similar metals.** "Berzelius" Metallhütten-G. m. b. H. (Max Gerhard Freise, inventor). Ger. 585,628, Oct. 24, 1933. Sn, Pb, Sb, Bi and similar metals are obtained by reduction of ores, etc., contg. oxides of Sn at temps. at which the metals are fused. A flux of alkali salts, such as soda, borax or water glass is used. The process is carried out in a rotary furnace.

**Iron.** A. Borsig G. m. b. H. and Heinrich Lanz A.-G. Ger. 573,017, Oct. 18, 1933. Fe contg. 4–4.3% of C + Si is held in the fused state for a sufficient time to ensure the formation of a eutectic of graphite and ferrite. The metal is then cast, and the casting is cooled in known manner under conditions promoting the formation of lamellar pearlite.

**Iron.** Vereinigte Stahlwerke A.-G. and Karl Emmel. Ger. 584,841, Sept. 25, 1933 (Cl. 18b. 1.02), and 585,869, Oct. 12, 1933 (Cl. 18c. 12.10). Addns. to 512,391 (C. A. 25, 908). The process of Ger. 512,391 is supplemented by a second stage in which the C content of the metal in the furnace is raised to above 3%. Iron particularly useful for the manuf. of thin-walled castings is obtained (584,841). Cast iron made by the process of Ger. 512,391 is improved by annealing for up to 20 hrs. at about 850° (585,869).

**Iron.** Eugen Piwowarsky and Heinrich Nipper. Ger. 589,257, Dec. 4, 1933 (Cl. 18d. 1.20). In the manuf. of malleable cast iron, the Si ordinarily added to promote the formation of graphite is replaced wholly or in part by an addn. of 0.2–1.5% of Al. The method may be applied in the manuf. of malleable cast iron contg. a small proportion of Co, Cr or Ti.

**Spongy iron.** Alfred Wilhelmi. Ger. 579,753, Nov. 1, 1933 (Cl. 18a. 18.08). App. for making spongy Fe by

smelting Fe ore on a traveling grate in currents of reducing gas is described.

**Spongy iron.** Alfred Wilhelmi. Ger. 581,578, Nov. 6, 1933 (Cl. 18a. 18.08). Addn. to 579,753 (preceding abstr.). Details of the app. for heating the reducing gas are given.

**Cast iron.** Ceskomoravská-Kolben-Danek and Miroslav Jandacek. Fr. 754,993, Nov. 17, 1933. Gray cast Fe is hardened by introducing H into the surface thereof and, preferably, producing at the same time a metal coating on the treated surface. The introduction of H may be made electrolytically which may take place during chroming.

**Cast iron.** Alexandre Polliet and Nicolas Sainderichin. Fr. 755,341, Nov. 23, 1933. The phys. characteristics of cast Fe are improved by placing it in a mixt. of Al,  $\text{Al}_2\text{O}_3$ , one or more carbides of a metal or semimetal and preferably a small proportion of anhyd. chromic chloride and heating to 800–1150° in the absence of air.

**Cast iron.** Soc. franco-sarroise de constructions mécaniques. Fr. 755,410, Nov. 24, 1933. Coke of inferior quality may be used in cupola furnaces for the production of cast Fe by using the coke in large pieces and breaking it as little as possible during charging.

**Container suitable for use in nitriding steel or cast iron articles.** Adrien J. P. Duval (to Aubert & Duval Frères). U. S. 1,941,128, Dec. 26. Structural features.

**Converting iron baths into steel.** Hugo Bansen and Karl Löbbecke (to Fried. Krupp A.-G.). U. S. 1,940,341, Dec. 19. Water in liquid state is introduced into an iron bath (in a described app.) so as to cause its decompn. and the combustible gases of decompn. are burned by supplying air immediately above the surface of the bath.

**Deoxidizing iron and steel.** Frank G. Norris (to American Rolling Mill Co.). U. S. 1,938,716, Dec. 12. Metallic Na is injected beneath the surface of the molten iron or steel, in small increments, through the bottom of a container (of a described app.) holding the molten metal (the Na being vaporized by the heat of the metal).

**Hardening iron and steel.** Issar Budowski and Hans Bardt. Fr. 755,516, Nov. 25, 1933. The metals to be heated are first coated with a paste contg. a support for C, finely divided metals or metal compds., alkali or alk. earth compds. of org. acids and a free alk. substance. An example contains coke 100, Ni hydroxide 20, Ba oxalate 15, Ba formate 15,  $\text{SrCO}_3$  10 and KOH 10 parts, this being mixed with 150 parts of water contg. 5% of glue.

**Steel.** Herman A. Brassert (to H. A. Brassert & Co.). U. S. 1,939,874, Dec. 19. Ore is reduced and melted in a shaft furnace into which it is charged with C; gaseous products of combustion are passed upwardly through the charge, impurities are removed by blowing a blast of air through the metal; ferrous scrap is melted in a sep. shaft furnace, the C content of the 2 metal products is suitably controlled and proportioned and they are mixed with each other and further refined. App. is described.

**Steel.** Theodor Czepl. Austrian 135,535, Nov. 25, 1933 (Cl. 18b.). Steel of high resistance to hot or cold  $\text{H}_2\text{SO}_4$  or HCl contains C up to 1, Ni 20–40, Mo 2–6 and Cu 1.5–3%.

**Steel.** Österreichische Schmidtstahlwerke A.-G. (Leo Klüger, inventor). Ger. 585,070, Sept. 28, 1933. See Austrian 129,586 (C. A. 26, 5541).

**Dephosphorization of steel.** Soc. d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine. Fr. 755,451, Nov. 25, 1933. Steels which are highly oxidized and have a relatively low P content are dephosphorized by the process of Fr. 724,368 (C. A. 26, 4789) but the content of oxides of Fe in the slag used is greatly reduced or removed.

**Hollow-steel aircraft propeller blades with nitrided exterior surfaces.** John Squires. U. S. 1,940,333, Dec. 19.

**Steel of reduced tendency to brittleness due to ageing and blue fracture.** Hans Meyer. U. S. 1,941,101, Dec. 26. Soft ingot steel is subjected to initial heat working in the zone above the  $A_1$  point and the working is continued down to a temp. between the  $A_1$  point and 700° to produce

a pronounced crystallographic directional effect in the steel and attain a sufficient toughness largely to overcome brittleness arising from ageing and blue fracture.

**Alloy steels.** Henry A. de Fries (to Ludlum Steel Co.). U. S. 1,941,202, Dec. 26. Alloy steels of easy machinability and forgeability contain Cr 1-30, Cu 0.2-1.2 and S 0.1-0.5%, the remainder being Fe. These alloys have a resistance to corrosion comparable to that of an alloy steel contg. Cr in a similar proportion together with less than 0.1% of S. U. S. 1,941,203 relates to similar alloy steels, in making which Cu mat is added to give a S content of 0.1-0.5%.

**Steel alloys.** Wm. H. Hatfield and Joseph F. Bridge. Brit. 396,809, Aug. 14, 1933. An austenitic steel for use in turbine blading, etc., comprises Cr 16-30, Ni 6-15, C 0.20-0.8, Si 0.8-2 and Ti 0.8-2.5%. Other elements, *e. g.*, Mn, V, Mo or Be, may be present up to about 1%. The steel may be softened by air-cooling from about 800-1150°.

**Hard steel alloy.** John L. Cox. U. S. 1,939,390, Dec. 12. A hard steel alloy suitable for valves of internal-combustion engines contains C about 0.2-1.0, Ni 0.5-8.0, Cr 6-15 and Al 0.5-7.0%, the remainder being substantially Fe and the amount of Ni being less than 2.5 times the amt. of Al.

**Chromium steel.** Kenneth M. Simpson (to International Chromium Process Corp.). U. S. 1,939,795, Dec. 19. A furnace is charged with Cr ore and an exothermic reducing agent such as ferro-Si or Al and the charge is heated by fuel firing to reduce the ore and form slag and metal; the slag is removed from the furnace and steel is added to the reduced metal in the furnace to form Cr alloy steel.

**Chromium steels.** Russell Franks (to Electro Metallurgical Co.). Brit. 397,646, Aug. 31, 1933. High-Cr steels, particularly those contg. 15-35% Cr, contain also an amt. of combined N considerably higher than that normally present in steels, *e. g.*, 0.2-0.4%. They may contain 0.1-2% C and are produced by melting a C steel or high-Cr steel and adding nitrides, N-contg. ferrochrome and Cr. In 397,717, Aug. 31, 1933, addn. to 397,646, the alloy steel contains Cr, at least 15; Ni, at least 5 and alloyed N, at least 0.1%.

**Chromium-nickel steels.** Compagnie des Forges de Chatillon, Commentry & Neuves-Maisons. Brit. 397,373, Aug. 24, 1933. A corrosion-resistant austenitic Cr-Ni steel contains 0.1-0.75% As. The alloys may contain C 0.05-1, Cr 0.5-30, and Ni 2-40%, with or without up to 8% of Si, Mn, Mo, W, Co, V, Cu, Ti, Al or Zr.

**Steel drums for oil cracking.** Robert T. Pollock (to Wm. S. Gluck). U. S. 1,941,271, Dec. 26. The interior surface of steel drums used in oil cracking is rendered more resistant to injury from corrosion by a preliminary treatment with gases having a hardening effect, such as H, N or CO, at a temp. of about 650°.

**Armor plate.** Fried. Krupp A.-G. Brit. 397,079, Aug. 17, 1933. Armor plate, hardened on 1 side, is made from a steel alloy contg. C 0.05-0.65, Cr 1-4.5, Mo 0.1-1.5 and Co (and Ni) 1.5%, the Co being at least 1%. The Mo may be wholly or partly replaced by 1.5-3 times as much W.

**Armor plating.** Fried. Krupp A.-G. Fr. 755,131, Nov. 20, 1933. An armor plating steel hardened on one side only contains C 0.2-0.65, Cr 2-4.5, Mo 0.2-1.5 and Ni 0.5-4%, the Ni being replaced wholly or in part by Co.

**Alloys.** Aktieselskapet Elektrisk Bureau. Brit. 397,684, Aug. 31, 1933. An elec. cooking-plate is made from an alloy with a heat expansion coeff. of not more than  $0.04 \times 10^{-4}$  per °C. and with properties similar to Ni steels contg. up to 36% Ni as regards tendency to increase permanently in vol. upon heating. Suitable alloys are Ni steels having 21-33% Ni with not more than 0.2% C and an alloy contg. Fe 61, Ni 34 and Mo 5%.

**Alloys.** W. C. Heraeus G. m. b. H. Ger. 589,449, Dec. 7, 1933 (Cl. 40b. 4). Metals of the Pt group, or alloys thereof with one another, are alloyed with up to 5% of an alk. earth or earth metal. The alloys obtained are

less volatile than Pt and are useful for making furnace resistances and other articles exposed to high temps.

**Alloys.** Soc. anon. de Commentry, Fourchambault et Decazeville. Fr. 42,849, Nov. 4, 1933. Addn. to 698,724 (C. A. 25, 2965). Al 1-7 and Ti up to 5% are added simultaneously as hardening agents to the alloys described in Fr. 698,724, before the heat treatment. Other hardening elements such as C, Cu, Si and Be may also be added. The heating varies from 800° to 1300°.

**Alloys resistant to halogen hydric acids.** Hermann Frischer. U. S. 1,939,890, Dec. 19. Alloys suitable for resisting hot HCl, etc., are formed contg. Fe 1-30% and Sb 99-70%. Small amounts of W or Mo also may be added.

**Alloy for pistons of internal-combustion engines.** Ernst Mahle (to Elektronmetall G. m. b. H.). U. S. 1,940,629, Dec. 19. A ring-bearing portion of the piston is formed of a Be bronze contg. Cu together with Be 1-5%, and another portion such as the head is formed of a different metal such as a light alloy, which, however, has about the same coeff. of expansion as the Be bronze.

**Motor pistons.** Elektronmetall G. m. b. H. Fr. 42,833, Nov. 4, 1933. Addn. to 734,449. Examples of alloys are (1) Cu 9-11, Mn 0.1-0.5, Fe 1 and Al at least 87%, (2) Cu 4, Mg 1.5, Ni 2, Al 92.5%, (3) Cu 12, Ni 2.5, Si 4, Al 81.5%, (4) Sn 3, Si 2 and Mg 95%.

**Alloys for making electric resistances.** Berndorf Metallwarenfabrik Arthur Krupp A.-G. (Rudolf Krulla, inventor). Austrian 135,521, Nov. 25, 1933 (Cl. 18b.). Use is made of alloys contg. Mn 25-35, Ni 5-15 and Fe 55-65%. The alloys have good mech. properties, a high resistance and a low temp. coeff.

**Alloying metals such as those of brass alloys.** Elbert E. Fisher and Malvin A. Baernstein (to National Pigments and Chemical Co.). U. S. 1,940,678, Dec. 26. Tribarium aluminate is used as a flux and purifier. Na Ba aluminate also may be used.

**Bronze alloys.** Oetzberger & Co., Konstruktions-Bronzen G. m. b. H. Ger. 585,962, Oct. 13, 1933. A bronze alloy suitable for use in construction consists of 6-9% Sn, 0.1-3.8% Ni, 0.1-1.8% Ag and at least 90% of the remainder Cu. A max. of 2% of a hardening metal such as Zn may be added.

**Hard alloys.** Tool Metal Manufacturing Co. Ltd. Brit. 396,940, Aug. 17, 1933. A sintered alloy for tools and other working implements contains ZrC<sub>2</sub> and (or) ThC<sub>2</sub> 1-14%, metal(s) of lower m. p., *e. g.*, Fe, Co, Ni, Mn, up to 25% and W<sub>2</sub>C and (or) Ta carbide, the carbides of the alloy consisting, at least in part, of a heterogeneous mixt.

**Making articles from hard alloys.** Heinz Fasching. Austrian 135,324, Nov. 10, 1933 (Cl. 40b.). A powd. mixt. of a refractory carbide or nitride with a metal of higher m. p. is heated in a mold under pressure to a temp. just above the m. p. of the carbide or nitride, and then allowed to cool under pressure. Use may be made of a mixt. of a carbide or nitride of Si, Ti, Al, Zr, W, Mo or Ta with up to 60% of a metal such as W, Ta, Ti or Mo. The granule size of the mixt. may be 0.1-0.001 mm.

**Molded articles of hard alloys.** Philipp A. Kurt. Austrian 135,669, Nov. 25, 1933 (Cl. 40b.). Addn. to 106,973. Hard, acid-resistant articles are prepd. by fusing in a mold at 1700-1800° a powd. mixt. of Ni and Mo contg. 2-12% of B or Ti and sufficient C to form B<sub>4</sub>C or TiC.

**Hard alloys for tools, armored rollers, etc.** Heraeus-Vacuumschmelze A.-G. and W.-Rohn. Ger. 585,823, Oct. 11, 1933. The alloys comprise 8-15% Al, 2-7% B, 1-5% Mo or W, 0-1.5% C, 0-2.5% Ti and the remainder Ni or Co or both. Alternatively, 70% of the remainder may be Fe.

**Magnetic alloys.** International Standard Electric Corp. Ger. 588,381, Nov. 21, 1933 (Cl. 40b. 14). The manuf. of powd. magnetic alloys contg. Fe, Ni and a metal of the Cr group, with or without Co, is improved by including up to 4% of Cu in the alloys. The addn. of Cu prevents the alloys from becoming brittle in the hot-rolling process which generally precedes pulverization. A specified alloy contains Ni 78.5, Fe 13.5, Mo 4 and Cu 4%.

**Ferromagnetic substances.** Siemens & Halske A.-G. (Frans Noll, inventor). Ger. 585,770, Oct. 9, 1933. Addn. to 576,509 (C. A. 28, 735<sup>1</sup>). The method of 576,509 for improving the magnetic properties of Ni-Fe or Si-Fe alloys by coating them with water glass and heating to glowing is improved by carrying out the heating in the presence of Fe or steel filings.

**Aluminum alloys.** Louis W. Kempf (to Aluminum Co. of America). U. S. 1,940,139, Dec. 19. Alloys which are suitable for casting washing-machine parts, etc., contain Al together with Cu 4-10, Mg 2-6, Fe 0.5-2.0 and Si 0.5-3.0%. Cf. C. A. 28, 460<sup>2</sup>.

**Aluminum alloys.** Court C. Titus. Fr. 755,359, Nov. 23, 1933. Light, hard alloys of Al contain B 0.05-2 and Mg 0.25-2.25%. At least one of V, W, Mo, Cr, Cu, Zn and Co, in amt. of 0.25-5%, may also be added.

**Treatment of aluminum alloys.** Aluminium Ltd. Ger. 588,024, Nov. 11, 1933 (Cl. 48b. 9). In coating Al alloys with Al or other Al alloys, the alloy to be coated is cast in a heat-conducting mold lined on one or more sides with Al or Al alloy. The compd. casting is then rolled, etc., in known manner, but at a sufficiently low temp. to prevent any substantial diffusion of components of the coated alloy into the coating.

**Wire of aluminium alloys.** Hackethal-Draht- und Kabel-Werke A.-G. (Carl Haase, inventor). Ger. 585,942, Oct. 18, 1933. Mixed-crystal alloys of Al are hot-rolled or hot-pressed at a temp. below 250°, cold-drawn, and finally annealed at temps. below 250°.

**Aluminum-copper alloys.** Compagnie de produits chimiques et électrometallurgiques. Alais, Froges et Camargue. Fr. 754,539, Nov. 8, 1933. The ductility of Al-Cu alloys is increased by the addn. of 0.005-0.1% of Sn. Other metals such as Ni, Si and Zn, but not Mg, may be present.

**Aluminum-magnesium alloys.** Aluminium Ltd. Brit. 398,080, Sept. 7, 1933. Al-Mg alloys having enhanced resistance to corrosion and contg. about 5-16% Mg are made by using com. Al under such conditions that they have a low Fe impurity. Preferably the total impurity of the Al used is not less than about 0.7%, the Si being equal to, or greater than, the Fe and the latter being not more than 0.1%. A small amt. of Cu may be present. Cf. C. A. 28, 460<sup>3</sup>.

**Aluminum-silicon alloys containing phosphorus in small proportion.** Roland Sterner-Rainer (to American Lurgi Corp.). U. S. 1,940,922, Dec. 26. Alloys which are suitable for bearings, pistons, etc., contain Al together with Si 5-40% and P 0.001-0.1%.

**Beryllium-aluminum alloys.** Joseph K. Smith (to Beryllium Corp.). U. S. 1,941,230, Dec. 26. Alloys which are suitable for airplane parts, etc., contain Al 55-70, Be 25-40 and Mn, Mo and Zr 0.5-2.5% each. U. S. 1,941,231 relates to alloys contg. Al 55-70, Be 25-40 and Mn, Mo and V 0.5-2.5% each. Cf. C. A. 27, 3430.

**Copper alloys.** George H. Zenner (to The Linde Air Products Co.). Brit. 397,897, Aug. 31, 1933; Ger. 589,237, Dec. 4, 1933 (Cl. 40b. 6). See Fr. 747,146 (C. A. 27, 4708).

**Copper alloys.** Hirsch, Kupfer- und Messingwerke A.-G. (Eugen Vaders, inventor). Ger. 585,002, Sept. 27, 1933. Alloys suitable for making bearings or for casting in sand molds contain Cu 80-90, Si 2.5-4.5 and Zn 5.5-17.5%, with or without 0.1-1% of Al, Mn, Co, Ni, Cr, Zr, W, Mo, Ti and (or) Sn.

**Copper alloys.** Imperial Chemical Industries Ltd. Fr. 755,116, Nov. 20, 1933. Bolts, screws, rivets, etc., are made from a Cu alloy contg. Ni and Al which is capable of being hardened, the alloy being in the soft state at the commencement of the making and afterward hardened by heating to 300-600°. The initial alloy is softened by heating to 800-900° and cooling rapidly. An example contains Cu 87.5, Ni 6, Al 1.5 and Mn 5%. Fr. 755,117. Rough shapes are cut from a band or sheet of metal alloy having the properties described in Fr. 755,116. An example contains Cu 60, Zn 18, Ni 20 and Al 2%. Fr. 755,118. Coins, etc., are made from an alloy having the properties described in Fr. 755,116. An example contains

Cu 92.5, Ni 6 and Al 1.5% or Cu 70, Ni 28.5 and Al 1.5%. Fr. 755,119. Articles such as tubes are made from alloys having the properties described in Fr. 755,116. An example contains Cu 72, Zn 21, Ni 5.2 and Al 1.8%.

**Working copper alloys containing chromium.** Metallgesellschaft A.-G., Walter Fraenkel and Arthur Burkhardt. Brit. 398,385, Sept. 14, 1933. The mech. properties of alloys consisting of Cu and 0.2-3.0% Cr are improved by working at above 700°, cooling in air and then heating to 350-700°. The alloy may contain 1-10% Al and also 1 or more elements, other than Be, Ti or Si, which do not combine with Cr, e. g., Ni 1-10, Sn 1-10 and Zn 1-20%.

**Iron alloys.** Berndorfer Metallwarenfabrik Arthur Krupp A.-G. (Rudolf Krulla, inventor). Austrian 135,327, Nov. 10, 1933 (Cl. 18b.). Rust-resistant alloys are prep'd. by adding Cr 7-8 and Al up to 1.5% to fused Fe which has been deoxidized by addn. of Pb.

**Magnesium alloys.** Alexander Luschenowsky. U. S. 1,941,039, Dec. 26. Alloys which have good strength and resistance to corrosion contain Mg together with Zn 0.5-15, Mn 0.01-3, Fe 0.01-1.5 and Ag or Be 0.005-1.5%, with or without Al up to 5%.

**Magnesium alloys.** The Dow Chemical Co. Brit. 397,427, Aug. 24, 1933. Ternary Mg alloys consist of Mg not less than 80, Cd 0.5-18 and Mn 0.5-2%.

**Nickel alloys.** Joseph K. Smith (to Beryllium Corp.). U. S. 1,941,368, Dec. 26. An alloy which may be heat-treated to improve its hardness and strength contains Ni about 96% together with Be, Mn and Mg (with the Be not in excess of 2% and the Mg and Mn each not in excess of 1%).

**Palladium alloys.** W. C. Heraeus G. m. b. H. Ger. 585,545, Oct. 5, 1933. Alloys contg. Pd and Rh, Pd, Au and Rh, or Pd, Ag and Rh, contain 70-99% of Pd, 1-30% Au or Ag and 1-20% Rh. The alloy is used for spinning nozzles for rayon.

**Use of silver-cadmium alloys for contacts of electrical circuit-breaker devices.** Lynn H. Matthias (to Allen-Bradley Co.). U. S. 1,940,962, Dec. 26. An alloy contg. Ag 80 and Cd 20% is suitable for contacts.

**Zinc alloys.** Compagnie française des conduites d'eau and Henry Petot. Fr. 754,945, Nov. 16, 1933. An alloy resistant to corrosion and of good mech. properties contains electrolytic Zn 75-95 and pure Al 25-5%. Sb, Bi and Ti may also be present. The Zn, Sb and Bi are added to previously molten Al which may already contain Ti, at 700°. A protecting flux of AlCl<sub>3</sub> or anhyd. ZnCl<sub>2</sub> may be used.

**Springs for clocks, etc.** Reinhard Straumann. Ger. 585,151, Sept. 29, 1933. Addn. to 578,390 (C. A. 27, 4207). Fe alloys contg. Ni 35-70, Be 0.1-3, and W, Cr, Mo, Mn or other usual component up to 40% are used for making temp.-compensated springs for clocks, etc.

**Bimetallic strip for thermostats.** Howard Scott (to Westinghouse Elec. & Mfg. Co.). U. S. 1,939,085, Dec. 12. Fe alloys of relatively high and low expansion are used together, the higher-expansion alloy contg. Ni, Mn and C in such proportions that the Ni content plus 18 times the C content is 32-8%, the lower expansion alloy contg. Ni 20-45, Co from a trace to 25, Ti from a trace to 10 and Mn from a trace to 1%. Cf. C. A. 27, 3125.

**Protecting metals from corrosion.** Horace C. Hall. Brit. 398,180, Sept. 4, 1933. Metals and alloys, e. g., Fe, steel, Al (alloys), are immersed in a hot aq. soln. of H<sub>3</sub>PO<sub>4</sub> and 1 or more of the Cr compds., CrO<sub>3</sub>, chromic acid, chromates and dichromates. The treatment may be applied to non-ferrous metals and alloys that have been treated by the process of Brit. 396,746 (C. A. 28, 461<sup>4</sup>), the original phosphate coat being reinforced by the deposition of Cr phosphate. Steel tools may be treated by the process to remove the surface H to render the cutting edge less susceptible to corrosion fatigue.

**Preventing corrosion.** The Gas Light & Coke Co. and Sydney G. Barker. Brit. 399,210, Oct. 2, 1933. A pipe, cable, etc., are protected against corrosion by a covering comprising 1 or more wound-on layers of coir fiber in the form of sliver or lap, the fiber being preferably impregnated with bitumen, etc., before application. The pipe, etc.,

- may be provided with a preliminary coating film of bitumen.
- Preventing corrosion of metals such as iron and lead.** Braxton D. Avis. U. S. 1,940,041, Dec. 19. Na tetraborate, Na salicylate and  $\text{NaNO}_2$  are used for inhibiting corrosion of iron and Pb when in contact with aq. and aq. alc. solns. such as those of engine cooling systems.
- Metal tubes with linings of corrosion-resistant material.** Alfred E. Maskrey (to Plykrome Corp.). U. S. 1,938,633, Dec. 12. Various details of app. and operation are described suitable for the manuf. of tubes lined with stainless steel.
- Welding.** Elektro Themit G. m. b. H. Fr. 754,079, Nov. 17, 1933. In aluminothermic welding of rails a plate composed of an alloy which melts with the aluminogenetic Fe and alloys with it is suspended in the space between the ends of the rails. The plate may be Ni-Cr, Fe contg. C, Mn, Cr and V or cast Fe.
- Arc welding.** Heinz Pasching. Austrian 135,672, Nov. 25, 1933 (Cl. 48b.). Arc welding electrodes contain Zr 0.05-3, Si 0.15-2.5 and Mn at least 0.25%, and are provided with a core of standard compn., which may contain Zr.
- Welding steel.** Clarence L. Delachaux. Ger. 585,261, Sept. 30, 1933. See Brit. 352,714 (C. A. 26, 2695).
- Electrically welding frame bars, etc., of steel containing carbon and manganese.** Grover A. Hughes (to Truscon Steel Co.). U. S. 1,939,395, Dec. 12. Welding is effected with use of an intervening element of greater C and Mn content than the main bars to be welded.
- Welding electrodes.** John B. Austin (to Una Welding, Inc.). U. S. 1,940,572, Dec. 10. Fluxing material such as talc and  $\text{Fe}_2\text{O}_3$  is deposited in depressions formed in electrodes such as those of low-C steel and is held in place by portions of the electrode metal extending partly over the depressions.
- Welding electrodes.** John B. Austin (to Una Welding, Inc.). U. S. 1,940,574, Dec. 19. A base rod formed largely of Cu is assoc. with a deoxidizing material such as Si or Mn in a proportion which may be about 2% or less and with a tinning or brazing material also forming 2% or less the wt. of the complete electrode. U. S. 1,940,573 relates to app. and details of operation for manuf. of welding electrodes carrying flux in depressions in the electrode metal.
- Flux for use in welding non-ferrous alloys such as copper alloys containing silicon.** Arthur R. Lytle (to Linde Air Products Co.). U. S. 1,940,262, Dec. 19. Finely ground boric acid is used in admixt. with 2-12% of NaF, KF, Li borate, Na borate or K borate.
- Blowpipe suitable for cleaning molds, brazing and welding.** Francis S. Austin (to Carbo-Oxygen Co.). U. S. 1,940,111, Dec. 19.
- Soldering.** Klippers Metallwerke G. m. b. H. Fr. 755,099, Nov. 18, 1933. A solder more particularly for use with Al or its alloys is composed of a soft alloy of low m. p., in which are dispersed harder crystals of an alloy of higher m. p. which remain solid in the fused alloy. The alloy of low m. p. may contain Sn 90 and Zn 10%, and the other alloy may contain Zn, Sn and Ni.
- Solder for noble metals.** W. C. Heraeus G. m. b. H. Ger. 588,187, Nov. 13, 1933 (Cl. 49a. 26). Use is made of alloys of noble metals with up to 5% of Si, P and (or) B.
- Metal plating.** Vereinigte Isolatorenwerke A.-G. Ger. 585,914, Oct. 12, 1933. Pressed objects made from  $\text{PhOH}\cdot\text{CH}_2\text{O}$  condensation products generally, with filling materials and dyes optionally incorporated, are given a coating of Ag salt soln., such as  $\text{AgNO}_3$ , without addn. of an addnl. reducing agent.
- Coating metals.** The Pyrene Co. Ltd. Brit. 397,179, Aug. 21, 1933. A protective coating is formed on the surface of Fe, Zn, Mg or their alloys by treating with a hot acid phosphate soln. contg. a small amt. of a metal less basic than that to be coated. The soln. is prepd. from materials described in Brit. 346,401 (C. A. 26, 611) and is then treated with an alk. substance, e. g.,  $\text{ZnCO}_3$ ,  $\text{MnCO}_3$ ,  $\text{Na}_2\text{CO}_3$ , until the desired proportion of total acid to free acid (10-15:1 for spraying or 10-12:1 when allowed to flow over the metal surface) is obtained. Alternatively the freshly prepd. soln. may be used as a dipping bath as described in 346,401 until the amt. of free acid has been sufficiently reduced.
- Spray-coating surfaces with metals such as zinc melted in an electric arc.** Charles M. Saeger, Jr. U. S. 1,940,814, Dec. 26. Various details of app. and operation are described.
- Coating aluminum.** Martin Tosterud (to Aluminum Co. of America). U. S. 1,939,421, Dec. 12. An Al surface is treated with a soln. of an alkali metal stannate and an alkali metal dichromate, in order to form a gray coating.
- Coating aluminum alloys.** Vereinigte Leichtmetallwerke G. m. b. H. Ger. 589,415, Dec. 8, 1933 (Cl. 48b. 9). In coating Al alloys with pure Al, diffusion of alloy components into the coating is avoided by interposing a layer of  $\text{Al}_2\text{O}_3$  between the alloy and the coating. Alternatively, the alloy may be coated with two layers of pure Al between which a layer of  $\text{Al}_2\text{O}_3$  is interposed.
- Coating iron, etc.** Aladar Pacz. Brit. 398,353, Sept. 14, 1933. See Fr. 728,411 (C. A. 26, 5542).
- Coating iron, etc., with zinc or zinc alloys.** Henry Csanyi. U. S. 1,939,667, Dec. 19. The plating metal is melted in finely divided form in contact with the plate-receiving metal together with a liquid vehicle comprising  $\text{NH}_4\text{Cl}$  and chloride of Ba, Sr or Be.
- Coating tungsten wire.** Siemens & Halske A.-G. (Werner Espe, inventor). Ger. 588,414, Nov. 17, 1933 (Cl. 21g. 13.03). A coating of a lower oxide is produced on W wire by treating the wire at 500-700° with a mixt. of steam with air and (or) H in such proportions that the wire acquires a blue color. The wire may be run through a vessel in which it is subjected to the treatment. The product is useful as a core for discharge-tube cathodes. App. is described.
- Preventing cleaned ferrous metals from rusting.** James H. Gravell (to American Chemical Paint Co.). U. S. 1,938,961, Dec. 12. The cleaned surface is coated with a film of As by treating it with Na arsenite soln.
- Apparatus for galvanizing wire, rods or strip material.** Rylands Brothers Ltd. and Frederick W. Upton. Brit. 397,908, Sept. 4, 1933.
- Grinding and abrading tools.** Paul Hopf. Brit. 398,073, Sept. 7, 1933. See U. S. 1,935,798 (C. A. 28, 733').

## 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

- Mechanism of the polymerization of olefins by acid catalysts.** Frank C. Whitmore. *Ind. Eng. Chem.*, 26, 94-5(1934); cf. C. A. 27, 5715-16.—Isobutylene is used to illustrate the mechanism of the polymerization of olefins under the influence of acid catalysts. The theory may also be used to predict the structure of the components of certain olefin mixts. obtained by polymerization.
- W. A. Moore
- Some ethylene and saturated hydrocarbons of  $\text{C}_6$  to  $\text{C}_{11}$ .** Marcel Tuot. *Compt. rend.* 197, 1434-6(1933).—Below are given, resp., the b. p. (pressure in parentheses),  $d_{20}^{20}$ ,  $n_D^{20}$ , R. M.,  $\gamma_m$  and  $P$  for various olefins and the corresponding satd. hydrocarbons.  $\text{MeCH}:\text{CMeCH}_2\text{CH}_2\text{CH}_2\text{Me}$ , 121° (750), 0.7296, 1.4183, 38.71, 22.27, 333.70;  $\text{C}_6\text{H}_{12}$ , 116.5° (747), 0.7033, 1.3982, 39.14, 20.39, 344.70;  $\text{Me}_2\text{CHCH}_2\text{CMe}:\text{CHMe}$ , 109° (737), 0.7313, 1.4160, 38.39, 21.64, 330.60;  $\text{C}_7\text{H}_{14}$ , 108° (750), 0.6986, 1.3950, 39.12, 19.97, 345.20;  $\text{Me}_2\text{C}:\text{CHCH}_2\text{CHMe}_2$ , 111° (739), 0.7265, 1.4134, 38.49, 21.58, 332.60;  $\text{C}_8\text{H}_{18}$ , 107° (747), 0.6937, 1.3922, 39.12, 19.04, 343.50.  $\text{Me}_2\text{CHCH}_2\text{CMe}:$

$\text{CHCH}_2\text{Me}$ , 131° (749), 0.7358, 1.4198, 43.42, 22.40, 372.90;  $\text{C}_9\text{H}_{18}$ , 130° (749), 0.7128, 1.4023, 43.75, 20.49, 382.40.  $\text{Me}_2\text{CHCH}_2\text{CH}:\text{CMeCH}_2\text{Me}$ , 137° (747), 0.7382, 1.4217, 43.34, 22.89, 373.60;  $\text{C}_9\text{H}_{18}$ , 133° (741), 0.7147, 1.4033, 43.73, 21.09, 384.10.  $\text{Me}_2\text{C}:\text{CMeCH}_2\text{CHMe}$ , 125° (741), 0.7340, 1.4180, 43.26, 21.635, 370.50;  $\text{C}_9\text{H}_{18}$ , 129° (738), 0.7171, 1.4051, 43.76, 21.17, 382.90.  $\text{Me}_2\text{CHCH}_2\text{CMe}:\text{CHCH}_2\text{CMe}$ , 154° (752), 0.7497, 1.4256, 47.81, 23.00, 112.00;  $\text{C}_{10}\text{H}_{20}$ , 152.5° (746), 0.7259, 1.4090, 48.36, 21.79, 423.00.  $\text{Me}_2\text{CHCH}:\text{CMeCH}_2\text{CHMe}$ , 142° (740), 0.7355, 1.4208, 48.12, 22.12, 413.15;  $\text{C}_{10}\text{H}_{20}$ , 143° (746), 0.7210, 1.4057, 48.34, 21.18, 422.90.  $\text{Me}_2\text{CHCH}_2\text{CMe}:\text{CHCH}_2\text{CHMe}$ , 168° (739), 0.7539, 1.4280, 52.56, 23.35, 450.30;  $\text{C}_{11}\text{H}_{22}$ , 167.5° (746), 0.7344, 1.4132, 52.99, 22.26, 461.80.

Rachel Brown

**Saponification of ethylene bromide with alcoholic alkali hydroxide.** A. L. Bernoulli and Walter Kampli. *Helv. Chim. Acta* 16, 1187-200 (1933).—The sapon of  $\text{BrCH}_2\text{CH}_2\text{Br}$  (I) with  $\text{H}_2\text{O}$  and  $\text{K}_2\text{CO}_3$  gave a mixt. of  $\text{HOCH}_2\text{CH}_2\text{OH}$  (II) and  $\text{BrCH}_2\text{CH}_2\text{Br}$  (III) in which II predominated. In the presence of 50% aq. EtOH a similar mixt., consisting mainly of III, was formed. The quant. results obtained from these sapon. expts. had no significance for the study of reaction kinetics. The decompn. of I, with the exclusive formation of III, by sapon. with NaOH in abs. EtOH is purely a bimol. reaction. The reaction velocity is considerably reduced by the addn. of  $\text{H}_2\text{O}$  to the reaction mixt. The dependence of the reaction velocity on the temp. is given by the exponential formula  $k_t = k_0 \times e^{(u-t)/\tau} = k_0 \times 10^{(u-t)/\tau}$ . For reaction mixts. whose reaction const. have been reduced by the addn. of  $\text{H}_2\text{O}$ , the same temp. relation with the same coeffs.  $\tau$  or  $\tau'$  ( $\tau = 0.4343\tau'$ ) holds true.

C. R. A.

**Several reactions of carbon tetrachloride synthesis.** Colin G. Fink and Charles F. Bonilla. *J. Phys. Chem.* 37, 1135-67 (1933).—A study was made of several little-known reactions by which  $\text{CCl}_4$  might be commercially produced. New thermodynamic data were calcd. from available data. It was not possible to carry out appreciably the reaction  $\text{COCl}_2 + 2\text{MCl} = \text{CCl}_4 + \text{MeO}$ , where M is an equiv. of a metal (Si, Al, Sn). Ordinary animal charcoal was found to be a good catalyst for the reaction  $\text{CCl}_4 = \text{C} + 2\text{Cl}_2$  but the reverse reaction did not occur. The reaction  $2\text{COCl}_2 = \text{CO}_2 + \text{CCl}_4$  was attempted in both directions and indications obtained of false equilibria.

P. T. Newsome

**Alkyl and aryl bromosulfites.** P. Carré and D. Litvermann. *Compt. rend.* 197, 1326-8 (1933).—Unlike  $\text{SO}_2\text{Cl}_2$  (C. A. 27, 711, 3912),  $\text{SO}_2\text{Br}_2$  reacts with alic. to give alkyl bromides; however, with neutral alkyl or aryl sulfites, on standing at room temp. in anhyd. EtO, the corresponding bromosulfites are readily obtained:  $\text{EtOSOBr}$ ,  $b_p$  67-70°;  $\text{PrOSOBr}$ ,  $b_p$  90-3°;  $\text{iso-PrOSOBr}$ ,  $b_p$  72-4°;  $\text{BuOSOBr}$ ,  $b_p$  105-7°;  $\text{ClCH}_2\text{CH}_2\text{OSOBr}$ ,  $b_p$  118-20° (from  $\text{ClCH}_2\text{CH}_2\text{O})_2\text{SO}$ ,  $b_p$  146-8°);  $\text{PhOSOBr}$ ,  $b_p$  131-4°. These are less stable than the similar Cl compds.

H. A. Beatty

**Behavior of the hydrochlorides of organic bases toward chloroauric acid. Constitution of the abnormal auric chloride complexes.** Dinesh Chandra Sen. *J. Indian Chem. Soc.* 10, 497-501 (1933).—The following compds. of the types  $\text{XAuCl}_4$  and  $\text{X}_2\text{AuCl}_3$  (X = quaternary  $\text{NH}_4$  radical) have been prep'd. according to the procedure of Jenner and Tafel (*Ber.* 32, 3220 (1899)), by the addn. of chloroauric acid to the HCl salts of the org. bases, quinine, piperidine, EtNH<sub>2</sub>,  $\text{PhCH}_2\text{NH}_2$  and  $\text{NMe}_3$ :  $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_3\text{AuCl}_4$ , m. 238°;  $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_3\text{AuCl}_4 \cdot \text{C}_6\text{H}_5\text{NCl}$ , m. 180°;  $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_3\text{AuCl}_4$ , m. 206°;  $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_3\text{AuCl}_4 \cdot \text{C}_6\text{H}_5\text{NCl}$ , m. 183°;  $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_3\text{AuCl}_4$ , m. 195°;  $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_3\text{AuCl}_4 \cdot \text{C}_6\text{H}_5\text{NCl}$ , m. 70°;  $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_3\text{AuCl}_4$ , m. 168°;  $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_3\text{AuCl}_4$ , m. 220°. The normal salts,  $\text{XAuCl}_4$ , are always formed in aq. media, a max. yield being obtained with mol. proportions of the basic HCl salts and  $\text{AuCl}_3 \cdot \text{HCl}$ . In alc. HCl solns. of 2 mols. of basic HCl salts per mol. of  $\text{AuCl}_3 \cdot \text{HCl}$  max. yields of the compds.  $\text{X}_2\text{AuCl}_3$  were formed. Compds. of this type were also obtained by heating alc. solns. of  $\text{XAuCl}_4$  in the presence of HCl. They are unstable in

water and in acetone, and give abnormal values in b.-p. and mol.-wt. detns. in alc. From results of observations made on mol. vols. and sp. resistances it is definitely established that the abnormal auric chlorides of the type  $\text{X}_2\text{AuCl}_3$  are mol. compds. of the type  $\text{X}(\text{AuCl}_4) \cdot \text{XCl}$ . C. R. A.

**Hydrazide of 12-hydroxystearic (acid) and some of its derivatives.** J. Vorisek. *Collection Czechoslov. Chem. Communications* 5, 466-8 (1933).—12-Hydroxystearic acid, heated on a water bath for 12 hrs. with  $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ , gave  $\text{C}_{18}\text{H}_{35}\text{CH}(\text{OH})(\text{CH}_2)_{10}\text{CONHNH}_2$  (I), m. 115.5-16.5°. I, treated with HCl gas, gave the HCl salt, m. 162-3°; warmed with a slight excess of  $\text{Ac}_2\text{O}$ , it gave  $\text{C}_{18}\text{H}_{35}\text{CH}(\text{OH})(\text{CH}_2)_{10}\text{CONHNHAc}$ , m. 144-5°; when refluxed with  $\text{Ac}_2\text{O}$  for 15 min. it gave  $\text{C}_{18}\text{H}_{35}\text{CH}(\text{OAc})(\text{CH}_2)_{10}\text{CONHNHAc}$ . I (2 g.) added slowly to I (12 g.) in EtOH and then treated with 6 g. more of I at once gave  $[\text{C}_{18}\text{H}_{35}\text{CH}(\text{OH})(\text{CH}_2)_{10}\text{CONH}]_2$ , m. 153-4°.

J. White

**2,3-Dichlorodioxane.** Wilson Baker and A. Shannon. *J. Chem. Soc.* 1933, 1598. 2,3-Dichlorodioxane,  $b_p$  97-8°, m. 30°, reacts with  $\text{C}_2\text{H}_5\text{OH}$  to give a mixt. of two 2,3-ethylene-dioxycloxanes, so that inversion about 1 of the asym. C atoms must occur during the reaction. These 2 form a eutectic mixt., m. 86°, with 77% of the lower-melting isomer. Chlorination of 1,3-dioxacyclopentane gives an inseparable mixt. of 2-Cl and a smaller quantity of 4-Cl deriv.,  $b_p$  53-6°. 2,3-Dicyanodioxane could not be prep'd.

C. J. West

**Photochemical reactions in the series of o-nitrobenzylidene acetal derivatives.** VIII (I) (Di-o-nitrobenzylidene-1,2,5,6-dulcitol). Ioan Tanasescu and Eugen Macovski. *Bull. soc. chim.* 53, 1097-102 (1933); cf. C. A. 27, 2142. The condensation of dulcitol with o-o<sub>2</sub>N<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CHO in the presence of 75%  $\text{H}_2\text{SO}_4$  gave 1,2,5,6-bis(o-nitrobenzylidene)dulcitol (I),  $\text{C}_{30}\text{H}_{30}\text{N}_4\text{O}_{10}$ , m. 256°. The formation of I confirms the conception of Tollens (*Ann.* 310, 184 (1900)) that the acetalization of the polyols is favored by the trans-position of the OH groups. In dulcitol the 3,4-OH groups offer a steric hindrance to acetalization (C. A. 26, 4583). The existence of these OH groups is shown by the ready benzylation of I in pyridine to 1,2,5,6-bis(o-nitrobenzylidene)-3,4-dibenzoyldulcitol (II),  $\text{C}_{32}\text{H}_{32}\text{N}_4\text{O}_{12}$ , m. 310°. The photochem. isomerization of I gave a resin which could not be purified. I contains 3 active H atoms by the Zerewitinov method of detn. II was isomerized by light to 1,6-bis(o-nitrobenzoyl)-3,4-dibenzoyldulcitol (III),  $\text{C}_{34}\text{H}_{34}\text{N}_4\text{O}_{12}$ , m. 108-10°. This result verified the parallelism between the no. of mobile H atoms and the degree of photochem. isomerization and also afforded an explanation for partial isomerization as evidenced by the behavior of light on I in soln. The NO groups in III were apparent in the emerald-green of the substance in soln. and in the fused state. The existence of the 2,5-OH groups was proved by the formation of the di-Bz deriv., 1,6-bis(o-nitrobenzoyl)-2,3,4,5-tetra-benzoyldulcitol,  $\text{C}_{38}\text{H}_{38}\text{N}_4\text{O}_{14}$ , m. 110° (decompn.).

C. R. Addinall

**Thioketonic esters. IV.** Susil Kumar Mitra. *J. Indian Chem. Soc.* 10, 491-5 (1933); C. A. 27, 3914. Et ethylthioacetate (I), red oil,  $b_{14}$  85°, results in 80% yield from  $\text{AcCHEtCO}_2\text{Et}$  satd. with HCl at 0° and treated with  $\text{H}_2\text{S}$  for 8 hrs. at 0°. With  $\text{PhNHNH}_2$  I evolves  $\text{H}_2\text{S}$  and gives 1-phenyl-3-methyl-4-ethyl-5-ketopyrazolone (II), m. 108°. I, hydrolyzed with 10%  $\text{H}_2\text{SO}_4$ , gives MeCOPr. The Na deriv. of I and EtBr gives 60% of Et  $\beta$ -ethylmercapto- $\alpha$ -ethylcrotonate,  $b_{14}$  95°;  $\beta$ -iso-Bu deriv.,  $b_{14}$  100°; with  $\text{PhNHNH}_2$  there results II; on boiling with dil. acids these compds. evolve mercaptans and  $\text{CO}_2$ ; the absence of the thiol group is evidenced by the fact that they do not decolorize EtOH-I and do not yield Pb salts. Et  $\beta$ -acetylmercapto- $\alpha$ -ethylcrotonate,  $b_{12}$  105°, results from the Na compd. of I and AcCl or from  $\text{MeCSCH}_2\text{CO}_2\text{Et}$ , thioacetic anhydride and  $\text{C}_6\text{H}_5\text{N}$ ;  $\beta$ -Bz deriv.,  $b_{14}$  185°;  $\text{PhNHNH}_2$  gives II and Ac or Bz derivs. of  $\text{PhNHNH}_2$ . The Ac deriv. and EtMgBr give I and MeCOEt.

C. J. West

**Rotatory dispersive power of organic compounds. XXIV. Ascorbic acid.** T. M. Lowry and S. A. Pearman. *J. Chem. Soc.* 1933, 1444-9; cf. C. A. 28, 1111. Aq. solns. of ascorbic acid (I) do not undergo mutarotation in

the absence of  $O_2$  but they exhibit anomalous rotatory dispersion, with a max. in the violet. Alk. solns. also do not undergo mutarotation in the absence of  $O_2$  but the rotatory power is much higher and the rotatory dispersion is apparently simple. The rotatory power of I is increased by diln. and by the addn. of alkali but that of alk. solns. diminishes and then becomes neg. on atm. oxidation. Results are given in 3 tables and 5 curves.

C. J. West

A reagent of the enolic form. A. Dansi and A. Sempronj. *Gazz. chim. ital.* 63, 560 5(1933).—The new enol reaction of Zappi (C. A. 26, 2706; 27, 904) was applied to ketones, nitriles and mono- and polynitrophenols. Among ketones, MeEtCO, Me hexyl ketone, Me nonyl ketone and methylheptenone give pos. reactions. Others, like  $MeC_6H_4COMe$  and  $EtCOPh$ , have a reducing action, but form intermediate yellow compds., already noted by Z., with  $PhCOMe$  and  $Me_2CO$ . Passage to Hg takes place on heating. Attempts to isolate the yellow compds. were unsuccessful because of decompn. They are org. Hg compds. which evolve nitrous vapors when warmed. Among nitriles, MeCN prepd. from acetamide does not reduce  $HgNO_3$ , whereas when it is prepd. from  $Me_2SO$ , it does reduce, because of the presence of isonitrile. PhCN and *p*-nitrobenzonitrile are also without reducing power. Though Z. found no reduction with PhOH, prolonged heating of aq. PhOH with satd.  $HgNO_3$  gives a yellow ppt. which redissolves with deposition of a little Hg. Prolonged heating of the 3 aq. mononitrophenols with  $HgNO_3$  gives no reduction, but in EtOH they ppt. yellowish substances which turn dark. Though not observed by Z., aq.  $o-O_2NC_6H_4ONa$  with  $HgNO_3$  ppts. a greenish compd. which on heating decomp. to Hg. Under the same conditions *p*- $O_2NC_6H_4ONa$  ppts. a green compd. (I) mixed with Hg. The reduction is more rapid with *m*- $O_2NC_6H_4OK$ . Therefore the more highly disocd. is the nitrophenate the slower the reduction (cf. Ber. 8, 1556 (1875)). Hot aq. 5,2,4- $Br(O_2N)_2C_6H_3OK$  and  $HgNO_3$  ppt. the compd.  $C_6H_3O_2N_2BrHg$ , orange, turns green above 100°, becomes orange again at higher temps. and decomp. violently above 200°. It reduces  $AcCH_2CO_2Et$  instantly. Its constitution is probably

ogy with the anhydrides of mercurinitrophenols (cf. Ber. 39, 1105(1906); 40, 330(1907)). It was expected that K picrate would form an analogous compd., but actually there was pptd. a canary-yellow substance, with greenish reflection, contg. 50.75–51.15% Hg (between 1 and 2 Hg atoms per PhOH mol.). This mixt., partially sol. in hot water, yielded the  $(O_2N)_2C_6H_3(O):NO.O.Hg$  of Hantzsch.

With  $NH_4OH$  it ppts. a light yellow compd. which decomp. rapidly, particularly when warmed. It contains  $NH_3$ . The small proportion of water-insol. green product (III) contains both combined and free Hg, so that in this reaction most of the  $HgNO_3$  acts as a mercurating agent and does not form products of the II type. With cold  $AcCH_2CO_2Et$ , I, II and III are reduced immediately. Though Z. explained these reactions by the unsatd. active character of the enolic and the pseudo forms, it is possible that extremely unstable transition compds. between the enolic or pseudo forms and the mercurio compd. are formed, which are analogous to II. Thus with  $MeNO_2$ , formula II can be extended to a hypothetical unstable compd. of  $MeNO_2$ , where the 2  $-Hg.Hg-$  atoms are attached to the C and to the O of the  $NO_2$  group, resp. In an analogous way, the anhydrides of Hantzsch, formed in the mercuration of nitrophenols, are found in the aliphatic series in the mercuration of  $O_2NCH_2CO_2Et$  (cf. Scholl and Nyberg, Ber. 39, 1956(1906); D. and Ferri, C. A. 27, 2938), where the anhydride forms on a single C atom,

thus:  $EtO_2CC:NO.O.Hg$ . The introduction of the  $-Hg.-Hg-$  group in this type of product might originate from unstable compds. which would be immediately reduced to Hg.

C. C. Davis

**New derivatives of methoxymalonic acid.** John Pryde and R. Tecwyn Williams. *J. Chem. Soc.* 1933, 1627-8; cf. C. A. 27, 4217.— $MeOCH_2CO_2Me$ ,  $b_p$  129.5–30.5°,  $n_D^{20}$  1.3972 and  $(CO_2Me)_2$  with Na in dry Et<sub>2</sub>O give *M*,  $\alpha$ -*keto*- $\beta$ -methoxysuccinate, pale yellow,  $b_p$  110–20°,  $n_D^{20}$  1.4465; distn. at 745.5 mm. gives *Me methoxymalonic*, pale yellow,  $b_p$  215°; *methoxymalondiamide*, m. 203–4° (slight decompn.); the *methylamide* m. 115°.

C. J. West

**Structure of glutacnic acids and esters.** VIII. Some cyclic compounds of the glutacnic and the citraconic acid series. G. A. R. Kon and B. L. Nandi. *J. Chem. Soc.* 1933, 1628–34; cf. C. A. 27, 64.— $\Delta^2$ -Tetrahydrocyclophthalic acid (I) was prepd. in 2 ways. Cyclohexanone condenses with 2 mols.  $(CO_2Et)_2$ , using 2 mols. EtONa and gives, in addn. to Et cyclohexanone-2-glyoxylate, a small quantity of Et cyclohexanone-2,6-diglyoxylate, which on distn. yields Et cyclohexanone-2,6-dicarboxylate, which is more conveniently prepd. by Ushakov's method (C. A. 23, 4678); catalytic reduction gives Et cyclohexanol-2,6-dicarboxylate,  $b_p$  145.7°,  $d_4^{20}$  1.1202,  $n_D$  1.4679; dehydration with  $SOCl_2$  in  $C_6H_5N$  gives the *II* ester (II) of I,  $b_p$  149.51°,  $d_4^{20}$  1.0771,  $n_D$  1.4720.  $(CO_2Et)_2$  and Et tetrahydrobenzoate are condensed by EtONa to Et 3-carbethoxy- $\Delta^2$ -cyclohexenylglyoxylate (III), m. 105°, hydrolysis with 20% KOH gives the free acid, m. 221° (acid ester, m. 178°); oxidation of III or hydrolysis of II gives I, m. 197–8°; the action of  $O_3$  on I gives glutaric acid. II, Na and EtI give the *Et* ester,  $b_p$  145–50°,  $d_4^{20}$  1.0448,  $n_D$  1.4682, of 1-ethyl- $\Delta^2$ -cyclohexene-1,3-dicarboxylic acid, m. 162°. Heating I with 25% KOH in a sealed tube at 100° for 18 hrs. has no effect but with HCl at 180–90° for 4 hrs. I gives the  $\Delta^2$ -acid. Me  $\Delta^1$ -cyclobutene-1,2-dicarboxylate (Perkin, *J. Chem. Soc.* 67, 930 (1894)) with  $O_3$  gives Me  $\alpha,\alpha'$ -diketoadipate; the ester is not changed by EtONa at room temp. or by distn. at room temp. Et 1,2-dibromocyclobutane-1,2-dicarboxylate  $b_p$  150–8° (33% yield); reduction with Zn in EtOH gives Et  $\Delta^1$ -cyclobutene-1,2-dicarboxylate,  $b_p$  136.9°,  $d_4^{20}$  1.0870,  $n_D$  1.4571; with  $O_3$  it reacts as the Me ester. Attempts to prep. the  $\Delta^2$ - or  $\Delta^3$ -acid are reported.  $[CH(CO_2Et)]_4$ , Na and  $ClCH_2COCl$  give a mixt. of esters which could not be sep'd. by distn.; the phenylhydrazone, m. 128°, was probably derived from Et cyclobutan-3-one-1,1,2,2-tetracarboxylate; catalytic reduction and hydrolysis give a poor yield of 3-hydroxycyclobutane-1,1,2,2-tetracarboxylic acid(?), m. 191°. Et  $\Delta^1$ -cyclopentene-1,2-dicarboxylate with  $O_3$  gives Et  $\alpha,\alpha'$ -diketopimelate; the ester is not isomerized by EtONa nor is EtOH added, an acid ester,  $b_p$  135–40°, is formed in part; the acid is also unchanged by 25% KOH at 100° or by concd. HCl in a sealed tube. Et  $\Delta^2$ -tetrahydrophthalate,  $b_p$  155°,  $d_4^{20}$  1.0760,  $n_D$  1.4700; it is unchanged after 3 distns. at atm. pressure, after boiling 4 hrs. in a Geisler flask, after treatment with EtONa and after the last soln. has been boiled 4 hrs. The  $\Delta^1$ -isomer  $b_p$  160°,  $d_4^{20}$  1.0782,  $n_D$  1.4743, heating with EtONa for 4 hrs. gives a product with 12.4% EtO acid. The  $\Delta^1$ -acid is rapidly converted into the  $\Delta^2$ -acid on boiling with 12% alkali, the extent of the change being about 75% and practically complete in 15 min. The  $\Delta^2$ -acid is not changed by heating with 25% KOH at 100° for 6 hrs.

C. J. West

**Maleic acid and phthalic anhydride.** C. R. Downs. *Ind. Eng. Chem.* 26, 17 20(1934).—The diverse fields opened up commercially by the catalytic oxidation of benzene and naphthalene in the vapor phase to maleic and phthalic anhydrides are discussed. Correction. *Ibid.* 180.

W. A. Moore

**Ethyl and methyl esters of fluoroformic acid.** Harsh C. Goswami and Pulin B. Sarkar. *J. Indian Chem. Soc.* 10, 537–9(1933).—By the action of powd. anhyd. THF on  $ClCO_2Et$  and  $ClCO_2Me$  were produced the corresponding fluoroformic esters,  $FCO_2Et$ ,  $b_p$  57°,  $d_4^{20}$  1.11, and  $FCO_2Me$ ,  $b_p$  40°,  $d_4^{20}$  1.06. The substitution of Cl by F lowers the  $b.p.$  by 36° and 32° in the case of the Et and Me esters. A similar difference exists between  $AcCl$  and  $AcF$  and between  $EtCOCl$  and  $EtCOF$ . The Me ester is more dense than the Et ester; as with the initial chloroformic esters,

the combustion of the compds. for anal. purposes was carried out in a Cu tube, using a mixt. of CuO (80%) and PbO (20%) in a current of O. The analysis for F was effected by hydrolysis with 6 *N* NH<sub>4</sub>OH and pptn. as CaF<sub>2</sub>.

C. R. Addinall  
**Oxidation of uric acid in the presence of glycooal.** Frèrejacque. *Compt. rend.* 197, 1337-9 (1933).—Oxidation of uric acid, as previously described (C. A. 26, 1579), in the presence of glycine or alanine yields K salts of *N*-isoallantoylglycine (I) or *N*-isoallantoylalanine, resp. Treated with CuSO<sub>4</sub>, CuCl<sub>2</sub>, HgCl<sub>2</sub> or AgNO<sub>3</sub>, I forms slightly sol. cryst. double salts in which the K ion is replaced; in dil. HOAc, a double salt of I and the free base is obtained, but the latter alone is evidently unstable. Possibly such reactions occur in the *metabolism of uric acid*.

H. A. Beatty  
**Fructose anhydride. XIII. Synthesis of a difructose anhydride from fructose.** Hans H. Schlubach and Cessa Behre. *Ann.* 508, 16-24 (1933); cf. C. A. 27, 4780.—Fructose (10 g.) and 10 cc. dry HCl, allowed to stand in a sealed tube 5 hrs. at 14°, give a *difructose anhydride*, decomps. 250-70°,  $[\alpha]_D^{25}$  -43.9° (H<sub>2</sub>O, *c* 1.02); the half-period of hydrolysis with *N* H<sub>2</sub>SO<sub>4</sub> is 1071 min.; the hydrolytic product is pure fructose. The *Ac deriv.*, C<sub>24</sub>H<sub>40</sub>O<sub>10</sub>, m. 171-3°,  $[\alpha]_D^{25}$  -59.1° (CHCl<sub>3</sub>, *c* 1.02), -41.7° (C<sub>6</sub>H<sub>6</sub>, *c* 1.01); with 35% NaOH and Me<sub>2</sub>SO, there results a *hexa-Me deriv.*, m. 143-5°,  $[\alpha]_D^{25}$  -46.5° (CHCl<sub>3</sub>, *c* 1.00). Hydrolysis gives 3,4,5-trimethylfructose, b<sub>p</sub> 117°,  $n_D^{20}$  1.4723,  $[\alpha]_D^{25}$  -55.2° (CHCl<sub>3</sub>, *c* 1.07), -73.5° (H<sub>2</sub>O, *c* 0.70), -55.8° (CCl<sub>4</sub>, *c* 0.99), -57.9° (MeOH, *c* 0.93); osazone, oily.

C. J. West  
**Action of 2-hydroxycyclopentanecarboxylic acids on the electrical conductivity of boric acid. Mobility of the cyclopentane ring.** J. Böseken, G. Slooff, J. M. Hoeffelman and H. E. Hirsch. *Rec. trav. chim.* 52, 881-94 (1933).—Aliphatic  $\alpha$ -OH acids exert a very pronounced action on the elec. cond. of H<sub>3</sub>BO<sub>3</sub>, while  $\beta$ -OH acids are indifferent. Although aromatic *o*-hydroxy carboxylic acids are  $\beta$ -OH acids, they exert a pos. action on the conducting power of H<sub>3</sub>BO<sub>3</sub>, comparable with that of aliphatic  $\alpha$ -OH acids. Evidently the position of the OH and CO<sub>2</sub>H groups is very favorable to "aromatic tension"—the tension due to the fact that all the groups united directly with the benzene ring are forced to lie in the plane of the ring. It was to be expected that the *cis*-2-hydroxycyclopentanecarboxylic acids, being  $\beta$ -OH acids, could exert a pos. action on the cond. of H<sub>3</sub>BO<sub>3</sub>, not only because the complex activities of the open chain  $\beta$ -OH acids have disappeared, but also because the position of the OH and CO<sub>2</sub>H groups in the *cis*-isomers is favorable to the formation of a hexatomic ring. Results obtained by the authors in the investigation of certain acids have confirmed this hypothesis. Two 2-borneol-3-carboxylic acids are known, I (m. 102°) and II (m. 175°). I increases the cond. of H<sub>3</sub>BO<sub>3</sub> and is therefore the *cis*-isomer; this is also in accord with the values of the electrolytic dissocn. const. The fact that II is difficultly attacked by KMnO<sub>4</sub> is proof of its *trans*-configuration, for in the *trans*-isomer the OH and CO<sub>2</sub>H groups are not situated in such a way as to favor the formation of a complex with KMnO<sub>4</sub>. II does not react with Me<sub>2</sub>CO or chloral; I reacts with Me<sub>2</sub>CO to give a solid, m. 124°, and with chloral to give a chloralide, m. 191°. 2-Hydroxycyclohexanecarboxylic acid (III), only 1 form (m. 111°) of which the authors were able to obtain, decreased the cond. of H<sub>3</sub>BO<sub>3</sub>. The cyclohexane ring being much more mobile than the pentatomic ring, the OH and CO<sub>2</sub>H groups will occupy a much less fixed position in this acid than in the hydroxycyclopentanecarboxylic acids. In that case the situation in the *cis*-isomer may be almost as unfavorable as in the *trans*-isomer. Although a chloralide (m. 142°) of III was obtained, this is no more a proof that the acid has the *cis*-configuration than the neg. conduction with reference to H<sub>3</sub>BO<sub>3</sub> is a proof of the *trans*-configuration. From the mother liquors of some preps. of III was obtained a small quantity of a sirup. After distn. it crystd. slowly to a solid which m. 57-63° and increased the cond. of H<sub>3</sub>BO<sub>3</sub>. At best it may be said that III is probably the *trans*-acid. Cyclization of Et adipate by

Na, reduction of the product with H<sub>2</sub> and Ni, treatment with KOH in MeOH and addn. of acid gave a viscous oil which would not crystallize. This mixt. of *cis*- and *trans*-2-hydroxycyclopentanecarboxylic acids was sepd. by means of Me<sub>2</sub>CO, since only the *cis*-isomer forms a volatile cyclic acetal with Me<sub>2</sub>CO. During acetonization in the presence of P<sub>2</sub>O<sub>5</sub> the *trans*-acid was transformed into its *cis*-isomer. The Me<sub>2</sub>CO compds. when hydrolyzed gave acids which increased the cond. of H<sub>3</sub>BO<sub>3</sub>, indicating their *cis*-configuration. To Et 8-methyladipate in PhMe was added a few drops of abs. EtOH and some Na wire. After the vigorous reaction had ceased, the solid mass of Na salts was heated for a time at 150°, then suspended in Et<sub>2</sub>O and acidified. The product b<sub>p</sub> 130-5° and on reduction with H<sub>2</sub> and Ni at 150-60° under pressure gave a mixt. of the esters of 4- and 5-methyl-2-hydroxycyclopentanecarboxylic acids, b. 72-82° in cathode vacuum. Sapon. of the esters gave a mixt. of *cis*- and *trans*-acids, which was sepd. by acetonization in the presence of P<sub>2</sub>O<sub>5</sub>. No isomerization of *trans*-acid to the *cis*-acid occurred, owing to stabilization by the Me group of the cyclopentane ring. From the Me<sub>2</sub>CO soln. was obtained on distn. the Et ester of 5-methyl-2-hydroxycyclopentanecarboxylic acid, b<sub>p</sub> 115-7°. The marked difference between the increase in cond. of H<sub>3</sub>BO<sub>3</sub> (0.5 *M*) produced by borneolcarboxylic acid and that produced by the simple cyclopentanecarboxylic acids is attributed by the authors to a much more pronounced rigidity of the pentatomic rings of borneol.

Louise Kelley  
**Constituents of Filix mas. II. Synthesis of filicinic acid.** Alexander Robertson and Wm. F. Sandrock. *J. Chem. Soc.* 1933, 1617-18; cf. C. A. 27, 4800.—Partial hydrolysis of Me<sub>2</sub>C(CO<sub>2</sub>Et)<sub>2</sub> gives the *acid ester*, b<sub>p</sub> 114-16°, b<sub>p</sub> 185-6°; PCl<sub>5</sub> gives the *acid chloride*, b<sub>p</sub> 74-8° (*anhydride*, m. 47-8°); with the Na deriv. of CO(CH<sub>2</sub>CO<sub>2</sub>Et)<sub>2</sub>, there results Et 1,1-dimethylpentane-2,4-dione-1,3,5-tricarboxylate, yellow, b<sub>p</sub> 175-80°; ring closure with EtONa gives Et 1,1-dimethylcyclohexane-2,4,6-trione-3,5-dicarboxylate, m. 147-8°; simultaneous hydrolysis and decarboxylation gives filicinic acid (Boehm, *Ann.* 329, 289, 321 (1903)), which is 1,1-dimethylcyclohexane-2,4,6-trione.

C. J. West  
**Reactions of substituted cyclohexanones.** Robert E. Meyer. *Helv. Chim. Acta* 16, 1291-5 (1933).—The absorption of 376 g. of Cl by a well-stirred suspension of 265 g. cyclohexanol in 660 cc. H<sub>2</sub>O contg. 400 g. CaCO<sub>3</sub>, kept at 20-5° for 9.5 hrs., produced 42 g. cyclohexanone, 198 g. (56.6%) of 2-chlorocyclohexanone (I), b<sub>p</sub> 79°, m. 22-3°,  $d_4^{20}$  1.161,  $n_D^{20}$  1.4825, and 63 g. of a denser, more highly chlorinated product which on distn. gave 41 g. of 2,6-dichlorocyclohexanone (II), m. 72-3°, b<sub>p</sub> 106°,  $d_4^{20}$  1.2950,  $n_D^{20}$  1.5034. II was quantitatively dechlorinated on heating with K<sub>2</sub>CO<sub>3</sub> in 50% alc. Addn. of powd. KCN to alc. I yielded 64% 2-cyanocyclohexanone (III), b<sub>p</sub> 129-31°. On exposure to the air III is slowly converted into adipic acid (IV), m. 149.5-50°. The cyclohexanone ring is cleaved to 6-hydroxy-8-cyanocaproic acid which liberates HCN and yields HO<sub>2</sub>C(CH<sub>2</sub>)<sub>4</sub>CHO, transformed by atm. oxidation into IV. Steam distn. of III in 10% NaOH for 10 hrs. (to cessation of NH<sub>3</sub> evolution) gave 84.7% of pimelic acid (V), C<sub>7</sub>H<sub>10</sub>O<sub>4</sub>, m. 104-5°. The best method of prepg. V was found to consist in the treatment of the reaction product of KCN and I with tech. 25% NaOH. Quant. expts. showed that the acid is not volatile on steam distn.

C. R. Addinall  
**Free nitrogenated radicals. The structure of diarylnitroxides.** L. Cambi, Emilio Tremolada and G. Devoto. *Gazz. chim. ital.* 63, 579-84 (1933).—The magnetic susceptibilities of 3 nitroxides with quadrivalent N, viz., Ph<sub>2</sub>NO (I), (p-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>NO (II) and (p-MeOC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>NO (III), were detd. by a method already described in previous work (cf. C. and Szegö, C. A. 26, 887). The following data give the temp. (abs.),  $\chi_{mol.}$   $\times 10^4$  and  $\chi_{mol. cor.}$   $\times 10^4$  values at the temp., and the Weiss magneton, resp., for the 3 compds.: I, 291°, 1160, 1275, 8.45; II, 350°, 1083, 1234; 294°, 1318, 1469; 192°, 1960, 2111; 84°, 4220, 4391, 9.20; III, 243°, 954, 1087; 291°, 1160, 1293; 193°, 1760, 1893; 84°, 2550, 2683; 8.60. Because

of its instability, I could be measured only at 291° (abs.). The  $\chi_{\text{mol. cor.}} \times 10^4$  values of II between 343° and 193° (abs.) and of III at the lowest temp. show a zero value of the  $\theta$  coeff. in the  $\chi_m(T - \theta) = C$  formula of Weiss and Curie. II has a tendency toward Bohr magneton values below 1 at the lowest temps., though lack of data below 84° (abs.) leave the question unsettled. The structure of nitroxides in relation to their elec. moments is also discussed (cf. C. and Szegő, *Rend. ist. lombardo* 56, 439 (1933); C. A. 27, 3368). The magnetic susceptibility of  $R_2NO$  compds., the structure of which is indisputable, attest the general behavior of the NO group, which in both inorg. and org. derivs. has a magnetic moment of 1 Bohr magneton. There remains, however, the question whether the odd electron of the NO group belongs to the N. Based on analogy and on the chem. behavior of the NO group, the uncompensated active electron belongs to the N. Further examn. of the structure of diarylnitroxides is made possible by the data on the elec. moment. The moments ( $\mu$ ) of I, II and III are  $2.3 D \pm 0.2$ ,  $2.7 D \pm 0.5$  and  $3.3 D \pm 0.3$ , resp., i. e., of the same order of magnitude as that of PhNO ( $3.22 D$ ). These moments suggest a general form with semi-polar valences:  $R_2N \rightleftharpoons O$ , analogous to those of PhNO and PhNO<sub>2</sub>. Possibly there is a form with the following electronic arrangement:

R:

R:

C. C. Davis

**Influence of neutral salts on the optical rotation of  $\alpha$ -phenylethylamine hydrochloride.** Yen Ki Heng. *Compt. rend.* 197, 1316-18 (1933).—The sp. optical rotation of PhCHMeNH<sub>2</sub>Cl increases rapidly with the concn., and is augmented by the addn. of neutral salts. This effect depends on the charge, mass and structure of the anion added, and is a max. with phthalate ion; F<sup>-</sup>, Cl<sup>-</sup>, Br<sup>-</sup> and I<sup>-</sup> ions increase in effectiveness in that order; LiI shows an influence of the cation.

H. A. Beatty

**Causes of discoloration of aniline and measures for its possibly long preservation without change.** P. K. Bulich. *Anilinokrasochynaya Prom.* 3, 405-12 (1933).—The dark discoloration of PhNH<sub>2</sub> (I) was investigated with I derived from pure and tech. coal-tar C<sub>6</sub>H<sub>6</sub> (d. 0.880-0.885) and petroleum C<sub>6</sub>H<sub>6</sub> (d. 0.8665), whereby the former was found to be more stable than the latter. The discoloration of I caused by a photochem. oxidation is directly related to the intensity of actinic light and the duration of exposure. The reaction is furthered by the presence of impurities of *o*- and *p*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub>, but is retarded by *m*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub>, and nearly completely inhibited in the absence of O<sub>2</sub>. The discoloration of I is considerably retarded or completely checked by contact with minute amts. of Na<sub>2</sub>S (preferably anhyd.), oxalic acid, emery-surfaced Zn and Fe plates, untreated or after boiling with 20% Na<sub>2</sub>S. Fe plates cleaned by heating with dil. H<sub>2</sub>SO<sub>4</sub> accelerate the oxidation even when treated with Na<sub>2</sub>S, the preserving action being somewhat restored by mild heating over a gas flame. Partially rusted Fe plates after boiling with 20% Na<sub>2</sub>S also have a retarding action on the oxidation of I. Several large samples of colorless tech. I stored with the addn. of little oxalic acid and anhyd. Na<sub>2</sub>S, Fe plates and Fe plates treated with Na<sub>2</sub>S, showed no discoloration after 2 months. Na<sub>2</sub>S and the acid do not undergo changes. The method was applied with satisfactory results to the storage and transportation of com. I in iron drums. The drums were flushed with hot H<sub>2</sub>O, and without further cleaning were boiled with 5-20% Na<sub>2</sub>S, sealed, allowed to cool, then emptied, flushed with H<sub>2</sub>O, and then twice with I and filled as soon as possible to prevent the oxidation of the FeS film. Chas. Blanc

**Diazotization of aromatic nitroamines and the prevention of diaryl formation in the Sandmeyer reaction.** Herbert H. Hodgson and John Walker. *J. Chem. Soc.* 1933, 1620-1.—The diazotization of weak bases is rapid and complete when a soln. of the nitroamine in glacial

AcOH is added to NaNO<sub>2</sub> in concd. H<sub>2</sub>SO<sub>4</sub>; reversal of this order of addn. ppts. the sulfate of the base and greatly retards the rate of diazotization. When the diazo soln. is added in the cold to a soln. of CuCl or CuBr in the corresponding concd. acid or to a satd. aq. soln. of KI, decompn. rapidly takes place and the almost pure halogen compd. is pptd. in at least 80% yield; diaryl formation has not been detected. If an equal vol. of EtOH is added, with cooling, to the undil. diazo soln. and the temp. gradually raised to 80°, elimination of the diazo group takes place. Examples are cited. 4,4'-Dichloro-3,3'-dinitrobiphenyl, m. 237° (80% yield); 1-bromo-2,4-dinitronaphthalene, m. 100°; 1-1 deriv., pale straw-colored, m. 183°.

C. J. West

**The basic properties of hydrazones.** VII. G. Ottolingo. *Gazz. chim. ital.* 63, 513 16 (1933); cf. Ciusa and O., C. A. 27, 494.—When PhCH:NNPh<sub>2</sub> (I) is condensed with BzH in the presence of HCl and air, the reaction varies with the proportion of BzH. Thus I (10 g.), BzH (2 g.) and concd. HCl (100 cc.), heated until the vol. is reduced 0.5, yield  $\alpha, \alpha$ -diphenyl-*p, p'*-dihydrazinotriphenylmethane, PhCH(C<sub>6</sub>H<sub>5</sub>NPhNH<sub>2</sub>-*p*)<sub>2</sub> (II), m. 120°, reduces Fehling soln. Attempts to obtain derivs. resulted in complete demolition of the mol., e. g., boiling Ac<sub>2</sub>O forms I, aq. HNO<sub>2</sub> forms *p*-ONC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, and *p*-ONC<sub>6</sub>H<sub>4</sub>CHO in boiling AcOH forms *p*-ONC<sub>6</sub>H<sub>4</sub>CH:NNPh<sub>2</sub>. On the other hand, I (10 g.) and BzH (5 g.) under the conditions above yield unidentified substances and the *dibenzylidene deriv.*, PhCH(C<sub>6</sub>H<sub>5</sub>NPhN:CHPh-*p*)<sub>2</sub>, of I, m. 226°. Again under the same conditions, but with a trace of HNO<sub>2</sub>, there is formed the dye PhCH:NNPhC<sub>6</sub>H<sub>4</sub>Cl<sub>4</sub>-C<sub>6</sub>H<sub>4</sub>:N(N:CHPh)PhCl green with violet reflection, m. 165°. PhCH:NNPhMe and BzH form a compd. (III), m. 155°, already described by Ciusa (C. A. 16, 2126) and by O. (C. A. 26, 4313) which has the constitution: PhCH:NNMeC<sub>6</sub>H<sub>4</sub>CHPhC<sub>6</sub>H<sub>4</sub>NMeNH<sub>2</sub>, i. e., a *monobenzylidene deriv.* of  $\beta, \beta$ -dihydrazino- $\alpha, \alpha'$ -dimethyltriphenylmethane, because it reduces energetically Fehling soln., and when refluxed with *p*-ONC<sub>6</sub>H<sub>4</sub>CHO and glacial AcOH it yields a mixt. of the *p*-nitrobenzylidene deriv. of  $\alpha, \alpha'$ -dimethyl-*p, p'*-dihydrazinotriphenylmethane, C<sub>6</sub>H<sub>4</sub>MeO<sub>2</sub>N<sub>2</sub>, orange, m. 162°, and its isomer, red, m. 138°.

C. C. Davis

**Chemical studies on cresols.** Shigeru Komatsu, Shozo Tanaka and Toichiro Waida. *J. Chem. Soc. Japan* 54, 794-834 (1933).—C<sub>6</sub>H<sub>4</sub>OH (I) and its Me derivs. (II) are prepd. from PhOH, *o*-, *m*- and *p*-cresols by catalytic reduction. I and II are then catalytically dehydrogenated or dehydrated to form C<sub>6</sub>H<sub>4</sub>O (III) and its Me derivs. (IV). The phys. and chem. properties of the products from the catalytic reduction of III and IV are studied.

K. Katsuta

**Substituted aminoquinones.** M. Covello. *Gazz. chim. ital.* 63, 517-24 (1933).—Though the literature shows numerous investigations on aminoquinones, there is no reference to aminoquinones with the amino H atoms replaced by unsatd. dibasic acid residues. Accordingly a study was made of this subject, with special attention to the influence of the double bond. Attempts to condense 2,4,6-(H<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>OH.HCl (I) with maleic anhydride (II) under the conditions used in earlier expts. (cf. C. A. 24, 1630), i. e., by heating I and II in an inert gas, yielded only a dark mass from which no definite product could be isolated. Resort was then had to the free base (III) of I, and because of its instability in air, a special app. had to be devised. This is described and illustrated, and made possible contact of II in N with III just liberated. Under these conditions a mixt. of II in C<sub>6</sub>H<sub>6</sub> and alc. I treated with aq. Na<sub>2</sub>CO<sub>3</sub> forms *trimaleinic picramine*, 2,1,6-

(OC:CH:CH.CO.N)<sub>3</sub>C<sub>6</sub>H<sub>2</sub>OH (IV), light yellow, m. 200°. IV in aq. KOH (calcd.) treated with dil. HCl ppts. *picraminotrimaleinic acid*, 2,4,6-(HO<sub>2</sub>CCH:CHCONH)<sub>3</sub>-C<sub>6</sub>H<sub>2</sub>OH, brown powder, decomps. around 150°. Ag salt, C<sub>18</sub>H<sub>11</sub>O<sub>10</sub>N<sub>3</sub>Ag<sub>3</sub>, prepd. in red light, lustrous gray, cryst. IV and HNO<sub>3</sub> (d. 1.48), let stand and the product purified by EtOH, yield *dimaleindiaminoquinone*, OC:CH:-

decomps. around 180°, and malcinimide. V, added dropwise to alc. PhHNH<sub>2</sub>, gives the highest yield of the condensation compd. of V and PhHNH<sub>2</sub>, C<sub>20</sub>H<sub>15</sub>O<sub>5</sub>N<sub>2</sub>, yellow, decomps. 100°. C. C. Davis

Formation of complex oxidation and condensation products of phenols—origin and nature of humic acid. I. Reactivity of simple monocyclic quinones. H. G. H. Erdtman. *Proc. Roy. Soc. (London)* A143, 177-91. —Methoxyquinol (I) is prepd. from vanillin and H<sub>2</sub>O<sub>2</sub>; diacetate, m. 96-6°. I with anhyd. MgSO<sub>4</sub> and PbO<sub>2</sub> in C<sub>6</sub>H<sub>6</sub> gives methoxyquinone (II), m. 143-4°. Treatment of II with Ac<sub>2</sub>O and H<sub>2</sub>SO<sub>4</sub> yields 2,4,5-triacetoxy-1-methoxybenzene (III), m. 142°. Hydrolysis of III and methylation gives 1,2,4,5-tetramethoxybenzene (IV), m. 103°. III oxidizes easily to 2,5-dimethoxyquinone. HCl and II give 4,4'-dimethoxy-"diquinhydrone." 1,2,3-Triacetoxy-3,1-dimethoxybenzene (V), m. 93-4°, is obtained from 2,3-dimethoxyquinone in Ac<sub>2</sub>O and H<sub>2</sub>SO<sub>4</sub>. m-Xyloquinone treated as in the prepn. of V gives 2,4,5-triacetoxy-1,3-dimethoxybenzene (VI), m. 103-4°. p-Xyloquinone yields 2,3,5-triacetoxy-1,4-dimethoxybenzene (V), m. 110°. By the same procedure 5-methoxytoluquinone gives 2,3,5-triacetoxy-4-methoxytoluene (VIII), m. 91-2°. Refluxing VIII in MeOH-H<sub>2</sub>SO<sub>4</sub> in an atm. of H<sub>2</sub> for 1 hr. gives 2,3,4,5-tetramethoxytoluene (IX); m. 51-2°. AcCl and 5-methoxytoluquinone give 3-chloro-2,5-diacetoxy-4-methoxytoluene (X), m. 126°. Bromination of creosol in glacial AcOH gives 6-bromocreosol (XI), m. 82-3°. Methylation of XI gives 6-bromoveratrole m. 35-6°; 6-nitrobromoveratrole, m. 121°. Thiele acetylation of thymoquinone yields fractions A, m. 87-8°, and B, m. 136-7°. Reductive acetylation of 3-hydroxythymoquinone gives 2,3,6-triacetoxy-1-methyl-4-isopropylbenzene (XII), m. 87-8°. 6-Hydroxythymoquinone gives 2,3,5-triacetoxy-1-methyl-4-isopropylbenzene (XIII). Mixed m. ps. of A and B with XII and XIII, resp., show no depression. II. Coupling of simple phenols and quinones to biphenyl derivatives. *Ibid.* 191-222.—Pyrogallol shaken with baryta soln. for 5 min. gives 2,3,4,2',3',4'-hexahydroxybiphenyl (I), m. 310-20° (decompn.); hexacetate, m. 163-4°, hexa-Me ether, m. 123°. Bipyrogallol hexa-Me ether brominated in CHCl<sub>3</sub> gives a dibromohexamethyl ether, m. 110-1°. Pyrogallol tri-Me ether with I and HgO gives 72% of 4-iodopyrogallol tri-Me ether (II), m. 40-2°. Heated with Cu powder, II yields 2,3,4,2',3',4'-hexamethoxybiphenyl, m. 110-1°. Electrolytic oxidation of pyrogallol gave neg. results. Electrolysis of pyrogallol tri-Me ether in Me<sub>2</sub>CO and 2 N H<sub>2</sub>SO<sub>4</sub> gives 2,6-dimethoxybiquinone, m. 255°; diacetate, m. 133°. Methoxyquinone and methoxyquinol in C<sub>6</sub>H<sub>6</sub> gives on evapn. methoxyquinhydrone (III), m. 97°. Thermal decompn. of III yields a coupled product which on oxidation yields 4,4'-dimethoxybiquinone (IV), m. 212-14°. In Ac<sub>2</sub>O and H<sub>2</sub>SO<sub>4</sub> IV gives 2(?) , 3,6,2',3',6'-hexa-acetoxy-4,4'-dimethoxybiphenyl. HCl (2 mol.) adds to IV, giving a chlorophenol which on boiling with Ac<sub>2</sub>O gives an anhydride (?), m. 253°. HI and PhNHNH<sub>2</sub> reduce IV to 4,4'-dimethoxybiquinol (V), m. 210°; tetraacetate (VI), m. 186-7°. Hydrolysis and subsequent methylation of VI yields 2,4,5,2',4',5'-hexamethoxybiphenyl (VII), m. 177-9°. VI, refluxed with HBr, gives 2,3,6,7-tetraacetoxybiphenylene oxide (VIII), m. 262°. Hydrolysis of VIII yields 2,4,5,2',4',5'-hexa-acetoxybiphenyl, m. 172-4°. Hydroxyquinol tri-Me ether and ICl<sub>3</sub> or H<sub>2</sub>C<sub>2</sub>O<sub>4</sub> soln. yields VII. Anodic oxidation of the same ether in strongly or weakly acid soln. also gives VII. Dehydrovanillin with H<sub>2</sub>O<sub>2</sub> in acetylating soln. forms 3,3'-dimethoxybiquinol (tetraacetate) (VIII), m. 176-8°. Bromination of VIII in AcOH gives 6,6'-dibromo-3,3'-dimethoxybiquinol tetraacetate, m. 207-8°. Hydrolysis of VIII results in 2,3,5,2',3',5'-hexamethoxybiphenyl (IX), m. 119-20°. Bromination of IX in CHCl<sub>3</sub> gives the 6,6'-di-Br deriv. (X), m. 271-2°. 6,6'-Dinitro deriv. of IX, m. 300-1°. Nitration of X yields 6,6'-dibromo-3,3'-dimethoxybiquinone, m. 240-2° (decompn.). Toluquinol di-Me ether (XI), nitrated, gives the 5-nitro deriv., m. 117-

8°. 5-I deriv. m. 85°. With C<sub>6</sub>H<sub>5</sub>N, Ac<sub>2</sub>O and Zn dust, 4,4'-ditoluquinone gives tetraacetylbiphenyl, m. 137°, hydrolyzed and methylated to give 2,5,2',5'-tetramethoxy-4,4'-dimethylbiphenyl, m. 135-6°. Reduction of Nietzki's quinone with SO<sub>2</sub> gives 2,2'-diethoxy-5,5'-dimethoxy-4,4'-dimethylbiphenyl, m. 116-8°. Methylation of Noeltzing's reduced quinone gives 2,2'-dimethoxy-5,5'-diethoxy-4,4'-dimethylbiphenyl, m. 94-6°. Bitoluquinone with Ac<sub>2</sub>O and H<sub>2</sub>SO<sub>4</sub> yields 2(?) , 3,6,2'(?), 3',6'-hexa-acetoxy-4,4'-dimethylbiphenyl, m. 202-3°. Reduction of nitroquinol dibenzyl ether gives the amino deriv. (XII), m. 100-2°; Ac deriv., m. 86-7°. Fusion of XII and p-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CHO yields the p-nitrobenzylidene deriv.; m. 105°. The following derivs. of 2-iodo-4-nitroaniline were prepd.: p-nitrobenzylidene, m. 194-6°; m-nitrobenzylidene, m. 177-8°. III. Rearrangements of oxidation-reduction type in the biquinone group. *Ibid.* 223-8.—α-BrC<sub>6</sub>H<sub>4</sub>, satd. at 200° with dimethoxybiquinone, gives 6-hydroxy-2,7-dimethoxybiphenylene oxide quinone (1,4) (I), m. 250°; acetate, m. 252-4°. Reduction of I with Zn dust gives 1,4,6-tri-hydroxy-2,7-dimethoxybiphenylene oxide (II), m. 210° (decompn.); triacetate, m. 232°. Tri-p-nitrobenzoyl deriv. of II, m. 300°. Methylation of the triacetate of II which has been treated with Zn dust gives 1,2,4,6,7-penta-methoxybiphenylene oxide, m. 109-10°. Heating 4,4'-dimethylbiquinone with α-BrC<sub>6</sub>H<sub>4</sub> yields 6-hydroxy-2,7-dimethylbiphenylene oxide quinone (1,4), m. 218-20°. IV. Terminal polymerization products of p-benzoquinone, toluquinone, and α-naphthoquinone. *Ibid.* 228-41.—Polymerization of benzoquinone with H<sub>2</sub>SO<sub>4</sub> and AcOH gives diacetoxytriphenylene dioxide (I), m. 236-7°. Hydrolysis of I gives dihydroxyphenylene dioxide (II), m. 336-40°; di-Me ether (III), m. 210-1°. With Br<sub>2</sub> in CHCl<sub>3</sub> a di-Br deriv. is obtained (decompn.). Other derivs. isolated in the prepn. of I are sep'd.; the structures are questionable. Toluquinone polymerized as in I gives diacetoxytritolylene dioxide (IV), m. 285-6°. Dihydroxytritolylene dioxide (V), m. 260-7°, is obtained from IV. Methylation of V gives the di-MeO deriv. (VI), m. 233-4°. The mono-Br deriv. of VI m. 274-5°, and the mononitro deriv. m. 305°. α-Naphthoquinol polymerizes with concd. H<sub>2</sub>SO<sub>4</sub> and AcOH to diacetoxytrinaphthalene dioxide, m. 340-3°, and trinaphthobenzene trioxide (charred at 400° but did not melt).

W. J. Peterson

Preparation of phenacylcarbinol and some of its ethers. M. Darmon. *Compt. rend.* 197, 1328-9 (1933).—PhCH<sub>2</sub>MgCl and HOCH<sub>2</sub>CN yield PhCH<sub>2</sub>COCH<sub>2</sub>OH, m. 48°; b.p. 144-5° (semicarbazone, m. 134°; oxime, m. 118° (cf. C. A. 26, 3493), and (PhCH<sub>2</sub>)<sub>2</sub>C(OH)CH<sub>2</sub>OH. From MeOCH<sub>2</sub>CN and EtOCH<sub>2</sub>CN are obtained, resp., PhCH<sub>2</sub>COCH<sub>2</sub>OMe, b.p. 139-40° (semicarbazone, m. 127-8°), and PhCH<sub>2</sub>COCH<sub>2</sub>OEt, b.p. 116-18° (semicarbazone, m. 100°). PhCH<sub>2</sub>ONa, ClCH<sub>2</sub>CO<sub>2</sub>Et and NH<sub>3</sub> give PhCH<sub>2</sub>OCH<sub>2</sub>CONH<sub>2</sub>, m. 91°, which, with PhCH<sub>2</sub>MgCl yields PhCH<sub>2</sub>COCH<sub>2</sub>OCH<sub>2</sub>Ph, b.p. 235°; semicarbazone, m. about 105°.

H. A. Beatty

Glucosides. X. Synthesis of primeverin. Elfed T. Jones and Alexander Robertson. *J. Chem. Soc.* 1933, 1618-20; cf. C. A. 27, 511.—Me 4-methoxysalicylate (I) and O-tetraacetyl-α-glucosidyl bromide with Ag<sub>2</sub>O in quinoline give the O-tetraacetyl-β-glucoside of I, m. 138-9°; [α]<sub>D</sub><sup>20</sup><sub>CHCl<sub>3</sub></sub> -66° (Me<sub>2</sub>CO, c 0.83); NH<sub>3</sub> in MeOH gives the β-glucoside of I, m. 134-6°; the hemihydrate m. 124-6°; [α]<sub>D</sub><sup>20</sup><sub>CHCl<sub>3</sub></sub> -82.36° (Me<sub>2</sub>CO, c 0.41). Ph<sub>3</sub>CCl in C<sub>6</sub>H<sub>5</sub>N gives the 6-O-triphenylmethyl-β-glucoside, m. 120°; [α]<sub>D</sub><sup>20</sup><sub>CHCl<sub>3</sub></sub> -36.72° (Me<sub>2</sub>CO, c 0.31), the 2,3,4-triacetate of which m. 168-9°; [α]<sub>D</sub><sup>20</sup><sub>CHCl<sub>3</sub></sub> -103.41° (Me<sub>2</sub>CO, c 0.49); HBr in AcOH gives the 2,3,4-O-triacetyl-β-glucoside of I, m. 136°; [α]<sub>D</sub><sup>20</sup><sub>CHCl<sub>3</sub></sub> -40.82° (Me<sub>2</sub>CO, c 0.29); with O-triacetylxylosidyl bromide and Ag<sub>2</sub>O this yields an amorphous product, deacetylated to primeverin, whose hexaacetate m. 125°.

C. J. West

Action of halogens upon the nitrophenylazobenzoyletacetones. F. D. Chattaway and D. R. Ashworth. *J. Chem. Soc.* 1933, 1624-7.—p-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>N<sub>2</sub>Cl and BzCH<sub>2</sub>Ac with AcONa give quant. p-nitrophenylazobenzoyletacetone (I), yellow, m. 143°; o-NO<sub>2</sub> compd. (II), yellow, m. 145°. I and Br in AcOH-AcONa at 40° give ω-bromophenyl-

glyoxal *p*-nitrophenylhydrazones, pale yellow, m. 247° (decompn.); Cl in  $\text{CHCl}_3$  gives the  $\omega$ -Cl deriv., pale yellow, m. 243°; the corresponding *o*- $\text{NO}_2$  compd., yellow, m. 151°. In AcOH at 40° I and Cl give  $\omega$ -chlorophenylglyoxal 2-chloro-4-nitrophenylhydrazones, yellow, m. 183°; the 4-chloro-2-nitrophenylhydrazones, yellow, m. 157°. I and Br in boiling AcOH give quant.  $\delta$ -bromo- $\alpha,\beta,\gamma$ -triketo- $\alpha$ -phenylbutane  $\beta$ -*p*-nitrophenylhydrazones (III), yellow, m. 172° (decompn.); the *o*- $\text{NO}_2$  compds., yellow, m. 155° (decompn.); I and 2 mols. Br give the  $\delta,\delta$ -di-Br deriv. (IV), yellow, m. 170° (decompn.). III and AcOK in boiling EtOH give 4-hydroxy-3-benzoyl-1-*p*-nitrophenylpyrazole (V), yellow, m. 211-5°; the *o*- $\text{NO}_2$  compd., yellow, m. 121°. IV gives the 5-Br deriv. of V, yellow, m. 167°. V and Cl in  $\text{CHCl}_3$  give the 5,5- $\text{Cl}_2$  deriv. (VI), orange, m. 145°; the *o*- $\text{NO}_2$  compd., yellow, m. 166°. VI and KI in AcOH form the 5-Cl deriv. of V, pale yellow, m. 177°; the *o*- $\text{NO}_2$  compd., pale yellow, m. 120°. VI, boiled with EtOH for 5 min., gives Et  $\alpha,\beta,\gamma$ -triketo- $\gamma$ -phenylbutyrate  $\beta$ -*p*-nitrophenylhydrazones, yellow, m. 135°; this was also prepd. from  $p\text{-O}_2\text{NC}_6\text{H}_4\text{N}_2\text{Cl}$  and  $\text{BzCH}_2\text{-COCO}_2\text{Et}$ ; the *o*-nitrophenylhydrazones, yellow, m. 108° (Me ester, yellow, m. 119°). VI and aq. NaOH give  $\alpha,\beta,\gamma$ -triketo- $\gamma$ -phenylbutyric acid  $\beta$ -*p*-nitrophenylhydrazones, yellow, m. 154°.

C. J. West

3-Chlorophthalic acid. J. C. Smith. *J. Chem. Soc.* 1933, 1643-4.—3-Nitrophthalic anhydride (I) and  $\text{PCl}_5$ , heated 9 hrs. at 190-200°, give an anhydride, m. 126°, hydrolyzed to an acid, m. 200-2°; direct hydrolysis of the reaction product gives 90% of 3-chlorophthalic acid (II); impure I gives a product m. 185° (decompn.) (mixed m. p., 186°; Bogert and Boroschek's II m. 186° (*J. Am. Chem. Soc.* 23, 751(1901))). II is slightly sol. in cold  $\text{H}_2\text{O}$ .

C. J. West

1,3-Dioxins. IV. Condensation of 3,3'-dinitro-, 3,5'-dinitro-, and 5,5'-dinitro-2,2'-dihydroxybiphenyl with formaldehyde. Fernando Calvert and Ernesto Seijo. *Anales soc. españ. fis. quim.* 31, 889-95(1933).—Aldehydes condense with substituted phenols under certain conditions in different ways, depending upon their *o*- or *p*-structure. *o*-Substituted phenols give substituted alcs. or  $\text{Ph}_2\text{CH}_2$  derivs.; *p*-substituted phenols give benzodioxin derivs. It is shown here that the 3,3', 5,5'- and 3,5'-dinitro-2,2'-dihydroxybiphenyls condense with  $\text{HCHO}$  and react as if both nitrophenolic nuclei acted independently upon the aldehyde, in accordance with the general rule.  $[3,2\text{-O}_2\text{N}(\text{HO})\text{C}_6\text{H}_4]_2$  gives 5,5'-diformyl-3,3'-dinitro-2,2'-dihydroxybiphenyl (a monoxime, of which has been prepd.), which, on oxidation, gives the corresponding 5,5'-dicarboxylic acid.  $[5,2\text{-O}_2\text{N}(\text{HO})\text{C}_6\text{H}_4]_2$  gives 6,6'-dinitrobenzo-1,3-dioxinyl-(8,8'). 3,5'-Dinitrodihydroxybiphenyl condenses with  $\text{HCHO}$  to give 8-(5'-formyl-3'-nitro-2'-hydroxyphenyl)-6-nitrobenzo-1,3-dioxin, which forms a well-characterized oxime.

E. M. Symmes

Optical activity of a biphenyl derivative, the dissymmetry of which is caused by the space effect of only one group. Mary S. Lesslie and Eustace B. Turner. *J. Chem. Soc.* 1933, 1588-92.—Shaw and Turner (*C. A.* 27, 2144) have pointed out that for a 2,3'-disubstituted  $\text{Ph}_2$  to show mol. dissymmetry the 2-substituent either must, if an atom, have a radius equal to or greater than that of I (1.33 Å) or, if a group attached to the 2-position through an atom smaller than that of I, must exhibit a "dynamic" effect; 2 compds. of the latter type have been prepd. 2-Nitro-*N,N'*-dicarboxybenzidine and Br in boiling AcOH-AcONa give the 3-bromo-2'-nitro deriv., m. 145-7°, transformed by concd.  $\text{H}_2\text{SO}_4$  to 3-bromo-2'-nitrobenzidine, deep golden red, m. 155-6° (cor.); through the diazo reaction there results 3-bromo-2'-nitrobiphenyl, pale yellow, m. 53-4° (cor.); the 2'- $\text{NH}_2$  deriv., b.p. 195° m. 69-70° (cor.); 2'-dimethylamino deriv., m. 47-8° (chloroplatinate); MeI gives 3'-bromobiphenyl-2-trimethylammonium iodide, deliquescent, decomp. on heating; the *d*-camphorsulfonate and *d*- $\alpha$ -bromocamphor- $\alpha$ -sulfonate are deliquescent glasses, resolution of which proved impossible. 3'-Bromobiphenyl-2-arsonic acid, m. 189-90° (cor.); MeI gives 89% of 3'-bromobiphenyl-2-trimethylarsonium iodide, m. 183-4° (cor.); the *d*-camphor-10-sulfonate gave

1 fractions varying from 19.2° to 21.8° for  $[\alpha]_D^{25}$ , m. 219-20° (cor.); the *d*- $\alpha$ -bromocamphor- $\alpha$ -sulfonate gave a fraction m. 184-5°,  $[\alpha]_D^{25}$  46.5°,  $[\alpha]_D^{25}$  54.4° ( $\text{H}_2\text{O}$ ); an intermediate fraction having  $[\alpha]_D^{25}$  43° m. 180-3°; KI gives an arsonium iodide with  $[\alpha]_D^{25}$  1.5° (EtOH), gradually becoming inactive at room temp. All samples of the sulfonate underwent racemization at 100° in  $\text{H}_2\text{O}$ , giving the *dl*-arsonium salt with  $[\alpha]_D^{25}$  41.5°. The Grignard reagent from bromomesitylene and  $\text{Me}_3\text{AsI}$  give 2,4,6-trimethylphenyldimethylarsine, b.p. 138-9°; methiodide, m. 219-20° (cor.); ethiodide, m. 174-5° (cor.).

C. J. West

Nitration of 2,2'-dihydroxybiphenyl. A description of a new dinitro derivative. Fernando Calvert and Ernesto Seijo. *Anales soc. españ. fis. quim.* 31, 882-8(1933).—The nitration of (*o*- $\text{HOCH}_2$ )<sub>2</sub> has been described (*Ber.* 35, 309(1902)). When using concd.  $\text{HNO}_3$  and glacial AcOH as solvent, the isomers 3,3'- and 5,5'-dinitro-2,2'-dihydroxybiphenyl were isolated. This work was repeated, and the  $[5,2\text{-O}_2\text{N}(\text{HO})\text{C}_6\text{H}_4]_2$ , m. 240-50°, was found to be a mixt. of the 5,5'-isomer, m. 301°, and the 3,5'-isomer, m. 210-11°. These two were sepd. by fractional crystn. 3,5'-Dinitro-2,2'-dihydroxybiphenyl is dimorphic, crystg. either as yellow needles or orange-red rhombocyclic polyhedrons giving a di-Ac deriv. m. 122-5°, and a di-MeO deriv. m. 133-5°.

E. M. Symmes

Action of nitrous acid on dimethylaniline. I. John C. Earl and Alan W. Mackney. *J. Proc. Roy. Soc. N. S. Wales* 67, 231-9(1933); cf. *C. A.* 27, 275.—The main product from a soln. contg. equimol. quantities of  $\text{PhNMe}_2\cdot\text{HCl}$  and  $\text{NaNO}_2$  was *p*- $\text{C}_6\text{H}_4(\text{NMe}_2)_2$  formed by the oxidizing action of  $\text{HNO}_2$ , together with a little *p*- $\text{ONC}_6\text{H}_4\text{NMe}_2$ . By the action on  $\text{PhNMe}_2$  in the cold, of a large excess of  $\text{N}_2\text{O}_5$  prepd. from  $\text{HCl}$  and  $\text{NaNO}_2$  or by acting on  $\text{As}_2\text{O}_5$  with  $\text{HNO}_3$ , a substance (I), m. 157-8° (decompn.) (Cohen and Calvert, *J. Chem. Soc.* 73, 163(1898)) was produced together with 3,3'-dinitrotetramethylbenzidine, m. 189°, and *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{NMe}_2$ . I shows no reaction for nitrite and gives no pos. reaction for the NO group by the Liebermann test. It is cleaved by boiling NaOH to *p*- $\text{ONC}_6\text{H}_4\text{OH}$  and  $\text{NHMe}_2$ . A 0.02 *N* soln. has  $p_H$  3.0. I is evidently closely related to *p*- $\text{ONC}_6\text{H}_4\text{NMe}_2\cdot\text{HNO}_3$  but the strong yellow color of its at. soln. suggests a quinonoid structure. Cautious heating with AcOH yields *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{NMe}_2$  and a nitroso compd. m. 86° contg. 21.5% N.

C. R. Addinall

Pyro reaction of hydrogenated diphenic acids. Blanc's rule. Fritz Vocke. *Ann.* 508, 1-11(1933).—Catalytic reduction of di-Me diphenate and hydrolysis gives a mixt. of *perhydrodiphenic acid*, m. 245° (I) and m. 213° (II), and *hexahydrodiphenic acid*, m. 242° (III) and 220° (IV), sepd. by means of the Ba salts and crystn. from AcOH. III, heated above 300°, gives a mixt. of IV and a ketone, whose semicarbazone,  $\text{C}_{14}\text{H}_{11}\text{ON}_3$ , pale yellow, m. 220° (decompn.). The Me ester of III, heated 6-8 hrs. in methylcyclohexane, gives the Me ester of IV. IV gives the same ketone as III; with  $\text{Ac}_2\text{O}$  IV gives an anhydride, m. 120°, which yields the ketone on distn. at atm. pressure. At 300-25° about 50% of I sublimes unchanged; the remainder gives a ketone, whose semicarbazone,  $\text{C}_{14}\text{H}_{11}\text{ON}_3$ , m. 215° (decompn.);  $\text{Ac}_2\text{O}$  and I give the anhydride, m. 265°; on heating at 300-10° there results the ketone and an isomeric anhydride, m. 115°, which yields I on sapon. II sublimes unchanged at 290-310°;  $\text{Ac}_2\text{O}$  gives the anhydride, m. 86°, which loses little  $\text{CO}_2$  at 300° and atm. pressure. Catalytic reduction of diphenic acid in AcOH with Pt gives a mixt. of products, from which dodecahydrodiphenic acid, decomp. 273°, was isolated; di-Me ester, m. 57°; distn. of the acid with  $\text{Ac}_2\text{O}$  gives dodecahydrofluorenone, m. 87°; semicarbazone, m. 209-10° (decompn.); oxime, m. 172°.

C. J. West

Chemistry of the rubenes. A colorless hydrocarbon of violet fluorescence derived from diphenylditolylrubene. Léon Enderlin. *Compt. rend.* 197, 1332-4(1933); cf. *C. A.* 26, 1601, 2189.—Dehydration of the monoxide of the dihydroxydihydro deriv. of bis(*p*-tolyl)diphenylrubene yields 96%  $\text{C}_{24}\text{H}_{20}$ , colorless, shows violet fluorescence at a diln. of 1,000,000; free from solvent, it m. 875°. There

is also obtained a trace of yellow compd. with green fluorescence, m. about 350°.

**Sensitivity to light of aromatic nitro compounds. II. peri-Derivatives of 1-nitronaphthalene.** Robert E. Steiger. *Helv. Chim. Acta* 16, 1315-23 (1933); cf. C. A. 27, 4791.—Ten cc. of pyridine (I) and 2.72 g. 1,5-C<sub>10</sub>H<sub>7</sub>(NO<sub>2</sub>)SO<sub>2</sub>Cl (II) gave 1.56 g. of pyridinium 1-nitronaphthalene-5-sulfonate (III), recrystd. from alc. m. 194-5°. The K sulfonate (IV), m. 110°, was prepd. from 2.72 g. II in 10 cc. I and 20 cc. N KOH. To prep. pyridinium 1-nitronaphthalene-8-sulfonate (V), 8.16 g. of 1,8-C<sub>10</sub>H<sub>7</sub>(NO<sub>2</sub>)SO<sub>2</sub>Cl (VI) was dissolved in 50 cc. 1% NaOH on the water bath. The excess alkali was neutralized with 90 cc. N HCl and the soln. filtered after the addn. of charcoal. N HCl (35 cc.) and 6 cc. I were added and the mixt. was concd. to 60 cc. On cooling, crystals of V sepd. in 70% yield. Purification from I and C<sub>6</sub>H<sub>6</sub> gave a product m. 165-7°. A mixt. of 10 cc. I and 1.34 g. 1,8-C<sub>10</sub>H<sub>7</sub>(NO<sub>2</sub>)SO<sub>2</sub>Me in 20 cc. C<sub>6</sub>H<sub>6</sub> gave a quant. yield of the N-methylpyridinium salt (VII), m. 162-4°. VI (2.72 g.) was shaken with 32 cc. I and cooled to 5°. N KOH (20 cc.) was added and the mixt. allowed to warm; H<sub>2</sub>O was added and excess I removed by evapn. After clarification with charcoal 1.24 g. of K 1-nitronaphthalene-8-sulfonate (VIII) sepd. After recrystn. from alc. VIII m. 200°. Aq. and pyridine solns. of III were only slightly colored. V, VII and VIII were extremely sensitive to light.

**The composition of α-naphthalenesulfonic acid and analysis of the β-naphthalenesulfonic acid melt.** Z. E. Zin'kov. *Anilinokrasochnaya Prom.* 3, 387-91 (1933); cf. Vorozhtzov and Krasova, C. A. 27, 5321; Ioffe, C. A. 28, 957°.

**Polycyclic aromatic hydrocarbons. XII. Orientation of derivatives of 1,2-benzanthracene, with notes on the preparation of some new homologs and on the isolation of 3,4,5,6-dibenzophenanthrene.** J. W. Cook. *J. Chem. Soc.* 1933, 1592-7; cf. C. A. 28, 145°.—The following esters were prepd. by oxidation of the benzantraquinone derivs., forming the Ag salts and reacting with MeI: di-Me anthraquinone-1,2-dicarboxylate, pale yellow, m. 208°; tri-Me anthraquinone-1,2,3-tricarboxylate, m. 184-5°; 1,2,5-isomer, m. 212-3°; 1,2,6-isomer, m. 233.5-4.5°; 1,2,7-isomer, m. 204-4.5°; tetra-Me anthraquinone-1,2,6,7-tetracarboxylate, m. 188-90°, from 6,7-dimethyl- or 6,7-cyclopenteno-1,2-benzanthraquinone; 1,2,7,8-isomer, yellow, m. 237-9°. Heating 1,2,3-C<sub>10</sub>H<sub>7</sub>BzMe<sub>2</sub> at 415° for 5 hrs. gives 4-methyl-1,2-benzanthracene, m. 124.5-5.5° (picrate, m. 149-50°). The dehydrogenation of the crude carbinol from MeMgI and 5-keto-5,6,7,8-tetrahydro-1,2-benzanthracene gives 5-methyl-1,2-benzanthracene, m. 167.5-8.5° (picrate, dark red, m. 163-3.5°); oxidation gives 5-methyl-1,3-benzanthraquinone, orange-yellow, m. 173.5-4.5°. α-C<sub>10</sub>H<sub>7</sub>COCl and 2,3-C<sub>10</sub>H<sub>7</sub>Me<sub>2</sub> with AlCl<sub>3</sub> give 1-α-naphthyl-2,3-dimethylnaphthalene (I), yellow, m. 191°; the β-isomer m. 120-30°; heating either isomer at 445° for 2 hrs. gives 4-methyl-1,2,5,6-dibenzanthracene, m. 184-5° (picrate, light red, m. 200-1°). I and II<sub>2</sub>SeO<sub>3</sub>, heated 5 hrs. at 220°, give 1-α-naphthyl-6-methyl-2-naphthaldehyde, yellow, m. 185-6°. Catalytic reduction of 1,2,5,6-dibenzanthracene (II) with Ni at 205° and 200 lb. per sq. in. gives a small yield of the 9,10-dihydro deriv. (III), m. 198-8°. Oxidation of II with Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub> in AcOH gives 1,2,5,6-dibenz-3,4-anthraquinone (IV), dark red, m. 326-7° (decompn.), the asine of which, yellow, decomp. above 300°; oxidation of III gives about 10% IV, the other product being the 9,10-isomer. The crude mixt. of acids resulting from the Paschorr reaction with di-α-α-aminobenzylidene-β-phenylenediacetic acid (Weitzenböck and Klinger, C. A. 13, 423) could not be purified through the Na salts; oxidation gives 3,4,5,6-dibenzophenanthra-1,2,7,8-diquinone, dark red, m. above 360°; diisins, yellow, m. above 360°; the AcOH liquors from the oxidation contained 1,2,5,6-dibenzanthraquinone-1,8-dicarboxylic acid, m. above 360°. The original alc. ext. of the crude acids contained 3,4,5,6-dibenzophenanthrene, m. 177-8°; if this has any carcinogenic activity, it is of a very low order.

C. J. West

**Zierone.** A. E. Bradfield, A. R. Penfold and J. L. Simonsen. *J. Proc. Roy. Soc. N. S. Wales* 67, 200-5 (1933); cf. C. A. 21, 474.—The constitution of zierone (I) previously advanced is incorrect. I is a tricyclic sesquiterpene ketone, C<sub>15</sub>H<sub>22</sub>O, isomeric with crenophyllone. I, a viscous, colorless oil, b<sub>15</sub> 147-9°, mol. refraction [R<sub>L</sub>]<sub>D</sub> 66.98, gives a semicarbazone, m. 182°, and a 2,4-dinitrophenylhydrazones, m. 95-7°. The presence of the group CH<sub>3</sub>COCH<sub>3</sub> is shown by the formation of a liquid hydroxymethylene deriv. (2,4-dinitrophenylhydrazones, m. 155-7°), by the action of Na in HCO<sub>2</sub>Am and Et<sub>3</sub>O. Catalytic (Pd-norite) reduction of I gives a mixt. b<sub>15</sub> 110-4°, contg. an unidentified hydrocarbon. Reduction of I with Na and EtOH gives siorol (II), a colorless, viscous oil b<sub>17</sub> 151-2°, n<sub>D</sub><sup>20</sup> 1.5094, [α]<sub>D</sub><sup>20</sup> 37.4° (MeOH, c 8.5); oxidation gives I. Dehydration of II with HCO<sub>2</sub>H yields a hydrocarbon which when dehydrogenated with Se at 250-80° for 48 hrs. gives an asulene, b<sub>15</sub> 135-65°; picrate, m. 110-1°.

C. W. Soderström

**Some reactions of 2,4-dimethylmagnesiopyrrole.** F. Ingrassia. *Gazz. chim. ital.* 63, 584-91 (1933).—Because of the anomalous behavior of magnesiopyrrole with SOCl<sub>2</sub> (I) and CS<sub>2</sub> (cf. Oddo and Mingoa, C. A. 21, 1458), it was decided to study their action as well as that of ClCO<sub>2</sub>Et (II) on a little studied deriv. of pyrrole, viz., 2,4-dimethylpyrrole (III) in the form of its magnesiyl deriv. (IV), and on magnesiopyrroles with neg. radicals (to stabilize the ring). IV and II in anhyd. Et<sub>2</sub>O, heated, and decompd. with ice, yield Et 2,4-dimethyl-5-pyrrolecar-

boxylate, HN.CMe:CH.CMe:CCO<sub>2</sub>Et (V), slightly yellow, m. 124°. I in Et<sub>2</sub>O added to ice-cold IV (2 mols.) in Et<sub>2</sub>O, after standing decompd. with ice, neutralized with NaHCO<sub>3</sub> and purified with difficulty (Et<sub>2</sub>O, petr. ether, Me<sub>2</sub>CO and C<sub>6</sub>H<sub>6</sub>), yields 3,5,3',5'-tetramethylpyrro-

(2,2')-sulfone, (HN.CMe:CH.CMe:C)<sub>2</sub>SO<sub>2</sub>, dark violet, decomp. around 95°, stable toward hot alk. hydroxides, is not reduced by Zn and AcOH, is decompd. with evolution of H<sub>2</sub>S by Sn in hot HCl. Ag deriv., probably an α'-deriv. IV and CS<sub>2</sub> in Et<sub>2</sub>O heated, decompd. with ice, acidified with H<sub>2</sub>SO<sub>4</sub>, the Et<sub>2</sub>O-sol. product treated with aq. NaOH, and acidified when ice-cold, ppts. 2,4-dimethyl-5-

dithiopyrrolecarboxylic acid, HN.CMe:CH.CMe:CC(:S)SH (VI), also obtained directly but very impure by drying the Et<sub>2</sub>O-sol. portion (loc. cit.). It is unstable and immediately oxidizes to 2,4-dimethylthiopyrrole di-

sulfide, [HN.CMe:CH.CMe:CC(:S)S]<sub>2</sub>, red, m. 156°. With neutral Pb(OAc)<sub>2</sub>, the aq. Na salt (VII) of VI ppts.

the Pb salt, [HN.CMe:CH.CMe:CC(:S)S]<sub>2</sub>Pb, yellow. In darkness, aq. VI and AgNO<sub>3</sub> ppt. the Ag salt,

HN.CMe:CH.CMe:CC(:S)SAg, brick-red. No Zn salt is pptd. from aq. VII and Zn(OAc)<sub>2</sub>. It was then to be detd. whether with a compd. contg. a neg. CO<sub>2</sub>Et group, e. g., V, the reaction with EtMgBr is normal, and if so to det. the behavior of the new metal deriv. in comparison with III. Actually V and EtMgBr in anhyd. Et<sub>2</sub>O evolve C<sub>2</sub>H<sub>6</sub> and form the magnesiyl deriv. (VIII), BrMg-

N.CMe:CH.CMe:CCO<sub>2</sub>Et or HN.CMe:C(MgBr).CMe:CCO<sub>2</sub>Et, yellowish oil. Heated with CS<sub>2</sub> or with AcCl in anhyd. Et<sub>2</sub>O, VIII remains unaltered. This incapacity to react probably depends upon the assumption of the

enolic form, N:CMe.CH:CMe.C:C(OMgBr)OEt, as was found with alkyl pyrrol ketones by Oddo (C. A. 19, 2492; *Gazz. chim. ital.* 40, ii, 15 (1910); cf. C. A. 4, 2460).

C. C. Davis

**Pyrrole blacks obtained by reduction.** G. Illari. *Gazz. chim. ital.* 63, 591-6 (1933).—A preliminary note. A survey of the literature shows that all pyrrole (I) blacks so far prepd. are products of a complex process of oxidation, combined with one of condensation, where an unknown no. of pyrrole nuclei take part. In the new expts.,

the I black which is described is formed by condensation in a strongly reducing medium, a condition not described heretofore. I dissolves slowly in warm concd. aq.  $\text{HCO}_2\text{H}$  to give a ruby-red soln. which remains clear on cooling and on diln. When this is made alk. with aq.  $\text{KOH}$ , a flocculent brown ppt. is formed, which is sol. in dil.  $\text{AcOH}$ , and which on purification from  $\text{EtOH}$  yields the compd.  $\text{C}_{22}\text{H}_{19}\text{O}_2\text{N}_4$  (II), brown, basic, insol. in aq. alkalies, gives a red soln. in  $\text{AcOH}$ ; its alc. soln. is red with green fluorescence; when heated it carbonizes without fusion (evolution of fumes which give an intense pine splinter- $\text{HCl}$  reaction); its alc. soln. reduces  $\text{NH}_3\text{-AgNO}_3$ . II is probably formed from 5 mols. of pyrrole, and taking into account that its 2 O atoms belong to CHO groups, the high H content, the strongly reducing medium, earlier chem. knowledge about pyrrole blacks (including the fact that hydroxybipyrrol and tripyrrole are intermediate products in their formation), and the constitution of tripyrrole, II is formed by the union of I nuclei and pyrrolidine nuclei, thus:

The same reaction between I and  $\text{HCO}_2\text{H}$  takes place at room temp. but more slowly. When the reaction is at room temp. or at an elevated temp., there is formed besides II, an unidentified black infusible substance, insol. in all solvents. Alc. II and picric acid ppt. a picrate,  $\text{C}_{22}\text{H}_{19}\text{O}_2\text{N}_4\cdot\text{C}_6\text{H}_3\text{O}_7\text{N}_3$ , reddish brown; when heated it deflagrates without fusion. C. C. Davis

**Improved preparation of selenophene and attempts to prepare tellurophene.** Francis A. McMahon, Thomas G. Pearson and Percy L. Robinson. *J. Chem. Soc.* 1933, 1644.—Roasted bauxite is a catalyst for the prepn. of selenophene (I); at  $400^\circ$  Al selenide gives 15% I. I could not be obtained from Na succinate and selenide. The liquid from Al telluride,  $\text{C}_4\text{H}_2$ , and bauxite is believed to contain tellurophene, boiling about  $136^\circ$ . C. J. West

**Reaction capacity of the methyl group. I. Synthesis of 6,6'-dibenzoylindigo.** Louis Chardonvans. *Helv. Chim. Acta* 16, 1295-302 (1933).—Under the influence of the 2 neg.  $\text{NO}_2$  groups the H atoms of the Me group of 2,4-( $\text{O}_2\text{N}$ ) $_2\text{C}_6\text{H}_3\text{Me}$  show a certain mobility which makes them capable of reacting, in the presence of catalysts, with the CO group of aromatic aldehydes and with the NO group of aromatic nitroso compds. It has been shown that one of the  $\text{NO}_2$  groups can be replaced, without loss of activity on the part of the Me group, by a Bz group. Heating a mixt. of 3.5 g. of 4,2-Bz( $\text{O}_2\text{N}$ ) $\text{C}_6\text{H}_3\text{Me}$  (I) (C. A. 23, 4687) and 3 cc. BzH contg. 10 drops of piperidine for 6 hrs. at  $150\text{--}5^\circ$  under a reflux gave 2.1 g. of 2-nitro-4-benzoylstilbene,  $\text{C}_{21}\text{H}_{15}\text{NO}_3$ , m.  $120\text{--}1^\circ$ . Condensation of I with  $p\text{-ONC}_6\text{H}_4\text{NMe}_2$  and  $p\text{-ONC}_6\text{H}_4\text{NEt}_2$  in boiling alc. in the presence of dry powd.  $\text{Na}_2\text{CO}_3$  gave the corresponding azomethines, 4,2-Bz( $\text{O}_2\text{N}$ ) $\text{C}_6\text{H}_3\text{CH}:\text{NC}_6\text{H}_4\text{NR}_2$  (R = Me and Et),  $\text{C}_{22}\text{H}_{15}\text{N}_3\text{O}_4$ , m.  $174\text{--}5^\circ$ , and  $\text{C}_{24}\text{H}_{17}\text{N}_3\text{O}_4$ , m.  $146\text{--}7^\circ$ . Both azomethines were hydrolyzed by  $\text{HCl}$  into 4,2-Bz( $\text{O}_2\text{N}$ ) $\text{C}_6\text{H}_3\text{CHO}$  (II), m.  $102.5\text{--}3^\circ$  (phenylhydrazone,  $\text{C}_{20}\text{H}_{13}\text{N}_3\text{O}_4$ , m.  $206^\circ$ ), oxidized by  $\text{CrO}_3$  in  $\text{AcOH}$  into the corresponding acid, m.  $187\text{--}9^\circ$ . Condensation of II with acetone in the presence of  $\text{NaOH}$  by the method of Baeyer (*Ber.* 15, 2856 (1882)) yielded 6,6'-dibenzoylindigo,  $\text{C}_{20}\text{H}_{11}\text{N}_2\text{O}_4$ , m.  $355\text{--}60^\circ$  (decompn.). This new blue-green dye has a clearer tint than indigo; its alk. vat is a beautiful faintly violet blue. C. R. A.

**Directive effect of substituents on the cyclization of substituted s-diarylthiocarbamides. II. Effect of the fluorine atom on the thiazole cyclization of p-fluoro-s-diphenylthiocarbamides by bromine.** Mohammad Omar Farooq and Robert F. Hunter. *J. Indian Chem. Soc.* 10, 465-70 (1933); cf. C. A. 27, 1883.—The condensation of  $p\text{-MeC}_6\text{H}_4\text{NH}_2$ ,  $p\text{-BrC}_6\text{H}_4\text{NH}_2$  and  $p\text{-ClC}_6\text{H}_4\text{NH}_2$  with  $p\text{-fluorophenylthiocarbamide}$  (C. A. 25, 4880) in benzene yielded the  $p\text{-fluoro-s-diphenylthiocarbamides}$ ,  $p\text{-FC}_6\text{H}_4\text{NHCSNH}(\text{C}_6\text{H}_5)_2$  (R = Me, Br and Cl), m.  $169^\circ$ ,  $164\text{--}5^\circ$  and  $159\text{--}9^\circ$ , resp. Under the usual conditions of thiazole cyclization of Br these carbamides gave rise to 4'-fluoro-1-

anilinobenzothiazoles,  $\text{FC}_6\text{H}_4\text{NHC}(\text{N}:\text{C}_6\text{H}_5)_2\text{S}$  (R = Me, Br and Cl), m.  $182^\circ$ ,  $222\text{--}3^\circ$  and  $222\text{--}3^\circ$ , resp., identical with the bases obtained by condensation of  $p\text{-FC}_6\text{H}_4\text{NH}_2$  with the corresponding 5-substituted-1-chlorobenzothiazoles. The cyclization of  $p\text{-FC}_6\text{H}_4\text{NHCSNH}(\text{C}_6\text{H}_5)_2$ , m.  $170\text{--}1^\circ$ , prepd. by the condensation of equimol. proportions of  $p\text{-nitrophenylthiocarbamide}$  (C. A. 18, 3363) and  $p\text{-FC}_6\text{H}_4\text{NH}_2$  in benzene, yielded a base isomeric with 4'-fluoro-5-nitro-1-anilinobenzothiazole, m.  $278\text{--}9^\circ$ , obtained from 5-nitrochlorobenzothiazole and  $p\text{-FC}_6\text{H}_4\text{NH}_2$ , which was shown to be 4'-nitro-5-fluoro-1-anilinobenzothiazole,  $\text{C}_{13}\text{H}_9\text{FN}_2\text{O}_2\text{S}$ , m.  $252\text{--}3^\circ$ , by its synthesis from  $p\text{-O}_2\text{NC}_6\text{H}_4\text{NH}_2$  and 5-fluoro-1-chlorobenzothiazole obtained from 5-fluoro-1-aminobenzothiazole (C. A. 25, 4888).

The effect of the F atom falls into line with that of the halogens previously studied (C. A. 23, 2973; 24, 4036), the inhibitory effect of substituents on benzothiazole formation from thiocarbanilides being in the order:  $\text{NO}_2 > \text{F} > \text{Cl} > \text{Br} > \text{EtO} > \text{Me}$ . **III. Effect of carbethoxy group on the formation of anilinobenzothiazoles from p-carbethoxy-s-diphenylthiocarbamides and bromine.** *Ibid.* 563-71.—The  $\text{O}_2\text{N}$  and  $\text{NC}$  groups in  $p$ -substituted s-diphenylthiocarbamides do not direct thiazole cyclization by Br in the sense opposite to that of  $o,p$ -directing substituents, but give rise to anilinobenzothiazole derivs. in which the  $m$ -directive substituent appears in the 1-arylamino grouping (C. A. 24, 4036; 26, 2978). It appeared of interest to exam. the effect of the carbethoxy group whose  $m$ -directive tendencies are ascribed to the "electron sink" properties of the CO group (C. A. 20, 1608) on the thiazole cyclization of  $p$ -substituted s-diphenylthiocarbamides. The condensation of  $\text{PhNH}(\text{C}_6\text{H}_5)_2$ ,  $p\text{-MeC}_6\text{H}_4\text{NH}_2$ ,  $p\text{-BrC}_6\text{H}_4\text{NH}_2$  and  $p\text{-ClC}_6\text{H}_4\text{NH}_2$  with  $p\text{-carbethoxyphenylthiocarbamide}$  (C. A. 27, 294), purified by recrystn. from petr. ether, in benzene yielded the  $p\text{-carbethoxy-s-diphenylthiocarbamides}$  (I),  $p\text{-RC}_6\text{H}_4\text{NHCSNH}(\text{C}_6\text{H}_5)_2$  (R = H, Me, Br and Cl), m.  $129\text{--}30^\circ$ ,  $160\text{--}1^\circ$ ,  $158\text{--}9^\circ$  and  $159\text{--}40^\circ$ , resp. On treatment with Br under moderately vigorous conditions  $\text{PhNHCSNH}(\text{C}_6\text{H}_5)_2\cdot\text{CO}_2\text{Et}$  gave rise to Et 1-anilinobenzothiazole-4'-carboxylate,  $\text{EtO}_2\text{CC}_6\text{H}_4\text{NHC}(\text{N}:\text{C}_6\text{H}_5)_2\text{S}$  (II) (R = H), m.  $182\text{--}3^\circ$ , whose constitution was established by synthesis from 1-chlorobenzothiazole and  $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{Et}$  (III). On prolonged bromination in the presence of excess Br nuclear substitution occurred with the formation of II (R = Br), m.  $227\text{--}8^\circ$ , whose orientation follows from its synthesis from  $\text{H}_2\text{NC}_6\text{H}_3\text{BrCO}_2\text{Et}$  and 1-chloro-5-bromobenzothiazole, m.  $101\text{--}2^\circ$ , prepd. in quantity by the conversion of 5-bromo-1-aminobenzothiazole obtained from 1-aminobenzothiazole. Although II (R = Br) was formed in the reaction between I (R = Br) and Br, it was not found possible to isolate the base in a pure state from the reaction mixt. Treatment with Br converted  $s\text{-p-carbethoxyphenyl-p-tolylthiocarbamide}$  (I, R = Me),  $\text{C}_{17}\text{H}_{15}\text{N}_2\text{O}_2\text{S}$ , into the benzothiazole (II, R = Me), m.  $206\text{--}7^\circ$ , identical with that obtained from III and 1-chloro-5-methylbenzothiazole, m.  $49\text{--}50^\circ$ , prepd. from 1-amino-5-methylbenzothiazole by means of the Sandmeyer reaction. The bromination of the thiocarbamide (I, R = Cl),  $\text{C}_{16}\text{H}_{13}\text{ClN}_2\text{O}_2\text{S}$ , produced the benzothiazole (II, R = Cl) in an impure state. The Et 5-chloro-1-anilinobenzothiazole-4'-carboxylate,  $\text{C}_{16}\text{H}_{13}\text{ClN}_2\text{O}_2\text{S}$ , m.  $226^\circ$ , was obtained in a satisfactory condition of purity by the condensation of III with 1,5-dichlorobenzothiazole,  $\text{C}_6\text{H}_3\text{Cl}_2\text{NS}$ , m.  $101^\circ$ , which was synthesized from 5-chloro-1-aminobenzothiazole (C. A. 24, 4036). The effect of the  $\text{EtO}_2\text{C}$  group falls well into line with that of the other  $m$ -directive substituents. The bromination of  $s\text{-p-carbethoxyphenyl-p-nitrophenylthiocarbamide}$  (IV),  $\text{C}_{17}\text{H}_{13}\text{N}_3\text{O}_4\text{S}$ , m.  $154\text{--}5^\circ$ , in which the inhibitory effects of the 2  $m$ -directing groups are in opposition, gave rise to Et 4'-nitro-1-anilinobenzothiazole-5-carboxylate,  $\text{C}_{17}\text{H}_{13}\text{N}_3\text{O}_4\text{S}$ , m.  $241\text{--}3^\circ$ , by a thiazole cyclization. This base is isomeric with the

benzothiazole (II,  $R = NO_2$ ), m. 242–3°, synthesized from III and 5-nitro-1-chlorobenzothiazole (V), m. 190°, prep'd. by the nitration of 1-chlorobenzothiazole. An attempt to synthesize V from *p*-nitrophenylthiocarbimide and  $PCl_5$  proved unsuccessful, the reaction being accompanied by considerable decompn. and charring. The effect of the pos. pole of the  $NO_2$  group outweighs the "electron sink" capacity of the CO group in  $EtOCOC_6H_4NHCSNH_2C_6H_4NO_2$ , thiazole cyclization taking place in this case on the nucleus which carries the *m*-directive  $CO_2Et$  group.

**Derivatives of 5-aminotetrazole.** R. Stollé and O. Roser. *J. prakt. Chem.* 139, 63–4 (1933); cf. *C. A.* 27, 2687.—5-Aminotetrazole (I) and picryl chloride in AcOH, heated 2 hrs., give 5-picrylamino-tetrazole, yellow, m. 224°; Ag salt; the Cu and Pb salts were prep'd. but not analyzed; both detonate on heating or percussion. The Na salt of I and 2,4-( $O_2N$ ) $_2C_6H_3Cl$  in  $C_6H_5Me_2$ , boiled 6 hrs., give 5-(2,4-dinitrophenyl)tetrazole, brown-red, m. 174° (decompn.); in AcOH only the Ac deriv. of I is formed.

**Conditions for the formation of rings attached to the positions of the benzene nucleus.** S. G. P. Plant. *J. Chem. Soc.* 1933, 1586–8.—*o*- $MeOC_6H_4CO(CH_3)_2$  in  $HNO_3$  (d. 1.5) at –5° to 0° gives the 5- $NO_2$  deriv., pale yellow, m. 112°; 5- $NH_2$  deriv., m. 118° (HCl salt, m. 168° (decompn.)); with alk.  $\beta$ - $C_{10}H_7OH$  the diazo soln. gives a red dye; the Bz deriv. m. 146°; the Ac deriv. m. 112°. No indications have been obtained of ring closure with the  $NH_2$  comp'd. or its derivs. Et cyclopentanone-2-carboxylate and *p*- $ClC_6H_4OH$  with  $P_2O_5$  give 6-chloro-2,3-dihydropentachromone, pale yellow, b<sub>m</sub> 233–5°, m. 129–30°; hydrolysis gives 5,5-chloro-2-hydroxybenzoylvaleric acid, m. 136°; 2-MeO deriv., m. 94°; this also results from the above 5- $NH_2$  deriv. through the Sandmeyer reaction.

**Attempted synthesis of primetin.** S. Sugawara. *J. Chem. Soc.* 1933, 1621–4.—Iattori and Nagai (*C. A.* 24, 3510) have assumed that primetin is 5,6-dihydroxyflavone; attempts to synthesize this comp'd. have failed thus far. 6,2,3- $H_2N(MeO)_2C_6H_3CO_2H$  through the diazo reaction gives the 6-Bz deriv., whose anilide m. 135–7°; with AcONa and (AcO) $_2Cu$  there results *o*-veratric acid. 6-Iodo-2,3-dimethoxybenzoic acid, m. 137–8°; with  $PhCH_2ONa$  there results the 6-benzoyloxy deriv., m. 128–9°; the acid chloride, m. 75–6°; with  $MeZnI$  gives 6-benzoyloxy-2,3-dimethoxyacetophenone, pale yellow, m. 90–1°; debenzoylation was carried out with HCl in AcOH and, as the product would not crystallize, it was fused with Bz $_2O$ , giving 5-hydroxy-8-methoxyflavone, bright yellow, m. 129–30° (Ac deriv., very pale yellow, m. 146–7°); HI gives 5,8-dihydroxyflavone (?), m. 179–80°. Et 2,4,3',4'-tetramethoxydiphenate, m. 124–5°, was prep'd. from  $I(MeO)_2C_6H_3CO_2H$ ; the ester could not be hydrolyzed with boiling EtOH-KOH.

**Synthesis of tricrin.** K. C. Gulati and K. Venkataraman. *J. Chem. Soc.* 1933, 1644.—Synthetic 5,7,4'-trihydroxy-3',5'-dimethoxyflavone (*C. A.* 27, 5239) is identical with tricrin.

**Reactions of dinitriles with aromatic hydroxy aldehydes.** Nirulananda Palit. *J. Indian Chem. Soc.* 10, 529–35 (1933).—Mohr (*J. prakt. Chem.* 56, 124 (1897)) found that 2 mols. of *o*- $HOC_6H_4CHO$  (I) reacted with 1 mol. of  $MeC(NH)CH_2CN$  with the elimination of 2 mols.  $H_2O$  to give a product,  $C_{10}H_{11}N_3O_2$ , of undetd. constitution in place of the expected 3-cyanoquinoline deriv. This is the general course of the reaction with I though a dicyanohydropyridine deriv. was obtained when  $MeC_6H_4C(NH)CH_2CN$  was condensed with I. Evidence has been brought forward to indicate the presence of a xanthidrol ring in the above products. In the condensation of MeCN with PhCN,  $MeC_6H_4CN$  and  $MeOC_6H_4CN$  by heating the mixt. with mol. Na in Et $_2O$  for 9 hrs. and letting stand overnight, improved yields were obtained of *p*-tolu- (II), benzo- (III) and *p*-anisylacetodinitrile (IV),  $C_{10}H_{11}N_3O$ , m. 117°. Condensation of I with II by heating the mixt. for 9 hrs. in boiling  $H_2O$  gave a cryst. comp'd.  $C_{20}H_{19}N_3O_2$ , m. 217–18° (Ac deriv.,  $C_{20}H_{19}$

$N_3O_2$ , m. 180–1°), hydrolyzed by heating in a sealed tube with concd. HCl at 180–5° for 4 hrs. into a NaOH-sol. vermilion powder,  $C_{20}H_{19}N_3O_4$ , m. 198°. In glacial AcOH I and II condense to form a substituted 3,5-di-cyanodihydropyridine deriv.,  $C_{21}H_{11}N_5O$ , m. 206–7°, sol. in hot NaOH, rep'd. on acidification. Condensation of I with III in  $H_2O$ , AcOH or AcOH in the presence of dry HCl invariably gave a comp'd.  $C_{20}H_{11}N_3O_2$ , m. 225–6°, having the same empirical formula as Mohr's comp'd. A comp'd. of this type was formed by the condensation of I and II in AcOH contg. dry HCl. IV gave a similar product,  $C_{20}H_{11}N_3O_2$ , m. 247–8°. Condensation of the dinitriles with *m*- and *p*- $HOC_6H_4CHO$  gave substituted 3,5-dicyanodihydropyridine derivs.

$RCH_2C(CN):CR'.NH.CR':CCN$  ( $R = m$ - and *p*- $HOC_6H_4$ ;  $R' = Ph, C_6H_4Me$  and  $C_6H_4OMe$ ): *m*- $HOC_6H_4CHO$  condensation products with II, III and IV, resp.;  $C_{20}H_{11}N_3O$  (V), m. 269–70°,  $C_{20}H_{11}N_3O$ , m. 267–8°, and  $C_{22}H_{13}N_3O_2$  (VI), m. 218–20°: *p*- $HOC_6H_4CHO$  isomers, m. 259–60°, 218–19° and 385°, resp. By oxidation with  $N_2O_5$  in warm glacial AcOH the dihydropyridines V and VI did not give the expected pyridines but the mol. was ruptured to yield a diketone  $HOC_6H_4CH:(COCN)_2$ , m. 256–7°. The oxidation of the dihydropyridines from *p*- $HOC_6H_4CHO$  proceeded normally to form the substituted pyridines  $C_{20}H_{11}N_3O$ , m. 245–6°,  $C_{20}H_{11}N_3O$ , m. 265°, and  $C_{22}H_{13}N_3O_2$ , m. 248–50°.

**Polymembered heterocyclic compounds.** I. Cyclo-octamethylenimine, cyclopentadecamethylenimine, cyclohexadecamethylenimine and dicyclopentadecamethylenedimine. L. Ruzicka, M. W. Goldberg, M. Hürbin and H. A. Bockennoogen. *Helv. Chim. Acta* 16, 1323–34 (1933).—On heating with 80%  $H_2SO_4$ , cyclooctanone oxime underwent a Beckmann rearrangement to give

85–90% of cyclooctanone isoxime (I),  $\dot{C}H_2.(CH_2)_6.CO.NH$ , b<sub>m</sub> 164–6°, m. 72–3°,  $d_4^{25}$  1.0087,  $n_D^{25}$  1.4889, M. R. 40.37 (calcd. 40.55). I was also formed by the condensation of cyclooctanone and  $N_2H$  in the presence of an ice-cold mixt. of concd.  $H_2SO_4$  and benzene together with a tetrazole deriv. The reduction of I with Na in abs. alc. gave 10% yields of the extremely hygroscopic cyclooctamethylenimine (II),  $C_8H_{11}N$ , b<sub>m</sub> 69°,  $d_4^{25}$  0.8905,  $n_D^{25}$  1.4771, M. R. 40.36 (calcd. 40.54) (picrate,  $C_{14}H_{11}N_3O_7$ , m. 148–9°), and 1-amino-octan-8-ol (III), (urea,  $C_8H_{11}N_3O_2$ , m. 94°; phenylurea deriv.,  $C_{22}H_{19}N_3O_2$ , m. 147–8°). II and III are alike in their narcotic action and both cause convulsions and death in equal doses. They restrict the movement of the isolated frog heart. II has a more powerful papaverine-like action on the intestine than III. Fruitless attempts were made to improve the yields of II by the electrolytic reduction of I. I was converted into the corresponding thioisoxime by the method of Kindler (*C. A.* 17, 2278). To a soln. of 5.1 g. of I in 25 cc. xylene at 80–5° were added 7.5 g. of finely powd.  $K_2S$  and 5 g.  $P_2S_5$  with stirring. The residue from a 5-fold extn. with 25 cc. xylene was recrystd. from benzene and gave 50% of cyclooctanone thioisoxime (IV),  $C_8H_{11}NS$ , m. 89°. The prep'n. was modified by omitting the  $K_2S$  and adding NaOH at the end of the reaction. By this procedure 10 g. of I gave 9.6 g. of IV. Attempts to reduce IV with Hg-Mg and moist Et $_2O$ , Hg-Al and aq. alc. or Zn dust and AcOH were unsuccessful. Reduction of 8 g. of IV in alc. with Na in glacial AcOH gave only 2.3 g. of II. Electrolytic reduction of 5 g. of IV in 110 cc. 55%  $H_2SO_4$  at 30–2° at a 90 sq. cm. Pb cathode with 18 amp. and 5 v. for 5.5 hrs. gave 3.5 g. (85%) of II. The 16- and 17-membered cyclic imines were similarly prep'd. from cyclopenta- and cyclohexadecanone. The Beckmann rearrangement, by heating with 80%  $H_2SO_4$ , gave a 90% transformation of cyclopentadecanone oxime into cyclopentadecanone isoxime (V),  $C_{15}H_{21}NO$ , m. 133–4°. V was converted by treatment with  $P_2S_5$  into cyclopentadecanone thioisoxime (VI),  $C_{15}H_{21}NS$ , m. 104–5°, which was reduced by Na in EtOH to cyclopentadecamethylenimine,  $C_{15}H_{21}N$ , m. 48–9°, b<sub>m</sub> 112–14°; picrolonate, m. 221–2°; HCl salt,  $C_{15}H_{21}NCl$ , m. 170–8°. Treatment

of cyclohexadecanone with  $N_2H_4$  in an ice-cold mixt. of concd.  $H_2SO_4$  and benzene gave *cyclohexadecanone isoxime*, m. 125-6°, converted at 100° with  $P_2S_5$  in an 85% yield of the corresponding *thioisoxime* (VII),  $C_{16}H_{31}NS$ , m. 104-5°. On account of its insol. in dil.  $H_2SO_4$ , the electrolytic reduction of VII was carried out in alc.  $H_2SO_4$  and gave *cyclohexadecamethylenimine*,  $C_{16}H_{31}N$ , m. 58-9°, b.p. 120-7°; *picrolonate*,  $C_{16}H_{31}N_2O_6$ , m. 208-10°; *tartrate*, m. 154° (used in prepn. of the pure base). The Beckmann rearrangement of the dioxime gave *cyclotriacetans-1,16-dione diisoxime*,  $C_{16}H_{31}N_2O_8$ , m. 178-9°, converted by Kindler's procedure into the *dithioisoxime* (VIII),  $C_{16}H_{31}N_2S_2$ , m. 177°. VIII was reduced by Na in AmOH to the *disimine* (IX),  $C_{16}H_{31}N_2$ , m. 62-3°; *HCl salt*,  $C_{16}H_{31}N_2Cl$ , m. 200° (decompn.); *acetate*, m. 120°. The Beckmann rearrangement of the dioxime may take place sym. or unsym. and so give rise to 2 isoximes. IX

may have 1 of the formulas  $HN(CH_2)_{15}.NH(CH_2)_{14}CH_3$ ,

$HN(CH_2)_{15}.NH(CH_2)_{15}CH_3$  or may correspond to a mixt. of both. II. 4,5-Cyclopolymethylenetetrazoles and 2,3-cyclopolymethylenesquinolines. L. Ruzicka, M. W. Goldberg and M. Hurbin. *Ibid.* 1335-9. By the condensation of cyclohexanone with excess  $N_2H_4$  Schmidt (C. A. 18, 2808) obtained 4,5-cyclopentamethylenetetrazole (I). Cycloheptanone (12 g.) and 11.5 g.  $N_2H_4$  (C. A. 26, 2306) in 280 cc. benzene were added in the course of 45 min. to an ice-cooled and well-stirred mixt. of concd.  $H_2SO_4$  (60 cc.) and benzene (100 cc.). After diln. with ice and  $H_2O$  the acidic layer was neutralized with NaOH and on extrn. with  $Rt_2O$  yielded 4,5-cyclohexamethylenetetrazole (II),  $C_6H_{11}N_4$ , m. 66-8°. Similarly were prepd. the corresponding *heptamethylene* and *octamethylene* homologs (III),  $C_8H_{13}N_4$ , b.p. 145-6°, and IV,  $C_{10}H_{15}N_4$ , m. 97-8°. II and III have physiol. properties similar to I, used medicinally under the designation "Cardiazole." The 16-membered ring compd. IV is physiol. less active. By a condensation, analogous to that of Borsche (C. A. 2, 2807), *o*- $H_2NC_6H_4CHO$  was condensed with alc. cyclooctanone in the presence of 10% NaOH to give 2,3-cyclohexamethylenesquinoline (V), b.p. 130-5°; *HCl salt*,  $C_{16}H_{23}ClN$ , m. 200-2°; *picrate*, m. 212°. Similarly was prepd. 2,3-cyclotridecamethylenesquinoline (VI),  $C_{18}H_{25}N$ , b.p. 197°; *picrate*,  $C_{18}H_{25}N_4O_7$ , m. 169-71°. V has a definite action on the heart but VI is relatively inactive. C. R. Addinall

**Antimonial analogs of the acridine series—dihydrostibacridines.** Gilbert T. Morgan and Glyn Rees Davies. *Proc. Roy. Soc. (London)* A143, 38-47 (1933).—Addn. of  $Sb_2O_3$  to diazotized *o*- $PhCH_2C_6H_4NH_2$ .  $HCl$  gives *diphenylmethane-2-stibonic acid* (I). Trituration of I gives the *diphenylmethane-2-stibine dichloride* (II), m. 129-30°. With NaI in  $Me_2CO$ , II gives the *diiodide*, m. 95°; with  $HBr$  the *tribromide*, m. 121°. II, washed with  $Ac_2O$  and dil.  $NH_3$  in the cold, yields the *oxide*,  $PhCH_2C_6H_4SbO$ , m. 82-3°. I with  $Ac_2O$  and  $H_2SO_4$  upon treatment with  $HCl$  gives *stibacridine trichloride* (III). Reduction of III with  $SO_2$  gives 10-chloro-9,10-dihydrostibacridine (IV), m. 105°; 10-I deriv., m. 160-2°; 10-Br deriv., m. 112°. With dil. alc.  $NH_3$  these halogeno derivs. give 10,10'-oxybis(9,10-dihydrostibacridine), m. 211-15°. *Stibacridinic acid* was sepd. in the prepn. of IV. The I deriv. from IV with  $MeI$  and  $MeMgI$  gives 10-methyl-9,10-dihydrostibacridine (V), m. 101°; *dichloride*, m. 177-8°. With  $NH_3$  in  $Me_2CO$ , II gives *tetrakis(diphenylmethane-2)stibine oxide* (VI), m. 117°. Concd.  $HCl$  with VI gives the chloride ( $C_6H_5CH_2C_6H_4$ ) $_4SbCl$ , m. 87.5°; *bromide*, m. 86.5°; *iodide*, m. 73-5°; *trichloride* (VII), m. 129°. With dil.  $NH_3$ , VII gives *bis(diphenylmethane-2)stibinic acid*, m. 248°. Heating VII to 150° gives 10-(diphenylmethane-2')-9,10-dihydrostibacridine oxide, m. 158-60°; *dichloride*, m. 224°.

W. J. Peterson

**Bis( $\beta$ -haloethyl)amines. III. *N*-Phenylpiperazine.** V. Prelog and G. J. Driza. *Collection Czechoslov. Chem. Communications* 5, 497-502 (1933); cf. C. A. 26, 2168.—( $ClCH_2CH_2$ ) $_2NH$  (40 g.), in  $MeOH$ , refluxed 16 hrs.

with  $PhNH_2$  (40 g.), gave *N*-phenylpiperazine (I), 156°.

250-2° piperazine, m. 96°; *HCl salt*, m. 213-4°. Similarly the following were obtained: *N*-benzoyl-*N*-phenylpiperazine, m. 96-7° (*HCl salt*, m. 244°); *N*-*p*-tolylsulfonyl-*N*-phenylpiperazine, m. 199-200°; 4'-nitro-4-piperazine-1-azobenzene, m. 250° (decompn.); *Na* 4'-piperazylazobenzene-4-sulfonate, m. about 210° (decompn.). The mother liquor of I contained *bis*( $\beta$ -phenylaminoethyl)amine, b.p. 268-76°; *HCl salt*, m. 237°. C. J. West

**Asymmetric arsenic atom.** Attempts to prepare optically active arsenicals. John D. A. Johnson. *J. Chem. Soc.* 1933, 1634-7.—If the difficulty in resolving asym. org. arsenicals lies in the ease of racemization, a factor which might assist in the resolution is restriction of the motion of the attached groups (a) by making the As atom common to 2 or 3 rings or (b) by increasing the bulk of the groups; a combination of (a) and (b) might also be very effective, e. g., a heterocyclic As atom attached to 2 bulky groups. Attempts to prep. spiro compds. conforming to (a) have not been successful.  $PhCH_2Br$  and 2-methyl-10-propyl-5,10-dihydrophenarsazine, heated 4 hrs. at 100°, give the *bromide* of the 10-benzyl deriv. I, m. 206-7° (decompn.); the 10-phenacyl deriv. was also prepd.; its *d*-camphor- $\beta$ -sulfonate is a gum. The *d*- $\alpha$ -bromocamphor- $\pi$ -sulfonate of I is a gum; the *d*-camphor- $\beta$ -sulfonate, m. 262° (decompn.),  $[\alpha]_D^{25}$ , 21° ( $EtOH$ ), and showed no resolution. 10-Chloro-2-methyl-5,10-dihydrophenarsazine and  $PhCH_2MgBr$  give the 10-benzyl deriv., pale yellow, m. 132.5°;  $BzCH_2Br$  gives 10-phenacyl-10-benzyl-2-methyl-5,10-dihydrophenarsazinium bromide, m. 203°; the *d*-camphor- $\beta$ -sulfonate, m. 184° and had  $[\alpha]_D^{25}$ , 17.25° ( $EtOH$ ), the least and most sol. fractions having the same rotation; KI gives the *iodide*, m. 179°, which reacts with moist  $Ag_2O$  to give presumably 10-benzyl-2-methyl-5,10-dihydrophenarsazinium dihydroxide with an indefinite m. p. 10,10'-bis(5,10-dihydrophenarsaziny) (II) and  $EtBr$ , heated 9 hrs. at 100°, give 10,10'-diethyl-5,10-dihydrophenarsazinium bromide, m. 152-3°; this was also prepd. from the 10-Et deriv. and  $EtBr$ ; the *iodide* m. 230° (decompn.).  $EtBr$  does not react with 10,10'-bis(5-acetyl-5,10-dihydrophenarsaziny) or with 5-acetyl-10-methyl-5,10-dihydrophenarsazine. 10-Methyl-5,10-dihydrophenarsazine reacts vigorously with  $(BrCH_2CO)_2O$  but definite products could not be isolated.  $(CH_2)_5Br$  and II give a compd., m. 160°, which is a mixt., some of the bromide having reacted with the :NH group also. In the reaction with  $EtBr$  there appeared to be no tendency for the :NH group to react. C. J. West

**Synthesis of *dl*-homolaudanosoline and its dehydrogenation.** Shigehiko Sugawa and Haruo Yoshikawa. *J. Chem. Soc.* 1933, 1583-5.—Homoveratrylamine and veratrylpropionyl chloride with NaOH in  $Et_2O$  give about 70% of  $\beta$ -3,4-dimethoxyphenylpropiono- $\beta$ -', $\beta$ '-dimethoxyphenylethylamide, m. 99-100°; 15 g. amide and 60 g.  $POCl_3$  in  $PhMe$ , heated 1.5-2 hrs. at 120-30°, give about 13 g. of 6,7-dimethoxy-1- $\beta$ -3',4'-dimethoxyphenylethyl-3,4-dihydroisoquinoline (I), m. 96-7°. I was also prepd. from divertyrideneacetone by reduction to bis( $\beta$ -3,4-dimethoxyphenyl)ethyl ketone and treating the oxime with  $POCl_3$  in  $PhMe$ . The methochloride of I, catalytically reduced, gives *dl*-homolaudanosoline (II), the perchlorate of which decomp. 183-5°. HI is the best reagent for the demethylation of II;  $AlCl_3$  does not give good results. Homolaudanosoline-HI and chloranil in  $AcOH$  give 80% of 2,3,11,12-tetrahydroxy-8-methyl-6,7,15,16-tetrahydro-5,18,9,14-dibenzopyridocolinum iodide, yellow-brown, decomp. 252-3°; methylation gives 2,3,11,12-tetramethoxy-6,7,15,16-tetrahydro-5,18,9,14-dibenzopyridocoline, whose methiodide, yellow, decomp. 237-8°; the methochloride, decomp. 204-5°, on decompn. gives a compd. m. 153.5-4.5°, which is being investigated. C. J. West

**Yohimbine.** Geo. Barger and Caesar Scholz. *Helv. Chim. Acta* 16, 1342-54 (1933); cf. C. A. 27, 4235—

By a modification of Wihaut's method (C. A. 25, 2730) 60 g. of yohimboic acid (I) was dehydrogenated by heating with 45 g. of powd. Se for 30 min. at 300° to give 14-15 g. tetrahydroyobyrine (II),  $C_{15}H_{25}N$ , m. 167°; 1.5-2.0 g. ketoyobyrine (III), m. 830° (slight decompn.); and 8-9 g. yobyrine (IV),  $C_{15}H_{25}N$ , m. 218-9° (the yields given refer to purified material). The difference of 4 H atoms between II and IV suggests the presence of a benzene nucleus E in IV, which is tetrahydrogenated in II and fully reduced in yohimbine (V). It is from this nucleus E that phthalic acid and  $(CH_3CO_2H)_2$  are, resp., derived in the oxidation of IV and of V.

The ring system A, B, C has already been related to that of harmann and to elucidate that of D II was oxidized with  $HNO_3$  to berberonic acid (VI), m. 249° (decompn.), identical with that prepd. by the oxidation of berberine (Ber. 12, 410(1879)) but differing from  $\alpha$ -carbocinchomeronic acid (Ann. 204, 88(1880)). This proposed ring system permits the fitting into it of all the degradation products previously obtained; even the puzzling appearance of isoquinoline in the Zn dust distn. of V (C. A. 22, 1592) can be explained by the assumption of a ring C cleavage. The alk. fusion method of Mendlik and Wihaut was refined and by heating with KOH in AmOH for 12 hrs. III was cleaved into norharman, m. 197-8° (identical with a sample synthesized from HCHO and tryptophan), and 2,3-dimethylbenzoic acid, m. 143-4°. The 2 Me groups correspond to the C atoms 14 and 21 and so the CO group of III must be attached to C atom 16 or 19. III may be formed by ring closure, most likely with atom 1, since diacetylyohimbine does not give III. Thus the CO group is probably attached at position 16. In the above reactions the C atom 14 remains attached to ring E. By the alk. fusion of I,  $m$ - $MeC_6H_4CO_2H$ , m. 109°, in which the C atom 14 has been split away from ring E, was formed together with 2-indolecarboxylic acid, m. 203°, and II. II was also prepd. (C. A. 9, 2888) by the dry distn. of I with CaO at 4 mm. V contains no NMe group and yields few definite cleavage products on degradation. The oxidation of I gives  $(CH_3CO_2H)_2$  as the only identified product. The meager results suggest that in V and I the rings C, D and E are fully reduced and, moreover, carry substituent groups. Apo- and desoxy-yohimbine (C. A. 17, 2585) may afford the clue to the detn. of the position of the OH group in V. The origins of the sufficiently described degradation products of V are reviewed in a tabular form provided with literature references. In this table the C atoms of the  $CO_2H$  group and the Me group are numbered 22 and 23, resp. It is suggested that V may be looked upon as originating from tryptophan and phenylalanine in the same way as the alkaloids of the berberine type are derived from 2 mols. of phenylalanine or tyrosine. C. R. Addinall

Sapic acid, a constituent of American pine resin. Fritz Vocke. Ann. 508, 11-15(1933).—The pine resin, freshly collected and protected from the air, slowly deposits sapic acid (I),  $C_{20}H_{30}O_8$ , m. 143°,  $[\alpha]_{D^{25}} -123^\circ$  (2.31 g. in 50 cc. 98% EtOH); the yield of I is 80-100 g. from 500 g. crude resin. Oxidation of I with  $HNO_3$  gives a very small yield of the acid  $C_{10}H_{16}O_4$ . Heating I in AcOH for 2-3 hrs. gives nearly quant. abietic acid. On illumination of I in 96% EtOH for 48 hrs. the rotation

changes to  $[\alpha]_{D^{25}} 81^\circ$ . On catalytic reduction I quickly takes up 1 mol.  $H_2$ , giving the acid  $C_{20}H_{32}O_8$ , m. 195°,  $[\alpha]_{D^{25}} 28.7^\circ$ ; further reduction gives hydroabietic acid, m. 173°,  $[\alpha]_{D^{25}} 28.3^\circ$ . C. J. West

Heart glucosides. IV. Desacetyldigilanides A, B and C. Arthur Stoll and Walter Kreis. Helv. Chim. Acta 16, 1390-407(1933); cf. C. A. 28, 7857.—By the careful treatment of the glucoside digilanides A, B and C with a 25-30% excess of  $Ca(OH)_2$  total deacetylation takes place with the formation of the corresponding desacetyldigilanides. Under the prescribed conditions the opening of the lactone ring of the aglucones and the formation of the isomeric compds. (C. A. 18, 2170) are almost entirely avoided. From a similar treatment, followed by acidification, the cryst. desacetyldigilanide C is recovered unchanged. To a soln. of 5.2 g. vacuum-dried digilanide A in 185 cc. MeOH was added 0.2525 g.  $Ca(OH)_2$  in 185 cc.  $H_2O$ . After 3.5 hrs. standing at room temp. and neutralization with 0.1 N HCl, the soln. was concd. *in vacuo* to 180 cc. and reneutralized. The crude glucoside (4.63 g.) was extd. with 25 cc. hot EtOH and the residue (4.4 g.) was dissolved in 55 cc. of a 5-1 mixt. of MeOH and  $H_2O$ . The cooled soln. was filtered through talc and the glucoside was thrown down by diln. with 45 cc.  $H_2O$ . After 15 hrs. standing the mixt. was filtered and yielded 3.2 g. of desacetyldigilanide A (I).  $C_{27}H_{40}O_{15}$ , mol. wt. 927 (detd. by lactone titration), m. 258° (decompn.),  $[\alpha]_D^{25} 10.3^\circ$ . A soln. of 3.5690 g. dry finely powd. I in a mixt. of 110 cc. 95% EtOH and 100 cc. 2 N  $H_2SO_4$  at 40° was dild. with 200 cc.  $H_2O$  at 40° after 2 hrs. standing. The hydrolysis was continued overnight and the resulting mixt. yielded 1.439 g. of digitoxigenin,  $C_{27}H_{40}O_8$ . The aglucone-free liquid was dild. to a 1%  $H_2SO_4$  content and covered with toluene. After 2 months the liquid yielded 1.20 g. (1 mol.) of the alc.-insol. diglanidobiose (II),  $C_{12}H_{20}O_8$  (81% in cryst. form), and 1.08 g. (2 mols.) of the alc.-sol. digitoxose (III),  $C_6H_{12}O_5$ . For the enzyme cleavage of I a glucoside-free enzyme prepn. was made from 1 kg. of the fresh leaves of *Dig. purpurea*. This was added to a soln. of 2 g. of I in a mixt. of 1 l.  $H_2O$  and 1 l. EtOH. After stirring for 3.5 days at room temp. the filtrate was extd. with  $CHCl_3$  and yielded digitoxin,  $C_{41}H_{64}O_{14}$ , with the phys. consts., aglucone and digitoxose content and physiol. properties as described in the literature. Desacetyldigilanide B (IV),  $C_{27}H_{40}O_{15}$ , mol. wt. 943, m. 240° (cor.) (decompn.),  $[\alpha]_D^{25} 20.4^\circ$ , was similarly prepd. IV gives the same blue zone in the AcOH layer (Keller-Killiani color reaction) as the A and C compds. but in contrast shows an intense red zone at the  $H_2SO_4$  interface. Acid hydrolysis of IV yielded digitoxigenin,  $C_{27}H_{40}O_8$ , 2 mols. III and 1 mol. II. The enzyme cleavage gave cryst. gitoxin,  $C_{41}H_{64}O_{14}$ ,  $[\alpha]_D^{25} 3.54^\circ$ , crystd. from and characterized by its difficult soly. in 75% alc. (1 in 1000). The corresponding C compd. was easily prepd. on account of its cryst. form. Desacetyldigilanide C (V),  $C_{27}H_{40}O_{15}$ , mol. wt. 943,  $[\alpha]_D^{25} 12.2^\circ$ , crystallizes with  $H_2O$  of crystn. which is firmly retained. From hot MeOH V yields a solvent-free modification, m. 265-8° (decompn.). The occurrence of these 2 modifications and their ease of conversion are similar to that of Scillaren A. V was hydrolyzed by acid, to digoxigenin,  $C_{27}H_{40}O_8$ , 2 mols. III and 1 mol. II. Enzyme cleavage gave cryst. digoxin,  $C_{41}H_{64}O_{14}$ , m. 260-5° (cor.),  $[\alpha]_D^{25} 13.2^\circ$ , agreeing in physiol. behavior with a prepn. according to Smith (C. A. 25, 1533). A Keller-Killiani test showed a blue color in the AcOH layer and a red-brown  $H_2SO_4$  zone. The desacetyldigilanides have the same effect on the heart as the original digilanides. Since the iso compds. have a greatly diminished activity it is evident that the mild alk. treatment used in the deacetylation does not give rise to any considerable isomerization. S. and K. consider this to be the first example of the removal of a part of a natural glucoside by a purely chem. reagent without any considerable effect on its activity. C. R. Addinall

Ergosteryl acetate-maleic anhydride and its hydro derivative. H. H. Inhoffen. Ann. 508, 81-8(1933).—

Ergosteryl acetate (40 g.), 15 g. maleic anhydride and 100 cc.  $C_6H_5Me_3$ , heated 8 hrs. at  $135^\circ$  in a tube, give 8-10 g. of the addn. product (I), m.  $216^\circ$ ,  $[\alpha]_D^{25} -19^\circ$  (1% in  $CHCl_3$ ); dibromide, m.  $252-3^\circ$ ; hydrolysis of I with  $EtOH-H_2SO_4$  gives ergosterol-maleic anhydride, m.  $202^\circ$ ; hydrolysis with 10%  $MeOH-KOH$  gives the acid, m.  $198-9^\circ$  (decompn.), which yields with  $CH_3N_3$  a di-Me ester (II), m.  $163^\circ$  (acetate, m.  $164^\circ$ ). I distills nearly undecompd. at 0.0002 mm. and  $240^\circ$ ; at a higher temp. and a water-pump vacuum, I is decompd. into its components in nearly quant. yield. I is unchanged after the action of  $HCl$  in  $CHCl_3$  at  $0^\circ$  for 1.5 hrs. Catalytic reduction of I in  $Me_2CO$  with  $Pd$  gives the dihydro deriv., m.  $202-3^\circ$ ,  $[\alpha]_D^{25} -9.1^\circ$  (48.2 mg. in 2 cc.  $CHCl_3$ ). II gives di-Me dihydroergosteryl acetate maleate, m.  $116-7^\circ$ . If I is reduced at  $80^\circ$  in  $AcOH$  there results a tetrahydro deriv., m.  $187-7.5^\circ$ ,  $[\alpha]_D^{25} -25.4^\circ$ , which is stable in vacuo at  $270^\circ$  for 1 hr.; alk. hydrolysis gives the maleic acid, m.  $218-20^\circ$  (decompn.), whose di-Me ester m.  $138^\circ$ ,  $[\alpha]_D^{25} -69.8^\circ$  (21.5 mg. in 2 cc.  $CHCl_3$ ). The formation of a tetrahydro deriv. is difficult to reconcile with the accepted formula for ergosterol. C. J. West

Addition product of maleic anhydride and dehydroergosterol and its reduction products. H. Honigmann. *Ann.* 508, 89-104(1933); cf. *C. A.* 25, 4007.—In some preps. of dehydroergosteryl acetate-maleic anhydride (I), a product m.  $205^\circ$  was obtained, while in others the I m.  $220-40^\circ$  (decompn.); on standing 14 days the product m.  $205^\circ$  had changed into the higher-melting form; this may be a case of crystal polymorphism; I is not changed by a further heating of 8 hrs. with maleic anhydride. I in  $CHCl_3$  gives a dibromide, m.  $245^\circ$  (decompn.),  $[\alpha]_D^{25} 68.6^\circ$  (21 mg. in 2 cc.  $CHCl_3$ ). Distn. of I at 0.0004 mm. and  $210-20^\circ$  gave unchanged I; at 0.1 mm. at  $240^\circ$  there results dehydroergosteryl acetate, m.  $146^\circ$ ,  $[\alpha]_D^{25} 203.7^\circ$ . The free acid from I m.  $170-5^\circ$  (decompn.),  $[\alpha]_D^{25} 67.5^\circ$ , and yields a di-Me ester, m.  $180^\circ$ . Catalytic reduction of I with  $Pd$  and  $H_2$  in  $Me_2CO$  gives a dihydro deriv. (II), m.  $216^\circ$ ,  $[\alpha]_D^{25} 81.6^\circ$  (27.7 mg. in 2 cc.  $CHCl_3$ ); the free HO acid,  $C_{28}H_{44}O_4$ , crystals with 0.5 mol.  $H_2O$ , m.  $180^\circ$  (decompn.),  $[\alpha]_D^{25} 96.5^\circ$  (19.7 mg. in 2 cc.  $CHCl_3$ ); di-Me ester is an oil, whose acetate m.  $163^\circ$ . Distn. of II at 0.0005 mm. and  $215-20^\circ$  gives 75% of 22-dihydrodehydroergosteryl acetate, m.  $128^\circ$ ,  $[\alpha]_D^{25} 219.8^\circ$  (23.2 mg. in 2 cc.  $CHCl_3$ ); reduction with  $Na$  and abs.  $EtOH$  gives tetrahydrodehydroergosterol, crystals with 1 mol.  $H_2O$ , m.  $132^\circ$ ,  $[\alpha]_D^{25} -12.5^\circ$  (22.4 mg. in 2 cc.  $CHCl_3$ ); it contains 2 double bonds; acetate, m.  $141^\circ$ ,  $[\alpha]_D^{25} -9.7^\circ$  (22.6 mg. in 2 cc.  $CHCl_3$ ); isomerization with  $HCl$  gave no definite product. Catalytic reduction of I with  $Pt$  and  $H_2$  in  $AcOH$  gives a tetrahydro deriv. of I, b.p.  $270^\circ$ , m.  $197^\circ$ ,  $[\alpha]_D^{25} 26.8^\circ$  (23.1 mg. in 2 cc.  $CHCl_3$ ); II gives the same product with possibly some hexahydro deriv.; the free HO acid, m.  $180^\circ$  (decompn.),  $[\alpha]_D^{25} 63^\circ$  (18.1 mg. in 2 cc.  $CHCl_3$ ); the di-Me acetate, m.  $135^\circ$ ,  $[\alpha]_D^{25} 46.2^\circ$  (20.8 mg. in 2 cc.  $CHCl_3$ ). Catalytic reduction of the tetrahydro deriv. in  $AcOH$  at  $70^\circ$  gives the hexahydro deriv., m.  $187^\circ$ , identical with tetrahydroergosteryl acetate-maleic anhydride. C. J. W.

22-Dihydroergosterol. A. Windaus and R. Langer. *Ann.* 508, 105-14(1933).—22-Dihydroergosteryl acetate-maleic anhydride, heated in portions of 1.5 g. 1 hr. in vacuo at  $220^\circ$ , gives the acetate (I), m.  $157-8^\circ$ ,  $[\alpha]_D^{25} -74.8^\circ$  (30.5 mg. in 2 cc.  $CHCl_3$ ), of 22-dihydroergosterol (II), m.  $152-3^\circ$ ,  $[\alpha]_D^{25} -109^\circ$  ( $CHCl_3$ ), which resembles ergosterol in its soly., its color reactions and its chem. behavior. I (3 g.) and 3 mg. eosin in 1 l.  $EtOH$ , treated with  $O_2$  in the light (500-watt lamp) for 96 hrs., give 1.2 g. of the peroxide, m.  $173^\circ$ ,  $[\alpha]_D^{25} 9.7^\circ$  (22.8 mg. in 2 cc.  $CHCl_3$ ); photochem. oxidation of II gives its peroxide, m.  $171^\circ$ ,  $[\alpha]_D^{25} 5.4^\circ$  ( $CHCl_3$ ); reduction with  $Zn$  and 10%  $EtOH-KOH$  gives an ergosteretriol, m.  $218^\circ$  (decompn.), and shows no rotation in  $C_6H_5N$ . I (0.9 g.) and 0.9 g. eosin in 170 cc.  $EtOH$  and 30 cc.  $C_6H_6$ , with  $O_2$  in the light for 72 hrs., give the diacetate, m.  $200^\circ$ ,  $[\alpha]_D^{25} -161^\circ$  (22 mg. in 2 cc.  $CHCl_3$ ), of 22-dihydroergosteretriol (III), m.  $197^\circ$  (decompn.),  $[\alpha]_D^{25} -204^\circ$ . Heating III at 0.1 mm. and  $180^\circ$  for 1 hr. gives dihydroneo-

ergosterol, m.  $150^\circ$ , whose acetate, m.  $118^\circ$ ,  $[\alpha]_D^{25} -3.1^\circ$  (35 mg. in 2 cc.  $CHCl_3$ ); this also results by catalytic reduction of neoergosteryl acetate. I, treated with  $HCl$  in  $CHCl_3$  at  $0^\circ$  for 2 hrs., gives a mixt. of isomers, from which dehydroergosteryl acetate, m.  $133^\circ$ , can be isolated. Catalytic reduction of I and hydrolysis give  $\alpha$ -ergosterol (IV); reduction of II with  $Na$  and  $PrOH$  gives a  $\gamma$ -ergosterol (V), m.  $145-6^\circ$ ; Ac deriv., m.  $157^\circ$ ,  $[\alpha]_D^{25} -5.3^\circ$  ( $CHCl_3$ ); benzoate (VI), m.  $179^\circ$ ; 3,5-dinitrobenzoate, yellow, m.  $209-10^\circ$  (that of IV, pale yellow, m.  $196-7^\circ$ ); V is unchanged on heating with maleic anhydride at  $135^\circ$ ; shaking with  $Pt$  or  $Pd$  and  $H$  gives IV, although no  $H$  absorption is observed. VI is isomerized by  $HCl$  in  $CHCl_3$  at  $0^\circ$  to  $\beta$ -ergosterol benzoate. C. J. West

Leucopterin, the wing pigment of common white butterflies. Heinrich Wieland, Hermann Metzger, Clemens Schöpf and Margarete Bülow. *Ann.* 507, 226-65(1933); cf. *C. A.* 21, 224.—Leucopterin (I), probably  $C_{18}H_{12}O_{11}N_{16}$  (39.1 g. crude product from 1164 g. wings, of which about 60% is lost in purification), does not react with  $CH_3N_3$  and is not affected by reducing agents, such as  $HI$ ,  $Na-Hg$  or  $Al-Hg$ , does not absorb  $O_2$  in alk. soln. but is oxidized by  $K_2Fe(CN)_6$  (7.7-7.8 mols. per mol. I); I gives the murexide reaction but the color is different from that with uric acid. I,  $Ac_2O$  and  $H_2SO_4$  give a tri-Ac deriv.,  $C_{18}H_{14}O_{10}N_{16}Ac_3$ ;  $Ac_2O$  alone or in  $C_6H_5N$  or  $BzCl$  in  $C_6H_5N$  or in alkali do not react with I. I,  $PCl_5$  and  $POCl_3$ , boiled 0.75 hr., give leucopteryl chloride,  $C_{18}H_{14}O_8N_{16}Cl_2$ , light yellow. I,  $NaNO_2$  and  $H_2SO_4$  give desimino-leucopterin,  $C_{18}H_{14}O_{10}N_{12}$  (II). I is isomerized by concd.  $H_2SO_4$  to isoleucopterin, a hexabasic acid, which yields a yellow acid Na salt. On heating 30 mg. I or II with 1 cc. concd.  $H_2SO_4$  2 hrs. at  $150^\circ$ , only traces of  $CO_2$  are eliminated and 20 mg. are recovered unchanged. I (1 mol) is hydrolyzed by concd.  $HCl$  at  $160-70^\circ$  to 3 mols.  $H_2N-CH_2CO_2H$  (III), 12 mols.  $NH_3$ , 9 mols.  $CO_2$  and 3 mols.  $CO$ ; under the same conditions uric acid gives 1 mol. III, 3 mols.  $NH_3$  and 3 mols.  $CO_2$ , while guanine gives 4 mols.  $NH_3$ , 2 mols.  $CO_2$  and 1 mol.  $CO$ . I in  $MeOH$ , brought into soln. by  $Cl$  gas and decompn. of the  $HCl$  salt with  $C_6H_5N$ , gives a triglycol hexa-Me ether (IV),  $C_{18}H_{18}O_{11}N_{16}(OMe)_6$ , darkens without melting at  $200^\circ$ ; crystn. of IV from  $H_2O$  gives the compd.  $C_{18}H_{17}O_{10}N_{16}(OH)_2(OMe)_4$ , darkens at  $180^\circ$ . Decompn. of the  $HCl$  salt of IV in aq.  $C_6H_5N$  gives the compd.  $C_{18}H_{19}O_{11}N_{16}(OH)_2(OMe)_4 \cdot 4H_2O \cdot 2C_6H_5N$ . IV and dil.  $HCl$  give the salt,  $C_{18}H_{19}O_{11}N_{16}(OH)_2(OMe)_4 \cdot 3HCl$ , which seps. with 1 or 8 mols.  $H_2O$ . The desimino compd. could not be isolated. I, shaken with  $Cl-H_2O$ , gives a triglycol (V),  $C_{18}H_{18}O_{11}N_{16}(OH)_6 \cdot 6H_2O$ , which becomes anhyd. at  $100^\circ$ , yellow; the tri-HCl salt has no definite decompn. point; concd.  $HNO_3$  gives a nitrate; the glycol does not give the murexide reaction; heating with 3 equiv. 0.1 N  $HCl$  at  $140-50^\circ$  gives 4.3-4.9 mols.  $CO_2$ , 3-3.4 mols.  $NH_4HC_2O_4$  and 1.27 mols. guanidine (VI) (acetate, m.  $224-6^\circ$ ). I and  $Cl_2$  in  $AcOH$ -2 N  $HCl$  give a diglycol (VII),  $C_{18}H_{21}O_{12}N_{16}(OH)_4 \cdot H_2O$  (tri-HCl salt); II similarly gives a compd.,  $C_{18}H_{20}O_{11}N_{16} \cdot 3HCl$ , hydrolysis of which by 0.1 N  $HCl$  at  $170^\circ$  does not give VI. I and Br give a compd.  $C_{18}H_{20}O_{11}N_{16}$ . IV is hydrolyzed by  $H_2O$  at  $65^\circ$  to  $CO$ ,  $MeOH$ , VI, an acid, probably  $H_2NCOCH(OMe) \cdot NHCOC_2H$  (Me ester, hydrolyzed by 2 N  $HCl$  to  $(CO_2)H$  and  $CHOCO_2H$ ) and a MeO-free compd.,  $C_{18}H_{22}O_{12}N_{16}$ ; the last 2 compds. are isolated by pptn. with  $Hg(OAc)_2$ .  $(CO_2)H$  is also formed by alk. hydrolysis of IV, V and VII. VII is hydrolyzed by aq.  $Ba(OH)_2$  to VI and by  $H_2O$  to a compd.  $C_{18}H_{21}O_{12}N_{16}$ , darkens at  $220^\circ$ . Soln. of I in  $Na_2CO_3$  and pptn. with  $HCl$  gives some anhydrous leucopterin,  $C_{18}H_{18}O_{10}N_{16}$ , which resembles I in its soly. and properties. The pigment obtained by extn. of the whole animals with aq.  $NH_3$  differs from I and is termed pseudoleucopterin, which does not give concordant analyses; concd.  $H_2SO_4$  gives an isomer of I;  $HNO_3$  gives desimino-pseudoleucopterin,  $C_{18}H_{18}O_{10}N_{12}$ . Xanthine and  $Cl_2$  in  $MeOH$  give  $NH_4Cl$  and Me 5-methoxyuramil-N(5)-carboxylate. Uric acid could not be isolated from the wings of *Pieridae* but it is readily isolable from the body

and excrement. Various structures are suggested for I.

C. J. West  
Occurrence of pterins in wasps and butterflies; leucopterins and xanthopterins. Clemens Schöpf and Erich Becker. *Ann.* 507, 266-96 (1933).—Soln. of xanthopterin (I), probably  $C_{11}H_{11}O_7N_3$ , in hot half-satd. (at  $20^\circ$ ) aq.  $Ba(OH)_2$  and cooling gives *Ba*  $\beta$ -xanthopterin (II),  $C_{11}H_{11}O_8N_3Ba$ , which is hydrolyzed by crystn. from  $H_2O$  to the salts  $(C_{11}H_{11}O_8N_3)_2Ba$  and  $(C_{11}H_{11}O_8N_3)_2Ba_2$ . The previously described *Ba* salt is termed the  $\alpha$ -isomer (C. A. 20, 902). The absorption spectrum of II in  $AcOH$  is given for 4 samples from *Gon. rhamni*, *Vespa crabro*, *V. germanica* and *V. vulgaris*. A concd. soln. of II in 2 N  $HCl$ , treated with concd. aq.  $AcONa$ , gives amorphous I; in more dil. solns. products of different cryst. forms are obtained, designated *xanthopterin hydrates a* and *b*, probably  $C_{11}H_{11}O_{10}N_3$ . I does not contain NMe groups; with 2,5- $Cl_2C_6H_3N_2X$  it gives the compd.  $C_{11}H_{11}O_7N_3Cl_2$  (xanthine gives the compd.  $C_{11}H_9O_7N_3Cl_2$ ); hydrolysis with aq.  $Ba(OH)_2$  gives 1 mol.  $NH_3$ . (With Erwin Bumm and Hans Stober.) *Gonepteryx rhamni* gives, in addn. to I, a mixt. of leucopterins *a* (III) and *b* (IV); the white female contains III but no I. III and IV are also isolated from the aurora butterfly (*E. cordamines*). III gives a  $Na_2$  salt, while IV forms a  $Na$  salt; IV may arise from III by the action of the  $HCl$  used in purification and may be identical with isoleucopterins. Details are given of the isolation of I, III, IV and a new pterin from *Vespa crabro*, *V. germanica* and *V. vulgaris*.

Plimmer, R. H. A.: Organic and Bio-Chemistry. 5th ed. of "Practical Org. and Bio-Chemistry." New York: Longmans, Green & Co. 624 pp. \$7.50.

Taylor, F. S.: A Short Organic Chemistry. London: W. Heinemann, Ltd. 378 pp. 5s. Reviewed in *Chemistry & Industry* 1933, 853.

Hydrocarbons. I. G. Farbenind. A.-G. Ger. 586,800, Oct. 26, 1933 (Cl. 12o. 1.04). Polynuclear aromatic hydrocarbons of the  $Ph_2$  type are purified by treatment with a chem. agent with a condensing action, e. g., concd.  $H_2SO_4$  or  $H_3PO_4$ . Examples are given.

Liquid hydrocarbons from ethylene. Franz Eisenstecken. Ger. 588,158, Nov. 14, 1933 (Cl. 12o. 1.03). Liquid hydrocarbons are obtained by passing  $C_2H_4$  or gases contg. it at  $450-750^\circ$  over a catalyst, e. g., Cu, after addn. of about 0.1% of  $SO_2$ . The presence of  $SO_2$  prevents the formation of C. The gases are cooled after contact with the catalyst. App. is described.

Apparatus for making liquid hydrocarbons by thermal treatment of methane. C. Otto & Co. G. m. b. H. Ger. 587,494, Nov. 4, 1933. Addn. to 505,353 (C. A. 24, 5764).

Producing hydrocarbons of higher carbon content from aliphatic gaseous hydrocarbons. Franz Fischer and Helmut Pichler. U. S. 1,940,209, Dec. 19. Hydrocarbon material such as coke-oven gas or  $CH_4$  is burned in the presence of O in insufficient vol. for complete com-

bustion by subjecting the material to a temp. of not less than  $1000^\circ$  for a period of less than 0.01 sec. so that any subsequent action of the resulting steam upon the hydrocarbons of high C content produced is avoided. The product contains  $C_2H_2$ .

Oxidizing hydrocarbons to produce alcohols, aldehydes and acids. Gustav Egloff (to Universal Oil Products Co.). U. S. 1,939,255, Dec. 12.  $Et_4Pb$  is used to control and limit the oxidation in effecting reactions such as the oxidation of gasoline or fuel-oil constituents by heating in the presence of air to form alcs., aldehydes and acids.

Partial oxidation of hydrocarbons. Joseph H. James (to Clarence P. Byrnes). U. S. 1,941,010, Dec. 26. A mixt. of hydrocarbon material such as natural gas and O in gaseous phase is passed through a reaction zone, an oxidized hydrocarbon product such as formaldehyde is condensed and removed from the resulting gas stream, fresh hydrocarbon and O are added and the new mixt. is passed through a reaction zone. App. is described. Catalysts such as Mo oxides may be used.

Oxidation products of hydrocarbons. Wilhelm Dietrich (to I. G. Farbenind. A.-G.). U. S. 1,940,400, Dec. 19. In working up products from the liquid-phase oxidation of difficultly volatile hydrocarbons such as gas oil or paraffin by use of anhyd. gaseous oxidizing agents contg. free O, the oxidation products are heated to above  $150^\circ$  (suitably  $250^\circ$ ) while avoiding distn., in order to improve the recovery of fatty acids. Cf. C. A. 27, 4813.

Oxygenated organic compounds from carbon monoxide and hydrogen. I. G. Farbenind. A.-G. (Mathias Pier and Johannes Kleine, inventors). Ger. 587,818, Nov. 11, 1933 (Cl. 12o. 5.01). Addn. to 490,248 (C. A. 24, 2137), 548,434 (C. A. 26, 3513), 559,892 (C. A. 27, 730), 568,627 (C. A. 27, 2691) and 580,695 (C. A. 28, 1721). The cold or not very hot parts of the app. which come into contact with CO may be made of Fe, Ni or Co, provided that the gases used are dry.

Organic bases. I. G. Farbenind. A.-G. (Robert Griessbach and Siegmund Münch, inventors). Ger. 582,845, Aug. 23, 1933 (Cl. 12q. 14.03). Org. bases are sepd. from creosote oils by treating the latter with less than 10 times the theoretical amt. of  $H_3PO_4$  or acid phosphate solns. to combine with the bases. The ext. is washed and refined. Thus, lignite creosote oil contg. 2.3% pyridine is treated with 70%  $H_3PO_4$  to remove the pyridine.

Organic bases. I. G. Farbenind. A.-G. (Eduard Dörr and Albert Möhring, inventors). Ger. 588,044, Nov. 11, 1933 (Cl. 12p. 6). Mixts. of volatile org. bases are obtained by heating sucrose or materials contg. it, e. g., molasses or beet juice, with aq.  $NH_3$  or its derivs. or their salts to a temp. above  $100^\circ$  under pressure, e. g., to  $150-200^\circ$  under 20-50 atm. pressure. The yield may be raised by adding to the mixt. a sulfite, an acid sulfate, animal C or a heavy metal salt, e. g.,  $CuSO_4$ . The bases, which include pyrazine derivs., may be sepd. by distn. after addn. of alkali. Examples are given.

Sulfonation process. Soc. pour l'ind. chim. à Bâle. Fr. 754,361, Nov. 6, 1933. See Swiss 161,837 (C. A. 28, 487\*).

Sulfating olefins. Benjamin T. Brooks (to Standard Alcohol Co.). U. S. 1,940,073, Dec. 19. An initial quantity of aq.  $H_2SO_4$  is reacted with a liquid olefin such as  $C_2H_4$ ,  $C_3H_6$  or  $C_4H_8$  to effect sulfation of the olefin and the latter is added gradually in small amount to the  $H_2SO_4$ . App. is described.

Alcohol. Usines de Melle (Soc. anon.) and Henry Martin Guinot. Fr. 754,877, Nov. 16, 1933. Alc. is dehydrated in a continuous manner by mixing it with a suitable amt. of a liquid insol. in water, treating the mixt. with dehydrating agents generally used for drying org. liquids, finishing the dehydration by azeotropic distn. in a distg. column, the addnl. liquid, e. g., a petroleum fraction b. between  $80^\circ$  and  $85^\circ$ , playing the double role of diluent in the 1st stage and entraining liquid in the 2nd.

Alcohols. Imperial Chemical Industries Ltd. Fr. 755,489, Nov. 25, 1933. Alcs. are made by heating liquid or solid waxes with dry KOH or dry KOH and NaOH, and sepg. the alc. by distn.

**Alcohols.** H. Th. Böhme A.-G. (Hermann Prückner, inventor). Ger. 588,067, Oct. 18, 1933 (Cl. 12o. 5.02). Addn. to 574,834 (C. A. 27, 4539). The method of 574,834 for producing alcs. by treating Ca salts of fatty acids with at least 2 C atoms, with  $(\text{HCO}_2)_2\text{Ca}$  in the presence of a solvent and a catalyst, is modified by dispensing with the solvent, the formed alc. serving this purpose. Thus, Ca salt of cacao fatty acid is treated with  $(\text{HCO}_2)_2\text{Ca}$  in the presence of a Cu-Cr catalyst to give the corresponding alc. Cf. C. A. 27, 4813.

**Alcohols from waxes.** Imperial Chemical Industries Ltd., Wilfred A. Sexton and Denis Ward. Brit. 398,807, Sept. 18, 1933. Solid or liquid waxes, e. g., spermaceti, beeswax, Chinese wax, wool fat, carnauba wax, sperm oil and arctic sperm oil are sapon. by heating with dry KOH or NaOH or preferably with a mixt. thereof in equimol. proportions. Alcs. are sepd. from the sapon. mixt. by distn. in superheated steam at atm. or reduced pressure.

**Alcohols from waxes.** Deutsche Hydrierwerke A.-G. Ger. 588,201, Nov., 14 1933 (Cl. 12o. 5.02). Natural waxes are dissolved in an org. solvent and reduced with nascent H at a temp. above  $100^\circ$ . Free acids in the wax may first be esterified, if desired. Examples are given.

**Unsaturated alcohols.** I. G. Farbenind. A.-G. Brit. 398,982, Sept. 28, 1933. Unsatd., especially aliphatic, aldehydes and ketones contg. more than 15 C atoms are converted into unsatd. alcs. by catalytic hydrogenation under mild conditions. When using highly efficient catalysts, e. g., Pt, Pd, Co, Ni, their activity is reduced by poisoning with org. S compds. or by diln. with weaker catalysts. Preferred catalysts are Cu, Zn and Cd and their compds., e. g., chromates, chromites, manganates, manganites, molybdates, tungstates and uranates. Examples describe the hydrogenation of heptadecenyl methyl ketone (I) with Cu-Al and basic Zn chromate catalysts, oleic aldehyde with a Cu catalyst and I or diheptadecenyl ketone with a  $\text{CuCrO}_4$  catalyst.

**Amino alcohols.** Julius A. Brachfeld and Albert Smola. Austrian 135,351, Nov. 10, 1933 (Cl. 12e). Aliphatic amino alcs. are obtained by hydrating unsatd. aliphatic amines with the aid of mineral acids. Thus,  $\text{CH}_2=\text{CHCH}_2\text{NH}_2$  (I) may be treated at  $80\text{--}100^\circ$  with concd.  $\text{H}_2\text{SO}_4$ , and the resulting sulfuric ester ( $\text{MeCH}(\text{OSO}_3\text{H})\text{CH}_2\text{NH}_2$ ) boiled with water to produce  $\text{MeCH}(\text{OH})\text{CH}_2\text{NH}_2$  (II). Other concd. mineral acids, excepting H halides, may be used instead of  $\text{H}_2\text{SO}_4$ . II may also be prepd. directly by heating I under pressure to  $150\text{--}220^\circ$  with dil. mineral acids, including dil. H halides. Other unsatd. aliphatic amines, e. g., 1-amino-2-butene, react similarly to I. The amines may be prepd. *in situ* from the corresponding esters of isothiocyanic acid. Details are given. Cf. C. A. 27, 4813.

**Amino alcohols.** Knoll A.-G. chem. Fab., Gustav Hildebrandt and Wilfrid Klavehn. Ger. 585,667, Oct. 6, 1933 (Cl. 12g. 32.21). Addn. to 548,450 (C. A. 26, 3623). 1-Aminopropanols are prepd. from 1-keto alcs. of the formula  $\text{RCH}(\text{OH})\text{COMe}$ , where R is an alkyl, aryl or heterocyclic radical, by condensing the keto alcs. with amines, and simultaneously or subsequently reducing the products. Thus, 1-1-phenylpropan-1-ol-2-one, treated in  $\text{Et}_2\text{O}$  soln., without heating, first with  $\text{EtNH}_2$ , and then with activated Al and MeOH, yields 1-1-phenyl-2-ethylaminopropan-1-ol (HCl salt, m.  $220^\circ$ ). Examples are given also of the prepn. of 1-1-phenyl-2-nonylamino-propan-1-ol, b.  $193\text{--}5^\circ$  (HCl salt, m.  $219\text{--}20^\circ$ ), 1-1-p-methoxyphenyl-2-methylaminopropan-1-ol (HCl salt, m.  $247^\circ$ ), 1-1-(3',4'-methylenedioxyphenyl)-2-methylaminopropan-1-ol (HCl salt, m.  $225^\circ$ ) and 1-1-furyl-2-methylaminopropan-1-ol (HCl salt, m.  $130^\circ$ ).

**Optically active amino alcohols.** Helmut Legerlotz. Ger. 585,164, Sept. 29, 1933. Optically active amino alcs. of the formula  $\text{R}_1\text{CHOHCH(R}_2\text{)NHR}_3$ , where  $\text{R}_1$  is a phenyl or monohydroxyphenyl group,  $\text{R}_2$  is H or an alkyl group, and  $\text{R}_3$  is an alkyl group, are inverted by acetylation followed by sapon. Examples are given.

**Polymerized polyhydroxy alcohols and their esters**

**derivatives.** Karl Noack. Brit. 398,474, Sept. 6, 1933. Highly polymerized aliphatic alcs. contg. 3 or more OH groups, free from di- and tri-polymers, are made by heating the alc. at  $250\text{--}275^\circ$  in the presence of heavy metal salts as condensing agents, e. g.,  $\text{HgCl}_2$ ,  $\text{HgSO}_4$ ,  $\text{CuCl}$ ,  $\text{FeCl}_3$ , removing the  $\text{H}_2\text{O}$  formed by a stream of inert gas, e. g.,  $\text{CO}_2$ , N, and further heating to form a highly viscous product. In an example glycerol is heated at  $250^\circ$  with CuCl in a stream of inert gas, the catalyst is decompd. by treating the reaction mass with  $\text{H}_2\text{S}$  and the resulting ppt. removed. The glycerol may be replaced by chlorinated glycerol or by a mixt. of glycerol and a higher alc. contg. more than 3 OH groups.

**Apparatus for vaporizing and catalytically oxidizing alcohols,** the evaporation being produced independently of the oxidation by an electric heating resistance. Ch. Mildé Fils et Cie. Brit. 398,736, Sept. 21, 1933.

**Derivatives such as alcohols and esters from olefins.** Hyym E. Buc (to Standard Oil Development Co.). U. S. 1,939,384, Dec. 12. Olefinic material such as that from oil cracking is subjected to a preliminary esterification with a halogen-substituted aliphatic acid such as monochloroacetic acid followed by a treatment with water or an aliphatic acid of lower b. p. than the halo-substituted aliphatic acid used and adapted to regenerate the latter while also producing alcs. and esters which are finally sepd. App. is described.

**Aldehydes.** Friedrich W. Guthke (to General Aniline Works). U. S. 1,939,006, Dec. 12. In the production of an aldehyde such as benzaldehyde or p-chlorobenzaldehyde by the reaction of CO under superatm. pressure on an aromatic hydrocarbon such as  $\text{C}_6\text{H}_6$  or a halogen deriv. such as PhCl, the reaction is carried out in the presence of a catalyst comprising anhyd.  $\text{AlCl}_3$  together with a small proportion of Ti chloride. Cf. C. A. 27, 3944.

**Aromatic hydroxy aldehydes.** Franz Elger (to Hoffmann-La Roche Inc.). U. S. 1,939,491, Dec. 12. See Brit. 392,399 (C. A. 27, 5337).

**Ketones.** Walthey Dilthey. Ger. 575,857, Nov. 16, 1933 (Cl. 12o. 10). Deep colored ketones are prepd. by condensing aromatic o-diketones, their derivs. or reduction products with ketones or derivs. contg. a reactive  $\text{CH}_3$  group next to the CO group. The condensation may take place in acid or alk. mediums, with or without solvents. Thus, a boiling alc. soln. of benzil and dibenzyl ketone is given an addn. of alc. KOH to give a quantitative yield of the ketone *tetraphenylpentadione*, m.  $216\text{--}8^\circ$ . Other examples are given. The products are used as *starting materials for dye manuf.*

**Ketones.** Schering-Kahlbaum A.-G. (Erwin Schwenk and Erich Borgwardt, inventors). Ger. 584,373, Sept. 19, 1933 (Cl. 12o. 25). Addn. to 582,545 (C. A. 28, 779<sup>a</sup>). The method of 582,545 for prepg. ketones of the cycloolefin series by the action of  $\text{SeO}_2$  or  $\text{H}_2\text{SeO}_3$  on cycloolefins is modified by carrying out the reaction in the presence of solvents and, if necessary, under pressure. Thus, a soln. of 1-menthene in  $\text{EtOH}$  is treated with an alc. soln. of  $\text{SeO}_2$  to give an 85% yield of  $\text{C}_{10}\text{H}_{18}\text{O}$ . Other examples are given.

**Recovering ketones such as acetone from gaseous mixtures.** Donald F. Othmer (to Eastman Kodak Co.). U. S. 1,939,222, Dec. 12.  $\beta,\beta'$ -Dichloroethyl ether is used as an absorbent for the ketone.

**Ketones from shale-distillation products.** Johannes Döderlein. Ger. 587,784, Nov. 7, 1933 (Cl. 12o. 10). Addn. to 571,226 (C. A. 27, 9800). The distillate obtained in the process of Ger. 571,226 is treated with  $\text{NaHSO}_3$  soln. to ext. the ketones, which are then recovered by boiling the soln. without addn. of acid or alkali.

**Esters.** Edward H. Strange and Thomas Kane. Brit. 398,627, Sept. 8, 1933. Esters are made by the reaction of a fatty acid, having 5 or less C atoms, with an olefin, having 7 or less C atoms, in presence of a catalyst at above the b. p. of the ester under the reaction conditions and continuously withdrawing the ester from the reaction space as vapor. Suitable catalysts are chlorides, bromides, phosphates and sulfates of Zn, Al, Hg, Cu, Cd, Bi and

Sb, relatively non-volatile inorg. acids, e. g.,  $H_3PO_4$ ,  $H_2SO_4$ , and the metal acid salts and alkyl and aryl derivs. of these acids, e. g.,  $NaHSO_4$ , ethylsulfuric acid and benzenesulfonic acid. Among examples 500 parts adsorbent C are treated with 50 parts 75%  $H_3PO_4$  and heated to 150–250° for 2 hrs. in a current of air and a mixt. of  $AcOH$  vapor and  $C_2H_6$  is passed over this catalyst at 110°.

**Esters.** Invention Ges. für Verwaltung und Verwertung chemisch-technischer Patente G. m. b. H. Ger. 589,431, Dec. 7, 1933 (Cl. 12o. 11). See Fr. 741,293 (C. A. 27, 2694).

**Alkyl esters.** N. V. de Bataafsche Petroleum Maatschappij. Fr. 755,155, Nov. 21, 1933. In making alkyl esters from olefins and strong acids, such as  $H_2SO_4$ ,  $H_3PO_4$  or certain sulfonic acids, the components of the reaction are caused to react in small amts., either by portions or continually as rapidly as possible and with cooling, and the reaction products are eliminated from the reaction zone immediately after they are formed. Thus, the components are passed through a rapidly rotating app. in the liquid state or are intimately mixed by an ejection action. Cf. C. A. 27, 997.

**Mixed neutral carboxylic acid esters of aliphatic alcohols and phenols.** Lucas P. Kyrides (to Monsanto Chemical Co.). U. S. 1,939,217, Dec. 12. Various examples and details are given of the production of esters such as ethyl phenyl phthalate,  $b_p$  195°, methyl phenyl phthalate,  $b_p$  191°, ethyl and methyl tolyl phthalates, ethyl phenyl succinate and methyl phenyl maleate, which are suitable for use as high-boiling solvents or plasticizers with cellulose esters, etc. Similar esters comprising butyl and benzyl, chlorophenol or chloronaphthol radicals, etc., also are mentioned and general claim is made to all mixed alkyl phenyl esters of dicarboxylic acids as being new products.

**Vinyl esters.** I. G. Farbenind. A.-G. (Walter Reppe, inventor). Ger. 588,352, Nov. 15, 1933 (Cl. 12o. 19.03). Vinyl esters of fatty acids contg. more than 4 C atoms are prepd. by treating the acids in the liquid phase with  $C_2H_2$  in the presence of an org. salt of Zn or Cd. The reaction is preferably effected at 160–180° under pressure. Dild.  $C_2H_2$  may be used, and a solvent may be present. The proportion of Zn or Cd compd. should be at least 2%, calcd. as oxide on the fatty acid. The esters can be polymerized by standard methods to yield waxy products or viscous drying or nondrying oils. Examples are given of the prepn. of vinyl valerate,  $b_p$  134°, caproate,  $b_p$  165–7°, caprylate,  $b_p$  94°, laurate,  $b_p$  123°, myristate,  $b_p$  150°, palmitate,  $b_p$  165°, stearate,  $b_p$  167° and oleate,  $b_p$  173°. Cf. C. A. 27, 4243.

**Vinyl ethers.** Walter Reppe (to I. G. Farbenind. A.-G.). U. S. 1,941,108, Dec. 26. For producing a vinyl ether such as vinyl ethyl ether, a vinyl halide contg. at least one H atom connected with the C atom of the double linkage which is free from halogen, such as vinyl chloride is treated with an alcoholate such as  $NaOEt$  in the presence of an org. diluent such as  $EtOH$  (suitably at a temp. of about 100°). Cf. C. A. 28, 1058°.

**Amides.** Chemische Fabrik von Heyden A.-G. (Curt Philipp, inventor). Ger. 585,740, Oct. 7, 1933. Amides of benzylated mono- or dihydroxyacetic acid are prepd. by treating esters or haloides of the acids with  $NH_3$  or primary or secondary amines. Thus, the Et ester of benzylglyoxyacetic acid is treated with a concd. aq. soln. of  $NH_3$  to give a 90% yield of *benzylglyoxylacetamide*, m. 95°. The prepn. of *dibenzylglyoxylacetamide*, m. 91°, and *N-methylphenyldibenzylglyoxylacetamide*, is described.

**Phenols.** Chemische Fabrik von Heyden A.-G. (Curt Rühl, Kurt Buchheim and Karl W. Rittler, inventors). Ger. 586,046, Oct. 25, 1933 (Cl. 12q. 14.02). See Fr. 751,158 (C. A. 28, 1049°).

**Purifying phenols.** Clyde O. Henke (to E. I. du Pont de Nemours & Co.). U. S. 1,939,591, Dec. 12.  $H_2SO_4$  is used for treating phenols such as those from coal tar, to eliminate catalyst poisons such as would interfere with subsequent catalytic hydrogenation of the material.

**Methylamines.** Henry Dreyfus. Brit. 398,502, Sept. 11, 1933. Methylamines are produced by hydrogenating aqueous mixts. comprising  $HCN$  in the presence of cata-

lysts consisting of cyanides of hydrogenating metals, e. g., Ni, Cu and Zn, with or without the free metals and with or without alkali or alk. earth cyanides. The catalysts may be supported on carriers, e. g., pumice, Carborundum, kieselguhr. In 398,503, Sept. 11, 1933, solns. or suspensions of cyanides are treated with H in the presence of a hydrogenating catalyst, e. g., a colloidal dispersion of Ni, Cu, Zn, Fe, Co, Sn or Ag. Suitable cyanides are alkali and alk. earth cyanides,  $K_4Fe(CN)_6$  and cyanides of the hydrogenating metals. In 398,504, Sept. 11, 1933, a gaseous mixt. comprising H and  $HCN$  is treated with a catalyst consisting of or comprising the above metals, with or without 1 or more alkali or alk. earth cyanides. Examples are given of the 3 processes.

**Glycidic acid amides.** Schering-Kahlbaum A.-G. (Otto von Schickh, inventor). Ger. 586,645, Oct. 25, 1933 (Cl. 12o. 16). Ketones or aldehydes are treated with low mol.  $\alpha$ -monohalogen fatty acid amides in the presence of solvents or suspension agents, and alk. condensing agents. Thus,  $CH_3ClCONH_2$  is treated with acetone in the presence of Na to give an 80% yield of  *$\beta$ -dimethylglycidic acid amide*, m. 121°. The prepn. of the following is also described:  *$\beta$ -dimethylglycidic acid diethylamide*,  $b_p$  122–4°, *ethylphenylglycidic acid amide*, m. 119–21°,  *$\alpha$ -methyl- $\beta$ -phenylglycidic acid methylamide*, m. 116°, and *citraalglycidic acid amide*, m. 118.5°.

**Dialkylamides of polyalkoxy benzoic acids.** Marcus Guggenheim (to Hoffmann-La Roche Inc.). U. S. 1,939,496, Dec. 12. The derivs. of di- or tri-methoxy- and -ethoxybenzoic acids are prepd. by transforming these acids into dimethyl- and diethyl-amides, resp., as by treating halides of the acids with dialkylamines. Veratric acid diethylamide,  $b_p$  205°. Veratric acid dimethylamide,  $b_p$  203°, forms crystals, m. 102–3°. 3,4,5-Trimethoxybenzoic acid dimethylamide,  $b_p$  218°, forms crystals, m. 74°. The corresponding diethylamide  $b_p$  220–6° and m. 54°. 2,3-Dimethoxybenzoic acid dimethylamide,  $b_p$  172°. 3-Methoxy-4,5-diethoxybenzoic acid diethylamide,  $b_p$  211–12°. 3,5-Dimethoxy-4-ethoxybenzoic acid diethylamide,  $b_p$  213°. Prepn. of these compds. is described.

**Hydroxybenzocarbazoles.** I. G. Farbenind. A.-G. (Erich Koehler and Otto Goll, inventors). Ger. 586,804 Oct. 26, 1933 (Cl. 12p. 2). The 2-hydroxy derivs. are prepd. from benzocarbazoles contg. a replaceable group in the 2-position. Thus, Na 5,6-benzocarbazole-2-sulfonate is mixed with powd. KOH and fused to give 2-hydroxy-5,6-benzocarbazole, m. 195°. The prepn. of 2-hydroxy-7,8-benzocarbazole, m. 241°, is also described.

**Arylisothiazolones.** I. G. Farbenind. A.-G. Brit. 398,947, Sept. 28, 1933. Ger. 585,333, Oct. 2, 1933. See Fr. 748,516 (C. A. 27, 5339°).

**Phenol derivatives.** Hyym E. Buc (to Standard Oil Development Co.). Brit. 398,218, Sept. 7, 1933. Alkylphenols, useful as *antiseptics* and *germicides*, are prepd. by the interaction of an unsulfonated phenol with an aliphatic or cyclic olefin (other than  $C_2H_4$ ) at below 70° in the presence of  $H_2SO_4$  of at least 90% strength. The *sec*- or *tert*-alkylphenol may be isolated, in admixt. with the arylalkyl ethers also formed, by dildn. with  $H_2O$  and sepn. of the upper layer but in some cases an intermediate hydrolysis is necessary by refluxing with  $H_2O$  or distg. with superheated steam. In examples a mixt. of hexylcresyl ethers and *sec*-hexylcresols is obtained from com. cresol and 2-hexene and a product comprising *sec*-hexylresorcinols from resorcinol and 2-hexene.

**Anthraquinone derivatives.** I. G. Farbenind. A.-G. (Karl Zahn and Heinrich Koch, inventors). Ger. 586,880, Oct. 27, 1933 (Cl. 12q. 37). New derivs. are prepd. by condensing mono- or poly(aminoarylamino)anthraquinones, which may also have other substituents in the anthraquinone and arylamino residues, with acyl acetic esters, aryl-bis-acetic esters or hydroxyarylcboxylic acids. Thus, 1,4-di(*p*-aminoanilino)anthraquinone is condensed with acetoacetic ester to give the diacetoacetyl deriv., m. 203–4°. Other examples are given.

**Anthraquinone derivatives.** Compagnie nationale de matières colorantes et manufactures de produits chimiques

du nord réunies établissements Kuhlmann. Ger. 586,515, Oct. 21, 1933 (Cl. 12p. 37). See Fr. 750,112 (C. A. 28, 487<sup>2</sup>).

**Anthraquinone derivatives.** Soc. pour l'ind. chim. à Bâle. Ger. 589,074, Dec. 1, 1933 (Cl. 12q. 37). Anthraquinone- $\beta$ -sulfonic acids, substituted by OH, NH<sub>2</sub>, alkyl and (or) arylamino groups, are desulfonated by treatment in aq. alk. soln. with the stoichiometric amt. of a reducing agent in the absence of air. The mixt. is kept at about 0° until the formation of leuco compd. is complete, and is then warmed to decomp. the leuco compd. Thus, 1-hydroxy-4-aminoanthraquinone-2-sulfonic acid, treated in aq. NaOH soln. with an equimol. amt. of Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> in the absence of air, first at 0 to -5° and then at 40°, yields 1-hydroxy-4-aminoanthraquinone. Other examples are given.

**Barbituric acid derivatives.** Chem. Fab. von Heyden A.-G. (Curt Rühl and Rudolf Gebauer, inventors). Ger. 589,146, Dec. 4, 1933 (Cl. 12p. 7.01). An alkali salt of ethylbarbituric acid is condensed with a *p*-nitrobenzyl halide to yield *p*-nitrobenzylethylbarbituric acid, m. 285-7°. This is reduced with SnCl<sub>2</sub> and HCl to the corresponding amine, m. 218°, and the latter is diazotized and then reduced first with Na<sub>2</sub>SO<sub>3</sub> and HCl and then with Zn and AcOH, this yielding the Zn compd. of *p*-hydrazinobenzylethylbarbituric acid. The latter is finally condensed with acetoacetic ester to produce the corresponding pyrazolone deriv., m. 252°. The *N*-methyl deriv., m. 300-5°, of the pyrazolone deriv. has also been prepd. The pyrazolone derivs. are of therapeutic value.

**Derivative of dihydrobenzocarbazole.** I. G. Farbenind. A.-G. (Otto Goll and Heinrich Morschel, inventors). Ger. 586,803, Oct. 26, 1933 (Cl. 12p. 2). The deriv. 2-hydroxy-5,6-dihydro-7,8-benzocarbazole, m. 183°, is prepd. from derivs. of 5,6-dihydro-7,8-benzocarbazole contg. a replaceable group in the 2-position. Examples are given.

**Pyrene derivatives.** I. G. Farbenind. A.-G. (Erwin Kramer, inventor). Ger. 589,145, Dec. 2, 1933 (Cl. 12a. 15). Pyrenoyl-*o*-benzoic acid, m. 225-6°, of the formula *o*-HO.CC<sub>6</sub>H<sub>4</sub>.COP, where P is the pyrene residue, is prepd. by treating pyrene with phthalic anhydride at a temp. not exceeding 80-100° in the presence of a halide of Al and an org. solvent or diluent. Pyrenoylhalo-*o*-benzoic acids are prepd. similarly from pyrene and halo-phthalic anhydrides. An example is given of the prepn. of pyrenoyl-3,6-dichloro-2-benzoic acid, m. 268-9°.

**Pyridine derivatives.** Chemische Fabrik von Heyden A.-G. (Hans Maier-Bode, inventor). Ger. 586,879, Oct. 27, 1933 (Cl. 12p. 1.01). Pyridine derivs. contg. basic groups are prepd. by treating 3- or 5-halopyridine, which may contain other substituents also, with NH<sub>3</sub> or NH<sub>4</sub> derivs. in the presence of catalysts. Thus, 3-bromopyridine is treated with a concd. aq. soln. of NH<sub>3</sub> in the presence of CuSO<sub>4</sub> to give a 75% yield of 3-aminopyridine, m. 64°. The prepn. of methylphenyl(pyridyl-3)amine, m. 245-50°, and *p*-dimethylaminophenyl(pyridyl-3)amine, m. 200-20°, is also described.

**Polyaminoarsenostibionic derivatives.** I. G. Farbenind. A.-G. Fr. 755,514, Nov. 25, 1933. Comps. giving neutral solns. are obtained by causing alkylene oxides and CH<sub>3</sub>O-bisulfite or CH<sub>3</sub>O-sulfoxylate to react on aminoarylarsoenostibionic compds. contg. at least 2 NH<sub>2</sub> groups. Examples are given of the prepn. of 4-hydroxy-3-dihydroxypropylamino-4'-hydroxy-3'-formaldehyde-bisulfiteamino- and the bisulfite-formaldehyde compd. of 4-hydroxy-3-amino-4'-carbmino-3'-dihydroxypropylamino-arsenostibiobenzene.

**Diazo compound.** I. G. Farbenind. A.-G. (Karl Schnitzspahn and Rudolf Jung, inventors). Ger. 587,644, Nov. 7, 1933 (Cl. 12q. 10). Addn. to 586,354 (C. A. 28, 780<sup>2</sup>). The diazo compd. of *m*-aminoazotoluene is pptd. from soln. as diazonium acid sulfate and dried. A stable product is obtained.

***N*-Sulfoethyl compounds of arylamino sulfonic acids.** I. G. Farbenind. A.-G. (Hans Grotowsky and Wilhelm Mühl, inventors). Ger. 586,973, Oct. 28, 1933 (Cl. 12q. 6.03). Primary or secondary arylamines which

1 have a HSO<sub>3</sub> group, are treated with C<sub>2</sub>H<sub>5</sub>ClHSO<sub>3</sub> in the presence of an acid-binding agent. Thus, monobenzyl-aniline-3'-sulfonic acid is treated with C<sub>2</sub>H<sub>5</sub>ClNaSO<sub>3</sub> to give the Na salt of *N*-*w*-sulfoethylbenzylaniline-3'-sulfonic acid. The prepn. of the di-Na salt of *disulfoethyl-m-toluidine* and the di Na salt of *N*-*w*-sulfoethyl-aniline-2-sulfonic acid is also described.

**Vinyl and polyvinyl compounds.** Henry Dreyfus, Brit. 398,173, Sept. 1, 1933. Divided on 385,978 (C. A. 27, 4247<sup>2</sup>). Vinyl compds., contg. hydrophile groups, *e. g.*, OH, COOH, HSO<sub>3</sub>, NH<sub>2</sub> or other acidic or basic groups, which render the compds. more readily sol. or dispersible in aq. liquids, are made by reaction of a vinyl halide with a compd. contg. a replaceable H atom and at least 1 hydrophile group. The replaceable H may be present in a OH, COOH or NH<sub>2</sub> group. The products may be polymerized, alone or in admixt. with each other or other vinyl compds., by heat and (or) light in the presence or absence of diluents and (or) polymerization catalysts, *e. g.*, Bz peroxide. In examples (1) vinyl chloride is heated to 80-100° in an autoclave with Na glycol to produce glycol monovinyl ether; the product may be polymerized by warming under a reflux condenser with Bz peroxide and under the radiation from a quartz Hg vapor lamp; the polymerized product may be dissolved in H<sub>2</sub>O and used directly as a size and (2) a mixt. of mono-K succinate, vinyl chloride and PhMe is heated in an autoclave to 100-130° to yield vinyl succinate ester. The vinyl chloride in both examples may be replaced by  $\beta$ -chloropropylene to produce the corresponding Me-substituted vinyl compds. Cf. C. A. 27, 1212.

**Polymerizing vinyl compounds.** Leland C. Striver (to Carbide and Carbon Chemicals Corp.). U. S. 1,938,870, Dec. 12. See Brit. 397,364 (C. A. 28, 780<sup>2</sup>).

**Polymerized vinyl compounds.** I. G. Farbenind. A.-G. (Arthur Voss, inventor). Ger. 578,996, Sept. 25, 1933 (Cl. 39b. 4.02). Addn. to 526,497 (C. A. 28, 173<sup>2</sup>). Plastic products of low soly. in water and org. solvents are prepd. by heating polymerized vinyl esters or ethers to above 100° in the presence of a small proportion of a condensing agent, *e. g.*, HCl or ZnCl<sub>2</sub>.

**Nonbenzenoid acetylene polymers.** E. I. du Pont de Nemours & Co. Ger. 588,283, Nov. 15, 1933 (Cl. 12a. 19.01). See Brit. 384,654 (C. A. 27, 4251<sup>2</sup>).

**Condensation products.** I. G. Farbenind. A.-G. (Ernst Roell, inventor). Ger. 586,878, Oct. 27, 1933 (Cl. 12a. 1.01). Addn. to 584,762 (C. A. 28, 1052<sup>2</sup>). The method of 584,762 for producing condensation products of the type Ph<sub>2</sub> by passing aromatic hydrocarbon vapor over heated alk. earth or earth metal oxide catalysts, is modified by using oxides of metals forming several oxides, and which are not reduced to the metal under the conditions of the reaction, as catalysts. These are coated with anthracite. WO<sub>2</sub> is mentioned as an example.

**Condensation products.** Hefkel & Cie. G. m. b. H. Fr. 42,834, Nov. 4, 1933. Addn. to 747,433 (C. A. 27, 5084<sup>2</sup>). The esters referred to on Fr. 747,433 are condensed with tertiary amines, such as NMe<sub>3</sub> and pyridine. The products sol. in water have soapy properties. Examples are given of the prepn. of CH<sub>3</sub>:CH CH<sub>2</sub>:CH N-

(Cl)CH<sub>2</sub>COOCH<sub>2</sub>(CH<sub>2</sub>)<sub>10</sub>CH<sub>3</sub>, and compds. from the octadecyl ester of ClCH<sub>2</sub>COOH and pyridine and NMe<sub>3</sub>.

**Condensation products of aromatic amines with butyraldehyde.** Ira Williams (to E. I. du Pont de Nemours & Co.). U. S. 1,939,192, Dec. 12. By the reaction of equimol. proportions of butyraldehyde with an aromatic amine such as aniline or *o*-toluidine or  $\alpha$ -naphthylamine in the presence of a weak org. acid such as HOAc and then eliminating the excess acid and water present, products are obtained suitable for use as antioxidants in making vulcanized rubber compns.

**Condensation products of glycidic acids with amines.** Schering-Kahlbaum A.-G. (Otto von Schickh, inventor). Ger. 588,045, Nov. 16, 1933 (Cl. 12p. 8.01). Heterocyclic condensation products are obtained by heating glycidic acids or their esters or amides with aliphatic primary or secondary diamines, or with cyclic primary

or secondary *o*-diamines, or with  $N_2H_4$  or its monosubstitution products. Thus,  $PhNHNH_2$  and dimethylglycidic amide (I) or Et ester, heated at  $150-180^\circ$  for 10 hrs., yield 1-phenyl-3,3-dimethyl-4-hydroxy-5-pyrazolone, m.  $182-3^\circ$ . Urea and I yield 4,4-dimethyl-2,6-diketo-5-hydroxypyrimidine, m.  $196-7^\circ$ . Compds. of unsaturated constitution, m., resp.,  $155-8^\circ$  and  $205-6^\circ$ , have also been prepd. from I and (1) *o*-phenylenediamine and (2)  $C_6H_4(NH_2)_2$ .

**Acridine salts.** I. G. Farbenind. A.-G. (Ludwig Benda and Otto Sievers, inventors). Ger. 585,597, Oct. 5, 1933. Aq. solns. of aminoacridine- or aminoacridinium salts of high-mol. fatty acids, olefin carboxylic acids and ester ethanesulfonic acids obtained from these, are prepd. by adding excess of an alkali salt of the fatty or other acid in the presence of water. Thus, 3,6-diaminoacridine stearate is stirred with Na oleate and water. More water is added and the whole boiled. The resulting soln. filters clear. Other examples are given. Cf. C. A. 27, 3722.

**Alkyl halides and carboxylic acid anhydrides.** Lucas P. Kyrides (to Monsanto Chemical Co.). U. S. 1,939,216, Dec. 12. An alkyl halide such as  $EtCl$  and a carboxylic acid anhydride such as phthalic anhydride are made by causing an alkyl ester of an unsubstituted carboxylic acid, such as diethyl phthalate to react with a carboxylic acid halide such as phthalyl chloride (suitably by heating with 0.2% of  $ZnCl_2$  to about  $130^\circ$ ).

**Acetyl chloride.** I. G. Farbenind. A.-G. Fr. 754,986, Nov. 17, 1933.  $AcCl$  is made by causing gaseous  $COCl_2$  to react at a high temp. on liquid  $AcOH$ , the  $AcCl$  being continuously removed by evapn. A catalyst such as  $MgO$ ,  $CaCl_2$  or  $Al(AcO)_3$  may be used. Cf. C. A. 27, 3350 and following abstr.

**Acetyl chloride.** I. G. Farbenind. A.-G. Fr. 755,052, Nov. 18, 1933.  $AcCl$  is made by causing  $COCl_2$  to act on gaseous  $AcOH$  in the presence of charcoal activated by  $H_3PO_4$  or charcoal of equal efficacy. A temp. not above  $250^\circ$  is used.

**Vinyl chloride.** I. G. Farbenind. A.-G. Ger. 585,793, Oct. 9, 1933.  $CH_2=CHCl$  is prepd. by passing  $C_2H_4Cl_2$  vapor mixed with inert gases over active C at temps. of  $230-350^\circ$ . An example is given.

**Aromatic amino sulfonyl chlorides, substituted in the amino group.** Hugo Schweitzer and Karl Burr (to I. G. Farbenind. A.-G.). U. S. 1,939,025, Dec. 12. Compds. of the probable general formula  $(CISO_2)_n-R-X$ , wherein R stands for an aromatic nucleus, such as a benzene or naphthalene nucleus which may be substituted by an alkyl or a hydroxy group, X stands for an amino group in which one H atom may be substituted by alkyl, aralkyl, aryl, acyl or the radical of a heterocyclic nucleus attached to the N atom of the amino group by means of a C atom, e. g., for the residue of the cyanuric nucleus, wherein the other H of the amino group may be substituted by alkyl, aralkyl, aryl, acyl, and wherein one or both H atoms may be substituted in such a manner that the N of the amino group is a member of a 5- or 6-membered heterocyclic nucleus attached to the aromatic nucleus R in *o*- or *peri*-position to the amino group, and "n" stands for 1, 2 or 3, are prepd. by causing to react upon each other,  $CISO_2H$  and an aromatic aminosulfonic acid, substituted in the amino group and which may be represented by the probable general formula  $(HO)_nS-R-X$  (R, X and n meaning the same as stated). The process may be carried out between about  $0^\circ$  and about  $140^\circ$ , and the reaction is complete either immediately after mixing together the two components or may last some hrs. or even several days, depending on the specific N-substituted aminoarylsulfonic acid used and the temp. According to the working conditions and the constitution of the aromatic aminosulfonic acid substituted in the amino group employed either the corresponding amino sulfonyl chloride is obtained or further sulfonyl chloride residues are introduced into the mol. From the reaction mixt. the amino sulfonyl chlorides may be isolated by pouring the mixt. onto ice and may be purified by recrystn. from a suitable org. solvent. They are generally colorless

to red cryst. substances, "rather stable," sol. in org. solvents, of high reactivity and split off  $HCl$  on heating with water which may contain an alkali or alc. 2-Acetyl-amino-5-naphthol-7-sulfonyl chloride swells at about  $180^\circ$  but does not melt even at  $290^\circ$ . 2-Acetyl-amino-8-naphthol-6-sulfonyl chloride has similar properties and 1-acetylaminonaphthalene-4-sulfonyl chloride m. about  $170^\circ$ . 1-Acetyl-amino-8-naphthol-3,6-disulfonyl chloride, m.  $188-9^\circ$ . There also may be obtained acetyl-amino-8-naphthol-4,6-disulfonyl chloride, yellow crystals from ether, m.  $145-7^\circ$ ; benzoylamino-naphthalene-6-sulfonyl chloride, weakly yellowish colored crystals ( $PhCl$ ), m.  $185-6^\circ$ ; 1,2-dihydro-1-keto-4-benzoxazole-sulfonyl chloride, colorless (glacial  $AcOH$ ), m.  $230-1^\circ$ ; 1,2-dihydro-1-keto-4,6-disulfonyl chloride, colorless, ( $PhCl$ ), m.  $210-14^\circ$ ; 1,2-dihydro-1-keto- $\alpha$ -naphthoxazolesulfonyl chloride, almost colorless (acetone), m.  $262-3^\circ$ ; 2,3-dihydro-2-keto-1,3-*peri*-naphthoxazine-5,8-disulfonyl chloride, yellowish ( $PhCl$ ), m.  $214-16^\circ$ ; 1-methylbenzoxazole-4-sulfonyl chloride, colorless ( $AcOH$ ), m.  $189-90^\circ$  (decompn.); 2-hydroxyperimidine-5,8-disulfonyl chloride, yellowish (glacial  $AcOH$ ), decompn. at  $250^\circ$ , no m. p.; 2-methylperimidinedisulfonyl chloride, yellow ( $PhCl$ ), m.  $200-4^\circ$ ; diphenylurea-4,4'-disulfonyl chloride, colorless crystals; 2-methylamino-1-methylbenzene-4-sulfonyl chloride, yellow (benzene), m.  $99-100^\circ$ ; dimethylaniline-3-sulfonyl chloride, yellow (ether), m.  $38^\circ$ ; dimethylaniline-4-sulfonyl chloride, yellow (ether), m.  $108-11^\circ$ ;  $\beta$ -naphthoxazole-disulfonyl chloride, yellow, m.  $131-2^\circ$ . From 2-dimethylaminonaphthalene-5-sulfonic acid two isomeric monosulfonyl chlorides, yellow crystals (ether), m.  $80^\circ$ , and red crystals (ether), m.  $108-10^\circ$ , were obtained.

**Organic phosphates.** Chemische Fabrik von Heyden A.-G. Brit. 398,650, Sept. 21, 1933. Tertiary org. phosphates, e. g., triphenyl, tributyl, diphenyl *o*-tolyl, monophenyl dibutyl, are made by oxidizing the corresponding tertiary phosphites. Suitable oxidizing agents are  $As_2O_5$ ,  $SO_2$ ,  $H_2SO_4$ ,  $V_2O_5$ , N oxides,  $H_2O_2$ ,  $BaO_2$ , persulfuric acid. Examples are given.

**Dinitrophenylbenzothiazyl sulfide.** Wm. P. ter Horst (to Rubber Service Laboratories Co.). U. S. 1,941,142, Dec. 26. Substantially equimol. proportions of mercaptobenzothiazole and  $Na_2CO_3$  are mixed in alc. in the substantial absence of water, and an equimol. proportion of dinitrochlorobenzene dissolved in alc. is added at a temp. of about  $50-70^\circ$ , the materials are heated to  $50-70^\circ$  to complete the reaction, water is added and dinitrophenylbenzothiazyl sulfide is sepd. Cf. C. A. 28, 9323.

**Potassium formate.** Emil Hene (to Rudolph Koepp & Co. Chem. Fabrik A.-G. Oestrich). U. S. 1,939,625, Dec. 12. An aq. soln. of Ca formate is caused to react with  $K_2SO_4$  in such proportions that the filtered soln. contains 40-70% K formate and 60-30% Ca formate; this soln. is caused to react with  $K_2SO_4$  so as to form syngenite, the latter is sepd. from the soln. of K formate, treated with an aq. soln. of Ca formate and the soln. is sepd. from the  $CaSO_4$ .

**Separating sodium and potassium acetates.** Charles J. Strosacker, Chester C. Kennedy and Earl L. Pelton (to Dow Chemical Co.). U. S. 1,940,611, Dec. 19. Mixed  $NaOAc$  and  $KOAc$  are dissolved in water,  $NaOH$  is added in such amt. that the combined Na in the soln. corresponds at least to the total acetate, and the  $NaOAc$  is crystd. as trihydrate.

**Basic aluminum acetylsalicylate.** Chinoin Gyógyszer és Vegyészeti Termékek Gyára R. T. (v. Kereszty and Wolf) and Emil Wolf. Ger. 585,986, Oct. 14, 1933. A soln. of acetylsalicylic acid or its salts is treated with a soln. of an Al compd. The solvent may be alc., the basic salt being pptd. by addn. of water. Examples are given. Cf. C. A. 28, 489<sup>a</sup>.

**Organic acids from alcohols and carbon monoxide.** Gilbert B. Carpenter (to E. I. du Pont de Nemours & Co.). U. S. 1,940,674, Dec. 26.  $HOAc$  and other org. acids are formed from  $MeOH$  or other alc. and CO by passing the alc. vapor and CO over a catalyst config. a titratable H ion, such as phosphoric, boric or arsenic acid

together with a promoter such as an oxide of Ti, Zr, Ce or Th, which may be carried on a support such as charcoal, fuller's earth or silica gel (preferably under 350-700 atm. pressure, and suitably at temps. below or above 300° according to whether or not ester formation, more of which takes place at higher temps., is desired).

**Organic acids from carbon monoxide and alcohols.** John C. Woodhouse (to E. I. du Pont de Nemours & Co.). U. S. 1,940,987, Dec. 26. In a synthesis such as the production of HOAc from CO and MeOH, the initial reacting materials are passed into a circulating gaseous medium contg. a high concn. of by-products of the reaction and the resulting gaseous mixt. is circulated over a heated catalyst such as silicotungstic acid followed by removal of the org. acid produced and further recirculation of the by-products in a reacting gaseous mixt. of substantially uniform concn.

**Organic acids from carbon monoxide and alcohols.** Alfred T. Larson (to E. I. du Pont de Nemours & Co.). U. S. 1,940,988, Dec. 26. CO together with a portion of an alc. such as MeOH with which it is ultimately to react is subjected to the action of a heated catalyst, more alc. is added to the resulting mixt. and further reaction is effected in contact with a heated catalyst and without adding more CO.

**Organic acid production from alcohols and carbon monoxide.** Alfred T. Larson (to E. I. du Pont de Nemours & Co.). U. S. 1,940,989, Dec. 26. In effecting reaction such as the production of HOAc from MeOH and CO, a catalyst such as Th oxide gel is heated to the reaction temp. (suitably about 350°) in an atm. of a circulating gaseous medium incapable *per se* of forming the desired product, such as a mixt. contg. CH<sub>4</sub> and gases for the reaction are thereafter continuously added for contact with the catalyst, the desired product such as HOAc is sep'd. and uncombined gases are recirculated while maintaining a substantially uniform concn. of the inert gases by withdrawal of portions of the circulating mixt. and replacement with fresh mixts. of gases for the reaction.

**Aliphatic amino acids.** I. G. Farbenind. A.-G. Fr. 755,144, Nov. 20, 1933. Aliphatic amino acids and their salts are prepd. by causing anhyd. HCN and NH<sub>3</sub>, preferably as gas, to react at 5-100° on an aliphatic aldehyde to produce a nitrile which is then sapon'd. Examples are given of the prepn. of Na alanine and Na salts of higher condensation products, particularly of imino-dipropionic acid, and K glycocoll.

**Apparatus for concentrating acetic acid by distillation.** Kodak A.-G. Ger. 586,801, Oct. 26, 1933 (Cl. 12o. 12).

**Dehydrating acetic acid.** Kodak A.-G. Ger. 585,050, Sept. 28, 1933. See Can. 321,229 (C. A. 26, 3265).

**Dehydrating aqueous solutions of propionic acid.** Herbert G. Stone (to Eastman Kodak Co.). U. S. 1,939,237, Dec. 12. Ethylene chloride is added and water and ethylene chloride are dist'd. from the mixt. App. and various details of operation are described.

**Glycolic acid.** Ges. für Kohlentechnik m. b. H. (Walter Klempt and Fritz Brodkorb, inventors). Ger. 585,160, Sept. 29, 1933. Cryst. glycolic acid is recovered from the crude acid by esterifying the latter completely with EtOH in the presence of HCl, and distg. and sapong. the ester.

**Malonic acids.** Alexander Wacker Ges. für elektrochemische Industrie G. m. b. H. Fr. 754,808, Nov. 14, 1933. Substituted malonic acids are prepd. by oxidizing the corresponding hydroxy or keto derivs. with oxygenated compds. of N. Examples are given of the prepn. of a diethyl- (m. 120°) and a methylethyl-malonic acid, m. 121°.

**Oxalic acid.** Consortium für elektrochem. Ind. G. m. b. H. (Josef Wimmer, inventor). Ger. 588,150, Nov. 13, 1933 (Cl. 12o. 11). Wood meal, straw or like cellulosic material is treated at about 50° with H<sub>2</sub>SO<sub>4</sub> of 70-75% concn., and the mixt. is filtered. The filtrate is treated at 60-75° with HNO<sub>3</sub> or an oxide of N in the presence of a catalyst, *e. g.*, V<sub>2</sub>O<sub>5</sub>, with or without O or gases contg. O, under pressure if desired. The mixt. is

then cooled, to effect crystn. of (COOH)<sub>2</sub>, and the mother liquor is conc'd. *in vacuo* and used to treat a fresh batch of cellulosic material. Details are given.

**Monocarboxylic acids such as benzoic acid from dicarboxylic acids such as phthalic acid.** Alphons O Jaeger (to Selden Co.). U. S. 1,939,212, Dec. 12. The wet dicarboxylic acid is heated with an oxide of a non-alkali-forming metal such as ZnO or Cu oxide at temps. of 325-450°.

**Benzoic acid and benzoates.** Bozel-Malétra (Société industrielle de produits chimiques). Ger. 585,332, Oct. 7, 1933 (Cl. 12o. 14). Addn. to 573,982 (C. A. 27, 4248). The method of 573,982 for producing benzoic acid or benzoates by oxidizing toluene with chromates at temps. above 100° in neutral aq. soln. is modified by using crude chromates such as sintered chromate obtained by the alk. decompn. of Cr alloys. Examples are given. Cf. C. A. 28, 1056<sup>4</sup>.

**Benzoic acid and benzoates.** Bozel-Malétra (Société industrielle de produits chimiques). Ger. 585,429, Oct. 3, 1933 (Cl. 12o. 14). Addn. to 573,982 (C. A. 27, 4248). In prepg. benzoic acid or benzoates by the method of 583,982, *i. e.*, by oxidizing toluene with chromates or dichromates the alkali formed is treated with dichromate to convert it to monochromates. Examples are given.

**Glucuronic acid.** Fritz Weinmann. Ger. 586,589, Oct. 25, 1933 (Cl. 12o. 7.03). The *d*-form of the above acid is prepd. by hydrolyzing vegetable gums. The unchanged glucosides present are decomposed by addn. of mineral acid, and impurities of a caramel-like or resinous nature are removed by fractional pptn. of their alk. earth salts with alc. Thus, gum Arabic is hydrolyzed by treatment with dil. H<sub>2</sub>SO<sub>4</sub> in boiling water. The CaSO<sub>4</sub> resulting is removed and the filtrate treated with 9% H<sub>2</sub>SO<sub>4</sub> and heated. A yield of 60 g. of the acid per kg. of gum is obtained. Other examples are given.

***d*-Glutamic acid from Steffen's waste water or the like.** Reiske Masuda (to Larowe-Suzuki Co.). U. S. 1,940,428, Dec. 19. A hot soln. of a hydrolysate of Steffen's waste water of a *pH* approx. 3.2 and a sp. gr. of about 1.47 at 65° is partially cooled to about 60° to cryst. out inorg. salts which would interfere with the subsequent procedure; the remaining soln. is dild. until it contains about 55 g. per l. of *d*-glutamic acid, and the latter is crystd. out in a relatively pure state on cooling.

**Catalysts for producing methanol, etc.** Alfred T. Larson (to E. I. du Pont de Nemours & Co.). U. S. 1,939,708, Dec. 19. A catalyst for gaseous phase reactions such as the production of MeOH from CO and H comprises the reaction product of a fused mixt. of Cu oxide, Mn oxide and an oxide of Mg, Al or Si. Cf. C. A. 27, 3724.

**Separating acetylene and ethylene from gaseous mixtures.** Robert G. Wulff. U. S. 1,938,991, Dec. 12. For sepg. C<sub>2</sub>H<sub>2</sub> and C<sub>2</sub>H<sub>4</sub> from a gaseous mixt. contg. them together with H<sub>2</sub> and CH<sub>4</sub>, the gaseous mixt. is cooled to a temp. of about -80°, washed with hexane at about this temp. to dissolve the C<sub>2</sub>H<sub>2</sub>, C<sub>2</sub>H<sub>4</sub> and a small portion of the CH<sub>4</sub>, the hexane soln. is removed and heated to eliminate CH<sub>4</sub> from it and is then further heated to about 87° to discharge the C<sub>2</sub>H<sub>2</sub> and C<sub>2</sub>H<sub>4</sub> with a small admixt. of the hexane and these latter substances are then sep'd. in a described fractional liquefaction system.

**Propylene.** Henry Rosenthal (to Columbia Engineering & Management Corp.). U. S. 1,939,084, Dec. 12. A hydrocarbon gas mixt. consisting essentially of butane and isobutane is subjected to thermal decompn., the mixt. of decompn. products is subjected to pressure in excess of 300 lb. per sq. in. and the mixt. is fractionated at such pressure and at temps. above the crit. temps. of such light gases as H<sub>2</sub>, CH<sub>4</sub>, C<sub>2</sub>H<sub>4</sub> and C<sub>2</sub>H<sub>6</sub>; these light gases are sep'd. and the remaining liquid is refractionated at a lower pressure and at a temp. above the crit. temp. of C<sub>2</sub>H<sub>6</sub>, the latter is sep'd. in the form of a vapor which is then condensed to a liquid conc. contg. a high percentage of C<sub>2</sub>H<sub>6</sub>; this conc. is further refractionated at a still lower pressure, butane and butylene are sep'd. as vapor, condensed to liquid and this liquid is returned to

the thermal decompn. stage. An arrangement of app. is described.

**Separating and purifying *o*-, *m*- and *p*-xylenes.** Hans Spannagel and Eduard Tschunkur (to I. G. Farbenind. A.-G.). U. S. 1,940,065, Dec. 19. See Ger. 567,331 (C. A. 27, 1366).

**Tribromoethyl alcohol.** I. G. Farbenind. A.-G. (Erich Goth, inventor). Ger. 581,846, Aug. 3, 1933. Addn. to 469,625 (C. A. 23, 1217). Liquid products are obtained by treating  $\text{CBr}_3\text{CH}_2\text{OH}$  with subordinate amts. of acid amides, including ureas, urethans, and cyclic amides such as diketopiperazine. Examples are given. Cf. C. A. 28, 783<sup>a</sup>.

**Phenethyl alcohol.** Paul P. Shorugiu, Veitsche I. Isagulyantz, Anna R. Guseva, Klara S. Polyakova and Valetina P. Osipova. Brit. 398,561, Sept. 21, 1933; Swiss 159,939, Apr. 17, 1933. See Fr. 738,277 (C. A. 27, 1638).

**Hydrazine.** E. Merck chem. Fab. (Otto Seuffert and Iggon Ihwe, inventors). Ger. 578,486, Oct. 18, 1933. An aq. alk. soln. of urea is heated to 100° with an alkali hypochlorite in the presence of a colloid such as glue or gelatin or their degradation products.

**Benzanthrone.** Radio Patents Corp. Ger. 585,428, Oct. 7, 1933. See U. S. 1,893,575 (C. A. 27, 2163).

**Dibenzanthrone.** Scottish Dyes Ltd. Ger. 589,079, Dec. 2, 1933 (Cl. 22b. 2.02). Dibenzanthronyl prep. by the process of Brit. 278,112 (C. A. 22, 2668) is fused with caustic alkali.

**6-Bromo(and chloro)-2,4-dinitroaniline.** I. G. Farbenind. A.-G. Fr. 754,364, Nov. 6, 1933. These products, m. 151–2° and m. 155°, are prep. by submitting 2,4-dinitroaniline in aq. suspension to the progressive action of Br or Cl, with as rapid a distribution as possible, and preferably at 40–60°.

**Phenyl ether.** I. G. Farbenind. A.-G. Fr. 755,051, Nov. 18, 1933.  $\text{Ph}_2\text{O}$  is made by the action of an aq. soln. of NaOH on  $\text{PhCl}$  at temps. above 300° and in the presence of a catalyst, e. g., Cu, adding to the reaction mixt. an amt. of  $\text{PhOH}$  such that the reaction takes place in a homogeneous phase.

**Biphenyl from benzene.** John H. Reilly (to Dow Chemical Co.). U. S. 1,938,609, Dec. 12.  $\text{C}_6\text{H}_6$  vapors are mixed with steam superheated to a temp. sufficient to produce a mixt. temp. of 800–950°, in the presence of  $\text{Fe}_2\text{O}_3$ . Cf. C. A. 27, 5341.

**3-Carboxy-4-hydroxybiphenyl.** Adelbert W. Harvey (to E. R. Squibb & Sons). U. S. 1,941,207, Dec. 26. 4-Hydroxybiphenyl is converted into the Na phenolate, the dried pulverized phenolate is treated with  $\text{CO}_2$  at reaction temp. under superatm. pressure to form the Na carboxy deriv. of 4-hydroxybiphenyl, the latter is sep. from the product by heating in water and treating with  $\text{CO}_2$ , and the 3-carboxy-4-hydroxybiphenyl is pptd. by acidification. The product m. about 213° and is sol. in alc., ether,  $\text{C}_6\text{H}_6$  and  $\text{CHCl}_3$ . Mention is made of salts such as the mono-Na salt, and the compd. may be used as an intermediate in making pharmaceutical compds.

**1,8-Cineole.** Rheinische Kampfer-Fabrik G. m. b. H. (Josef Kathol, inventor). Ger. 585,162, Sept. 29, 1933. 1,8-Cineole is recovered from mixts. contg. it by treating the mixts. with a phenol, isolating the mol. compd. of 1,8-cineole with the phenol by a phys. process, and then decomp. the mol. compd. Thus, mixts. contg. 1,4-cineol, 1,8-cineole and terpene hydrocarbons may be treated with  $\text{PhOH}$  and then freed from hydrocarbons and 1,4-cineole in turn by fractional distn. The distn. residue is treated with aq. NaOH, to remove  $\text{PhOH}$ , and 1,8-cineole then crystd. Numerous details are given.

**1,2,3,4-Tetrahydronaphthalene 1-peroxide.** Soc. pour l'ind. chim. à Bâle. Fr. 754,799, Nov. 14, 1933. See Brit. 396,351 (C. A. 28, 494<sup>a</sup>).

**3-Hydroxyiselenaphthene and its derivatives.** I. G. Farbenind. A.-G. Fr. 754,786, Nov. 14, 1933. See Brit. 396,011 (C. A. 28, 494<sup>a</sup>).

**Purifying sublimable organic materials such as anthracene and phenanthrene.** Kurt F. Pietzsch (to Selden Co.). U. S. 1,939,224, Dec. 12. Vapors of the ma-

terial are absorbed in a recirculating stream of a solvent such as furfural having slower solvent power for the material than for the impurities, and portions of the soln. thus formed are withdrawn from the stream for recovery of the dissolved material. App. is described.

**1-Phenyl-2,3-dimethyl-5-pyrazolone.** Soc. des usines chim. Rhône-Poulenc. Ger. 581,779, Aug. 2, 1933. Addn. to 568,297 (C. A. 27, 1896). Fused 1-phenyl-3-methylpyrazolone is treated at about 120° with gaseous MeBr in the absence of a solvent.

**Diresorcinol isatin.** Walter G. Christiansen and Sidney E. Harris (to E. R. Squibb & Sons). U. S. 1,940,660, Dec. 26. Isatin and resorcinol are suspended in glacial HOAc,  $\text{H}_2\text{SO}_4$  is added drop by drop until the mixt. is homogeneous and of deep red color; the mixt. is then poured into cold water contg. a small proportion of NaOAc, filtered off, washed with water and dried at 60–80°. The compd. m. above 270°.

**Dioxane and its homologs.** Gerhard Steimmig and Otto Hambach (to I. G. Farbenind. A.-G.). U. S. 1,939,189, Dec. 12. A mixt. of homologous 1,2-glycols, obtainable from the mixt. of olefins evolved in cracking oils or tars is treated with  $\text{H}_2\text{SO}_4$  at the b. p. of the mixt., further initial material being added in an amt. corresponding to that of the mixt. of dioxane and its homologs distg. off. Cf. C. A. 27, 4252.

**Recrystallizing tetryl.** Wm. H. Rinkenbach and Eugene D. Regad. U. S. 1,940,811, Dec. 26. Tetryl is dissolved in about 1.7 times its wt. of ethylene chloride at about 80°, the soln. is allowed to cool to about 20°, and the solvent is removed.

**Phenolphthalein.** Max H. Hubacher (to Kavalco Products, Inc.). U. S. 1,940,494, Dec. 19. Phthalic anhydride is condensed with phenol in the presence of  $\text{ZnCl}_2$ , a relatively small amount of  $\text{H}_2\text{SO}_4$  and a decolorizing carbon. U. S. 1,940,495 relates to a process of producing phenolphthalein, in which an alkali metal salt of phenolphthalein is treated with an oxidation preventive such as Na metabisulfite or  $\text{Na}_2\text{SO}_3$ . Numerous details of procedure are described.

**Purifying phenolphthalein.** Harold P. Roberts (to Kavalco Products, Inc.). U. S. 1,940,146, Dec. 19. Phenolphthalein contg. resinous impurities is treated with an alkali carbonate such as with dil.  $\text{Na}_2\text{CO}_3$  soln. (suitably at its b. p.) to dissolve impurities without dissolving any substantial amt. of phenolphthalein.

**Thymol.** Rheinische Kampfer-Fabrik G. m. b. H. (Karl Schöllkopf, inventor). Ger. 587,645, Nov. 7, 1933 (Cl. 12g. 16). Addn. to 586,150 (C. A. 28, 483<sup>a</sup>). Mixts. of thymol isomers, prep. by the process of Ger. 586,150, are heated to 330–400° in the absence of a catalyst and preferably under pressure, whereby the position of the propyl or isopropyl group is altered. Mixts. of thymol and some of its isomers are thus obtained, from which thymol is recovered by fractional distn. Thymol may be recovered similarly from mixts. of *m*-cresol and polypropyl- or polyisopropyl-*m*-cresols. Details are given.

**Thymol.** Rheinische Kampfer-Fabrik G. m. b. H. (Karl Schöllkopf and Arthur Serini, inventors). Ger. 588,824, Nov. 27, 1933 (Cl. 12g. 16). Addn. to 586,150 (C. A. 28, 483<sup>a</sup>). Mixts. of thymol isomers, prep. by the process of Ger. 586,150, are converted into addn. compds. with inorg. substances, e. g.,  $\text{SbCl}_5$ ,  $\text{SbBr}_5$  or  $\text{SnCl}_4$ , or are treated with reagents which introduce an acid group into the mol., e. g.,  $\text{H}_2\text{SO}_4$  or  $\text{H}_3\text{PO}_4$ . When the addn. compds. or substitution products are heated to about 100°, the position of the propyl or isopropyl group is altered, and after the inorg. substance or the acid group has been removed in known manner, mixts. of thymol and some of its isomers are obtained, from which thymol is recovered by standard methods. Thymol may be recovered similarly from mixts. of *m*-cresol and polypropyl- or polyisopropyl-*m*-cresols. Numerous details and examples are given.

**Sterols.** Robert F. Light and Charles N. Frey (to Standard Brands Inc.). U. S. 1,941,097, Dec. 26. See Can. 828,325 (C. A. 27, 1092).

**Styrenes from alkyl benzenes.** Willis A. Gibbons and Omar H. Smith (to Naugatuck Chemical Co.). U. S. 1,938,827, Dec. 12. For producing a styrene from an alkyl benzene having at least 2 C atoms in an aliphatic side chain, such as ethylbenzene, the initial material is split into a styrene and H by heat in the presence of volatile S-free material comprising Cl or Br such as Cl<sub>2</sub>, Br<sub>2</sub>, CCl<sub>4</sub> or EtBr so that halogen is continuously combined with the liberated H<sub>2</sub> and the styrene formed is sepd. from the reaction products.

## 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

### A—GENERAL

ARTHUR W. DOX

**Parallel adsorption of crystalline pepsin and peptic activity upon casein and ovalbumin.** James B. Sumner. *Proc. Soc. Exptl. Biol. Med.* 31, 204-6(1933).—Peptic activity and pepsin-protein were equally and completely removed from a soln. of cryst. pepsin-protein by repeated adsorption on casein or ovalbumin. Peptic activity was detd. by the method of Anson and Mirsky (cf. C. A. 27, 117). Pepsin-protein was estd. by adding 1 drop of 10% NaOH to 5 cc. of the test soln. and then adding 1 cc. of 0.5 N H<sub>2</sub>SO<sub>4</sub>; the resulting suspension of coagulated protein was measured nephelometrically. Contrary to Waldschmidt-Leitz and Kofrányi (cf. C. A. 27, 2971), Northrop's cryst. pepsin (cf. C. A. 24, 5318; 25, 5905; 27, 114) is not simply an enzyme adsorbed upon protein.

C. V. Bailey

**The chemical effects of radiations.** H. G. Chapman. *Chem. Eng. Mining Rev.* 26(?), 101-2(1933).—A study is desirable of the biol. effects which continue some days after irradiation. Changes taking place during the cure of a cancer depend upon the later biol. changes in the tissues.

W. H. Boynton

**Cetacea. XLIV. The isoelectric flocculation of porphyrins.** Yoshio Okahara. *Japan. J. Med. Sci.* 11. *Biochem.* 2, 189-94(1933).—The optimum flocculation of hematoporphyrin (I), uroporphyrin (II) and porphyrin from the whale intestine (III) depends upon the  $p_H$  more than upon the salt concn. Flocculation occurs at  $p_H$  3.9-4.2 with I, 2.2-2.9 with II and 3.2-3.8 with III. R. B.

**The amylase system of the liver.** Leonore Hollander. *Science* 79, 17-18(1934).—In the digestion of starch by rat liver preps. in a few instances the blue-violet I end point was reached without the formation of maltose. There are apparently 2 different components of liver amylase active in the digestion of starch with characteristic maltose levels, and an unstable inhibiting substance specific for the component showing more maltose formation.

Rachel Brown

**The action of oxidizing and reducing agents on papain. II. The influence of light, organoarsenic compounds and ascorbic acid.** Theodor Bersin. *Z. physiol. Chem.* 222, 177-86(1933); cf. C. A. 27, 5760.—Activation of glutathione-free papain and cathepsin is due to a reduction of SS groupings present in the enzyme-protein complex to SH. This reduction is accomplished by a variety of substances including SO<sub>2</sub>, H<sub>2</sub>S, cysteine, glutathione, HCN and succinate + dehydrogenase. The same result is obtained by ultra-violet irradiation, the reducing effect of which has recently been demonstrated in the formation of cysteine from cystine. This explains the increase in the proteolytic index of skin and blood after ultra-violet irradiation. The effect of org. As derivs. on enzymes offers a new approach to the mode of action of these chemotherapeutic agents. Certainly an activation or inactivation of the enzymes by such agents must exert an important influence on the metabolism of the cells. On the one hand the virulence of the parasitic microorganisms is assocd. with their capacity for producing endo- and ecto-enzymes, and on the other hand the resistance of the host organism may be a matter of enzyme activity as well as hormone and vitamin functions. Although phosphatase is not influenced by arsenic acids and arsenoxides, papain is activated by those As derivs. which reduce the SS to SH. *p*-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>AsO activates papain, while *p*-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>-AsO<sub>2</sub>H<sub>2</sub> and especially *p*-AcNHC<sub>6</sub>H<sub>4</sub>AsO<sub>2</sub>H<sub>2</sub> injure it.

The harmful effect of the latter is completely overcome by addn. of SH-glutathione. The reducing action of certain As derivs. on disulfides has been demonstrated in several instances. Arsenoxides react with disulfides to form mercaptan and arsonic acid; arseno compds. convert disulfides into dithioarsenites which then hydrolyze into arsonic acid and mercaptan. Thus the increased resistance of the host organism to bacterial invasion as a result of As therapy may be due to an activation of catheptic enzymes by reduction to their SH-form. The failure of ascorbic acid to activate papain may be attributed to its inability to form thiol derivs. from disulfides as illustrated in case of dithiodilactylic acid. A. W. Dox

**Tumor arginase. IV. The significance of concomitant substances for the activity of arginase in normal and malignant tissues.** G. Klein and W. Ziese. *Z. physiol. Chem.* 222, 187-202(1933); cf. C. A. 27, 737.—The activity of arginase is greatly influenced by the surrounding medium. The behavior of crude exts. and suspensions, except in high diln., is quite different from that of the enzyme purified by adsorption and elution. Purified arginase is strongly inhibited at all  $p_H$  values by SH compds., such as H<sub>2</sub>S, cysteine and glutathione, even in the absence of phosphate. Crude arginase, e. g., the prepn. obtained by extn. at 70°, is "activated" by these same SH compds. The activation is not suppressed by a previous O<sub>2</sub> treatment. Activation is also effected by Fe<sup>++</sup> and N<sub>2</sub>H<sub>4</sub>. Its mechanism is therefore characterized by a non-specific reduction of concomitant substances or possibly arginase carriers. A combination of heavy metal with SH-compd. is not essential for activation, but only one of the possibilities. Purified arginase is not inhibited by O<sub>2</sub> as are many crude preps. It even withstands the action of H<sub>2</sub>O<sub>2</sub> in alk. medium without loss of activity. Fundamental changes in medium, e. g., at the site of malignant tumors, can exert a profound influence on the enzymic processes of the tumors. The effects are mainly of a secondary character and may or may not be a detg. factor for the processes in operation at the site of malignancy. The origin of a tumor by perversion of enzyme action has not been proven.

A. W. Dox

**Inhibition of cathepsin and activation of papain by  $\alpha$ -thiocarboxylic acids.** Ernst Maschmann and Erica Helmer. *Z. physiol. Chem.* 222, 207-14(1933); cf. C. A. 27, 4820.—Papain is activated by  $\alpha$ - and  $\beta$ -SH-carboxylic acids regardless of whether the SH is on a primary, secondary or tertiary C-atom. Cathepsin is inhibited by  $\alpha$ -SH acids, e. g., HSCH<sub>2</sub>CO<sub>2</sub>H, MeCHSHCO<sub>2</sub>H, Me<sub>2</sub>CSHCO<sub>2</sub>H and thiomalic acid, but activated by  $\beta$ -SH acids such as cysteine, SH-glutathione and SHCH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>H. The inhibition by  $\alpha$ -SH is not overcome by the presence of  $\beta$ -SH or of ascorbic acid, but is diminished or even reversed by Fe<sup>++</sup>. The effect of the Fe in conjunction with  $\alpha$ -SH depends on the source of the cathepsin, i. e., the concomitant substances present. The development of a red or violet color at the neutral point suggests the formation of an Fe- $\alpha$ -SH complex, since no color is obtained with  $\beta$ -SH derivs. Ionized Fe is not initially present but is gradually liberated from complex linkage, mainly in the enzyme soln. The inhibition of catheptic action is probably due to a splitting off of Fe from a complex which at some stage plays an important part in the proteolysis. Dipyriddy derivs. have no particular influence on cathepsin or papain. The red color which gradually develops is less intense than in the SH- acid expts. and is attributed to Fe in the gelatin substrate rather than in the enzyme soln.

A. W. Dox

**Addendum to our paper on catheptic protease.** Ernst Maschmann and Erica Helmer. *Z. physiol. Chem.* 222, 215-19(1933); cf. *C. A.* 27, 2698, 4820.—The fully active cathepsin present in kidney preps. after complete removal of glutathione by repeated EtOH extn. amounts to about 80% of the total cathepsin initially present. Its activity is dependent on the presence of insol. SH-proteins which are unusually stable to atm. oxidation. The participation of cathepsin in intracellular protein transformation is a normal physiol. process and as such is not capable of causing pathol. alterations of the cell.

**The biological breakdown of chlorophyll. IV. Preparation of pheophorbide a from silkworm feces.** Hans Fischer and Albert Hendschel. *Z. physiol. Chem.* 222, 250-60(1933); cf. *C. A.* 27, 2461.—Pheophorbide a was obtained from silkworm feces by MeAc extn. and identified by sapon. to chlorine and esterification of the latter with  $\text{CH}_3\text{N}_2$  to the tri-Me ester. A small amt. of pheopurpurin 7 was obtained as a by-product in this reaction. Reduction of the pheophorbide by HI gave isopheophorphyrin  $a_8$  in the cold and pheophorphyrin  $a_8$  at 65°. Catalytic hydrogenation and re-oxidation in the air gave a mixt. of pheophorphyrin  $a_8$  and pheophorphyrin  $a_8$ . Phyllobombeycin is shown to be a mol. compd. of pheophorbide a with pheopurpurin 7. The breakdown of chlorophyll by the silkworm consists mainly in the formation of pheophorbide a by the splitting off of phytol and Mg.

**Glyceraldehyde-phosphoric acid as hydrogen donor.** B. Gössy. *Z. physiol. Chem.* 222, 279-80(1933).—Glyceraldehyde-diphosphoric ester is a very active H donor in the decolorization of methylene blue by washed thoracic muscle of the pigeon after addn. of coenzyme. Lactic acid and fructose diphosphate are the only other H donors active under these conditions.

**Plasmolysis and permeability. Preliminary communication.** Bruno Huber and Helmut Schmidt. *Protoplasma* 20, 203-8(1933).

**Definition of the lipid conception.** W. Halden. *Protoplasma* 20, 209-14(1933).—Twenty-six references.

**Absolute viscosity measurements with the aid of Brownian molecular movement. VI. The influence of temperature on cell fluid viscosity.** J. Pekarek. *Protoplasma* 20, 250-78(1933).

**The effect of ascorbic acid upon the action of arginase.** S. Edlbacher and Fr. Leuthardt. *Klin. Wochschr.* 12, 1843(1933).—Ascorbic acid in the presence of very small quantities of Cu increases the activity of arginase by 30-50%, presumably by virtue of its ability to combine with O. The same Cu-ascorbic acid mixt. inhibits urease, although the 2 components individually are ineffective.

**The fate of enzymes in the digestive canal.** W. Heupke and H. Wirtz. *Klin. Wochschr.* 12, 1866-7(1933).—Zymase and peroxidase are rapidly destroyed in the intestinal canal of mice. Myrosin, emulsin-urease and catalase remain active all the way to the large intestine. No absorption could be demonstrated, even with such readily demonstrated enzymes as emulsin and myrosin.

**The formation of cysteine from cystine by hydrolysis.** P. Holtz. *Klin. Wochschr.* 12, 1876(1933).—A preliminary report.

**Associated roles of the hydrogen and chloride ions in the activation of amylase.** L. Ambard and S. Trautmann. *Bull. soc. chim. biol.* 15, 1272-80(1933).—See *C. A.* 27, 3726.

**Blood cholesterol in man immediately after one irradiation by infra-red, solar or limited [Bucky lamp] rays.** S. Malczynski and J. Lankosz. *Compt. rend. soc. biol.* 114, 1126-8(1933); cf. *C. A.* 27, 5345.—A transient increase in blood cholesterol was produced in each case.

**The oxidase and dehydrogenase systems of the crystalline style of mollusca.** Cyril Berkeley. *Biochem. J.* 27, 1357-65(1933).—Glucose is oxidized to glucosone by the

activity of the cryst. style of *Saxidomus giganteus* in contact with air under the influence of an oxidase system, and out of contact with air under that of a dehydrogenase system. It is suggested that the oxidase system serves as a H-acceptor to promote the action of the dehydrogenase system.

**Component fatty acids of rat body fats.** Adam Banks, Thomas P. Hilditch and Edwin C. Jones. *Biochem. J.* 27, 1375-82(1933).—The body fat of the rat has, as component acids, palmitic (25-30%), myristic (4-5%), stearic (2-3%) and the remainder (65-70%) consists chiefly of oleic acid. Linoleic acid is absent. The addn. of cod-liver oil to the diet may introduce unsatd. acids of the  $\text{C}_{20}$  and  $\text{C}_{22}$  series in depot fats. The unsatd. acids present in the perinephric fat of a wild rabbit differ widely from rat fats, for linoleic acid is the main component, and considerable amts. of linolenic acid are also present. Two well-defined groups of depot fats characteristic of land (non-aquatic) animals are: (1) fats with component fatty acids contg. 30-35% satd. (usually 25-30% palmitic) acids and unsatd. acids of varying types (oleic, linoleic, etc.); (2) fats with component fatty acids made up of about 25-30% palmitic and small amts. of myristic acid, the remaining 65-70% consisting of stearic, oleic and linoleic acids. Under (1) come rodent body fats and probably bird depot fats. Under (2) come pig, ox, sheep, horse and reindeer.

**Effect of ultra-violet, radium and x-ray radiation on glutathione in pure solution.** Gladys Estelle Woodward. *Biochem. J.* 27, 1411-14(1933).—Both ultra-violet radiation and Ra produce a destructive effect on glutathione, the former much more so than the latter. The SH-group in glutathione is partially oxidized to the SS-form. x-Rays have no effect on glutathione.

**Hydrogenase. III. The bacterial formation of methane by the reduction of one-carbon compounds by molecular hydrogen.** Marjorie Stephenson and Leonard H. Stickland. *Biochem. J.* 27, 1517-27(1933); cf. *C. A.* 26, 5320.—The organism isolated is able to live anaerobically on an inorg. medium with formate as sole source of C. The formic acid is decompd. thus:  $4\text{HCOOH} \rightarrow \text{CH}_4 + 3\text{CO}_2 + 2\text{H}_2\text{O} + 39 \text{ kg. cal.}$  The reaction occurs in 2 stages: (1)  $\text{HCOOH} \rightarrow \text{H}_2 + \text{CO}_2$ ;  $4\text{H}_2 + \text{CO}_2 \rightarrow \text{CH}_4 + 2\text{H}_2\text{O}$ ; and is the work of 2 enzymes, formic hydrogenylase and hydrogenase. By means of mol. H the organism reduces the following to methane:  $\text{CO}_2$ ,  $\text{HCOOH}$ ,  $\text{CO}$ ,  $\text{HCHO}$  and  $\text{MeOH}$ . No compds. so far tested contg. more than 1 C atom are reduced by the organism with production of  $\text{CH}_4$ .

**Hydrogenylases. III. Further experiments on the formation of formic hydrogenylase by *Escherichia coli*.** Marjorie Stephenson and Leonard H. Stickland. *Biochem. J.* 27, 1528-32(1933).—The formation of formic hydrogenylase is probably a chem. reaction between the medium and the cells (cf. *C. A.* 26, 5320).

**Gluten-dissolving enzyme of wheat and barley seeds.** Andrey V. Blagoveshchenskiĭ and Nikolai I. Sosodov. *Biochem. J.* 27, 1575-7(1933).—The disintegration of gluten (including glutenin and gliadin) is an enzymic process. The enzyme acts in acid and alk. media and is formed in the seeds of wheat damaged by the "tortoise bug" and in the diastatic prepn. of malt.

**Monolayers of proteolytic enzymes and proteins.** Jack H. Schulman and Eric K. Rideal. *Biochem. J.* 27, 1581-97(1933).—The progress of reactions taking place at an air-liquid interface can be followed by observation of the rate of change of the phase boundary potential. When solns. of pancreatin are injected under monolayers of proteins such as egg albumin or caseinogen, proteolytic hydrolysis of the latter proceeds.

**Proteins of ox serum.** H. F. Holden and M. Freeman. *Australian J. Exptl. Biol. Sci.* 11, 185-95(1933).—Optical activity and soly. measurements indicate that serum euglobulin may be a mixt. of pseudoglobulin and a meta-protein.

**The ultrafiltration of malt amylase solutions.** Cornelia

T. Snell. *J. Biol. Chem.* 104, 43-51(1934).—Nitrocellulose membranes may be graded by means of  $C_2H_5(OH)_2$  and can be reproduced with reasonably good checks during periods of relatively low humidity, the mean of the av. deviations for membranes of the same grade being  $\pm 2.6\%$ . The membranes are ready for use in  $1/5$  the time required by Pierce's method (*C. A.* 22, 604). Malt ext. may be purified 3-fold in terms of solid content by ultrafiltration, by the use of membranes impermeable to the enzyme but permeable to more highly dispersed substances. Enzyme material is adsorbed by nitrocellulose membranes in the same way that egg albumin is adsorbed.

A. P. Lothrop

The effect of dilute alkali on the cystine content of casein. D. Breese Jones and Charles E. F. Gersdorff. *J. Biol. Chem.* 104, 99-106(1934).—The cystine content of casein which had been pptd. 5 times by acid from dil. NaOH soln. in the manner usually followed in prep. pure casein for scientific purposes was found to be only  $1/10$  of that present in the untreated casein. It is thus more readily acted upon by alkalis than most proteins. Attention is called to the dangers involved in the use of so-called purified casein both in chem. work and in exptl. feeding expts. in which it is used to supply the protein in basal rations.

A. P. Lothrop

The nature and amount of non-diffusible calcium in protein sols. W. G. Eversole, Leonard A. Ford and G. Wilson Thomas. *J. Biol. Chem.* 104, 107-14(1934).—The non-diffusible Ca in protein sols is present as a Ca-protein complex and not as a colloidal inorg. ppt. This has been shown by both electrometric and dialysis methods in sols made up of ash-free gelatin in solns. contg. only KCl and  $(AcO)_2Ca$ , thus avoiding the possibility of forming colloidal  $Ca_3(PO)_4$  or  $CaCO_3$ . Failure to correct properly for the vol. of the dispersed phase makes the published values for the amt. of combined Ca in protein sols erroneous. Making the proper corrections leads to somewhat higher values.

A. P. Lothrop

Summary of the isoelectric points of proteins. Arthur W. Thomas. *J. Am. Leather Chem. Assoc.* 29, 3-10, 52(1934).—Tabulation with bibliography. H. B. Merrill

The existence of a lipase in the tissue of adipose organisms. G. Quagliariello and G. Scoz. *Arch. ital. biol.* 89, 190-200(1933).—See *C. A.* 27, 1644. A. E. Meyer

The chain character of the decomposition reaction of hydrogen peroxide in the presence of peroxidase and catalase. A. N. Bakh. *J. Phys. Chem.* (U. S. S. R.) 4, 805-10(1933)(in German 510-11).—Peroxidase alone does not oxidize hydroquinone;  $H_2O_2$  must be present. No  $O_2$  is produced by the reaction of the 3 components. The system  $H_2O_2$ -catalase does not function as an oxidizing agent. The Haber-Willstätter mechanism (*C. A.* 26, 3774) with chains of  $HO-C_6H_4O_2$  and  $HO_2$  and  $OH$ , resp., cannot be verified experimentally. F. H. Rathmann

New investigations on "harmony." J. Straub. *Chem. Weekblad* 30, 790-2(1933); cf. *C. A.* 25, 860.—The contrast of ionic concn. in the white and the yolk of the hen egg is comparable to the contrasts found between yeast cells and their culture medium, *Valonia* and sea water, blood corpuscles and serum, where "harmony" dominates instead of equil. Living cells maintain themselves on an energy level above that of their environment by means of respiration energy. The harmonious relations of inner and outer ionic concns. are maintained by the const. diffusion of ionized products of metabolism, which is linked up with a potential gradient at the boundary. Diffusion of a nonelectrolyte does not influence the partition of ions. The unequal distribution of ions in white and yolk is a "harmony," for it is restored after being disturbed, and added  $NH_4NO_3$  undergoes an equally uneven distribution. It could not be ascertained as yet what ion is responsible for the maintenance of the harmonious state in the egg. E. Schotte

Isolation of a crystalline protein from pancreas and its conversion into a new crystalline proteolytic enzyme by trypsin. M. Kunitz and John H. Northrop. *Science* 78, 556-9(1933).—From fresh beef pancreas, by extg. with 0.385 *M*  $H_2SO_4$  and subsequently dissolving in 0.25 satd.

$(NH_4)_2SO_4$  at  $pH$  5 was crystd. a protein, chymotrypsinogen I, which had very slight proteolytic power. The addn. to 3 g. I of 1 mg. cryst. trypsin, however, led to the development of intense proteolytic power, reaching 100 times that of the trypsin added. It is supposed that I is converted by trypsin into a tryptic enzyme, chymotrypsin, II. The gelatin-hydrolyzing power of II is less than that of trypsin, but its casein-hydrolyzing and milk-clotting powers are much greater. Ten recrystns. of I, and 3 recrystns. of II, brought about no change in optical rotation, and with II, no increase in proteolytic activity; hence both I and II are probably pure proteins. Proteolytic activity is thus a property of the protein mol.

K. V. Thimann

Modern problems of alcoholic fermentation. Fernand Chodat. *Pharm. Acta Helv.* 8, 222-3(1933).—An address on the general significance for the living cell of the 3 principal intermediate steps: formation of methylglyoxal, phosphorylation and activation by cozymase. S. W.

LeComte, R. M.: Manual of Urology. Baltimore: Wm. Wood & Co. 317 pp. \$4.

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

A new type of centrifuge tube for preparation of blood serum for accurate  $pH$  work. Martin E. Haake. *Proc. Soc. Exptl. Biol. Med.* 30, 1129-31(1933).—In this tube the blood comes in contact only with glass and  $Hg$ ; no oil is used; the  $CO_2$  tension of the serum is unchanged.

C. V. Bailey

Microdetermination of oxalic acid in the blood. Shoichi Izumi. *Japan. J. Med. Sci. II. Biochem.* 2, 195-204(1933).—As little as 0.042 mg.  $CaC_2O_4$  may be pptd. with 0.25-0.5%  $CeCl_3$  and detd. by titration with  $KMnO_4$ . The presence of the alkali salts of HOAc, HOBu, HCOOH, HOPr,  $H_2SO_4$ , citric and tartaric acids, or of glucose, urea, uric acid, creatine, creatinine, adenine, guanine, hypoxanthine, lactate, malate, succinate, fumarate, HSCN and hexosephosphate did not affect the sensitivity of the reaction. Pptn. was quant. at  $pH$  2.3 and higher. For the detn. of  $H_2C_2O_4$  in the blood, protein was removed by the addn. of 2 cc. 20%  $CCl_3COOH$  to 4 cc. blood or serum dild. with 4 cc.  $H_2O$ . After 30-60 min. the soln. was filtered and to 10 cc. of clear filtrate a few drops of 0.25%  $CeCl_3$  soln. was added. After 30-60 min. the mixt. was centrifugalized, the ppt. washed twice with  $H_2O$  in the centrifuge tube and dissolved in 5 cc. *N*  $H_2SO_4$  and titrated at 70-80° with 0.01 *N*  $KMnO_4$ . Small amts. of oxalate in aq. soln. could be detd. colorimetrically as the  $Ce$  salt. Phosphate is also pptd. with the oxalate by  $Ce$  and has not yet been sepd. Rachel Brown

The biochemistry of copper. I. Colorimetric method for the microdetermination of copper. Uichiro Saruta. *Japan. J. Med. Sci. II. Biochem.* 2, 247-60(1933).—Cryogenin reacts with Cu salts forming a red color. Na, K, Cs, Mg, Ti, Al, Li, Pb, Ba, Sn, Ca, Bi, Sr, Rb, Hg, Ni, Cr, Co, Zn and Ag all fail to give the reaction. The shade and intensity of the color produced by Cu are affected by the presence of other metals. To det. Cu in biol. materials the org. matter is destroyed and the Cu converted into the nitrate. After the addn. of a 0.2% soln. of cryogenin and incubation at 40° for 40 min. the color is compared with standards. Quantities of Cu from 0.0005 to 0.03 mg. can be estd. with an error of  $\pm 1.5\%$ . II. The copper content of the blood with a method for its determination. *Ibid.* 261-75.—Expts. on the removal of org. matter from blood showed that  $H_2SO_4$  alone,  $HNO_3$  alone,  $H_2SO_4$  with the continuous addn. of  $HNO_3$  (Neumann) and  $H_2SO_4$  and  $HClO_4$  (Kennedy) were all unsatisfactory. The best results were obtained when 1 cc. of blood was digested with 2 cc.  $H_2SO_4$  (sp. gr. 1.84) until almost transparent and brown, cooled, treated with 5-10 drops perhydrol and heated for 10-15 min. The cryogenin reaction can be used without sepn. of the Cu or the Cu can be sepd. as follows and then detd. by the cryogenin reaction. After digestion the soln. is poured into a special centrifuge tube of small diam. at the

bottom, and the vol. made up to 30 cc. After the addn. of 0.5 cc. of 1%  $MgCl_2$ , 10 N NaOH is added to turbidity, then N  $H_2SO_4$  is added until the turbidity just disappears and 2 cc. in excess.  $H_2S$  is passed into the soln., which is then centrifugalized. After 3 washings in the tube the ppt. is dissolved in 2 cc.  $HNO_3$ (1:2). The soln. is evapd. to dryness on the water bath. Cu is detd. colorimetrically in a soln. of the residue by the cryogenin method. The Cu content of the blood varies with the species, that of the ox and horse being higher than that of the pig, rabbit, or man. Salt-water fish have more Cu in the blood than fresh-water fish. R. B.

Amplification of the method for the determination of phosphorus fractions in muscle, with particular reference to the determination of phosphagen in warm-blooded hearts. Hans Mücke. *Arch. expil. Path. Pharmacol.* 173, 333-40(1933).—In order to prevent chem. changes after removal from the organism, the tissues are frozen in liquid air (or ether- $CO_2$ ) and dried *in vacuo* over  $H_2SO_4$  in the ice box. Individual parts of the organ are now freed from blood, fat, etc., powd., extd.  $1\frac{1}{2}$ -2 min. with  $CCl_3CO_2H$  and treated with Ba salts by the method of Eggleton and Eggleton. So analyzed, the hearts of rabbits killed by a blow on the neck have a low phosphagen and a high orthophosphate content, but the hearts of rabbits under urethan anesthesia have a high creatine-phosphoric acid content, the phosphagen:orthophosphate ratio being not significantly different from that of skeletal muscle or frog heart. The decreasing functional capacity of isolated hearts is paralleled by the decreasing creatine-phosphoric acid content. Harry Eagle

The determination of the oxygen content and hemoglobin concentration in solutions of hemoglobin and in hemolyzed blood by a photoelectric method. Kurt Kramer. *Klin. Wochschr.* 12, 1875-6(1933). H. E.

Methods of staining plant tissues for differentiating the natural plant oils from petroleum spray oils. P. W. Rohrbough. *Stain Tech.* 9, 1-3(1934).—A technic involving Nile green and oil red O is described.

C. R. Fellers

Biological method for the concentration of hormones from biological fluids or tissues. M. de Gedroyc. *Compt. rend. soc. biol.* 114, 338-9(1933).—Red corpuscles, whole or hemolyzed, adsorb hormones from soln. After adsorption of the hormone the corpuscle material may be washed and dried and used for oral, subcutaneous or intravenous administration, or the hormone may be dissolved out by an org. solvent and recovered in a very pure form. Biological method of obtaining masculine hormone (androkinin) from male urine. *Ibid.* 340-2.—Twenty l. urine was concd. to 5 l. and mixed with 500 cc. hemolyzed red corpuscles. After sepn. and drying 110 g. of dry powd. active material was obtained.

L. E. Gilson

Precipitation of insulin in aqueous solution by hydrochloric acid. Norberto Lara. *Folia biol.* 1, 141-2(1933).—Insulin previously purified by pptn. at  $pH$  5 was dissolved to make a soln. contg. 600-800 units per cc. To the chilled soln. 10% by vol. of concd. HCl was added. The ppt. was redissolved and further purified by pptn. at  $pH$  5. The loss in total activity was about 18%, but the purified material contained 20 units per mg. of dry substance, whereas the original contained but 18 units per mg.

L. E. Gilson

Quantitative extraction of histamine from tissues by electrolysis. Robert G. Macgregor and Wm. V. Thorpe. *Biochem. J.* 27, 1394-9(1934).—The electrolysis method compares favorably with the alc. method (C. A. 21, 2140).

Benjamin Harrow

Microdetermination of pentoses, free and combined. I. Samuel Andrews and John A. Milroy. *Biochem. J.* 27, 1421-4(1934).—The principle of the method is the production of furfuraldehyde (I) from the action of  $AcOH$  on the pentoses, by means of evacuated and sealed tubes kept at  $170^\circ$  for some hours, and the subsequent direct detn. of the aldehyde colorimetrically with aniline acetate. The yields of I from purine nucleotides of muscle are

higher than those obtained by the usual steam distn. method from a HCl reaction mixt. Benjamin Harrow

Metabolism of normal and tumor tissue. XI. The measurement of respiratory quotient, respiration and glucolysis with the aid of the constant-volume differential manometer. Frank Dickens and Guy D. Greville. *Biochem. J.* 27, 1479-86(1933); cf. C. A. 28, 1097<sup>o</sup>.—An improved technic over that already described (C. A. 25, 308-9).

Benjamin Harrow

Microdetermination of bromine in blood. Arthur G. Francis and Cecil O. Harvey. *Biochem. J.* 27, 1545-50(1933).—A chromic-phosphoric acid mixt. is used for liberating the Br. The method is a modification of that of Evans (C. A. 25, 5871).

Benjamin Harrow

Some limitations of the Carius digestion for the measurement of chloride in biological material. Frederick W. Sunderman and Priscilla Williams. *Biochem. J.* 27, 1578-80(1933); cf. C. A. 27, 5768.—Failure to measure the chloride completely in desiccated biol. tissues must be attributed to other factors rather than to a loss of chloride.

Benjamin Harrow

A note on the use of Feulgen's reaction as a critical stain for wheat cytology. H. C. Gurney. *Australian J. Exptl. Biol. Med. Sci.* 11, 157-9(1933).—Hydrolysis of sectioned tissue with N HCl for 10 min. at  $60^\circ$  was necessary to liberate the proper amt. of aldehydic material in chromatin.

C. G. King

The precipitation of nitrogenous substances with alkaline mercuric reagents with special reference to urine. Mark R. Everett, Fay Sheppard and Erga O. Johnson. *J. Biol. Chem.* 104, 1-10(1934).—The degree of pptn. of Hg nitrogenous compds. in alk. soln. seems to be related to the structure of the substance, less pptn. occurring with alkylated and acylated N. Many amino acids, alkylamines, acid amides and heterocyclic compds. are found in the filtrates. Approx. 1.6% of urine N, 20% of muscle ext. N, 30% of liver ext. N and 70% of bile N is not pptd. Hippuric acid is the chief N-contg. constituent of the urine filtrate but urca, amino N and traces of creatinine and  $NH_3$  are also present. A method is described for the accurate detn. of small amts. of N in the filtrates from the Hg pptn. of nitrogenous substances in biol. fluids. A no. of new Hg compds. of certain acid amides and amino acids have been prepd. A. P. L.

An improvement in the Van Slyke method for blood-gas analysis. Friedrich Rappaport and Klara Köck-Molnar. *J. Biol. Chem.* 104, 29-31(1934).—The reagent described contains  $K_2Fe(CN)_6$  3.3 g., saponin 3.3 g., urea 450 g., octyl alc. 5 cc. and distd.  $H_2O$  to 1000 cc. When it is used, no clotting occurs in the app. as urea prevents protein pptn. even in acid soln. The reagent may be used for macro- and microanalysis of all blood gases in 1 sample and for detn. of CO in blood after absorption of the  $O_2$  with pyrogallol or hyposulfite. A. P. Lothrop

A comparison of the methods for the collection of blood to be used in the determination of gases. Joseph M. Looney and Hazel M. Childs. *J. Biol. Chem.* 104, 53-8(1934).—"A method of collecting and handling blood for gas analyses in a capped syringe is described and is shown to prevent error from exchange of blood gases with the air. Blood kept in 10 cc. portions for  $\frac{1}{2}$  to 2 hrs. under a layer of oil 5 cm. deep was found to lose  $CO_2$  and to absorb  $O_2$  from the air. The max.  $CO_2$  loss was 7.98 vols.%; the mean loss 1.86. For  $O_2$  the max. gain was 6.44 vols.%; and the mean gain 1.32. The effect of stasis on the gas content of blood can be avoided by allowing 1 min. to elapse after removing the tourniquet before drawing the blood."

A. P. Lothrop

A method for the quantitative estimation of indoxyl compounds in blood. Herman Sharlit. *J. Biol. Chem.* 104, 115-20(1934); cf. C. A. 27, 1024.—The method described for the estn. of indoxyl compds. in blood is essentially like the procedure for urine except that all reactions must be carried out at room temp. unless exceedingly high concns. of indoxyl are present in the blood samples. Normal blood contains less than 0.06 mg. % of indican but in cases of N retention 100 times the normal max. may be present.

A. P. Lothrop

**A method for the analysis of tissues.** James B. Gracser, Julius E. Ginsberg and Theodore E. Friedemann. *J. Biol. Chem.* 104, 149-55(1934).—A tissue crusher is described which can be cooled by CO<sub>2</sub> snow and can easily handle 1-10 g. samples. The entire operation of crushing and sampling can be carried out in 1-2 min. on tissues which have been frozen in liquid air. A comparison between the glucose and lactic acid content of tissue and blood samples obtained simultaneously suggests post-mortem changes in the tissues during the process of its prepn. for analysis even when the samples are immediately plunged into liquid air. A. P. Lothrop

**Controlled thermostats for physiological studies at low, non-freezing temperatures.** F. C. Steward. *Plant Physiol.* 8, 545-51(1933).—Description and construction of the app. consisting of a large cold-storage refrigerator cabinet and 3 accurately controlled low-temp. baths are given accompanied by 2 diagrams. The app. has been used to carry out expts. over long periods of time upon respiration and salt absorption at a variety of temps. between 0° and room temp. Walter Thomas

**Combustion with Cl [detn. of Pb] (Erdős, Groák) 1.**

**Handbuch der biologischen Arbeitsmethoden.** Edited by Emil Abderhalden. Lfg. 420. Abt. 2: Physikalische Methoden, Tl. 3, Heft 4. Nachweis der biologisch wichtigen Körper durch Fluoreszenz und Fluoreszenzspektren. Chas. Dhéré. Berlin: Urban & Schwarzenberg. pp. 3097-3306. M. 11.50. Cf. C. A. 27, 5770.

**Analytical apparatus for measuring the volume of gas evolved from a reaction mixture.** Werner Lanz. *Ger. 589,407*, Dec. 7, 1933 (Cl. 421.354). The app. is intended particularly for detns. of the urea content of blood serum.

## C—BACTERIOLOGY

CHARLES D. MORREY

**Decomposition of specific bacterial polysaccharides by a species of Myxobacterium.** W. T. J. Morgan and A. C. Thaysen. *Nature* 132, 604(1933); cf. C. A. 25, 4605.—An organism which appears to be a typical *Myxococcus thaxter*, isolated from decayed vegetable debris, attacked the sp. polysaccharides of *S. dysenteriae* Shiga, *S. dysenteriae* Flexner Y, pneumococcus (Type 11), and human tubercle bacillus and destroyed their power to form a sp. ppt. when mixed with homologous immune serum. Philip D. Adams

**Effect of urea upon activity of bacteriophage.** J. Bronfenbrenner and D. M. Hetler. *Proc. Soc. Exptl. Biol. Med.* 30, 1308-11(1933).—The lytic effect of bacteriophage on growths of *Es. coli* in agar medium decreased as the concn. of agar increased; with an agar concn. of 4-5%, lysis was completely absent. The addn. of urea to the medium intensified the lysis and permitted the bacteriophage to act in the higher concns. of agar. Urea prevents the binding of H<sub>2</sub>O by the agar and thus permits the swelling and subsequent bursting of the bacteria. C. V. Bailey

**Selective media for the isolation, cultivation and differentiation of *Escherichia coli* and *B. lactis aerogenes*.** W. J. Wilson. *J. Hyg.* 33, 404(1933); *U. S. Pub. Health Eng. Abstracts* 14, W, 3(Jan. 6, 1934).—By means of an agar medium contg. in each 100 cc. of nutrient agar, 1 g. each of anhyd. Na<sub>2</sub>SO<sub>3</sub> and Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> and a small amt. of Pb(OH)<sub>2</sub>, *Es. coli* and *Aerobacter aerogenes* formed black coliform colonies without clear differentiation. When a cover of agar was added to the plates after the inoculated media had hardened, the growth of *Aer. aerogenes* was suppressed. Other partially selective media in which Na citrate, Na taurocholate and hexamethylenetetramine are used are described. The latter suppresses the growth of *Aer. aerogenes*. C. R. Fellers

**Action of acetone extracts of organs of healthy guinea pigs on the pathogenic properties of the filterable elements of tubercle bacilli.** L. Nègre, J. Valtis and F. van Deinsse. *Compt. rend. soc. biol.* 114, 438-9(1933); cf. C. A. 27, 3507.—Injections of lipides from the lungs, liver or kidneys of healthy guinea pigs, like injections of

the lipid substances from Koch's bacillus, increases the virulence, in guinea pigs, of the acid-resistant bacilli: developing from the filterable elements of *M. tuberculosis* cultures. L. E. Gilson

**Bacterial hemolysis and cholesterologenes.** V. de Laverne and P. Kissel. *Compt. rend. soc. biol.* 114, 1014-15(1933).—Hemolytic bacteria and their toxins liberate cholesterol from corpuscles *in vitro*. L. E. Gilson

**Physicochemical properties of the endocellular substance of the diphtheria bacillus.** H. Goldie. *Compt. rend. soc. biol.* 114, 1149-52(1933); cf. C. A. 28, 5032. L. E. Gilson

**Research on the catadyn method.** W. Grimmer and A. Grentz. *Milchwirtschaft. Forsch.* 15, 367-80(1933).—A study of bactericidal action in which the time and quantity of Ag were varied. Bactericidal action is proportional to the time and quantity of Ag but varies with the organism studied. George R. Greenbank

**Studies in the biochemistry of microorganisms. XXXII. Cynodontin (1,4,5,8 - tetrahydroxy - 2 - methylanthraquinone), a metabolic product of *Helminthosporium cynodontis* Marignoni and *Helminthosporium euschlaenae* Zimmermann. Harold Raistrick, Robert Robinson and Alexander R. Todd. *Biochem. J.* 27, 1170-75(1933); cf. C. A. 27, 5371.—Cynodontin, a hitherto undescribed cryst. coloring matter, is 1-hydroxy-helminthosporin (cf. C. A. 27, 3471). XXXIII. The mycelial constituents of *Penicillium brevi-compactum* Dierckx and related species. 1. Ergosteryl palmitate. Albert E. Oxford and Harold Raistrick. *Ibid.* 1176-80.—Ergosteryl palmitate has been isolated from the mycelia of 14 out of 15 strains in the *P. brevi-compactum* Dierckx series and also from the mycelium of *P. italicum* Wehmer. All the molds were grown on synthetic media. XXXIV. Mechanism of the production of phenolic acids from glucose by *Penicillium brevi-compactum* Dierckx. Albert E. Oxford and Harold Raistrick. *Ibid.* 1473-8; cf. C. A. 27, 1027.—The yield of mycophenolic acid, C<sub>17</sub>H<sub>10</sub>O<sub>6</sub>, increases continuously during the whole course of metabolism. In the early stages of metabolism the presence of the acid C<sub>10</sub>H<sub>10</sub>O<sub>6</sub> could not be detected with certainty. The yield of the acid C<sub>10</sub>H<sub>10</sub>O<sub>6</sub> increases rapidly to a max. 3,5-Dihydroxyphthalic acid is never present in large amts. but increases steadily during the course of metabolism. The acid C<sub>10</sub>H<sub>10</sub>O<sub>6</sub> is present in small amts. in the early stages of metabolism, but is absent in the later stages. Benjamin Harrow**

**Acetic acid bacteria produced in Formosa. III.** Shosuke Tanaka. *J. Agr. Chem. Soc. Japan* 9, 1104-16(1933); cf. C. A. 27, 5364.—Five varieties of *Bacterium xylinum* Brown were isolated from fermentation products in southern Japan. The membrane produced gave the cellulose reaction. Production of acid was 4.4-5.1%. The bacteria assimilated the AcOH produced. They were not found of any industrial value. Y. Kihara

**A method for cultivating and preserving the gonococcus.** M. Maino. *Boll. soc. ital. biol. sper.* 8, 1209-12(1933).—The gonococci, after a series of daily transplants on ascites agar, are transplanted on a fluid medium prepd. as follows: add to 1 l. of a slightly alk. broth contg. 10 g. peptone, 10 g. meat ext. and 5 g. NaCl, 2 g. glucose. Distribute the medium into tubes and cover the surface with a one-cc. layer of liquid petrolatum. Sterilize for 15 min. at 120° and add to each tube 1 cc. of sterile ascites fluid. Incubate to insure sterility and then inoculate the surface of the broth below the petrolatum with a loopful of a freshly planted culture of gonococcus. Incubate at 37°. After 12 hrs. a thin film of growth develops between the petrolatum and the surface of the broth. After 8-10 days the pellicle sinks to the bottom. Transplants on ascites-agar 60-70 days later show that the organism is still living, although growth is somewhat retarded. The addn. of glucose to the medium prevents rapid formation of alk. while the addn. of liquid petrolatum limits the amt. of O accessible to the medium. Peter Masucci

**The gaseous metabolism of *L. pentoceticus* with reference to several representative members of the lacto-**

bacillus group. George A. Hunt. *J. Bact.* 26, 341-60 (1933).—Most lactobacilli utilize O and produce CO<sub>2</sub> in the fermentation of carbohydrates, in relatively small amts., but *L. pentoceticus* uses large amts. of O and produces equiv. amts. of CO<sub>2</sub>. It can utilize xylose and lactose readily with O consumption and CO<sub>2</sub> production in the vol. ratios of 1:1. None of the lactobacilli studied is inhibited by KCN in less than 0.1% concn. All species were inhibited by NaF and CH<sub>3</sub>ICOOH in 0.1 N and 0.0001 N concn., resp. Methylene blue and pyocyanine accelerate the O consumption by *L. pentoceticus* whether KCN is present or absent. Slightly higher ratios of volatile to non-volatile acids are obtained under aerobic than anaerobic conditions. However, the formation of large amts. of volatile acids under anaerobic conditions suggests a sep. mechanism for aerobic and for anaerobic conditions.

John T. Myers

Differentiation between Gram-positive and Gram-negative microorganisms by the use of enzymes. D. W. Bruner. *J. Bact.* 26, 361-71 (1933).—Aged glycerol exts. of pancreas inhibited the growth of Gram-negative bacteria when added to a medium consisting of Na<sub>2</sub>CO<sub>3</sub> 0.1, KH<sub>2</sub>PO<sub>4</sub> 0.2 urea 0.2 and agar 2.0% in distd. water, with a pH of 7.2-7.4. Heat or acid destroys the inhibitory action. Neither pepsin, amylase nor lipase will differentiate between Gram-positive or Gram-negative organisms. Trypsin is the inhibitory substance. The negative bacteria are digested. This may aid in the sepn. of Gram-positive from Gram-negative organisms.

John T. Myers

Agar-digesting bacteria. Harry E. Goresline. *J. Bact.* 26, 435-57 (1933); cf. *C. A.* 27, 2469.—Three groups of microorganisms capable of digesting agar were isolated from an exptl. trickling filter. They are different from previously described species. Viscosity detns. indicate that a marked change was effected in the gel structure of agar by growth of these organisms. J. T. M.

An improved method of obtaining surface colonies of anaerobic bacteria. James R. Reeves. *J. Bact.* 26, 471-4 (1933).

John T. Myers

The utilization of certain sugars and their derivatives by bacteria. Stewart A. Koser and Felix Saunders. *J. Bact.* 26, 475-88 (1933); cf. *C. A.* 27, 1907.—Methyl derivs. of several of the commoner sugars, in which the Me group was substituted for the H of the OH group attached to the no. one C atom, were distinctly resistant to bacterial attack. Thus  $\alpha$ -methyl-*D*-glucoside was utilized by comparatively few of the organisms which ferment glucose.  $\alpha$ -Methyl-*D*-mannoside,  $\beta$ -methyl-*L*-arabinose and  $\beta$ -methyl-*D*-xyloside were not fermented by those organisms capable of breaking down the corresponding unaltered sugars: *D*-mannose, *L*-arabinose and *D*-xylose. The *D*-form of arabinose was usually fermented much more slowly than the common *L*-form. The Me pentoses, rhamnose and fucose, in which the Me group is attached to the fifth C atom, were fermented readily. Two sugars contg. 7 C atoms,  $\alpha$ -glucoheptose and  $\alpha$ -glucoheptulose, were not fermented by any organism tested. Glucosamine was used by most cultures which utilized glucose, though in some instances with apparent difficulty. Gluconic acid was used by many bacteria. A S-contg. sugar, glucose ethyl mercaptal, gave entirely neg. results.

John T. Myers

The decolorization of heated blood agar by streptococci. F. D'Arcey Hart and A. B. Anderson. *J. Path. Bact.* 37, 334-5 (1933).—The action is apparently a bleaching by H<sub>2</sub>O<sub>2</sub>. The addn. of catalase inhibits it. The green color produced in unheated blood agar by pneumococci and *Strept. viridans* is due to the formation of a green pigment from hemoglobin.

John T. Myers

The identification of *Escherichia coli* by means of the indole reaction. Ernst Gottsacker. *Zentr. Bakt. Parasitenk.*, 1 Abt. 129, 517-20 (1933).—The test for indole by the Na nitroprusside method is useful. J. T. M.

The growth of the so-called *Bacterium typhi flamm* in blood and bile. Schaefer. *Zentr. Bakt. Parasitenk.*, 1 Abt. 130, 21-4 (1933).—Defibrinated sheep blood is a

good medium at either 22° or 37°. Ox bile kills the organisms at 37° but not at 22°.

John T. Myers

Effect of meat-curing solutions on anaerobic bacteria. II. Sodium nitrate. Fred W. Tanner and Florence L. Evans. *Zentr. Bakt. Parasitenk.*, II Abt. 89, 48-54 (1933); cf. *C. A.* 27, 2976.—NaNO<sub>2</sub> in concns. of 0.664-2.2135% did not inhibit any of the *Cl. botulinum* types A and B, *Cl. putrificum* or *Cl. sporogenes*. Concns. of NaNO<sub>2</sub> from 2.213 to 4.427% showed irregular inhibition of 7 strains of *Cl. botulinum*. The highest concn. prevents growth of 6 and toxin formation in 5 of the 7 strains. These expts. do not include the use of NaNO<sub>2</sub> in combination with other substances in meat-curing solns. It is also possible that different nos. of cells in the inoculum might influence the results.

John T. Myers

Bacterial proteins with special consideration of gonococcus and meningococcus. Alden K. Boor and C. Phillip Miller. *J. Exptl. Med.* 59, 63-74 (1933).—Methods of prepa. and certain properties of the nucleoproteins of gonococcus (I), meningococcus (II), *N. calarrhialis*, *R. pneumococcus*, *Str. hemolyticus* and *St. aureus* are described. No essential differences between the nucleoproteins and the intact cells of I and II were observed in their ability to engender immune substances, to induce bacterial allergy in rabbits or to elicit cutaneous reactions (of the delayed type) in rabbits rendered hypersensitive to these organisms. Measured by their lethal action in mice, the toxicity of I and II nucleoproteins was found to be but slightly less than that of the intact cells. It seems probable, therefore, that the toxic action of these organisms is due, chiefly or entirely, to some constituent of the nucleoprotein fraction. Extn. with Me<sub>2</sub>CO and Et<sub>2</sub>O in the cold did not reduce appreciably the toxicity of these organisms and their nucleoproteins, and did not alter their immunological behavior. Cross-precipitin reactions suggested that gonococcal nucleoprotein contains an antigenic factor in common with the non-encapsulated pneumococcus cell, and meningococcal nucleoprotein one in common with the capsular material of pneumococcus type III. Tryptic digestion destroys these antigenic factors but not those responsible for the cross-reactions within the genus *Neisseria*.

C. J. West

Carbohydrates of gonococcus and meningococcus. I. The alcohol-precipitable fraction. C. Phillip Miller and Alden K. Boor. *J. Exptl. Med.* 59, 75-82 (1933).—The EtOH-insol. polysaccharides of gonococcus and meningococcus were found to contain 4.2 and 3.7% N, resp., to be protein-free by chem. test, to reduce Fehling-Benedict soln. only after hydrolysis. They were non-toxic for rabbits and mice and failed to engender antibodies in rabbits. They produced no cutaneous reactions in normal, snuffle-free rabbits but caused typical allergic reactions of the delayed type in rabbits rendered hypersensitive to these organisms. Both carbohydrates reacted in high diln. with antipneumococcus serum Type III. For comparison, carbohydrates were prepd. also from *Neisseria calarrhialis*, *Streptococcus hemolyticus*, *Staphylococcus aureus* and a rough strain of pneumococcus.

C. J. West

Lipolytic bacteria (Horovitz-Vlasova, Livshitz) 12. Lactose broth fermenters (Keatley) 14. Phenol derivs. [germicides] (Brit. pat. 398,218) 10.

## D—BOTANY

THOMAS G. PHILLIPS

Ceryl alcohol from the grass, *Agrostis*. Charles E. Bills and Godfrey E. Steel. *Proc. Soc. Exptl. Biol. Med.* 31, 134-5 (1933).—The ceryl alc. of cocks foot and ryegrass is chiefly *n*-hexacosanol (cf. Pollard, Chibnall and Piper, *C. A.* 26, 2530). The ceryl alc. of bent grass (*Agrostis*) had a slightly higher mean C content; it is essentially hexacosanol.

C. V. Bailey

Direct transformation of nitrates into ammonia by the mycelium of lower fungi. D. Bach and D. Desbordes. *Compt. rend.* 197, 1463-5 (1933).—When *Aspergillus repens* is maintained in an acid medium of pH 1.61-2.36 the amt. of HNO<sub>3</sub> which disappears is equal to the amt. of NH<sub>3</sub> formed and no increase in the wt. of the mycelium

occurs. But at  $pH$  6.16 the amt. of  $NH_3$  formed is less than the amt. of  $HNO_3$  utilized, and the addnl.  $HNO_3$  is used in protein synthesis, as evidenced by the increase in wt. of the mycelium. Rachel Brown

The accumulation of ionizable benzene derivatives in yeast cells with special reference to the spontaneous reversal in the case of *o*-hydroxybenzoic acid. Fr. Axmacher. *Arch. expil. Path. Pharmacol.* 173, 722-36 (1933).—Of the simple acid and basic derivs. of benzene, those with the higher dissociation constants are preferentially adsorbed by yeast cells, the organic acids more strongly in acid reaction, the organic bases more strongly in alk. reaction. The degree of adsorption is not strictly parallel to the oil: water partition coefficient. Living yeast cells adsorb salicylic acid more strongly than dead cells, the adsorption being increased by multivalent cations and decreased by multivalent anions. The time curve of adsorption of salicylic acid suggests that it is subsequently re-dissociated from the cell surface, possibly as an  $NH_4$  salt. Harry Eagle

Effect of manganese deficiency on the growth and sugar content of plants. Lawrence P. Miller. *Am. J. Botany* 20, 621-31 (1933).—Wheat, corn, lettuce, cabbage, rye, barley, tobacco and tomato plants were grown under Mn-deficient conditions. The results indicate that Mn plays an important part in sugar formation and metabolism. Mn-deficient plants were much lower in sugar than the controls. Tomato fruits grown on low-Mn plants were lower in sugar content. The Mn salt solution necessary for the growth of tomato plants can be added directly into the stems of the plants with a fine pipet. It is thus possible to grow Mn-deficient plants in the same pot with plants receiving Mn. L. E. Gilson

Copper and iron in the tracheal sap of deciduous trees. J. P. Bennett and Jacob Oserkowsky. *Am. J. Botany* 20, 632-7 (1933).—The Fe, Cu and total electrolyte contents of the tracheal sap from branches of pear trees were detd. at intervals throughout the year. The parallelism shown in the curves indicates that the Fe, Cu and electrolyte concns. are controlled by the same factors. The tracheal sap from branches or roots of several varieties of fruit trees usually contained more Cu than Fe. No special relation of Cu to the functioning of Fe is indicated by the data. L. E. Gilson

Miscellaneous tropical and sub-tropical fruits. The papaya. Harold Mowry and L. R. Troy. Fla. Agr. Expt. Sta., *Bull.* 223, 88 pp. (1931).—Culture, fertilization of the papaya and other sub-tropical fruits are given together with some data on compn. The ripe papaya contains no papain, though this powerful digestive enzyme is present in the latex of the vegetable parts and in the immature fruit. C. R. Fellers

Production of mucus during the decomposition of plant materials. I. The effect of environmental conditions. Jageshwar Gopal Shrikhande. *Biochem. J.* 27, 1551-62 (1933).—In the presence of a mixed natural flora, the chief factors involved in causing stickiness in decomposing straw are the source of N supplied, the initial and final reactions of the material and the degree of decomposition. A  $pH$  of 9.5-10.0 seems to give the max. stickiness. II. Effect of changes in the flora. *Ibid.* 1563-74.—The production of stickiness in straws depends upon the presence of fungal tissue and the nature of the bacterium. Benjamin Harrow

The effect of various treatments of sugar-cane cuttings on the rate and extent of germination and the yield of cane. A. E. S. McIntosh. *Barbados Agr. J.* 2, No. 3, 20-5 (1933).—The rate and extent of germination of cane cuttings were increased by soaking the pieces for 48 hrs. in a satd. soln. of  $Ca(OH)_2$  or a 0.5% soln. of  $FeSO_4$ . Soaking in water alone or in satd.  $Ca(OH)_2$  plus 1 lb.  $MgSO_4$  per 50 gal. water had a smaller effect. The effect of soaking was most pronounced under conditions of low soil moisture. None of the treatments increased the vigor of the plants or the yield of cane. K. D. Jacob

Investigations on the development of prussic acid in cholam (*Berghum vulgare*). C. Narasimha Acharya. *Indian Agr. Sci.* 3, 551-60 (1933).—The HCN con-

tent of a normal crop of cholam decreases progressively from 0.2 to 0.3% at the early stages of growth till the flowering stage, at which it can be considered harmless. The leaves contain about 60% of the total cyanogen compds. present in the plant, and contain a higher percentage on the dry matter than do the stems and roots. The total HCN content of a plant and the percentage on the dry matter are lowest in the morning, then increase up to about 2 p. m., after which there is a slight decrease till 6 p. m., followed by a rapid decrease in the night. Young seedlings (less than 40 days old), plants stunted by drought, ratoons and secondary shoots contain the highest percentages of HCN on the dry matter. Seedlings grown in darkness contain as much HCN as those grown in sunlight. Drying the plants in the shade and in the sun decreased the HCN approx. 10 and 30 and 40%, resp. The poisonous principle is destroyed by heating the plants for several hrs. at  $100^\circ$  or by immersing for a short time in 10%  $H_2SO_4$ . Silages prepd. from seedlings and ratoons, originally contg. 0.1-0.2% HCN, showed only a trace of HCN after 2 months. There is evidence that the cyanophoric group in cholam may be present in less-stable combinations as well as in the glucosidal form. A simple I test is given for differentiating between poisonous and nonpoisonous cholam, based on the accumulation of starch in the stems of poisonous plants. A method for detg. the HCN content of cholam is described. Thirty-two references. K. D. Jacob

Physiological polarized mass exchange and photosynthesis in submerged water plants. I. K. Arns. *Planta (Abt. E., Z. wiss. Biol.)* 20, 621-58 (1933). The mechanism of the absorption and assimilation of  $CO_2$  by the leaves of water plants submerged in bicarbonate solns. and in distd. water is discussed in detail. Thirteen references. K. D. Jacob

The effect of some narcotics on the heterostyle flax variety *Linum austriacum* L. Maria Freiburg. *Planta (Abt. E., Z. wiss. Biol.)* 20, 659-87 (1933).—The effects of  $CHCl_3$ ,  $Et_2O$ , chloral hydrate and methylthylurthians on the chromosome alterations in *L. austriacum* were studied. Seventy-three references. K. D. Jacob

The significance of growth substance for the growth and the geotropic curvature of the roots of *Vicia faba* L. Boysen-Jensen. *Planta (Abt. E., Z. wiss. Biol.)* 20, 688-98 (1933); cf. *C. A. T.* 27, 4272.—When a root is geotropically induced for 2-4 hrs. a greater quantity of growth substance is recovered from the lower side than from the upper side of the root. The growth velocity of the root is retarded by the accumulation of growth substance. As a result of the geotropic curvature of the main root of *V. faba* the growth substance present in the root tip is shifted by the force of gravity into the lower side of the root; this causes a depression in the growth velocity of the lower side of the root in comparison with that of the upper side. K. D. Jacob

The assimilation of carbon dioxide at constant external conditions. II. The behavior of sun and shade plants. Richard Harder. *Planta (Abt. E., Z. wiss. Biol.)* 20, 699-733 (1933); cf. *Ibid.* 11, 283.—Species of *Fontinalis* were grown under natural and artificial light of relative intensities 1, 4, 64 and 256. The form of the  $CO_2$  assimilation curve depends both on the intensity of the light in which the plant is grown and on the intensity of the light in which assimilation takes place. Two extremes in the curves are observed, the one increasing to a max. in the course of hrs., the other showing little or no increase at 1st followed by a sharp decrease and then an irregular increase to a 2nd max.; all degrees of variation occur between these extremes. Under natural conditions the assimilation curves of shade and weak-light plants usually show 2 maxima, whereas those of sun and strong-light plants show only 1 max.; these relations do not hold, however, when the intensity of the exptl. light is altered. Fifteen references. K. D. Jacob

Seed germination in *Solanum lycopersicum*. A. W. Reinhard and M. Gorelik. *Planta (Abt. E., Z. wiss. Biol.)* 20, 792-4 (1933).—Germination was depressed in the presence of various esters of the expressed juice of

the fruit and in exts. of the mucous membrane surrounding the seed; aq. exts. of the ground seed were also harmful. The bad effect of the mucous membrane is due not only to O deficiency but also to the presence of some specifically harmful substance.

K. D. Jacob  
The effect of colored light on the genesis of chloroplastic pigments. Horst Rudolph. *Planta (Abt. E., Z. wiss. Biol.)* 21, 104-55(1933); cf. *C. A.* 28, 478<sup>a</sup>.—The mol. extinction coeff. of chlorophyll A and B is  $\lambda$  680-537  $\mu$  and of carotene and xanthophyll  $\lambda$  520-438  $\mu$ . As detd. by the polarization spectrophotometer the relative extinction coeff. of protochlorophyll is  $\lambda$  640-537  $\mu$ . With etiolated leaves the content of carotenoids depends on the leaf area; protochlorophyll does not show this relation and chlorophyll A and B are absent. Chlorophyll formation is strongest in leaves exposed to light filtered through red gelatin, and next strongest in those exposed to yellow-green and blue light, resp. Carotenoid formation is weakest in red light, stronger in yellow-green and strongest in blue. Protochlorophyll formation is not definitely connected with the kind of light. Production of all chloroplastic pigments was decreased in the absence of CO<sub>2</sub>. Young plants contain more chlorophyll per area of leaf surface than do older plants. Significant formation of chlorophyll was obtained by exposing leaves for 1 sec., at a distance of 30 cm., to unfiltered light from a 250-w. (osram lamp). After exposure to light, formation of protochlorophyll continued for 24 hrs. in leaves kept in the dark. A study of *Betula pendula* indicated no genetic relation between chlorophylls and carotenoids. Numerous references.

K. D. Jacob  
The phototaxis of chloroplasts. S. Heinz Voerkel. *Planta (Abt. E., Z. wiss. Biol.)* 21, 156-205(1933).—A study was made of the effect of light from different portions of the spectrum on the formation and development of chloroplasts and on the viscosity of the leaf plasma. In the visible range of the spectrum absorption of light by the carotenoids occurs. Numerous references.

K. D. Jacob  
The effect of growth substance on regeneration and wound-tissue formation [in plants]. O. Mrkos. *Planta (Abt. E., Z. wiss. Biol.)* 21, 206-10(1933). K. D. Jacob

The effect of nitrate supply on transpiration ratio in plants. L. A. T. Ballard. *Australian J. Exptl. Biol. Med. Sci.* 11, 161-76(1933).—Nitrate reduces the transpiration ratio (I) (water respired/dry matter produced, up to any point) by an effect on growth, and not by an effect upon the transpiration rate per unit wt. of leaf. A progressive reduction in I occurs with increasing age of plants. The transpiration rate also decreases with age.

C. G. King  
The mucilage from slippery elm bark. Ernest Anderson. *J. Biol. Chem.* 104, 163-70(1934).—The mucilage from slippery elm (*Ulmus fulva*) bark is a mixt. of 2 or more polyuronides with varying amts. of CaC<sub>2</sub>O<sub>4</sub> as impurity. On hydrolysis it yields definitely, galacturonic acid, l-rhamnose, d-galactose, and a colored non-saccharine X body; there are also indications of the presence of a pentose, a methylated hexose and a methylated uronic acid. The polyuronides seem to be composed of a uronic acid combined with 2 mols. of simple sugars and an H body in the following sequence: the uronic acid is combined through its CHO group with the Me pentose or pentose which, in turn, is combined through its CHO group with the hexose or Me hexose, the CHO group of which is united with the X body.

A. P. Lothrop  
The nature of the sheath material in the feeding punctures produced by the potato-leaf hopper and the three-cornered alfalfa hopper. Floyd F. Smith. *J. Agr. Research* 47, 475-85(1933).—A study was made of the chem. nature of the sheaths found in feeding punctures produced by the potato-leaf hopper (*Empoasca fabae*) and the 3-cornered alfalfa hopper (*Stictiocephala festina*). The sheaths made by the 2 species responded similarly in all tests. Color tests for mucin were neg. but certain color tests for proteins and amino acids showed that the sheath material is largely proteinaceous. The tests indicate the sheath is largely of insect origin and contains

no plant substance with the possible exception of pectose. The highly insol. sheath, persisting in the vascular tissue, probably interferes with the normal translocation of plant materials and accounts for the typical plant injuries caused by the feeding of these insects.

W. H. Ross  
Effect of weathering on composition of hardwood leaves. Herbert A. Lunt. *J. Forestry* 31, 943-5(1933).—Leaves of several hardwood species gained slightly in ash and N and lost considerably in K and P during 8 weeks on the ground. There was no change in Ca.

H. K. Salzberg  
Microchemical studies of tyloses. Irving H. Isenberg. *J. Forestry* 31, 961-7(1933).—Sections of 9 species of American hardwoods and 3 hardwoods from British India, in all of which tyloses are common, were examd. under the microscope simultaneously with the addn. of chemicals. The walls of the tyloses were found resistant to pectin solvents, but reacted to lignin and cellulose solvents. In ash the tylosis dissolves completely in lignin solvent but in the other woods this solvent acts only on an outer layer leaving an inner layer of cellulose.

H. K. Salzberg  
The action of potassium upon higher plants. August Rippel, Georg Behr and Rudolf Meyer. *Z. Pflansen-nähr., Düngung Bodenk.* 32A, 95-109(1933).—Oats and potatoes grown in pots of sand with complete nutrient solution and variation in K<sub>2</sub>O supply indicated that deficiency in K<sub>2</sub>O causes symptoms suggesting oversupply of N. Schmalfuss' (*C. A.* 27, 3500) observation that accumulation of NH<sub>3</sub> in the plant is a symptom of K<sub>2</sub>O deficiency was confirmed. Insufficient K<sub>2</sub>O did not cause (COOH), to accumulate in potato plants. No evidence was secured that the role of K<sub>2</sub>O is not in carbohydrate exchange.

C. J. Schollenberger  
Sand and solution culture experiments on the action of the copper ion. K. Scharrer and W. Schropp. *Z. Pflansen-nähr., Düngung Bodenk.* 32A, 184-200(1933).—Small grains grown in Neubauer dishes contg. 600 g. glass sand with 10<sup>-2</sup>-10 milliequivs. Cu as CuSO<sub>4</sub>.5H<sub>2</sub>O showed slight effects with up to 10<sup>-1</sup>, considerable injury with 1 and practically no growth with 10 milliequivs. Cu. Corn showed a stimulant effect, especially upon root growth, with up to 10<sup>-1</sup>, great injury with 1 and no growth with 10 milliequivs. Cu. Results with peas were similar but highly variable. The growth of corn seedlings transferred to Richter's soln. cultures with both 1-10 milliequivs. Cu and 0.5-2 milliequivs. Ca(NO<sub>3</sub>)<sub>2</sub>, indicated that Ca has an antagonistic effect upon Cu injury without lessening root stimulation, so that plants grew well in solns. contg. 10 and 2 milliequivs. Cu and Ca, resp. Extensive review and 88 references.

C. J. Schollenberger  
The effect of nitrogen nutrition on the protein and non-protein nitrogen of wheat. A. G. McCalla. *Can. J. Research* 9, 542-70(1933); cf. *C. A.* 27, 4852.—Wheat plants were grown in water cultures varied only with respect to N. The N as nitrate was supplied to half the plants continuously to maturity, and to the others only until the time of heading. Though uptake and reduction of nitrate continued in the former for some time after heading, org. N produced in vegetative parts of the plant, after heading, was not synthesized to protein but accumulated in the form of non-protein compds. Regardless of the extent of the N reserves in vegetative parts, translocation to the kernels during filling took place in about the same proportion. In plants with limited N supply, translocation to kernels consisted largely of decomposed proteins, and the kernels contained less gluten N than those of the plants with unlimited N supply which drew upon both protein and non-protein reserves. The N fractions of the gluten proteins were unaffected by the N nutrition of the plants. The total amount of non-gluten N was apparently also unaffected by the nutrition. Amide N was the most labile of the N fractions used.

J. W. Shipley  
A further note on catalase activity as a measure of seed viability. C. W. Leggett. *Can. J. Research* 9, 571-3(1933); cf. *C. A.* 24, 541.—Application of statis-

tical methods to the results of an investigation previously published has shown that viability, in the case of common wheat, can be estd. fairly closely from a detn. of total and thermostable catalase; this detn. can be completed within the course of a few hrs., as compared with the regular germination test requiring 12 days. The method has not yet been put on a practical routine basis.

J. W. Shipley

Investigation of the sensitiveness and differentiating power of the protoplasm of *Vallisneria* toward various  $\alpha$ -amino acids. Hans Fitting. *Jahrb. wiss. Botan.* 77, 1-103(1933); cf. *C. A.* 22, 796; 23, 3488. C. W. S.

Fixation of atmospheric nitrogen in the root bark of *Corallorrhiza innata* R. Br., also in the epiphytes *Cattleya bowringiana* Veit and *Laelia anceps* Ldl. Heinrich Wolff. *Jahrb. wiss. Botan.* 77, 857-84(1933).—The aerial roots of *Corallorrhiza* (I), *Cattleya* (II) and *Laelia* (III) are hosts of N-fixing mycorrhiza. Using his previously described method (*Jahrb. wiss. Botan.* 66, 1-34 (1926)) on the root bark of these plants W. found the fixation in 100 days was: I, 0.24-0.84 mg., N II and III 0.23-0.96 mg. in 100 cc. of culture soln. C. W. S.

Absorption tests with plants. VII. Absorption of phosphorus. F. Diaz Aguirreche. *Anales soc. españ. fis. quim.* 31, 896-904(1933); cf. *C. A.* 24, 454; 26, 3005; 28, 5061.—Tables show absorption of P by plants from various alkali phosphates and from their mixts. with KNO<sub>3</sub>.

E. M. Symmes

New method of arranging experiments with vegetables in sand cultures with flowing solution. Z. Zhurbitski. *Plant Physiol.* 8, 553-8(1933).—To the siphon which delivers the nutrient soln. to the culture vessels of Allison and Shive's app. (*C. A.* 18, 1006) is attached a Y tube (2 mm. in diam.) in the upper arm of which is a glass cock which regulates the flow of soln. The side tubes are drawn out to make outlets as uniform as possible. Delivery is uniformly distributed between 4 culture vessels by means of swinging curved tubes fastened to a common support. The app. is described in detail with 3 figures.

Walter Thomas

Character of hemicellulose in certain fruit trees. W. E. Tottingham. *Plant Physiol.* 8, 559-61(1933); cf. *C. A.* 18, 849.—Branch tissue taken in August from apple, cherry, pear, peach and plum trees was hydrolyzed with 1% (wt.) H<sub>2</sub>SO<sub>4</sub> after removal of lipides, sugars and starch. The proportions of galactose or galacturonic acid in the cherry and peach were 0.08 and 0.13%, resp., compared with 4.5% in apple, 3.7% in pear and 2.7% in plum tissues. Xylose in the cherry and peach is relatively high, 70 and 81.3%, resp., and in the apple 47.3%, pear 37.9%, plum 59.7%. The uronic acid equiv. of the free sugar fraction constitutes about 30% of the total hemicellulose of the tissues except in the plum where it reaches 64%. Free uronic acid ranged from 3 to 6% and the total uronic acid from 10 to 15% in the species studied. Conclusion: Glucose and xylose are equally significant reserve components in the hemicellulose fraction.

Walter Thomas

Detn. of nitrate in plants (Treschow, Gabrielsen) 7. Detn. of the varieties of sugar cane grown in Tucumán (Fawcett) 28.

Smith, Kenneth M.: Recent Advances in the Study of Plant Viruses. London: J. & A. Churchill. 423 pp. 15s.

## E—NUTRITION

PHILIP B. HAWK

Relative utilization of calcium from calcium carbonate and calcium gluconate by chickens. J. E. Hunter, R. Adams Dutcher and H. C. Knandel. *Proc. Soc. Exptl. Biol. Med.* 31, 70-5(1933).—CaCO<sub>3</sub> and Ca gluconate were equally efficient as sources of Ca for the growing chick when equiv. amts. of Ca were given. In the laying hen, Ca gluconate was more effective than CaCO<sub>3</sub> in the production of egg shell, shell ash and Ca in the egg contents.

C. V. Bailey

Influence of mineral oil on assimilation of vitamin A

from spinach. Helen S. Mitchell. *Proc. Soc. Exptl. Biol. Med.* 31, 231-3(1933).—In the rat, 10-12 times as much fresh green spinach was required to furnish a unit of vitamin A when accompanied by 1/2 cc. of mineral oil; and about 8 times as much when fed separately at least 6 hrs. apart. Paraffin oil with a higher m. p. and wax mixt. was less detrimental than the fluid oil.

C. V. Bailey

Chemical character of the blood and urine of colts. W. W. Demock and Daniel J. Healy. *J. Am. Vet. Med. Assoc.* 36, 806-9(1933).—Blood serum of normal and overfed fillies contained in mg. per 100 cc., resp., Ca 12.0, 12.5; K 15.4, 18.5; P 4.9, 5.0; non-protein N 28.1, 19.9; sulfate S 13.4, 10.0; sugar 106, 123. Urine from the same animals had d. 1034, 1038;  $\rho_H$  7.4, 6.6; albumin 0, 0; N11, 50.0, 100.0; Ca 128.5, 184.9; sulfate S 81.9, 63.1. When overfed fillies and colts were again put on a rational diet their leg trouble disappeared and the analyses of the blood and urine returned to normal.

Rachel Brown

Vitamin studies. VII. Vitamin C content of some little used foodstuffs. F. V. v. Hahn. *Z. Untersuch. Lebensm.* 66, 261-70(1933); cf. *C. A.* 24, 5342; 25, 4916; 27, 1920.—Pine needles contain large amts. of vitamin C, as do also the berries of the mountain ash. Various kinds of apples were examd. and the wild crab was found to contain more vitamin C than cultivated varieties. In quinces, those more closely related to the wild types contained more vitamin C than the cultivated kinds. The haw also contains this vitamin.

F. L. Dunlap

The vitamin content of Evianis (Vitaphos). A. Schenert, M. Schieblich and J. Reschke. *Z. Untersuch. Lebensm.* 66, 271-8(1933).—This study showed that Evianis (Vitaphos) contained no vitamins A and D and that the B complex was present in but very small amts.

F. L. Dunlap

The vitamin value of fermentation and artificial vinegars. Jaroslav Křizenecký and Michajl Nevalonnyj. *Z. Untersuch. Lebensm.* 66, 278-88(1933).—Two wine vinegars and 1 artificial vinegar prepd. from glacial acetic acid were investigated. The fermentation vinegars contained the antineuritic B vitamin and the water-sol. growth-promoting G. Vitamin C was not present in any significant amt. These vitamins were absent in the artificial vinegar. The AcOH of the artificial vinegar had a much more poisonous action than that from the fermentation vinegar.

F. L. Dunlap

Low-cost diets for emergency use. Harriet T. Barto, Julia Outhouse and Sybil Woodruff. *Ill. Agr. Expt. Sta., Circ.* 406, 3-12(1933).

C. R. Fellers

Growth of rats fed high-protein rations supplemented by different amounts and combinations of vitamins B (B<sub>1</sub>), G (B<sub>2</sub>) and B complex. Lillias D. Francis, Arthur H. Smith and Lafayette B. Mendel. *J. Nutrition* 6, 493-505(1933).—Unilateral nephrectomy *per se* did not impair the ability of rats to grow when fed rations contg. 18, 50 or 90% casein. The rats fed the ration contg. 50% casein made wt. gains equal to those on the 18% level, but were definitely superior to those on the 90% level. The optimum level of dietary protein lies between 18 and 50%. The high-protein groups of rats still made inferior wt. gains when the casein was supplemented with yeast alone. The best growth attained on the 18% casein ration was by the use of 0.8% of yeast and also by the 1.6 g. level of yeast plus tikitiki ext. In the absence of yeast, both an excess of B with a min. of G or an excess of G plus a small amt. of B are unsatisfactory growth stimulants. Probably autoclaved yeast and tikitiki ext. furnish only some of the necessary B vitamins. There is some evidence that better utilization of food for growth is possible by feeding high-protein rations in contrast to the control diet contg. 18% of casein.

C. R. Fellers

Calcium and phosphorus in the development of the turkey embryo. W. M. Insko, Jr., and Malcolm Lyons. *J. Nutrition* 6, 507-12(1933).—The daily increase in wet wt., dry wt. and ash content was very small until the 12th day, after which time increments of growth notice-

ably increase. The increase of Ca and P in the embryo was relatively slow until the 17th day. The Ca : P ratio was less than 1 until the 19th day of incubation, after which time it exceeded 1. The Ca content of the embryo can be used as a measure of growth provided the yolk material drawn into the body cavity is removed.

C. R. Fellers

Other factors than vitamins B and G in the vitamin B complex. Robert C. Lewis. *J. Nutrition* 6, 559-70 (1933).—A critical review with 57 references.

C. R. Fellers

Effect of fluorine on reproduction and lactation in swine. R. M. Bethke and C. H. Kick. Ohio Agr. Expt. Sta., *Bull.* 516, (51st Annual Rept.) 83 (1933).—The feeding of 1% or more of rock phosphate (3.5% F) or 30 or more g. of NaF per 100 lb. of basal feed mixt. to pigs for 2 or more years did not affect the no. or size of young at birth but influenced lactation through curtailment of feed consumption. Excessive F softened the teeth, increased the diam. of the mandibles and changed the type of marrow.

C. R. Fellers

Stage of maturity of hays as it affects their biological and chemical analyses. C. H. Hunt, R. M. Bethke, O. H. M. Wilder and D. S. Bell. Ohio Agr. Expt. Sta., *Bull.* 516, (51st Annual Rept.) 89-90 (1933).—Results of the first year's trials show that as alfalfa and timothy mature, the proteins and vitamins B and G decrease markedly. Timothy may have as high a vitamin G content as alfalfa providing it is cut at the proper time. Timothy cut on June 12th, 25th and July 13th yielded, resp., 6.6, 5.0 and 2.5 units of vitamin G per g. and 0.77, 0.66 and 0.50 unit of vitamin B. The expt. is being continued.

C. R. Fellers

Influence of radiant energy on the hematopoietic processes in the pig. R. D. Sinclair. *Sci. Agr.* 13, 737-42 (1933); cf. *C. A.* 27, 5787.—Radiant energy played no part and exerted no influence on red cell count or hemoglobin formation in the pig. While a decrease in red cell count, cell vol. and hemoglobin percentage occurred, the trend was seasonal rather than the result of exptl. factors. Low points were reached in Feb. with recovery occurring during Mar. and Apr. Pigs being fed supplemental minerals showed a more favorable blood condition than those on the basal diet. Leucocyte counts likewise failed to yield any information of interest.

C. R. Fellers

Note on pilchard oil for chicks. V. S. Asmundson and W. John Allardye. *Sci. Agr.* 13, 749-50 (1933); cf. *C. A.* 27, 5787.—Brit. Columbia pilchard oil, Calif. sardine oil and com. cod-liver oil, when fed at 1% levels, were equally effective in preventing rickets in chicks up to 5 weeks of age. Without any of these oils, the chicks developed severe rickets. The chicks fed the pilchard oil contg. 40% stearin gave equally good results as those obtained with cleared and uncleared oil from the same batch.

C. R. Fellers

Antirachitic value of pilchard oil (sardine oil) for growing chicks. Jacob Biely and V. Elvira Palmer. *Sci. Agr.* 14, 136-40 (1933); cf. *C. A.* 27, 5787.—Chicks fed a basic ration lacking vitamin D, which was supplemented with com. pilchard oil at 0.5 and 1% levels, showed practically the same ash analyses as chicks fed similar rations which were supplemented with 1% of the medicinal cod-liver oils.

C. R. Fellers

Vitamin A content of foods and feeds. G. S. Fraps and Kay Treichler. Tex. Agr. Expt. Sta., *Bull.* 447, 34 pp. (1933).—The units of vitamin A activity were estd. in over 107 samples of foods or feeds. These are tabulated together with all other estns. of vitamin A found in the literature or calcd. from data given. The quantity of vitamin A decreases during the storage of alfalfa, dried whole milk, yellow corn and other foods. There is a loss of vitamin A in drying moist foods. There is a direct quant. relationship between vitamin A in corn and the no. of genes for yellow pigmentation. There was a fairly const. gain of vitamin A in each grain during the period of growth of yellow corn, with the exception of the period of 21-28 days, when the gain was excessively rapid, and the last period, near maturity, when there

was little gain. The locality in which the corn was grown did not affect its vitamin A content. The vitamin A content of butter and eggs depended upon the food eaten by the animal. The vitamin A content of butter and eggs decreased during the period of feeding, when insufficient quantities of vitamin A were fed. Growing rats required 4 units per lb. per day for maintenance only and 6 units per lb. per day for both growth and maintenance. White Leghorn pullets required 32 units per lb. per day for maintenance and 6.3 units of vitamin A for each unit in the eggs. Milk cows have high requirements of vitamin A for maintenance and for production of butter of high potency. A man, woman or child requires 1000 units of vitamin A per day per person. Larger amts. may be required for higher vigor and better health. The 1000 units per person per day can be supplied at a low price by comparatively small quantities of collard greens, turnip greens, mustard greens, spinach or by somewhat larger amts. of bananas, carrots, yellow corn or sweet potatoes. Milk cows seem to require green pasture plants to produce milk of high potency and laying hens seem also to require green feed for the continued production of eggs of high potency. Orange peel and pulp contained 4-6 units of vitamin A per g. Cottonseed meal is very low in vitamin A. Hays and fodders may not supply enough vitamin A to maintain milk cows over a long period of time. Sorghum silage contg. 5.5-10 units of vitamin A per g. does not furnish enough vitamin A for cows to produce milk contg. normal amts. of vitamin A. Sixty-five references.

C. R. Fellers

Preliminary note concerning the appearance of experimental dermatitis (pellagra) in rats. Minerva Kellogg and Walter H. Eddy. *Science* 78, 609 (1933).—Rats were fed diets contg. graded amts. of vitamins B<sub>1</sub> and B<sub>2</sub> (G). The dermatitis developed more uniformly in practically all cases where B<sub>2</sub> was low and B<sub>1</sub> was high, the ratio of the 2 vitamins being more important than the abs. amt. of B<sub>2</sub>. This study, which is being continued, may result in giving support to the maize theory of the cause of pellagra.

S. B. Foster

The effect of washing and steaming rice at different polishing degrees on its content of vitamin B<sub>1</sub>. A. G. van Veen. *Mededeel. Dienst. Volksgezondheid Nederland. Ind.* 22, 181-9 (1933) (in German).—See *C. A.* 27, 5101.

Cystine and nephrotoxicity. Muriel E. Bell. *Biochem. J.* 27, 1267-70 (1933).—Feeding rats with diets contg. 1.0-2.0% free cystine fails to produce "cystine nephrosis."

Benjamin Harrow

Ascorbic acid as the antiscorbutic factor. Edmund L. Hirst and Sylvester S. Zilva. *Biochem. J.* 27, 1271-8 (1933).—Specimens of ascorbic acid from different sources do not altogether agree in their antiscorbutic effects. On the other hand, there are serious limitations in the biol. method of assaying. Ascorbic acid, regenerated from an oxidized product by reduction, showed a potency of the same order as several other samples of the untreated acid.

Benjamin Harrow

Silver nitrate staining reaction for ascorbic acid in the adrenal, pituitary and ovary of various species of animals. Jethro Gough and Sylvester S. Zilva. *Biochem. J.* 27, 1279-86 (1933).—If it is assumed that the substance reducing AgNO<sub>3</sub> is ascorbic acid (I), then I is present in the adrenals, pituitary and ovaries of all animals, whether they are susceptible to scurvy or not. On the other hand, the human subject and the guinea pig may be free from scorbutic symptoms and yet not show I in any of the organs by the AgNO<sub>3</sub> method. When the guinea pig receives decitrated lemon juice in amts. much above the min. protective dose, I was still absent in the adrenal cortex and in the pituitary. The anterior lobe of the pituitary of the ox is very potent antiscorbutically.

Benjamin Harrow

Vitamin content of the mango fruit. Margaret E. F. Crawford and Edith O. V. Perry. *Biochem. J.* 27, 1290-3 (1933).—The vitamins A, C and D of the 3 varieties of mango, Alphonso (I), Cawassi Patel (II) and Shendrya (III), were assayed. The vitamin A content of I was

approx. that of a good butter, and that of II and III was about  $1/2$ . The vitamin C content of I was about twice as active as lemon juice, II was a little less active and III was much less active. Vitamin D was absent in all 3 varieties. Benjamin Harrow

**Vitamin C in citrus juices.** Alexander H. Bennett and David J. Tarbert. *Biochem. J.* 27, 1294-301(1933).—Tillmans' reagent, dichlorophenolindophenol (C. A. 26, 5324), is used as a test for vitamin C. It is believed that in untreated juice (lemon or orange) the reducing factor is protected from atm. oxidation by the action of an enzyme. Benjamin Harrow

**Vitamin D activity of butter.** I. A chemical differentiation of the antirachitic factor of autumn and winter butter from irradiated ergosterol and the vitamin D of cod-liver oil. Stanislaw Kazimierz Kon and Roland Gordon Booth. *Biochem. J.* 27, 1302-9(1933).—The sapon. of butter causes a loss of 80% of its antirachitic potency. Neither irradiated ergosterol nor cod-liver oil loses its potency when treated similarly. B. H.

**Avian polyneuritis. Further studies on the action of vitamin B<sub>1</sub> concentrates in vitro.** Arnold P. Meiklejohn. *Biochem. J.* 27, 1310-19(1933).—The lesion in vitamin B<sub>1</sub>-deficient brain results in a lowered O uptake of the minced brain in the presence of lactate. The addn. of vitamin B<sub>1</sub> concentrate to the minced brain largely restores the lowered uptake but causes no corresponding increase in the removal of lactate. Benjamin Harrow

**An investigation of the cause of renal hypertrophy in rats fed on a high-protein diet.** Harry E. C. Wilson. *Biochem. J.* 27, 1348-56(1933).—Gelatin produces a more marked increase in kidney weight than either casein or liver. Glycine, glutamic acid and gluten all produce an increase which is approx. proportional to the addn. N consumed. It is possible that the hypertrophy is assoc. with some stage in the intermediate metabolism of protein. Benjamin Harrow

**Relation between lipochrome pigments and vitamin A in the nutrition of young fish.** Roy J. MacWalter and Jack C. Drummond. *Biochem. J.* 27, 1415-20(1933).—The ova of brown and rainbow trout contain a pigment similar to carotene. The amount of this pigment decreases in the development of the young fish, and there is a corresponding increase of absorption at 3280A., suggesting a conversion into vitamin A. Benjamin Harrow

**High-protein diets and acid-base mechanism.** Muriel Emma Bell. *Biochem. J.* 27, 1430-7(1933).—Addn. of alkali to diets (of rats) contg. a large percentage of casein or coagulated egg white does not improve the growth rate. Rats fed for 8 months on diets contg. 70% casein show no evidence of kidney damage. Uncoagulated egg white in the diet is fatal. Benjamin Harrow

**Variations in vitamin A content of fish-liver oils, with particular reference to seasonal fluctuations in the potency of halibut-liver oil.** John A. Lovern, Joseph R. Edisbury and Richard A. Morton. *Biochem. J.* 27, 1461-9(1933).—Oil obtained from any given halibut liver increases in mean annual potency as the fish grows older, and, in addn. fluctuates from season to season over a gradually increasing range. The extraordinary high proportion of vitamin A in some of the samples, together with these wide fluctuations in concn., suggests that, in the halibut at least, the vitamin A may play an addnl. role to that usually assoc. with the term "vitamin." The greater part of the carotene annually produced by the diatoms, and available for conversion into vitamin A by marine animal life, is synthesized during a comparatively short period in the spring or early summer. The best oils from the standpoint of vitamin A content are most likely to be obtained from large halibut caught in northern waters in the late spring or early summer, and in the autumn. Benjamin Harrow

**The diet of the halibut and intensity of feeding, in relation to the vitamin A potency of the liver oil.** John A. Lovern and James G. Sharp. *Biochem. J.* 27, 1470-2(1933).—The diet of the halibut does not include any outstandingly rich source of vitamin A. No relation exists between the intensity of feeding (the glycogen content

of the liver being taken as a criterion) and the vitamin A potency of the oil. In general, the livers of older fish afford a more potent oil than those of younger fish.

**Vitamins present in ox serum.** I. Joseph Fine. *Biochem. J.* 27, 1498-500(1933).—Ox serum contains vitamin A but not the vitamin B complex. B. H.

**Action of vitamin C on oxidation of tissues in vitro.** Douglas C. Harrison. *Biochem. J.* 27, 1501-5(1933). With scorbutic guinea pigs, thin slices of liver suspended in phosphate buffer ( $pH$  7.4) being used, the O uptake is lower than that of liver from normal animals. The addn. of 0.25 mg. of ascorbic acid increases the O<sub>2</sub> uptake from 5 to 57%. With normal guinea pigs, the O<sub>2</sub> uptake is unaffected. Benjamin Harrow

**Modern views of vitamins and their functions.** J. C. Drummond. *J. State Med.* 42, 3-39(1934). E. H.

**Nutritive value of the silk worm pupa produced in Manchuria.** I. The compositions of protein from the pupa of *Bombyx mori* and *Antheraea pernyi*. Seichi Izume, Yoshinori Yoshimaru and Kazuchika Yoshimaru. *J. Agr. Chem. Soc. Japan* 9, 922-31(1933).—Proteins of the pupa of *Bombyx mori* and *Antheraea pernyi* were similar to muscle protein from the standpoint of the content of diamino acids, cystine, tryptophan and tyrosine.

The nutritive value of the pupa of *Bombyx mori* was as high as that of beef protein. The nutritive value of the pupa of *Antheraea pernyi* was somewhat inferior to that of *Bombyx mori*. The addn. of the pupa improved remarkably the nutritive values of wheat protein and soybean protein. II. Vitamins A, B and D in the pupa of *Bombyx mori* and *Antheraea pernyi*. *Ibid.* 932-9.—The oil of the pupa was rich in vitamin A. The content of vitamin D was, however, insufficient. When the pupa oil was exposed to ultra-violet rays rickets in mice was cured with a dose of 10 mg. per day. The vitamin B<sub>1</sub> and B<sub>2</sub> contents of the pupa were very rich if the pupa was sepd. from fresh cocoons. Y. Kihara

**Vitamin A. V. Fractionation of the unsaponifiable matter of cod-liver oil by means of solvents.** Kozo Kawakami. *Bull. Inst. Phys.-Chem. Research (Tokyo)* 12, 825-33(1933)(Abstracts 7-8(in English) published with *Sci. Papers Inst. Phys.-Chem. Research (Tokyo)* 22, Nos. 457-67); cf. C. A. 27, 1861.—The crude biosterol (I) from cod liver was dissolved in petr. ether and extd. with 80% and 90% (vol.) MeOH; Ac<sub>2</sub>O may be used instead of 90% MeOH. Eighty % MeOH ext. (II) contained a toxic substance which, when injected subcutaneously to rats, produced severe cramps. Ninety % MeOH or cold Ac<sub>2</sub>O ext. (III) had a high vitamin A potency and consisted chiefly of an unsatd. compd. which had conjugated double bonds, forming a condensation product with maleic acid anhydride. Cod-liver oil units estd. for I, II and III and petr. ether ext., were 4800, 4220, 6500 and 2700. Other liver oils gave the same results. VI. The so-called vitamin A-choleic acid crystals. *Ibid.* 834-44(Abstracts 8-9(in English)).—Faint yellow crystals obtained from the mixt. of crude biosterol and desoxycholic acid and repeatedly recrystd. from EtOH, m. 185-90°, give, on decompn. with dil. alkali, a yellowish brown oil having far weaker vitamin A potency than that of the original biosterol or that of the mother liquor of the crystals. The mol. weight was about 323; analysis indicates that these crystals consist of one or more hydrocarbons having no vitamin A potency. Further a hydrocarbon obtained from cod-liver-oil by another method forms a cryst. choleic acid compd. resembling the crystals mentioned above. Vitamin A has, however, some affinity toward desoxycholic acid. VII. Certain naphthalene hydrocarbons isolated from commercial cod-liver oil. *Ibid.* 845-52(Abstracts 9(in English)).—Two naphthalene hydrocarbons obtained as picrate from the unsaponifiable substance of cod-liver oil, C<sub>21</sub>H<sub>14</sub>, orange, m. 105-6°, and C<sub>20</sub>H<sub>12</sub>, red, m. 126-7° give absorption spectra closely resembling that of 1,8-dimethylnaphthalene but not identical with it. K. Konda

**Inorganic salts in nutrition.** VII. Change in composition of bone of rats on a diet poor in inorganic constituents.

Richard O. Brooke, Arthur H. Smith and Paul K. Smith. *J. Biol. Chem.* 104, 141-8(1934); cf. *C. A.* 27, 2476.—"In rats restricted for 90 days to a ration extremely poor in inorg. salts, there occurs a reduction in the Ca, P and carbonate on the unignited bones. The  $\text{Ca}_3(\text{PO}_4)_2$  :  $\text{CaCO}_3$  ratio in the bone salt of these animals is significantly increased over that of the control animals but the non-carbonate Ca : P ratio remains normal. Mild inanition alters neither the phosphate : carbonate ratio nor the residual Ca : P ratio. These chem. changes are interpreted to mean that the persistent neg. Ca balance in the rats on the low salt ration exists at the expense of the carbonate to a greater extent than at the expense of the phosphate."

A. P. Lothrop  
The influence of acid- and alkali-forming diets on nitrogen metabolism. A. Rossi. *Arch. ital. biol.* 90, 38-47(1933).—See *C. A.* 27, 4283. A. E. Meyer

Natural coloring matters related to vitamins—Carotenes and flavines. R. Kuhn. *Chemistry & Industry* 1933, 981-6.—A review with 48 references. C. R. Moulton

Vitamin C. P. Karrer, K. Schöpp and F. Zehnder. *Helv. Chim. Acta* 16, 1161-3(1933); cf. *C. A.* 27, 5104.—The action of MeMgI on the substance represented by the lactone formula for acetonedimethylascorbic acid (I) should result in the introduction of 2 Me groups and the formation of 2 OH groups. But 1 Me and 1 OH would be introduced by the action of this reagent on the compd. represented by the furane formula of Michael (*C. A.* 27, 3503). Analysis of the viscous oil resulting from the action of MeMgI on I supports the lactone formula for this substance. The transformation of ascorbic acid to dehydroascorbic acid is thus completely analogous to the oxidation of dialuric acid to alloxan. W. Gordon Rose

True and apparent digestibility of oat hulls and alfalfa meal by swine, with special reference to the ability of swine to digest cellulose and crude fiber. H. H. Mitchell and T. S. Hamilton. *J. Agr. Research* 47, 425-35(1933).—The digestion and metabolism of 4 pigs were studied while they were consuming (1) a ration contg. 30% of oat hulls with starch, sugar and salts, and (2) a ration contg. starch, sugar and salts with paper pulp or Cellophane to furnish as much crude fiber as the oat hulls in the first ration. With 1 pig, a 3rd ration contg. about 30% of alfalfa meal and the rest of starch, sugar and salts was studied. The total digestible nutrients of the oat hulls as ordinarily computed amounted to 26.8 lb. and those of the alfalfa meal to 31.3 lb. per 100 lb. The metabolizable energy contents were 1168 and 1624 cal. per kg. of dry matter, resp. At the low levels of protein feeding prevailing the absorbed protein of both feeds was almost completely utilized in metabolism. The crude fiber of the oat hulls was digested to an av. extent of 2% and that of the alfalfa meal to approx. the same amt. The pure cellulose of the paper, as well as of the Cellophane, was digested to the extent of only 3.5% on an av. It appears that the crude fiber of oat hulls and of alfalfa meal, as well as pure cellulose, pass through the digestive tract of the pig almost, if not entirely, untouched by bacteria or other agencies of digestion. W. H. Ross

Some results that have been obtained by supplementing the dietary with cod-liver oil. Arthur D. Holmes. *Oil and Soap* 11, 3-8(1934).—The administration of cod-liver oil to the home dietary of certain types of persons is of definite value in improving their phys. well being. The investigations made supply a large vol. of data indicating that cod-liver oil is of value for reducing the prevalence of colds and similar infections. E. S.

Nervous system in deficiency diseases. II. Lesions produced in the dog by diets lacking the water-soluble, heat-stable vitamin B<sub>2</sub> (G). H. M. Zimmerman and Ethel Burack. *J. Exptl. Med.* 59, 21-34(1933); cf. *C. A.* 27, 1923.—Adult dogs maintained on an artificial, balanced ration adequate in all dietary essentials as far as is known, except H<sub>2</sub>O-sol., heat-stable vitamin B<sub>2</sub> (G) developed, after a sufficient time, a slowly progressive disease characterized by loss of wt., persistent vomiting and diarrhea and marked muscular weakness, which ended

1 fatally in 200-300 days. The clinical picture is quite different from black tongue. C. J. West

Nutritional myopathy in ducklings. Alwin M. Pappenheimer and Marianne Goettsch. *J. Exptl. Med.* 59, 35-42(1933).—Ducklings fed on a diet of skim-milk powder, casein, corn starch, lard, cod-liver oil, yeast, salts and paper pulp rapidly develop a disease characterized by extreme and progressive myasthenia, ending in death in a few days. The creatine content of the muscles is reduced in proportion to the muscle injury. Pathological changes are found in the skeletal muscles, while in chickens the injurious action is limited to the brain. C. J. West

Philippine rice-mill products—nutritive value of rice bran (West, Cruz) 12.

## F—PHYSIOLOGY

HOMER W. SMITH

Control of the bill color of the male English sparrow by injection of male hormone. Warren N. Keck. *Proc. Soc. Exptl. Biol. Med.* 30, 1140-1(1933).—Castration in the English sparrow caused a gradual change in the color of the bill from blue-black to the ivory color characteristic of the capon. Male hormone was prepd. from the urine of young men and standardized in rat units by the seminal vesicle test. The daily injection of  $\frac{3}{4}$  of a rat unit for 25 days restored the color of the bill; the deposition of pigment was from the tip toward the base and the extent of the pigmentation was an index of the potency of the prepn.; a definite response was obtained within 10 days. C. V. Bailey

Excretion of inorganic phosphate by the aglomerular kidney. E. K. Marshall, Jr. and Allan L. Grafflin. *Proc. Soc. Exptl. Biol. Med.* 31, 44-6(1933).—Urine obtained from the bladders of 10 freshly caught goosfish (*Lophius piscatorius*) contained 0.0007-0.045 mol. inorg. phosphate per l.; the plasma contained 0.0042-0.0077 mol. per l. Intramuscularly injected inorg. phosphate 6 was not excreted in the urine. The large amt. of inorg. phosphate found in the urine of normal goosfish is probably formed in the kidney from some precursor other than Na glycerophosphate. It is assumed that injected inorg. phosphate is excreted only by glomerular filtration; in support of this hypothesis, it was found that the clearances of inorg. phosphate and xylose (cf. *C. A.* 26, 4370) agreed fairly closely in the frog. C. V. Bailey

7 Effect of parathormone on bone phosphatase activity in vitro. Harry Bakwin and Oscar Bodansky. *Proc. Soc. Exptl. Biol. Med.* 31, 64-5(1933).—Parathormone had no effect *in vitro* upon the glycerophosphatase activity of aq. exts. of rat and cattle bones. C. V. Bailey

Concerning the absorption of unsplit protein through the lacteals. Benjamin M. Banks. *Proc. Soc. Exptl. Biol. Med.* 31, 51-4(1933).—In the dog, absorption of 8 unaltered egg albumin from the intestinal tract by way of the lacteals and the thoracic duct was not demonstrated. C. V. Bailey

Growth-inhibiting agent in extracts of desiccated mammary gland. F. A. McJunkin and A. S. Yuskis. *Proc. Soc. Exptl. Biol. Med.* 31, 105-6(1933).—Saline exts. of lactating beef mammary gland, injected intraperitoneally, inhibited mitoses in adenocarcinomata of spontaneous origin in mice mammary glands. The inhibition was observed 24 hrs. after the injection; subsequently, tumor growth continued at the usual rate. C. V. Bailey

Gall-bladder function after pancreatectomy. B. N. Berg, T. F. Zucker and P. Robin. *Proc. Soc. Exptl. Biol. Med.* 31, 106-7(1933).—In the dog, the removal of the pancreas did not alter the function of the gall bladder as detd. by the dye method. C. V. Bailey

Blood flow to the kidney and creatinine clearance. Grace Medes and J. F. Harriek. *Proc. Soc. Exptl. Biol.*

**Med. 31, 116-19(1933).**—In the unilateral nephrectomized dog, a general parallelism but not a direct proportionality existed between the rate of blood flow to the kidney and the rate of urinary excretion of intravenously injected creatinine. C. V. Bailey

**Transudation through living membranes.** Raymond Ratnoff. *Proc. Soc. Exptl. Biol. Med.* 31, 124-7(1933).—By a modification of the mech. system of Gunn (*J. Physiol.* 71, 412 (1931)) the transudation rate of Locke's soln. through freshly killed rabbit mesentery at a pressure of 150 mm. Hg. at 26° was measured in 15-min. periods. The addn. of saponin 1-1000 or Na taurocholate 1-1000 decreased transudation; the effects of salts and alcs. were variable. C. V. Bailey

**Water shift in the muscle of adrenalectomized rats.** C. A. Winter and F. A. Hartman. *Proc. Soc. Exptl. Biol. Med.* 31, 201-3(1933).—Changes in wt. of a muscle in balanced salt soln. represent mostly a shift of water into or out of the muscle; the shift occurred more readily in muscle from an adrenalectomized rat than in normal rat muscle. C. V. Bailey

**The excretion of ovary-stimulating hormone in the urine during pregnancy.** Douglas P. Murphy. *Surgery, Gynecol. Obstet.* 56, 914-17(1933).—The amount of hormone secreted in 24 hrs. in the urine of pregnant women ranged from less than 100 to 12,000 rabbit units, the amt. being usually less than 2000. The individual excretion per day was relatively const. The amt. excreted is not influenced by the amt. of urine. J. B. Brown

**Creatine in the brain.** Matsuo Matsumoto. *Japan. J. Med. Sci. II. Biochem.* 2, 205-13(1933).—Fresh pig brain was extd. first with alc. and then with Et<sub>2</sub>O. The alc. ext. contained the major portion of the creatine. In 8 g. of the hydrolyzed Et<sub>2</sub>O extractive 12.28 mg. creatine was found by the method of Harding and Eagles. By the method of Folin 8 g. of the Et<sub>2</sub>O extractive gave 6.48 mg. creatinine. To det. whether this was a correct value pure creatinine was investigated. It was adsorbed on animal charcoal to the extent of 81% in acid soln. and 99% in alk. soln.; on kaolin and Adsol the adsorption was more effective in acid medium. Al(OH)<sub>3</sub> did not adsorb creatinine. The chromogenic substance in the Et<sub>2</sub>O extractive of brain behaved toward adsorbents similarly to creatinine. The chromogenic substance in lecithin and cerebroside from rabbit brain behaved in the same manner. Inositol boiled with H<sub>2</sub>SO<sub>4</sub> gave a false test for creatinine. The high creatinine content of the brain should therefore probably be ascribed to lipoids or their split products. Rachel Brown

**The sugar content of semen.** Kichinosuke Yamada. *Japan. J. Med. Sci., II Biochem.* 2, 245(1933).—Three samples of human semen contained 62.5, 140 and 83 mg. sugar, probably levulose, per 100 cc. Prostate fluid was practically free from reducing substance. Rachel Brown

**Carbohydrate content of the liver and muscle of wild and domestic ducks.** Saburo Suzuki. *Japan. J. Med. Sci. II. Biochem.* 2, 277-83(1933).—In winter the carbohydrate content of the liver of the wild duck decreased considerably with the lack of food while that of the muscle remained unchanged. The carbohydrate content of the breast muscle was greater than that of the bone muscle in both wild and domestic birds. The saccharification of the glycogen proceeds to a greater extent in the liver than in the muscle. Rachel Brown

**Oxygen affinity of muscle hemoglobin.** R. Hill. *Nature* 132, 897-8(1933).—Muscle hemoglobin has a greater affinity for O than blood hemoglobin. The distinctive properties of muscle hemoglobin are due to its globin, which in combination with blood hemin, shows the same absorption spectrum as the original muscle hemoglobin. With its high affinity for O muscle hemoglobin can be the intermediate carrier of mol. O from the blood to the oxidase-cytochrome system in the cells. Rachel Brown

**The affinity of individual parts of the brain to bromine as administered in "physiological" quantities.** Artur Bier. *Arch. exptl. Path. Pharmacol.* 173, 508-12(1933).—After administration of either org. ("multibrol") or inorg. (NaBr) Br into rabbits, it can be demonstrated in the

1 brain, largely in the midbrain and medulla rather than i

**The hormonal control of the metabolism of surviving thyroid tissue.** Hermann Paal. *Arch. exptl. Path. Pharmacol.* 173, 513-25(1933).—The subcutaneous injection of anterior pituitary ext. into guinea pigs causes a 3-fold increase in the *in vitro* O consumption of extirpated thyroid tissue; histologically, the gland is found in a state of active secretion. Folliculin, vogan, carotene, hypophysin and prolan were ineffective. Thyroid tissue placed for 24 hrs. in serum contg. pituitary ext. or thyroxine (0.15-0.5 mg. per 3 cc.) also shows an increased O consumption when placed in the Warburg app. Thyroxine has no effect upon thyroid tissue previously activated by pituitary ext. Harry Eagle

**The biological storage of the halogen elements in chicken eggs and in the animal organism.** II. Blá Purjesz, László Berkesy and Klára Gönczi. *Arch. exptl. Path. Pharmacol.* 173, 553-7(1933); cf. C. A. 27, 5387. —After intravenous injection of NaBr into chickens, the Br content of the eggs increases from a normal value of approx. 23% to as high as 7 mg., largely in the yolk. In rabbits as in chickens, NaBr injected intravenously is stored in the brain in high concn.; and the offspring of injected animals also contain Br, again largely in the brain. The blood, liver, muscles and skin also store Br, the concn. decreasing in the order named. As compared with iodide-injected chickens, those injected with bromide have eggs contg. more halogen, and the halogen concn. in the egg remains high for a longer period of time. Harry Eagle

**The permeability of animal membranes for aluminum salts.** G. Kürber. *Arch. exptl. Path. Pharmacol.* 173, 697-709(1933).—Frog and toad skin are not permeable to alum, AlCl<sub>3</sub>, basic Al acetate or complex tartrates. The intestinal wall of cats is only slightly permeable to the chloride and the nitrate. Saponin had no significant effect upon the permeability of frog skin for Al compds. Harry Eagle

**The effect of the central nervous system upon the action of insulin and adrenaline.** A contribution to the problem of insulin resistance. F. Höglér and F. Zell. *Klin. Wochschr.* 12, 1719-22(1933).—The removal of the cerebrum, corpus striatum and thalamus in rabbits does not affect the activity of insulin or adrenaline. Removal of the midbrain beyond the corpora quadrigemina, however, decreases the sensitivity to insulin and increases the hyperglucemic action of adrenaline. Sectioning the spinal cord as high as the 6th cervical does not affect the sensitivity to insulin. Harry Eagle

**The synthesis of uric acid in birds.** III. Werner Schuler and Wilhelm Reindel. *Klin. Wochschr.* 12, 1838-40(1933); cf. C. A. 28, 10888. —In chickens and geese, slices of either liver or kidney form uric acid from a precursor substance *in vitro*. This precursor is formed by an enzyme reaction which does not necessitate the presence of living cells, and which takes place in both these organs. The analogy to previously reported findings in pigeons is complete except for the fact that in the latter the kidney is the only organ which can form uric acid from the precursor substance. Harry Eagle

**Absorptive power of red corpuscles.** R. Brauner and E. Soru. *Compt. rend. soc. biol.* 114, 312-14(1933).—Washed corpuscles adsorb active principles from therapeutic serums and toxins from bacterial cultures. L. E. Gilson

**Pancreatic secretion and variations in blood calcium and potassium.** L. Bouisset and G. Duclos. *Compt. rend. soc. biol.* 114, 489-91(1933); cf. C. A. 27, 5390.

9 dogs intraduodenal injections of 0.4% HCl caused a decrease in alkali reserve, a slight increase in blood Ca and a slight decrease in blood K. Intravenous injection of secretin caused a large decrease in alkali reserve, an increase in blood Ca and no change in blood K. In both cases a return to normal occurred in about 1 hr. Changes in blood calcium and potassium after intravenous injections of hypertonic sodium chloride solution. G. Duclos and P. C. Fabre. *Ibid.* 491-2.—The alkali reserve was

increased and blood Ca slightly decreased for a short time.

**Origin of phenols in the organism.** A. D. Marenzi. *Compt. rend. soc. biol.* 114, 800-1 (1933).—In dogs phenols are formed principally, but not entirely, in the intestine. Phenols are also conjugated in the intestine. **Fixation of phenols by the tissues.** *Ibid.* 802-3.—The normal phenol contents of the tissues of the principal organs of the white rat were detd. Phenol, 2.5 mg./kg., injected into rats disappeared from the blood in 90 min.; at the same time the kidneys showed an increase in phenols, especially in the conjugated form.

**Determination of sex in rabbits.** M. Ferreira de Mita. *Compt. rend. soc. biol.* 114, 845-7 (1933).—Prolonged treatment of paired rabbits with thyroxine to maintain their metabolism at a high level increased the percentage of male young while decreasing the total no. of young produced.

**Adrenaline content of the adrenals of parathyroidectomized animals.** Léon Binet and Georges Weller. *Compt. rend. soc. biol.* 114, 985-7 (1933).—In dogs the adrenaline content of the adrenals decreases to a quantity too small to detect in the 8 days after parathyroidectomy. But if blood Ca is kept about normal by injections of Ca gluconate no decrease in adrenaline occurs.

**The action of the hormone of the corpus luteum on the mucosa and muscle of rabbit uterus is specific.** M. Klein and L. Klein. *Compt. rend. soc. biol.* 114, 1011-6 (1933).—Expts. with various hormones are discussed.

**Relation of blood cholesterol to the activity of the sex glands.** J. Didry. *Compt. rend. soc. biol.* 114, 1080-1 (1933).—In dogs the removal of the testicles or ovaries has little or no effect on blood cholesterol.

**Iodine content of the blood of female dogs after castration.** M. Franke and L. Ptaszek. *Compt. rend. soc. biol.* 114, 1129-30 (1933); cf. *C. A.* 27, 5390.—Results were the same as previously reported for male dogs, except that in 2 very old females with inactive ovaries no change in blood I occurred.

**Blood glutathione of aged persons.** J. Nitzulescu and I. Ornstein. *Compt. rend. soc. biol.* 114, 1134-6 (1933).—In the 18 cases studied (aged 50-85 yrs.) blood glutathione was within the normal limits.

**Sugar metabolism of aged persons.** Alimentary hyperglucemia tests. J. Nitzulescu, I. Ornstein and M. Silber. *Compt. rend. soc. biol.* 114, 1136-8 (1933). The effects of ingestion of 50 g. glucose were detd. in 38 persons aged 40-90 yrs. Blood-sugar curves were normal or nearly so. In no case did glucosuria occur.

**Distribution of vitamin A in the human organism.** Robert Debré and André Bussion. *Compt. rend. soc. biol.* 114, 1162-4 (1933); cf. *C. A.* 26, 2218, 3825. The livers of 3 normal persons killed in accidents were found to contain considerable vitamin A, while the lungs, kidneys and spleens contained none. **Vitamin A content of human livers according to age.** *Ibid.* 1164-5. The liver of the newborn infant is usually devoid of vitamin A, and the livers of nursing infants contain very little. Livers of children over 2.5 yrs. old usually contain 2 or more rat units per g.

**Iodine content of the thyroids and other organs of Argentine cattle.** G. Ruff. *Folia biol.* 1, 131-2 (1933).—The thyroids of bovine cattle contained 357-410 mg. I per 100 g. dry tissue. The values were independent of age or sex but were lower in summer than in winter. The I contents of other glands were, in mg. per 100 g. dry substance: spleen 10.3, adrenals 5.5, testicles 3.8, ovaries 1.2, pancreas 1.0, placenta 0.7, mammary glands 0.2, liver 0.2, anterior hypophysis 0.4-0.6 and posterior hypophysis 0.16-0.34.

**Contribution to the study of tubular resorption.** Giovanni Ferro-Luzzi. *Minerva med.* 1933, 11, 871-2.—Resorption of  $\text{NH}_3$  and amino acids in 10 persons was calcd. on the basis of a previously proposed formula. The concn. of these substances in the resorbed liquid did not vary greatly from the concn. of the same substances in the blood.

Helen Lee Gruel

**Relation of lactic acid and alanine to glycogen formation.** Thomas H. Hodgson. *Biochem. J.* 27, 1157-62 (1933).—Na *dl*-lactate is easily transformed into liver-glycogen, but *dl*-alanine is not so transformed. It is probable that in the normal animal the tissues take up the amino acid rapidly and release it so slowly that no appreciable glycogen can be detected.

**The oxytocic hormone of the posterior lobe of the pituitary gland. II. The action of nitrous acid and nitric acid.** John M. Gulland. *Biochem. J.* 27, 1218-28 (1933); cf. *C. A.* 26, 4367.  $\text{HNO}_2$  rapidly converts the hormone into a deriv. A with an oxytocic strength equal to 35% of that of the hormone.  $\text{HNO}_2$  (formed by oxidation of the  $\text{HNO}$ ) then acts alone or in conjunction with  $\text{HNO}_2$  and produces a substance B with an oxytocic strength of 20%. The prolonged action of high concns. of  $\text{HNO}_2$  gradually transforms B into a substance D with an oxytocic strength of 0.1%.  $\text{HNO}_2$  converts the hormone into a substance C (activity 90%) which differs from the other derivs. in being unstable at  $\text{pH}$  7.2.  $\text{HNO}_2$  transforms C into a substance which is stable at  $\text{pH}$  7.2 and has an activity of 20%; this is probably identical with B. **III. The action of preparations of plant proteolytic enzymes.** John M. Gulland and Thomas F. Macrae. *Ibid.* 27, 1237-47.—The hormone is inactivated by yeast dipeptidase, aminopolypeptidase and proteinase. The enzyme responsible for the inactivation is a fourth enzyme, present in these preps. which has an optimum  $\text{pH}$  of 7.4. Papain preps. also contain the same enzyme. **IV. The action of preparations of animal proteolytic enzymes, and some observations on the nature of the hormone.** John M. Gulland and Thomas F. Macrae. *Ibid.* 1283-93; cf. *C. A.* 28, 1068.—The apparent inactivation of the hormone by enzymes of which the substrates are proteins is not brought about by those enzymes themselves but by unidentified enzymes which accompany them. The hormone is probably not protein-like in character.

**Influence of variations in systemic acid-base balance upon carbohydrate tolerance in normal subjects.** Geoffrey Thompson, David M. Mitchell and Lawrence C. Kolb. *Biochem. J.* 27, 1253-6 (1933).—Ingestion of large amounts of  $\text{NH}_4\text{Cl}$  reduces the alkali reserve of the blood plasma to a level such as is found in diabetic coma, and the urinary excretion of acid is raised 100-200% and of ammonia 300%. There is a failure in glucose tolerance, shown by hyperglucemia and slow return of the blood sugar to the fasting level after glucose ingestion. The ingestion of  $\text{NaHCO}_3$  in large doses is not followed by marked increase in the  $\text{CO}_2$ -combining power of the plasma. Ingestion of alkali showed little variation in the blood-sugar response to glucose ingestion.

**Influence of the gonads on protein metabolism. III.** (a) The effect of injections of anterior pituitary extracts on urinary creatinine in normal and castrated rabbits. (b) The tolerance of normal and castrated animals to injected creatine. Isidore Schrire and Harry Zwarenstein. *Biochem. J.* 27, 1337-41 (1933); cf. *C. A.* 27, 2990.—Injection of antuitrin or of anterior lobe exts. of the pituitary leads to an increased excretion of urinary creatinine in normal rabbits but has no effect on the high creatinine output of castrated animals. Normal rabbits show a high, and castrated animals a low, tolerance to subcutaneous injections of large amts. of creatine.

**Conditions of hypertrophy of the seminal vesicles in rats.** John Freud. *Biochem. J.* 27, 1438-50 (1933).—Using young, castrated rats, F. finds that an optimum growth of seminal vesicles (S. V.) is not obtained with the male hormone (M.) alone. The effect of M. on smooth muscle is only moderate, its main effect being on the columnar epithelium. Estrin and trihydroxyestrin act on smooth muscle tissue, while they do not affect the columnar epithelium or induce degeneration. The combined effects of follicular and male hormones upon S. V. is a mutual reinforcement of each other's actions ("pace-making"). Simultaneous expts. on capons and on infantile male rats show loss of activity of M. after purification as regards rats, while the activity is retained as re-

gards capons. Estrin in crystalline form up to 1000 mouse units a day has no influence on comb growth; the seminal vesicles, however, are distinctly influenced. B. H.

A study of the composition of human milk. The influence of the method of extraction on the fat percentage. Sibyl Taite Widdows and Margaret Frances Lowenfeld. *Biochem. J.* 27, 1400-10(1933).—Differences in the method of extn. account for wide variations in the fat figures obtained by different workers. The percentage of fat present will depend inversely upon the quantity of milk present in the breast at the time of taking the sample, and directly upon the degree of pressure exerted upon the areola and nipple in the process of extn. The lowest percentage of fat is found in milk which has dripped spontaneously from the breast. Benjamin Harrow

Absorption of *n*-hexadecane from the alimentary tract of the rat. Mohammed Abdel Hamid El Mahdi and Harold J. Channon. *Biochem. J.* 27, 1487-94(1933).—*n*-Hexadecane (I) is absorbed to the extent of 50-100 mg. per day. After removal of the livers and the alimentary tracts, the carcasses of the animals were examd. for I, and of 35 g. of the latter not recovered from the feces, evidence was obtained of the presence of 1.85 g. in the tissues. The disappearance of the remaining 33.15 g. suggests that the animal organism can metabolize normal aliphatic hydrocarbons. Benjamin Harrow

The thermostability of prolactin. Frederic A. Askew and Alan S. Parkes. *Biochem. J.* 27, 1495-7(1933).—The ovary-stimulating substance in the urine of pregnancy (prolactin) is not readily destroyed at 100° when heated in the form of a dry powder, although heating in the presence of water results in complete and rapid destruction. Benjamin Harrow

Effect of testicular hormone on normal sexually mature rats. A method of biological assay. Vladimir Korenchevskii, Marjorie Dennison and Alice Kohn-Speyer. *Biochem. J.* 27, 1506-12(1933); cf. *C. A.* 27, 3980, 5798.—Judged by changes in the wt. of the organs, the effect of these hormone injections was small. B. H.

Simultaneous administration of testicular hormone with antuitrin and prolactin or with desiccated thyroid. Vladimir Korenchevskii, Marjorie Dennison and Alice Kohn-Speyer. *Biochem. J.* 27, 1513-16(1933).—Testicular hormone + gonad-stimulating hormone were not very different from testicular hormone alone in the effect on the sexual, endocrine and other organs of castrated male rats. Testicular hormone did not prevent the appearance of changes produced by thyroid feeding. B. H.

Human lactation. C. Vincent and M. J. Vail. *Lact.* 13, 686-97, 904 14, 969-1006, 1116-25, 1250-7(1933).—Analyses of human milk collected 3 times daily over the last 9 months of a lactation period are given. Effects of various stimuli on milk yield and fat elaboration are discussed. A. H. Johnson

Nitrogenous compounds of the excrement from the cecum of the fowl. Kozo Suzuki and Akio Kawabata. *J. Agr. Chem. Soc. Japan* 9, 1095-1103(1933).—The excrement in the cecum of the fowl contained H<sub>2</sub>O 78.80, crude protein 9.86, pure protein 6.25, crude fat 1.36, crude fiber 0.79, crude ash 3.83, sol. non-nitrogenous matter 5.36 and ammoniacal N 0.099%. The quantity of protein was markedly larger than that in ordinary feces. The distribution of N in the dried excrement in the cecum was: total N 6.584, pure protein N 5.225, non-protein N 1.359, H<sub>2</sub>O-sol. N 2.153, N in the ppt. with Pb acetate 0.648, N in the ppt. with phosphotungstic acid 0.840%. The excrement was dried by ether and alc., and then extd. with H<sub>2</sub>O. Tyrosine (0.4 g.) and valine (1.1 g.) were isolated from the ext. of 100 g. of the excrement. Diamino acids could not be detected. Y. Kihara

The standard metabolism of the Australian aborigines. C. S. Hicks and R. F. Matters. *Australian J. Exptl. Biol. Med. Sci.* 11, 177-83(1933).—The gaseous metabolism of 40 Australian aborigines living in the savage state were measured by the Benedict portable metabolimeter. Measurements made in the early morning (at temps. of -2° to 10°) gave values 23 to 90% above normal.

1 The Dubois formula for surface area gave values within 5% of observed values. C. N. King

Growth of animal, and tryptophan and lysine. Kinsuke Kondo. *J. Chem. Soc. Japan* 54, 1198-1206(1933).—Tryptophan (I) or lysine (II) used alone has no biol. value as a supplement of zein, but the combined use of I and II with the zein produces good growth. K. K.

The cation and chlorine content of the rabbit brain. Matsuo Matsumoto. *Japan. J. Med. Sci., II Biochem.* 2, 11-20(1933).—In the gray matter the compn. is: Ca 7.7 ± 0.14, Mg 14.6 ± 0.08, K 351.7 ± 4.03, Na 131.9 ± 3.46, Cl 181.9 ± 1.30, water 81.85 and N 1.95 mg. %. In the white matter the compn. is: Ca 6.6 ± 0.16, Mg 16.1 ± 0.09, K 340.1 ± 5.61, Na 121.7 ± 4.11, Cl 165.4 ± 2.50, water 69.42 and N 2.07 mg. %. The brain of young rabbits weighing between 600 and 800 g. appears to be incompletely developed. The white matter of full-grown rabbits contains more water than that of young rabbits, while the gray matter is richer in K and poorer in Ca. B. S. Levine

The chlorine and total and residual nitrogen contents of the blood of the chick embryo. Kichinosuke Yamada. *Japan. J. Med. Sci., II Biochem.* 2, 81-3(1933).—After incubation for 15 days, eggs contained Cl 0.459, reducing substances 0.125, total N 1.251, residual N 0.057%; after 20 days, Cl 0.491, reducing substances 0.135, total N 1.258, residual N 0.064%. B. S. Levine

The inorganic and phosphagen phosphorus contents of the brain. Matsuo Matsumoto. *Japan. J. Med. Sci., II Biochem.* 2, 85-91(1933).—Rabbits and albino rats were used in the detns. The inorg. phosphate content is higher in the gray than in the white matter. Phosphagen is contained abundantly in the latter. The proportion of phosphagen P to total inorg. phosphate in the gray matter is 9:28. A large part of the creatine exists in the gray matter as creatinephosphoric acid. Pyrophosphate in minute amounts also was found in the brain substance, as were all other forms of P found in the muscles. The labile P appears to be more stable in the brain substance than in muscle tissues. B. S. Levine

Gastric secretion. V. The composition of gastric juice as a function of its acidity. Franklin Hollander. *J. Biol. Chem.* 104, 33-42(1934); cf. *C. A.* 26, 5639

6 "Addnl. evidence has been adduced in support of the hypothesis, previously formulated, that 'the parietal secretion is essentially an isotonic soln. of HCl.' It has been shown not only that this secretion contains no neutral chloride, but that combined acid, inorg. phosphate, org. P and org. acids are all absent. Inorg. solids are probably also absent although this has not been established conclusively. The sp. gr. conforms to that of a HCl soln. of 170 mm. concn.; the f.-p. depression is such as to establish the isotonicity of the pure soln. In short, if any substance other than HCl and H<sub>2</sub>O is contained in the parietal secretion, their quantities are so small as to be negligible in the initial formulation of any hypothesis concerning the formation of this fluid. Having thus established the essential characteristics of the parietal secretion, it should now be possible to proceed with a study of the thermodynamics of its formation—and thereafter, perhaps, of its mechanics." A. P. Lothrop

8 Fluctuations of the blood sugar in vitro. Isaac Wirth. *J. Biol. Chem.* 104, 129-30(1934).—Diabetic and normal human and dog bloods with added dextrose have been analyzed for blood sugar at 20-min. intervals for 2 hrs. (in some cases after 160 min.). Any variations from the usual glycolytic curve can be ascribed to limitations of analytical methods. No such fluctuations as described by Kleiner and Halpern (*C. A.* 27, 4287) occurred. A. P. Lothrop

9 The effect of dehydration on the pancreatic and intestinal enzymes. John R. Ross and Margaret M. Shaw. *J. Biol. Chem.* 104, 131-9(1934).—Young rats were dehydrated by being placed in an incubator at 37.5° for alternate 12-hr. periods during 3-4 days while H<sub>2</sub>O was withheld but an adequate normal diet furnished. From 23 to 29% of their wt. was lost after 4 days. There was a decrease in the production of both pancreatic and inter-

tinal enzymes which was probably comparable to that found in dehydrated infants suffering from acute intestinal intoxication (acute fermentative diarrhea). There was considerable individual variation between rats probably because of variations in the amt. of digestive activity in progress when the animals were killed. A. P. Lothrop

The iron content of the whole blood of normal individuals. O. M. Helmer and Charles P. Emerson, Jr. *J. Biol. Chem.* 104, 157-61 (1934).—There is close agreement between the hemoglobin content of blood as detd. by the  $O_2$  capacity and the Kennedy (*C. A.* 21, 3379) Fe method so that the detn. of Fe offers an easy means of estg. the hemoglobin content of blood and of standardizing colorimetric methods of estg. hemoglobin. The Kennedy method gives distinctly higher results and is more satisfactory than the Wong method (*C. A.* 22, 2762) although the simplicity of the latter method recommends its use. The blood Fe content of 18 normal men and 10 normal women per 100 cc. was found to be 49.3-57.2 mg. (av. 52.5) and 42.0-49.8 mg. (av. 45.8), resp. A. P. L.

The cytological study of certain properties of living protoplasm. T. Terni. *Boll. soc. ital. biol. sper.* 8, 1001-1131 (1933).—A review with an extensive bibliography.

Peter Masucci

Chromosomes and heredity. Agreements and disagreements with the physicochemical theories on the constitution of the chromatic substances. Cesare Artom. *Boll. soc. ital. biol. sper.* 8, 895-909 (1933).—A critical review.

Peter Masucci

Studies on senescence. I. Senile structural transformations of the thyroid. G. C. Dogliotti and G. N. Nuzzi. *Boll. soc. ital. biol. sper.* 8, 1168-71 (1933). II. Acid-base equilibrium in advanced age. G. C. Dogliotti and M. Santi. *Ibid.* 1172-3.—The  $pH$  and alk. reserve were detd. on 50 patients over 60 yrs. of age. In 13 cases the  $pH$  varied from 7.35 to 7.40; in 17 cases 7.28-7.35; and in 20 cases 7.40-7.53. The  $CO_2$ -combining power was 50-70 cc. in 31 cases, and lower in 19 cases. These results do not permit the drawing of a general conclusion that there is a prevalence of acidosis or alkalosis in old age.

Peter Masucci

Studies on the chemical composition of the blood in early infancy. G. De Toni. *Boll. soc. ital. biol. sper.* 8, 1188-90 (1933).—The non-protein N of the blood varies within wide limits; the av. is slightly higher than that of older babies. Blood urea and uric acid are present only in traces. Compared with adult normal blood, the amt. of creatine is about the same, creatinine somewhat higher, cholesterol higher, lecithin lower, chlorides the same, Ca higher and inorg. P about  $\frac{1}{2}$  higher. Peter Masucci

Adrenalinemia and vagal tone. G. Viale. *Boll. soc. ital. biol. sper.* 8, 1196-7 (1933).—Animals with a high vagal tone have the most adrenaline circulating in the blood; those with no vagal tone have no adrenaline in the blood.

Peter Masucci

Glycogen distribution in the beef heart. Lucio Pace. *Arch. ital. biol.* 89, 45-52 (1933).—See *C. A.* 27, 4291.

A. E. Meyer

The alkali reserve and the acid or alkaline nature of foods. A. Rossi. *Arch. ital. biol.* 89, 159-71 (1933).—The alkali or acid content of the common foods does not influence the alkali reserve to an appreciable degree.

A. E. Meyer

The lipid metabolism in the central nervous system. Ichele Mitolo. *Arch. ital. biol.* 89, 172-81 (1933).—The cerebrospinal axes from *Bufo* showed the following lipid content: free cholesterol 1.7622%, lecithin + myelin 0.3564, cephalin 0.4887, galactose of sated. cerebroside 0.027, sulfatides 0.2978, sphingomyelin 0.5593. All lipids decrease during rest of the nervous tissue; the decrease is lowest in sulfatides, highest in phosphatides. During reflex activity, the sulfatides decrease most, the phosphatides less, whereas the other lipids decrease at the same rate as during rest. All lipids, except sulfatides, increase during narcosis. Excitation caused by convulsive poisons produces a greater loss of all lipids than occurs during rest.

A. E. Meyer

The oxidation in vitro of fat of adipose tissues. G.

Quagliaricello and G. Scoz. *Arch. ital. biol.* 90, 9-21 (1933).—The respiration of fresh muscle tissue decreases gradually and approaches zero after 13 hrs., when the cells die. The following increase of absorption of  $O$  is due to oxidative processes. Phosphate soln. is a more favorable medium for the oxidation than bicarbonates; borates have an inhibiting action. The optimal concn. for phosphates is 0.002 to 0.124 mol. per l. at  $pH$  between 7 and 8. The oxidation of cod-liver oil, in identical conditions, is independent of the anions and is favored by a higher  $pH$ . Heat and KCN inhibit the oxidation in tissue, but not in oil. The oxidation in tissue leads to formation of  $CO_2$ .

A. E. Meyer

Gas exchange of the ovary. A. Chiatellino. *Arch. ital. biol.* 90, 33-7 (1933).

A. E. Meyer

Variations in the size and hemoglobin content of erythrocytes in the blood of various vertebrates. M. M. Wintrobe. *Folia Hematol.* 51, 32-49 (1933). J. T. M.

Group specific properties of various fluids of the body. T. Putkonen. *Acta Soc. Med. Fenn. Duodecim.* 14, 1-113 (1932); *Medico-Legal Criminol. Rev.* 1, 150-1.—Isoagglutinin was found in the saliva in 30.9% of the O group, 10.4% of the A and 12.5% of the B; the titer was low (1 or 2, rarely 4 or 8); most of the salivas inhibited agglutination (this varied with different persons), which showed itself in 86.5% of A, 87% of B and 81.3% of AB. Isoagglutinogens were also found in the saliva. No isoagglutinin was found in urine (138 persons tested); the inhibitory effect of the urine on agglutinins was found in 22 out of 51 A persons, in 24 out of 30 B and in 6 out of 18 AB. Isoagglutinogens were not present in urine when the saliva did not show them, but in some cases the saliva contained them but not the urine. Isoagglutinins were found in the lacrimal secretion (25 persons examd.) of 5 out of 21 persons of A, B and O groups; in 14 out of 20 persons of the A, B and AB individuals, the agglutination was restricted. No isoagglutinins nor isoagglutinogens were found in the cerebrospinal fluid (20 persons). No isoagglutinins were found in the liquor amnii of 30 persons; isoagglutinogens were found in 29 cases. Of 7 persons examd., no isoagglutinins were found in the sperm, and isoagglutinogens were found in 6 cases. In all cases but 3 (175 examd.) the receptor once discovered in the saliva was always present in subsequent exams. and when it was once missing it was always absent when again sought.

Cameron, A. T.: Recent Advances in Endocrinology. London: J. & A. Churchill. 365 pp. 15s.

## G—PATHOLOGY

H. GIDEON WELLS

Heterophile ophthalmic anaphylaxis. J. V. Chambers. *Proc. Soc. Exptl. Biol. Med.* 30, 874-5 (1933).—Rabbits locally sensitized by anterior chamber injections of sheep erythrocytes and guinea-pig kidney gave marked unilateral ophthalmic responses to intravenously injected homologous antigen; approx. 75% gave a demonstrable allergic cross-reaction to the heterophile antigen. Alc.-sol. lipoids from either antigen failed to sensitize the eye; and locally sensitized animals gave no ophthalmic response to intravenously injected alc.-sol. lipoids. The heterophile relationship in strictly local ophthalmic anaphylaxis is qualitatively different from systemic anaphylaxis and *in vitro* complement-deviation reactions.

C. V. Bailey

Microincineration of tubercles. Esmond R. Long. *Proc. Soc. Exptl. Biol. Med.* 30, 1090-2 (1933).—In tubercles microincinerated by the technic of Scott (cf. *C. A.* 26, 5640), degenerated and recently necrosed areas contained less ash than the corresponding undegenerated tissue; older necrotic tubercles were found to be remineralized. Viosterol given by mouth increased calcification in exptl. tuberculosis; in some cases it failed to do so.

C. V. Bailey

The mechanism of sodium depletion in Addison's disease. Robert F. Loeb, Dana W. Atchley, Ethel B. Gutman and Ruth Jillson. *Proc. Soc. Exptl. Biol. Med.*

31, 130-3(1933); cf. *C. A.* 27, 531, 2999.—The loss of Na from the body in Addison's disease is not dependent upon the excretion of unusual quantities of acid as detd. by the excretion of  $\text{NH}_3$  and titratable acid; the disorder is primarily a disturbance of the Na regulatory mechanism; the clinical condition parallels the concn. of Na in the blood and is dependent upon the amt. of Na ingested.

C. V. Bailey

**Heterophile ophthalmic allergy. Reactions to Landsteiner conjugates.** A. C. Kurtz and R. R. Madison. *Proc. Soc. Exptl. Biol. Med.* 31, 265-7(1933).—Horse serum, cow serum and egg white were strictly specific in their ophthalmic antigenicity when tested by the Segal technic (*J. Exptl. Med.* 54, 249(1931)); no cross-reaction or cross desensitization was found in 27 tests. Similar results were obtained with these proteins benzooylated (cf. *C. A.* 27, 3983) so that the protein mol. was the "carrier" of approx. 25 Bz radicals. A distinct "carrier" cross-reaction between egg white and Bz-egg white was found; a rabbit's eye locally sensitized by Bz-egg white reacted with equal severity to the intravenous injections of the benzooylated and the native protein if tested in that order. An eye sensitized to egg white reacted to intravenous egg white but did not react 24 hrs. later to Bz-egg white.

C. V. Bailey

**Stimulating effect of alum and T. A. B. vaccine in tetanus prophylaxis.** W. K. Chen. *Proc. Soc. Exptl. Biol. Med.* 31, 334-6(1933).—In the guinea pig the antigenic effect of tetanus toxoid and T. A. B. vaccine mixt. was equal to that of alum tetanus toxoid of Glenn (cf. *C. A.* 24, 5367). The addn. of  $\text{KAl}(\text{SO}_4)_2$  to the mixt. of T. A. B. vaccine and toxoid did not increase the antigenic value. In man, protection against both tetanus and enteric fever can be induced by a single series of 3 injections. C. V. B.

**Amount of material effective in pernicious anemia present in dog liver.** Maurice B. Strauss and Wm. B. Castle. *Proc. Soc. Exptl. Biol. Med.* 31, 360-3(1933).—Intramuscular injections of exts. of dog liver caused typical remissions in patients with pernicious anemia. The content of potent material in dog liver is approx.  $\frac{1}{6}$  that of the hog. Possibly a decreased amt. of specific thermolabile intrinsic factor (*Am. J. Med. Sci.* 178, 764(1929); cf. *C. A.* 27, 2981) is present in the gastric juice of the dog and this results in a decreased amt. of thermostable effective material stored in the liver. C. V. Bailey

**The ketogenic diet in the treatment of infections of the urinary tract.** D. C. Robb. *Brit. Med. J.* 1933, II, 1158-62.—In sixteen cases of infection of the urinary tract ingestion of a ketogenic diet lowered the urinary  $\text{pH}$  and resulted in clinical improvement. J. B. Brown

**Physicochemical study of the flocculation of myxoprotein by resorcinol.** Augustin Boutaric, Maurice Pictre and Mlle. Madeleine Roy. *Compt. rend.* 197, 1413-15(1933); cf. *C. A.* 27, 5106-7.—A 0.5% soln. of myxoprotein in physiol. saline is flocculated instantly by resorcinol in concn. greater than 2% and is not flocculated at all by a concn. of 1%. The resorcinol is adsorbed on the myxoprotein yielding a complex which is sol. in saline immediately after formation but which readily becomes insol.

Rachel Brown

**The induced oxidation of lactic acid by ascorbic acid and the cancer problem.** W. P. Jorissen and A. H. Belinfante. *Science* 79, 13(1934); cf. *C. A.* 27, 5811.—*In vitro* a soln. of lactic acid appeared to undergo considerable oxidation in the presence of oxidizing ascorbic acid. J. and B. ask if vitamin C can be applied in the treatment of cancer.

Rachel Brown

**The effect of vagotomy upon hyperglucemia.** F. Höglér and F. Zell. *Arch. exptl. Path. Pharmacol.* 173, 674-9(1933).—Unilateral or bilateral vagotomy does not significantly affect adrenaline, pyramidone or Mg hyperglucemias in rabbits. Harry Eagle

**Experimental animal studies on chlorine impoverishment.** I. J. Michelsen. *Arch. exptl. Path. Pharmacol.* 173, 737-45(1933).—Rabbits develop a neg. Cl balance after the administration of diuretin; this is independent of the water economy, and is fatal when it exceeds 10-12 millimols. per kg. body weight. There is also a neg. N

balance in the diuretin-treated animals, indicative of increased tissue breakdown. II. *Ibid.* 746-9.—The non-protein and urea N of the plasma are increased in the last stages of diuretin poisoning in rabbits, because of functional impairment of the kidneys. III. *Ibid.* 750-8.—The Cl impoverishment of diuretin-treated animals is accompanied by acidosis caused by the accumulation of lactic acid and other org. acids. The blood-sugar concn. and the ratio of the cell/serum Cl concn. are both increased. Harry Eagle

**The determination of lactic acid in gastric juice.** R. Enger. *Arch. Verdauungskrankh.* 54, 301-12(1933).—After the administration of caffeine or histamine, cases of gastric carcinoma show a sharp increase in the gastric lactic acid content, ascribed to a specific cellular reaction in the tumor itself. Harry Eagle

**The adsorption of dyestuff in the serum of cases of lead poisoning.** A. Seitz. *Klin. Wochschr.* 12, 1844-6(1933).—The addn. of serum markedly inhibits the diffusion of dyestuffs into gelatin. This inhibitory action is less pronounced with serum from cases of lead poisoning, provided that one uses naphthol yellow or orange II as the dyestuff. Other dyes show little or no difference. The addn. of  $\text{Ph}(\text{NO}_2)_2$  to normal serum makes it behave like that from cases of lead poisoning in this respect. Harry Eagle

**Value of the Vernes resorcinol reaction in pulmonary tuberculosis.** Nadzieja Berdo. *Rev. Tuberculose* Feb., 1933, 149; *Rév. hyg. méd. prévent.* 55, 795(1933).—The reaction is non-sp. for pulmonary tuberculosis. It had no diagnostic value when used on 355 cases. C. R. E.

**Photometric studies on the methods of Vernes, Kahn, and the Vernes cholesterolated perethynol tests (for syphilis).** G. H. Hufschmidt. *Bull. soc. derm. syph.* Apr., 1933, 679; *Rev. hyg. méd. prévent.* 55, 796(1933).—By photometric methods the Kahn and Vernes reactions may be considerably refined and the results made more accurate. The addn. of 4 mg. of cholesterol per cc. to perethynol did not favor the intensity or rapidity of either of the above reactions. C. R. Fellers

**Colloid-chemical experiments on the swelling of gelatin in serum from gynecological illnesses.** N. M. Mogilevskaya. *Kolloid-Z.* 65, 234-6(1933); cf. Hochloff, *C. A.* 27, 1801.—Swelling changes were detd. by an elastometer at the start, 30, 60, 90 min. and 24 hrs. after immersion in the serum. During the first 90 min. the loss of elasticity is marked for pathol. cases. The method provides a sensitive indicator. Arthur Fleischer

**Chemistry of haptens, especially of "lipoid haptens."** H. Rudy. *Kolloid-Z.* 65, 356-63(1933); cf. *C. A.* 28, 8154.—Review of literature, with bibliography, including definitions, immunological and chem. description of artificial and natural haptens, behavior of haptens with adsorbents, soly. of lipoid haptens, and concealment of haptens by lipoids. Arthur Fleischer

**Urinary albumose and Maillard's coefficient.** André Dufourt and P. Joet. *Compt. rend. soc. biol.* 114, 1114-15(1933).—Ninety tuberculous women aged 16-45 yrs. were examd. No direct relation was found to exist between the albumose content of the urine and the increase in Maillard's coeff. L. E. Gilson

**Antigenic power of a lecithin-diphtheria anatoxin complex.** Cesar E. Pico and Fernando Modern. *Folia biol.* 1, 132-4(1933); *Compt. rend. soc. biol.* 114, 1218-19(1933).—Lecithin decreases the toxicity of diphtheria toxin. Rabbits treated with a mixt. of lecithin and diphtheria anatoxin formed more antitoxin than those given anatoxin only. A precipitin for lecithin was found in the blood of rabbits which had been given injections of lecithin. L. E. Gilson

**Galactose tolerance in normogluceemic and pancreatic diabetics.** S. Battistini and L. Herlitzka. *Minerva med.* 1933, II, 762-5.—Five cases of normogluceemic diabetics were studied for glucose and galactose tolerance and the results compared with previously published results on pancreatic diabetics. The glucometric curve was practically normal, showing no sudden elevation after ingestion of galactose while the galactose curve reached higher values

and was more prolonged. A discussion is given of the probable pathogenesis of this galactose intolerance.

Helen Lee Gruehl

**Aminoacidemic curve in experimental uremia.** S. Cerequa. *Minerva med.* 1933, II, 802-9.—Amino N of blood was studied in dogs before and after ligation of the ureter and also after injection of 10% alanine into normal and ligatured animals. The amino N of ligatured dogs dropped below normal in the first 24 hrs., then rose to a max. a few hrs. before death which usually occurred 48-60 hrs. after the operation. In normal dogs the max. amino N was reached 15 min. after alanine injection with a return to normal in 60 min. while 48 hrs. after ligation the injection of alanine produced higher amino N value which persisted for 60 min. The increased amino N of the blood and its characteristic curve were considered an indication of an altered hepatic function in uremia.

Helen Lee Gruehl

**The pathogenesis of hypoglycemic phenomena.** Enrico Filia. *Minerva med.* 1933, II, 866-71.—A discussion and review of the subject are given.

Helen Lee Gruehl

**Lipuric diabetes and intermediate metabolism.** F. Galdi and C. Cassano. *Arch. ital. biol.* 89, 95-102 (1933).—Report of a case presenting hyperlipemia connected with lipuria. The quantity of lipoids eliminated was not in relation with the changing degree of lipemia.

A. E. Meyer

**Oxidations during fever. Dehydrogenating and oxidizing enzymes in the tissues during fever.** Antonio Spinelli. *Arch. ital. biol.* 89, 103-14 (1933).—Oxidation-reduction processes as well as simple oxidation are increased during fever. The content of oxidizing enzymes in the tissues is increased, with the exception of the liver.

A. E. Meyer

**Phosphatase studies. IV. Serum phosphatase of non-osseous origin. Significance of the variations of serum phosphatase in jaundice.** Aaron Bodansky and Henry L. Jaffe. *Proc. Soc. Exptl. Biol. Med.* 31, 107-9 (1933); cf. *C. A.* 27, 1375, 5092.—Serum phosphatase was decreased by prolonged fasting and increased by the feeding of dextrin; it was increased in about 50 patients with jaundice of liver origin, and the concn. varied directly with the icteric index and with the clinical condition of the patient. In jaundice assocd. with anemia the serum phosphatase was not increased. Evidently the liver and not the blood is the source of some of the serum phosphatase in jaundice.

C. V. Bailey

**Influence of ultra-violet irradiation on glucemia and glucosuria in healthy and in diabetic subjects.** A. Jona. *Minerva med.* 1933, II, 757-62.—Progressively increasing daily irradiations were given to 4 normal persons and 2 diabetics for about 1 month. In the normal cases there was a diminution in glucemia but no noticeable influence on provoked glucemia or glucosuria. In the diabetics while the glucemia and glucosuria were diminished, the general condition became aggravated and the acetoneuria increased.

Helen Lee Gruehl

**Influence of cod-liver oil on the hemolytic complement of human beings.** Thomas W. B. Osborn. *Biochem. J.* 27, 1425-9 (1933).—The injection of a dose of cod-liver oil by 50 exptl. subjects produced, on the av., a rise in hemolytic complement which was greater than that produced by olive oil (cf. *C. A.* 26, 2773).

## H—PHARMACOLOGY

A. N. RICHARDS

Action of theelol (trihydroxyestrin) on uterine fistulas

<sup>1</sup> in the unanesthetized rabbit. Samuel R. N. Reynolds. *Proc. Soc. Exptl. Biol. Med.* 30, 1165-6 (1933).—The time of onset, the duration, amplitude and frequency of rhythmic motility of the uterus after the subcutaneous or intravenous administration of theelol were similar to the effects produced by comparable doses of theelin (keto-hydroxyestrin).

C. V. Bailey

<sup>2</sup> Action of pilocarpine and atropine on uterine fistulas in the unanesthetized rabbit. Samuel R. N. Reynolds. *Proc. Soc. Exptl. Biol. Med.* 30, 1167-8 (1933).—When uterine motility was rhythmic and of marked amplitude, the intravenous injection of 0.6-6 mg. of pilocarpine caused a sustained contraction lasting 1-4 min. and subsequent contractions of increased duration and frequency. The quiescent uterus did not react to pilocarpine; the quiescent uterus in the non-sensitized rabbit did not react to injected protein (cf. *C. A.* 25, 5928). Atropine sulfate, 1-5 mg., had no effect on the quiescent or contracting uterus; it prevented a contractile response to subsequent injections of pilocarpine and caused relaxation of a uterus already contracted under the influence of pilocarpine.

C. V. Bailey

<sup>3</sup> Oxygen and carbon dioxide dissociation studies on blood drawn after intravenous injection of pitressin. E. M. K. Geiling, N. J. Eastman and A. M. De Lawder. *Proc. Soc. Exptl. Biol. Med.* 30, 1168-71 (1933).—For a period of 5-10 min. after the intravenous injection of moderate doses of pituitrin or pitressin, the venous blood becomes rich in O<sub>2</sub> and lactic acid and low in CO<sub>2</sub> content; the O<sub>2</sub> consumption and cardiac output are lowered. In the succeeding 2 hrs. the findings are for the most part abnormally reversed with a gradual return to the basal levels. O<sub>2</sub> and CO<sub>2</sub> dissociation studies of venous blood before and after the injections showed only slight changes which could be attributed to the excess of lactic acid; evidently the phenomena are not due to any interference with the power of the blood to yield its O<sub>2</sub> at a given tension.

C. V. B.

<sup>4</sup> Effect of pitressin and pitocin on oxygen consumption of excised tissue. Morris H. Pincus. *Proc. Soc. Exptl. Biol. Med.* 30, 1171-4 (1933).—The O<sub>2</sub> consumption of fresh liver, heart or diaphragm tissue in the presence of pitressin was detd. in Warburg vessels with Barcroft manometers at 37.5°. Ringer-buffer-glucose and saline-buffer-glucose solns. were used. A low concn. of pitressin increased the O<sub>2</sub> consumption; higher concns. progressively lowered the consumption to a subnormal level. The various tissues had different threshold levels of activity. The results with pitocin were less conclusive. The results do not explain the initial lowering of metabolism produced by the intravenous injection of small doses of pitressin in the intact animal.

C. V. Bailey

<sup>5</sup> Inhibition of hypoglycemic perspiration by spinal anesthesia. Harry Koster and Arthur I. Mirsky. *Proc. Soc. Exptl. Biol. Med.* 31, 135-8 (1933).—Profuse perspiration is an early and prominent symptom of insulin hypoglycemia in man. Spinal anesthesia was induced by neocaine and hypoglycemia by the intravenous injection of 0.1 units of insulin per kg. of body wt.; when the anesthetic area was below the 5th dorsal segment hypoglycemic perspiration occurred only above the area of anesthesia; when skin anesthesia extended above the 5th dorsal segment no visible perspiration occurred anywhere. Lumbar sympathectomy inhibited the sweating of the legs; sweating occurred when 2 or 3 times the insulin dose was given. The low blood sugar stimulates the sympathetic centers in the midbrain directly or indirectly through the adrenals and adrenaline; anesthesia of the sympathetic nerves prevents the transmission of impulses to the sweat glands and perspiration does not occur. With large doses of insulin, circulating adrenaline is markedly increased, the sympathetic nerve endings in the sweat glands are directly stimulated and sweating occurs.

C. V. Bailey

<sup>6</sup> Removal of bromosulfalein from the blood stream by the reticuloendothelial system. R. I. Klein and S. A. Levinson. *Proc. Soc. Exptl. Biol. Med.* 31, 179-81 (1933).—In the dog, 2 mg. of bromosulfalein per kg. of body wt. was injected intravenously; the concn. of the dye in the blood serum was detd. 5 and 30 min. later.

There was a slight but definite retention of the dye after splenectomy and a considerable retention after reticulo-endothelial blockade with India ink which lasted 48 hrs. and disappeared in 3-4 days. The dye is removed from the blood by the Kupffer and the splenic endothelial cells.

C. V. Bailey

Comparative pharmacology of some thiomorpholine derivatives. David I. Macht. *Proc. Soc. Exptl. Biol. Med.* 31, 234-6(1933).—The pharmacology of thiomorpholineethanol and 7 of its esters was compared with that of sulfoxythiomorpholineethanol and 7 of its esters in respect to local anesthetic effect, toxicity and action on blood pressure and respiration. Only the benzoic ester of thiomorpholineethanol showed any appreciable local anesthetic effect, and none of the sulfoxythiomorpholine compds. revealed any definite local anesthetic action. The toxicity of both series of compds. is not very great but the sulfoxythiomorpholine derivs. are in general more toxic than the thiomorpholine derivs.

C. V. Bailey

Glycogen formation after oral administration of mannitol to white rats. Alfred K. Silberman and Howard B. Lewis. *Proc. Soc. Exptl. Biol. Med.* 31, 253-5(1933).—Young white rats, after 24 hrs. without food, were fed solns. contg. 214-505 mg. of mannitol; analyses of the livers after absorption periods of 2-6 hrs. failed to reveal any significant increases in glycogen as compared with controls.

C. V. Bailey

Effect of chaulmoogric acid derivatives on lipolytic activity in vitro. George A. Emerson, Hamilton H. Anderson and Chauncey D. Leake. *Proc. Soc. Exptl. Biol. Med.* 31, 272-3(1933); cf. *C. A.* 27, 4293 and following abstr. —Shaw-Mackenzie (*Med. Press and Circ.* 2, 122 (1920)) found that Na gynocardate activated *in vitro* the lipase of a glycerol ext. of the pancreas. The expts. were repeated with both an aq. ext. and a 60% glycerol ext. of fresh dog pancreas; the former inhibited, the latter apparently slightly activated, the lipolytic activity. The activation was probably an artifact due to the disturbance of equil. brought about by the introduction of a salt or a weak acid into an enzyme reaction system contg. large amts. of free glycerol. If the chaulmoogric acid exerts any indirect action in leprosy therapy, aside from bactericidal action, it is improbable that the fat-splitting enzyme is involved.

C. V. Bailey

Comparative biological activity of seven new water-soluble chaulmoogric acid derivatives. George A. Emerson, Hamilton H. Anderson and Chauncey D. Leake. *Proc. Soc. Exptl. Biol. Med.* 31, 274-7(1933).—On the bases of *in vitro* bactericidal and hemolytic action, intravenous toxicity, tolerance and effectiveness in experimental rat leprosy, Na dichaulmoogryl- $\beta$ -glycerophosphate ("chaulphosphate") appears superior for possible use in the intravenous treatment of leprosy than other representative water-soluble chaulmoogric derivs., such as Na hydncarpate ("Alepol"), K iodidihydrochaulmoograte, Na chaulmoogrylglycinate, Na chaulmoogryl- $\alpha$ -aminobenzoate, diethylethanolammonium chaulmoograte and choline chaulmoograte.

C. V. Bailey

The laxative principle in prunes. George A. Emerson. *Proc. Soc. Exptl. Biol. Med.* 31, 278-81(1933).—The laxative properties of prunes are not due entirely to colloidal or emollient effects in the intestine; they are in part due to the presence of an agent, sol. in water, alc. and pyridine, which increases both tonus and amplitude of contraction. This active principle in certain chem. and physiol. properties is similar to dihydroxyphenylisatin and to caffeic and chlorogenic acids.

C. V. Bailey

Ether hyperglucemia. R. A. Phillips and N. E. Freeman. *Proc. Soc. Exptl. Biol. Med.* 31, 286-9(1933).—Ether hyperglucemia was present but considerably reduced in (1) cats with inactivated adrenals and cut liver nerves, (2) cats completely sympathectomized for 3 weeks and (3) cats sympathectomized 2 weeks and the adrenals removed 7 hrs. before etherization. The expts. rule out a sympathico-adrenal factor and leave the mechanism of ether hyperglucemia unexplained.

C. V. B.

Toxic effect of sodium iodoacetate on trypanosomes. C. V. Smythe and L. Reiner. *Proc. Soc. Exptl. Biol.*

*Med.* 31, 289-92(1933).—Na iodoacetate was highly toxic to *Trypanosoma equiperdum*, *in vitro*. In the infected rat, the injection of 0.2 cc. of a 0.25 M soln. kept the blood free from these organisms for 2-10 days; repeated injections were equally efficacious. The toxicity for rat or trypanosome was not counteracted by thiol compds. Strains of trypanosomes resistant to As were not resistant to iodoacetate. The mechanism of the action of iodoacetate is discussed.

C. V. Bailey

Effect of reticulo-endothelial blockade on blood chemistry. R. I. Klein and S. A. Levinson. *Proc. Soc. Exptl. Biol. Med.* 31, 353-5(1933).—In the dog, the continuous intravenous injection of an 8% suspension of India ink in normal saline caused an immediate decrease in white cells and cholesterol and a rise in blood sugar; the  $pH$ ,  $CO_2$ , and viscosity fell more slowly; there was peripheral vasoconstriction and increased splanchnic activity. After 45 min. there was a change toward normal values. With continued injection the white cells and sugar decreased, non-protein N increased; fatigue and functional paralysis, acidosis and death ensued after 1000 cc. had been injected in a period of 4 hrs.

C. V. Bailey

Comparison of the antipyretic action and toxicity of *d*-glucono- $\beta$ -phenetidine and acetophenetidine. W. E. Hamburger. *Proc. Soc. Exptl. Biol. Med.* 31, 365-7(1933).—The antipyretic action of gluconophenetidine in equinol. proportions was about equal to the action of acetophenetidine when tested on rabbits made febrile with injections of hay infusion. Gluconophenetidine was non-toxic to rats in doses up to 50 g. per kg.; acetophenetidine caused occasional toxic symptoms in doses as low as 4 g. per kg., and was fatal in 3 out of 5 animals with a dose of 6 g. per kg. This indicates a definitely wider range between therapeutic and toxic doses for gluconophenetidine than for acetophenetidine.

C. V. B.

Dinitrophenol hyperglucemia. I. Its independence of asphyxia. V. E. Hall, C. A. Brown and M. Salyun. *Proc. Soc. Exptl. Biol. Med.* 31, 380-2(1933).—In the cat anesthetized with pentobarbital, the intramuscular injection of 20 mg. of 2,4-dinitrophenol caused a rise in rectal temp., respiration rate and blood sugar; in the blood, the  $O_2$  content was unchanged, the  $CO_2$  content decreased, the  $pH$  of the plasma increased. The hyperglucemia is not secondary to a general asphyxia.

C. V. B.

Potassium the adrenalinogenic element. René Hazard. *Compt. rend.* 197, 1455-8(1933).—KCl on intravenous injection in dogs stimulates a true secretion of adrenaline by excitation carried by the splanchnic beyond the ganglions.

Rachel Brown

The behavior of hematoporphyrin in the animal body. Rudolf Hutschenreuter. *Z. physiol. Chem.* 222, 161-76(1933).—Rats subsisting on a meat-free diet tolerate relatively large doses of Nencki's hematoporphyrin, given both orally and intramuscularly, over considerable periods of time. With moderate doses the animals gain in wt. and show no photodynamic effects. Hemateric acid and coproporphyrin normally occur in the feces. After oral administration of hematoporphyrin this substance is found in the feces but not in the urine or blood. On the other hand, it occurs in both blood and urine after intramuscular administration. There is no evidence that hematoporphyrin is converted into hemateric acid. The path of excretion of hematoporphyrin is fundamentally different for oral and intramuscular administration, although in both cases the excretion is nearly quant.

A. W. Dox

The effect of halogen acids and their esters upon yeast cells. P. Cayrol. *Ann. physiol. physicochim. biol.* 9, 999-1102(1933).—A large no. of substances were studied in detail. In general, their inhibiting action upon fermentation is a function of the  $CH_2XCOOR$  group, where X is either Br or I; and at  $pH < 5$ , the inhibition is the same, whether the substance is a bromoacetate, an iodoacetate or an org. ester of the 2 acids. At neutral reaction, the mineral salts of these acids become much less active, while the esters continue to inhibit fermentation. The org. bromoacetates kill the cells in acid reaction; at neutral reaction they exert a sp. inhibition upon fermentation, without affecting cellular multiplication. Their action is

independent of the alc. radical, whether it is aliphatic, cyclic, a poly-alcohol, an ether oxide or whether it contains 1 or 8 C atoms. The R'CHXCOOR type of substance is in general less active, and its activity decreases markedly with increasing size of the R' group. The metabolism and growth of yeast cells in the presence of these substances is studied in detail. There is an extensive bibliography.

Harry Eagle

The effect of corn smut (*Ustilago maidis*). Sv. Sp. Barjaktarović and S. B. Bogdanović. *Arch. expl. Path. Pharmacol.* 173, 381-7(1933).—Fresh aq. exts. of corn smut caused hyperglucemia in rabbits, but inhibit or reverse the hyperglucemia caused by adrenaline. H. E.

The absorption of ethyl alcohol, with special reference to alcohol habituation. Gottfried Jungmichel. *Arch. expl. Path. Pharmacol.* 173, 388-97(1933).—With the Widmark method for the detn. of blood EtOH, it was found that absorption following peroral intake by fasting human beings is complete after 40-60 min. The blood concn. attained, and the time required for the max. value to be reached, are not reliable criteria for the diagnosis of chronic alcoholism. In general, those habituated to EtOH have a lower blood concn. after its ingestion, because of a more rapid combustion.

Harry Eagle

The effect of synthetic thyroxine, diiodothyronine and diiodotyrosine on the gas metabolism of normal and castrated rats. L. De Caro and M. Giani. *Arch. expl. Path. Pharmacol.* 173, 398-404(1933).—Thyroxine and diiodothyronine cause an increased gas metabolism in rats, the effect of the former being relatively more prolonged. In certain doses diiodotyrosine causes a temporary slight increase, followed by a decrease. In general, the response in castrated rats is less pronounced. All 3 substances may cause a decreased metabolism in some animals.

Harry Eagle

The course of absorption of salicylic acid after peroral and rectal application. Wilhelm Blume and Fritz S. Nohara. *Arch. expl. Path. Pharmacol.* 173, 413-30(1933).—After either peroral or rectal application, salicylic acid appears in the blood of rabbits in  $1\frac{1}{2}$ -2 min. and in the urine in 60 min. The curve of urinary excretion after peroral ingestion shows no max., and the total excreted varies between 50% (green vegetable diet) and 70% (carrot diet). There is a sharp max. in the urinary excretion approx. 2 hrs. after rectal administration. The blood concn. in approx.  $\frac{1}{2}$  hr. reaches a max. of 5.4 mg. % after oral, and 8.9 mg. % after rectal, administration.

Harry Eagle

Crystalline insulin. I. The significance of the site of application for the intensity and duration of the insulin effect. M. Bürger and H. Kohl. *Arch. expl. Path. Pharmacol.* 173, 431-8(1933).—The true measure of the insulin effect is not only the degree of hypoglycemia, but its duration: that is, the area embraced by the usual curve of hypoglycemia. So measured, both cryst. and colloidal insulin are more effective upon intraperitoneal than upon intravenous injection. Cryst. insulin is the more effective for intravenous use, and colloidal insulin for intraperitoneal injection. II. Preparation and chemical properties. E. Bruch. *Ibid.* 439-51.—Abel's technique yields cryst. insulin uniformly only if Squibb's insulin is used as the amorphous source material. Abel's results as to analysis, m. p. and cryst. form are confirmed. Upon oxidation with  $K_2Fe(CN)_6$ , 1 mg. of cryst. insulin reduces a quantity corresponding to 0.0509 mg. O, 0.0116 mg. more than is reduced after inactivation of the prepn. in alkali at 95°. The  $NH_2$  liberated and the decreased reducing activity after heating in 0.01 N NaOH do not parallel the degree of insulin inactivation. III. The effect of suboccipital injections of insulin in rabbits. Hans Kohl. *Ibid.* 452-7.—Both cryst. and amorphous insulin are absorbed from the cerebrospinal fluid. Injected suboccipitally into rabbits in doses of 15-100  $\gamma$  per kg. it causes pronounced hypoglycemia, the effect beginning more slowly but lasting longer than after intravenous injection, the total effect being greater. Hypoglycemic convulsions were frequently observed, often after doses

which did not cause convulsions upon intravenous injection.

Harry Eagle

The pharmacology of indium. Hans Steidle. *Arch. expl. Path. Pharmacol.* 173, 458-65(1933).—Indium salts are absorbed only slightly after peroral ingestion by rats, and are correspondingly non-toxic. The M. L. D. after subcutaneous injection into rats is 0.15 mg./kg. The metal is stored in the liver, and is excreted by the kidneys, intestine and skin. In its pharmacol. effects it resembles Al and Hg. The organ most damaged is the kidney.

Harry Eagle

The effect of vagal sympathetic stimulation upon gas exchange in the lungs. H. Becker, M. Hochrein and K. Matthes. *Arch. expl. Path. Pharmacol.* 173, 466-78(1933).—One of the chief causes of anoxemia in deep anesthesia (evipan, morphine, ether) is a disturbance in the O transport from alveolar air to blood. Elec. stimulation of the vagus sympathetic nerves causes an increased O satn. in arterial blood; this is due primarily to the congestion of blood in the lungs and the correspondingly increased respiratory surface. There may also be a direct effect upon the permeability of the capillary walls.

Harry Eagle

The effect of germanin. I. B. v. Issekutz. *Arch. expl. Path. Pharmacol.* 173, 479-98(1933).—Unlike neosarsphenamine or trypanavine, germanin has no effect upon the O consumption of trypanosomes *in vitro*. Moreover, the blood of a rabbit injected with germanin does not inhibit the respiration of the organisms *in vitro*, again unlike neosarsphenamine. That the drug does have an effect *in vivo* is shown by the disappearance of the organisms from the blood of infected rats 16-22 hrs. after injection, by their decreased O consumption 6-9 hrs. after the injection, and by their decreased viability 12 hrs. after the injection. II. The serum of animals cured by germanin contains a trypanocidal substance effective only at room temp., which also decreases the O consumption of the organisms, and which is most active in the first few days after the cure. *Ibid.* 499-507.—Germanin is taken up by circulating organisms in infected animals only in traces, 5-10 mg. % as compared with 24-42 mg. % for serum withdrawn at the same time. Although the drug has no effect upon the O consumption of organisms suspended in Ringer-sheep serum, their virulence is greatly decreased, animals infected with the treated organisms dying in 9-16 days instead of 3-5; however, even exposure for 9 hrs. to germanin does not completely destroy pathogenicity.

Harry Eagle

The mucous membrane and vascular effects of astringents. Gerda Hemmerling. *Arch. expl. Path. Pharmacol.* 173, 536-48(1933).—Tannin,  $Al(OAc)_3$ , and boric acid applied daily for 4 weeks to rabbit oral mucosa cause a characteristic hyperkeratosis, and prevent the inflammation otherwise caused by the application of concd. soap soles. These effects do not depend upon the acidity of the astringent, for HCl causes severe inflammation. Unlike tannin, boric acid was not found to be definitely vasoconstrictor (frog tongue prepn.). The several types of astringents therefore differ in their anti-inflammatory properties.

Harry Eagle

The central effects in veronal-caffeine mixtures. Karl Steinmetzer. *Arch. expl. Path. Pharmacol.* 173, 580-8(1933).—Caffeine and veronal are antagonistic in mice with respect to sleep, convulsions and respiratory paralysis. Caffeine administered in  $\frac{1}{2}$  the dose of veronal may completely prevent the hypnotic effect.

H. E.

The disappearance of local anesthesia by habituation to alcohol. Kitty Balodis. *Arch. expl. Path. Pharmacol.* 173, 589-94(1933).

Harry Eagle

The fate of morphine in the animal body. E. Keeser, H. A. Oelkers and W. Raetz. *Arch. expl. Path. Pharmacol.* 173, 622-32(1933).—After the subcutaneous injection of morphine into guinea pigs, it is most concd. in the kidneys and liver, less in the muscles and blood and least in the brain. After 24 hrs., it is demonstrable only in the kidneys and blood (Fleischmann method of analysis). After daily injections for 3-6 weeks, all the organs contain some of the alkaloid 16-24 hrs. after the last injection. If guinea pigs are injected daily for 4 days, or

mice over a long period, the injected morphine is recovered quantitatively in the excretions (urine and feces) during that period and in the animal body. Morphine is therefore not decomposed in the body in significant quantities.

Harry Eagle

Quantitative studies of various commercial posterior pituitary preparations with respect to their labor-stimulating components. Konrad Schübel and Walter Gehlen. *Arch. expil. Path. Pharmacol.* 173, 642-61(1933).

Harry Eagle

The combination of labor-inducing agents. Konrad Schübel and Walter Gehlen. *Arch. expil. Path. Pharmacol.* 173, 652-61(1933).—Quinine and posterior pituitary ext. have a synergistic action in stimulating contractions in the puerperal uterus of cats. "Gravitol" has neither an additive nor synergistic effect with either quinine or the pituitary ext.

Harry Eagle

The convulsive action of local anesthetics and the effect of mineral salts and adrenaline. F. Eichholtz and G. Hoppe. *Arch. expil. Path. Pharmacol.* 173, 687-96(1933).—The convulsive action of intravenous procaine, tutocaine, cocaine and pantocaine in white rats increases in the order named. It is slightly increased by NaCl, KCl, MgCl<sub>2</sub>, and markedly (45-95%) increased by the previous administration of Ca salts. The addn. of 1:40,000 adrenaline to the anesthetics causes a 2-4-fold increase in their convulsive action and toxicity, and often results in pulmonary edema because of an increased toxicity of the adrenaline itself. The latter effect is not observed with procaine.

Harry Eagle

The effect of insulin upon body temperature. L. Dünner. *Arch. expil. Path. Pharmacol.* 173, 710-21(1933).—Guinea pigs regularly have a fall in body temp. of as much as 2-3° within 1-2 hrs. after the injection of 2-3 units of insulin, not casually related to the hypoglycemia. The hypothermia is caused by the insulin itself, and not by the inert protein; cryst. insulin inactivated by H<sub>2</sub>O<sub>2</sub> no longer causes hypothermia.

Harry Eagle

Fluorescent microscope studies in a case of poisoning with hypnotics. E. Emminger. *Klin. Wochschr.* 12, 1840-2(1933).—The urine, bile and liver contained porphyrin; none of the other organs contained porphyrin demonstrable with the fluorescence microscope.

H. R.

Comparison of cardiazole and coramine in the animal experiment. B. Behrens and E. Reichelt. *Klin. Wochschr.* 12, 1860-2(1933).—In rabbits, cardiazole is the more effective prepn., and more rapidly absorbed after subcutaneous injection.

Harry Eagle

The glycerol treatment of ureteral stones. Heinrich Gissel. *Klin. Wochschr.* 12, 1867-9(1933).—Although glycerol appears in the urine after the ingestion of > 30 g., much larger quantities must be taken before a significant urinary concn. is reached (6% after the ingestion of 200 g.). There is no change in urinary viscosity. Its therapeutic action in cases of ureteral stone would appear to rest upon the increased diuresis and the increased sp. gr. of the urine.

Harry Eagle

Effect of vagotonin on adrenalinic hyperglucemia. D. Santenaise, G. Fuchs, L. Merklen and M. Vidacovitch. *Compt. rend. soc. biol.* 114, 1021-3(1933); cf. C. A. 27, 4590.—Vagotonin, through its effect on the parasympathetic system, brings about a condition such that the usual dose of adrenaline does not produce hyperglucemia.

L. E. Gilson

Variations in intraarterial tension in man during inhalation of amyl nitrite. M. Gaucher, J. Lequime and A. van Bogaert. *Compt. rend. soc. biol.* 114, 1056-7(1933).—The conclusions of Dautrebaude (C. A. 27, 1401) are criticized.

L. E. Gilson

Action of diethylaminomethylbenzodioxan and some related compounds on experimental exophthalmia. L. Justin-Besançon, D. Bovet, D. Kohler and Mme. S. Schiff-Wertheimer. *Compt. rend. soc. biol.* 114, 1082-3(1933); cf. C. A. 27, 4300, 5738.

L. E. Gilson

Action of adrenalin during general anesthesia by tribromomethanol. L. Garrelon and Jean Leroux-Robert. *Compt. rend. soc. biol.* 114, 1086-9(1933).—The injection of ordinary doses of adrenaline into dogs anesthetized

with 0.08-0.35 g./kg. of CBr<sub>3</sub>CH<sub>2</sub>OH does not cause any untoward effects, but if much larger doses of CBr<sub>3</sub>CH<sub>2</sub>OH are used adrenaline may cause cardiac syncope.

L. E. Gilson

Vagotonin and the efficacy of acetylcholine. D. Santenaise, L. Merklen and M. Vidacovitch. *Compt. rend. soc. biol.* 114, 1166-9(1933); cf. C. A. 27, 4589.—In dogs the physiol. effects of acetylcholine are intensified by previous administration of vagotonin.

L. E. Gilson

Curarizing action of bromoacetic acid [on frog muscle]. Miguel Ozorio de Almeida. *Compt. rend. soc. biol.* 114, 1197-1200(1933).

L. E. Gilson

Fetal resorption in animal husbandry. R. B. Hinman. *Proc. Am. Soc. Animal Production* 1932, 282-3(1932).—Subjection of male rabbits to alc. to the point of intoxication for various periods of time before breeding greatly increased the no. of partially and completely resorbed young in the uterus of the female.

K. D. Jacob

Growth and longevity of the white mouse. II. The influence of the continuous administration of vegetable nucleic acid and the intermittent administration of thyroid upon growth and longevity. T. B. Robertson, M. C. Dabarn, J. W. Walters and J. D. O. Wilson. *Australian J. Exptl. Biol. Med. Sci.* 11, 219-35(1933); cf. C. A. 27, 5422.—The growth of mice was decreased by administration of 25 mg. of vegetable nucleic acid daily throughout life, and 3 mg. of thyroid (0.1% 1) for 1, 2 or 3 periods of 28 days. Duration of life was slightly greater than for a control group when one period of thyroid feeding was followed, but fell below the control group when thyroid was fed during 2 or 3 periods.

C. G. King

A case of poisoning with a derivative of barbituric acid. T. J. Orford. *Can. Med. Assoc. J.* 30, 65(1934).—A patient, who had swallowed 18 gr. of "Dial," passed into a state of coma in 1½ hrs. and showed all the signs of barbiturate poisoning; respirations were about 6 8 per min. Coramine, 3 cc., was given intramuscularly about 2½ hrs. after the tablets were swallowed and a cold bath was given. Respirations and pulse improved at once; the patient was kept awake for 4 hrs. and was then allowed to sleep 14. Another 3 cc. of coramine was given and the patient made a complete recovery.

G. H. W. Lucas

Does oxyacanthine, an alkaloid of *Berberis vulgaris*, possess a sympatholytic action? Raymond-Hamet. *Compt. rend.* 197, 1354-7(1933).—Oxyacanthine, an alkaloid which accompanies berberine and berbamine in the bark of the roots of *Berberis vulgaris* L., gives the color reactions of Fröhde, which are characteristic of substances having sympatholytic properties. In dogs, after chloralose anesthesia and double vagotomy in the neck and artificial respiration, this alkaloid has counteracted the action of adrenaline on blood pressure and renal constriction. The amt. necessary for this has varied from 15 to 35 mg. per kg. It has some resemblance to quinine.

G. H. W. L.

The influence of acetylcholine on the blood pressure. G. Pupilli. *Arch. ital. biol.* 89, 1-34(1933).—See C. A. 27, 2497.

A. E. Meyer

The influence of insulin on the skin temperature of the rabbit. R. Sapegno and G. Ceruti. *Arch. ital. biol.* 89, 34-44(1933).—See C. A. 27, 4305.

A. E. Meyer

The action of cocaine on the blood respiration. G. Feloni. *Arch. ital. biol.* 89, 69-75(1933).—Cocainized blood absorbs O<sub>2</sub> more slowly than normal blood. The effect is more pronounced in the blood of oviparous animals than in that from viviparous. The effect is greatest in fresh blood and decreases as the red corpuscles die.

A. E. M.

The action of formaldehyde on erythrocytes, hemagglutination and hemolysis; the transfusion of heterogeneous formalized blood. V. Ducceschi and A. Cardin. *Arch. ital. biol.* 89, 115-30(1933).—The agglutination of human erythrocytes is inhibited by 0.8-1% H<sub>2</sub>CO, but the agglutination returns after lavage with Ringer soln. The agglutination and hemolysis of heterogeneous blood are also inhibited. Transfusions of moderate quantities of such blood are possible.

A. R. Meyer

The influence of hypertonic sodium chloride solutions on the motility of the intestine. Ludovico Dacimo

*Arch. ital. biol.* 89, 131-9(1933).—The introduction of a 20% NaCl soln. into the intestine causes an increase of contractility, if the latter was moderate before. A decrease of the contractions occurs, if they were strong before. The application on the serosa always causes an increased motility.

A. E. Meyer

The action of amino acids on leucocytes and on the glumatic curve. C. Manzini and C. Arullani. *Arch. ital. biol.* 89, 201-12(1933).—Parenteral injections of amino acids showed in rabbits the following influence on the leucocytes: increase by glycine, asparagine, arginine, histidine, cystine, creatinine, alanine and tryptophan; decrease by tyrosine and leucine. Glycine, histidine, tryptophan, cystine and creatinine cause inversion of the ratio between polynuclears and lymphocytes. Cystine causes besides a relative basophilia. The other acids do not change the relative leucocyte count. Arginine, histidine, leucine, glycine and creatinine increase the blood sugar; tryptophan and asparagine decrease it; tyrosine produces an initial increase followed by decrease. Alanine and cystine give changing results.

A. E. Meyer

The influence of creatine on the muscle tonus. F. M. Chiancone. *Arch. ital. biol.* 90, 22-5(1933).—See C. A. 27, 5821.

A. E. Meyer

The distribution of fats introduced into the organism. G. Peretti, L. Reale and L. Cioglia. *Arch. ital. biol.* 90, 59-70(1933).—See C. A. 27, 342.

A. E. Meyer

## 1—ZOÖLOGY

R. A. GORTNER

Role of bacteria in the nutrition of mosquito larvae. The growth-stimulating factor. E. Harold Hinman.

*Am. J. Hyg.* 18, 224-36(1933); *U. S. Pub. Health Eng. Abstracts* 13, Ma, 25 (Nov. 11, 1933).—A summary of 4½ years' research shows that moderate nos. of bacteria in culture media stimulate the growth of mosquito larvae, but excessive contamination invariably destroys the larvae. The autoclaving of culture media renders it unfavorable to larval development. Likewise the killing of bacterial cultures at low temp. destroys the growth-stimulating factor. Bacterial cells killed by HCHO also prevented the development of larvae. The vitamin-like growth stimulator could not be isolated, but was not extra-cellular because the bacterial filtrate failed to stimulate larva development. The factor is probably contained within the bacterial cells. Fungi and yeasts may play a similar role in the nutrition of culicid larvae. Microorganisms of various types have a marked influence in the nutrition and metabolism of invertebrates in supplying elements controlling their life processes.

C. R. Fellers

The copper content, and its variations, of the different organs of the snail. R. Guillemet and A. Sigot. *Compt. rend. soc. biol.* 114, 1041-3(1933).—Analyses are given. The hepato-pancreas is relatively low in Cu and evidently not an organ of storage as it is in vertebrates.

L. E. G.

Distribution of glycogen in the organs of the squid. M. Chaigne. *Compt. rend. soc. biol.* 114, 1103-5(1933).—Glycogen occurs in all the organs. Analyses for different seasons of the year are given.

L. E. Gilson

Detection of copper in snail blood by the electrolytic staining of a protein membrane. M. Chanoz, P. Ponthus and R. Niel. *Compt. rend. soc. biol.* 114, 1109-12(1933); cf. C. A. 27, 2973.—With the method previously described Cu can be detected in 0.05 cc. of snail blood.

L. E. Gilson

The colorimetric determination of the pigment content, carotenoids and flavones, of eggs of various species of silk worms and their hybrids. Carmela Manunta. *Boll. soc. ital. sper.* 8, 1278-82(1933).—Flavones were not present in *Awjiku-F.* 936; K. N.<sub>12</sub>; K. N.<sub>22</sub>; flavones were present in traces only in R.<sup>III</sup>; K. N.<sub>1</sub>; SB 333; F 367; A. L. III; and K. N.<sub>7</sub>. Carotenes were not present in F 789; K. N.<sub>12</sub>; S. V. 6<sup>III</sup>; V. W. 333; A. V. 222. Xanthophyll was present in all the species.

Peter Masucci

Leucopterin, the wing pigment of common white butterflies (Wieland, *et al.*) 10. Pterins in wasps and butterflies (Schöpf, Becker) 10.

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

Food values and their practical application in dietetics. J. A. Nixon. *Brit. Med. J.* 1934, I, 1-4.—A lecture.

J. B. Brown

Fluorescence comparisons in the examination of food. John Muir. *Food* 3, 9-10, 95-8(1933).—A brief description of the Muir Ultra-Violet Comparator together with a no. of typical examples of its application to the examn. of various foodstuffs.

A. Papineau-Couture

Determination of small quantities of tin in foodstuffs. H. Cheftel and Mme. J. Blass. *Ann. fals.* 26, 528-31(1933).—Take 1-2 g. of drained canned goods, dry at 100° on an ashless filter, place in a 100-cc. Pyrex flask (for liquid goods, introduce 1-2 cc. directly into the flask), destroy org. matter with 1 cc. concd. H<sub>2</sub>SO<sub>4</sub> and repeated addns. of 1 cc. concd. HNO<sub>3</sub>, heating to SO<sub>2</sub> fumes between each addn. of HNO<sub>3</sub>, cool, dil. to 4 cc., add 0.1 cc. concd. HCl and 1 drop of 0.5 N NiSO<sub>4</sub>, reduce by gentle boiling with 4 successive addns. of 0.1 g. Zn, while passing CO<sub>2</sub> through the soln., cool, while maintaining the current of CO<sub>2</sub>, add 2-3 cc. 0.004 N I (measured with a microburet), titrate with 0.004 N Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> from a microburet, adding 1 cc. of Tromsdorff's indicator (20 g. ZnCl<sub>2</sub>, 4 g. starch and 2 g. ZnI<sub>2</sub> per l.) toward the end of the titration. Titrations on 0.2-0.5 mg. Sn, with and without addn. of sucrose, Fe and (or) Pb, showed an error of ±3.5%. When Pb was first detd. on the same sample

as Sn (Macheboeuf, C. and B., C. A. 26, 4886-7), the error increased to -4.5 to -6.2%.

A. P.-C.

The microbiology of frozen foods. Lawrence H. James. *Ice and Cold Storage* 36, 150-1, 173-4(1933).—The type of the microorganism and the type of food material in which the microorganism is frozen det. the degree of survival. Fats and sugar soln. have a protective action on the microorganism during freezing, while acid materials produce a greater killing.

A. H. Johnson

Conserving food value, flavor and attractiveness in cooking vegetables. Rosemary Loughlin. U. S. Dept. Agr., *Circ.* 265, 1-12(1933).—General.

C. R. Fellers

Correlations between commercial and laboratory milling tests. C. H. Bailey and M. C. Markley. *Cereal Chemistry* 10, 515-30(1933).—If baking methods are used which tend to eliminate variations in diastatic activity, there is a correlation between the baking qualities of commercially and experimentally milled flours from the same wheat.

L. H. Bailey

Report of the 1932-33 committee on the standardization of laboratory baking. W. F. Geddes, *et al.* *Cereal Chemistry* 10, 531-2(1933).—The report includes recommendations for further study.

L. H. Bailey

Comparison of various baking formulas used in testing wheat quality for the plant breeder. R. K. Larmour, W. F. Geddes and A. G. O. Whiteside. *Cereal Chemistry*

10, 601-4(1933).—The malt-bromate-phosphate formula gave the greatest range of loaf vol., 335-500 cc.

L. H. Bailey

Further experiments with the "short fermentation method" in laboratory test baking. R. M. Sandstedt and M. J. Blish. *Cereal Chemistry* 10, 605-12(1933).—When baking experimentally milled flours by the short method (1½ hrs. fermentation) the use of 1% sugar and 0.5 mg. of KIO<sub>3</sub> will give baking characteristics (exclusive of crumb color) closely resembling those obtained when the same flour has been milled on a com. unit, given an av. bleaching and maturing treatment, and then baked by the short fermentation method with no sugar and no iodate.

L. H. Bailey

The wheat-meal fermentation time test. H. K. Wilson, M. C. Markley and C. H. Bailey. *Cereal Chemistry* 10, 619-20(1933).—A table shows correlation coeffs. between various baking characteristics and wheat-meal fermentation time test.

L. H. Bailey

Variability in experimental baking. I. Effect of mechanical mixing devices, time of dividing doughs and quantity of dough mixed on loaf characteristics. Ray Weaver, Philip Talbott and D. A. Coleman. *Cereal Chemistry* 10, 612-16(1933).—In mixing expts., the Hobart-Swanson mixer is preferred to the Hobart. Doughs mixed from 200 g. flour and divided immediately showed advantages over the doughs that were mixed and carried as a single dough until time of panning. Less variability in loaf vol. was shown when 200 g. doughs were mixed and then divided than when mixed as 100 g. doughs.

II. Yeast variability. *Ibid.* 617-18.—A table shows the effect of age and brand of yeast on loaf vol. values from 50 replicate bakes—first clear flour. III. The influence of experimental milling in evaluating wheat strength. W. F. Geddes, H. N. Bergsteinsson and S. T. Hadley. *Ibid.* 555-9.—Variations in flour characteristics due to exptl. milling must be considered in evaluating wheat strength. Correlations computed between loaf vol. and the scores assigned for crumb color and texture, while not of great magnitude, were pos. and significant. The correlation between texture and crumb color was of greater magnitude, this showing that the scoring of bread for crumb color is strongly influenced by differences in pore size.

IV. Studies on mixing, sheeting rolls, pan shape and 50- and 25-gram formulas. W. F. Geddes and L. D. Sibbitt. *Ibid.* 560-84.—There is less gluten modification by mechanized procedure than by hand treatment. The work indicates that it is necessary to conduct duplicate bakings on sep. mixings to secure a valid error for the estn. of significant differences between flour samples. Different characteristics of flour can be studied by small loaf baking tests.

L. H. Bailey

Diastatic supplements for the A. A. C. C. baking test. Quick Landis and Charles N. Fry. *Cereal Chemistry* 10, 388-92(1933).—Tables, formulas and discussion about adequately maintaining the sugar level in standard test baking.

L. H. Bailey

Studies on the A. A. C. C. standard baking test as applied to the testing of whole wheat flours. R. T. Bohn and F. D. Machon. *Cereal Chemistry* 10, 533-44(1933).—The A. A. C. C. standard baking test formula was used. Fermentation: 1st, punch 90 min.; 2nd, punch 45 min.; to pan 15 min., proof 35 min.

L. H. Bailey

Testing biscuit and cracker flour. J. A. Dunn. *Cereal Chemistry* 10, 628-31(1933).—Tests should include protein, ash, moisture, viscosity and the differential modified Werner test.

L. H. Bailey

The results of bleaching Michigan soft winter wheat cake flours by the Brabender electric bleaching apparatus. G. L. Alexander. *Cereal Chemistry* 10, 623-6(1933).—With this method there is a moderate whitening of the flour color, and a slight oxidizing effect on the gluten, starch and fatty constituents.

L. H. Bailey

Tests for biscuit and salt-rising flours. H. G. Walter. *Cereal Chemistry* 10, 635-41(1933).—Further work is suggested to include studies on shortening, temps. of doughs and absorption.

L. H. Bailey

The inorganic constituents of wheat and flour. B. Sullivan. *Cereal Chemistry* 10, 503-14(1933).—The av. analyses of the elements found in wheat, flour and bread (dry basis) are:

Constituents	Wheat	Patent Flour	Bread
Total Ash	1.85%	0.45%	2.77%
K	0.571%	0.168%	0.200%

Selected bibliography.

L. H. Bailey

Cake-baking method for testing soft wheat flours. L. H. Bailey. *Cereal Chemistry* 10, 627-8(1933).—A standard procedure is described including supplementary tests for sugar and shortening tolerances. For exptl. flours the sugar is reduced by 5% and the water by 10% of that in regular formula.

L. H. Bailey

Tentative formula for testing cake flour. Laura K. Track. *Cereal Chemistry* 10, 632-4(1933).—Comparative results are shown when a tentative formula is compared with a more lean formula.

L. H. Bailey

A mechanical method for the determination of absorption in bread doughs. C. C. Fifield. *Cereal Chemistry* 10, 547-54(1933).—Absorption figures as detd. by the supercentrifuge did not closely agree with those obtained by the "touch" method.

L. H. Bailey

The effects of ammonium phosphate on loaf volume. R. K. Larmour and S. F. Brockington. *Cereal Chemistry* 10, 599-601(1933).—The quantity of (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub> superimposed on the malt-bromate formula to produce the best results was 0.1%.

L. H. Bailey

Scoring crumb grain. C. H. Bailey and M. C. Markley. *Cereal Chemistry* 10, 545-7(1933).—Bread crumb from 13 loaves was scored by 6 collaborators with and without reference to crumb standards. Better correlation was secured when the standards were used.

L. H. Bailey

Some relationships between sugar, diastatic malt extract and potassium bromate in the baking formula. R. K. Larmour and S. F. Brockington. *Cereal Chemistry* 10, 593-8(1933).—As a general optimum formula for detg. strength, the authors have chosen tentatively the 0.001% bromate, sugarless dough contg. 0.5% malt ext. (200° Lintner).

L. H. Bailey

Phosphoric acid [fertilizers] and baking quality [of flour]. J. Lemmerz. *Phosphorsäure* 3, 589-93(1933).—Investigations relating to the effect of P fertilizers on the baking qualities of flour are briefly reviewed. Twelve references.

K. D. Jacob

Experimental use of dried yeast for baking bread. N. N. Ivanov and Ph. L. Trainina. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 110-19(1933).—A carefully dried top yeast with good initial leavening power still retained 75% of this leavening power after drying, and storage for 6 months in glass at room temp. caused no further loss in potency.

Julian F. Smith

Making bakers' yeast from sulfite liquor. L. N. Gurfein and V. Ya. Chastukhin. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchevoi Vneshnei Prom.*, No.

9, 35 pp. (1932).—Sulfite liquor, if neutralized and enriched in nutrients yielding N and P, is an excellent medium for cultivation of bakers' yeast. Heating for 1 hr. with steam after neutralization increases the sugar content; excessive heating destroys the sugar. The optimum sp. gr. of the liquor is 1.050–1.060; higher concns. introduce plasmolytic effects. Yield depends on degree of aeration and may be 40–100% of the sugar. The yeast which is produced has a relatively high dry matter content, namely 29.6%. Yeast production is one of the most profitable means for biochem. utilization of sulfite liquor.

Julian F. Smith

**Yield and composition of milk from Aberdeen-Angus cows.** L. J. Cole and Ivar Johansson. *J. Dairy Sci.* 16, 565–80 (1933).—Lifetime records on milk production are presented for 7 purebred Aberdeen-Angus cows and compared with those for 2 Jersey and 6 Holstein-Friesian cows kept and fed under the same conditions. Because of a lower rate of milk secretion and a shorter lactation period the av. yield (3100 lbs.) per lactation period from Aberdeen-Angus cows was lower than that from the other breeds. Individual cows, however, may be found which yield equally as high as low- or medium-producing Jerseys. Butter fat averaged 4.06% and protein 3.56%, both decreasing slowly with increasing age of the cow. The av. fat content of the milks decreased in the following order: Jersey, Aberdeen-Angus, Holstein. The Aberdeen-Angus milk contains nearly the same amt. of ash and lactose as Jersey milk.

H. K. Salzberg

**Milk-energy formulas for various breeds of cattle.** O. R. Overman and W. L. Gaines. *J. Agr. Research* 46, 1109–20 (1933).—Formulas were derived for detg. the energy content of milk from the analysis. From a large no. of analyses of milk from Ayrshire, Guernsey, Holstein, Jersey and crossbreds the following energy values were found: fat,  $9.253 \pm 0.065$ ; protein,  $5.853 \pm 0.127$ ; and lactose,  $3.893 \pm 0.059$  cal. per g. While different breeds show slight differences, the formula  $4\%$  milk =  $0.4 M + 15F$ , in which  $M$  = wt. of milk and  $F$  = wt. of fat in the same units, is sufficiently accurate for practical purposes. One kg. of 4% milk = 750 cal. Whole milk usually contains between 43 and 49 mg. of protein per cal. of total energy. Feeding standards for dairy cattle may be detd. from the energy and protein content of the feed, and its digestibility coeffs. alone.

A. L. Mehring

**The enzymes of cow milk.** R. G. Lapsley. *Chem. Eng. Mining Rev.* 26(7), 99–101 (1933).—Enzymes normally present in cow milk are: galactase, a protease, amylase, peroxidase, catalase and reductase. Three tests are given for peroxidase. Its importance and that of catalase and reductase are noted. The peroxidase and reductase enzyme systems in milk afford an example of a typical bio. oxidation-reduction system.

W. H. Boynton

**A new method for determining the protein content of milk.** Luscar Buruiana. *Lait* 13, 1214–21 (1933).—A colorimetric method based on the reaction between  $\text{HNO}_3$  and protein is described for detg. the protein or casein content of milk. One cc. of milk is introduced into a test tube after which 6–7 cc. of concd.  $\text{HNO}_3$  is added. The test tube is closed with a rubber stopper equipped with a condenser. The liquid in the tube is boiled for 2 min., cooled and transferred to a 50-cc. graduated flask. The acid is neutralized with 40% caustic, cooling continually during the neutralization, and the liquid made to vol. and filtered. Color comparison is then made in a colorimeter, a standard casein soln. or a dichromate-permanganate standard (18.6 cc. of 0.1 N  $\text{K}_2\text{Cr}_2\text{O}_7$  plus 2.7 cc. of 0.1 N  $\text{KMnO}_4$  made to 100 cc.) being used. If the temp. is kept low enough in conducting the test, material other than protein in milk will not interfere. The concn. of protein used in the test should not exceed 70 mg. per 100 cc. Color comparison should be made within 15 min. after neutralization, as the color changes. The method has the advantages of being simple, exact and accurate.

A. H. Johnson

**A decade and a half of soft-curd milk studies.** Rueben L. Hill. *Utah Agr. Expt. Sta., Circ.* 101, 2–14 (1933);

cf. C. A. 26, 218.—The "curd-o-meter" and technic used in the Hill curd test are described. Goat milk is harder curded than cow milk, and shows a curd tension variation of 20–250 g. The curd from goat milk is granular in nature rather than rubbery as in cow milk. Pasteurization has little effect on curd hardness, but boiling softens the curd. Evapd. milks are soft curded because of the heat treatment they receive during sterilization. Homogenization of milk softens the curd to some extent. Digestibility of cow milk is almost inversely proportional to the curd hardness. Soft-curd milk is normal milk; it is unrelated to mastitis or other diseased condition in most cases. Hard-curd milk is preferable for the manuf. of cheese. The literature is critically reviewed.

C. R. Fellers

**Soft-curd milk and mastitis.** R. C. Welch and F. J. Doan. *Milk Plant Monthly* 22, No. 11, 30–6 (1933).—The curd tension of normal milk and the casein content showed a correlation, but such correlation was not perfect. The curd tension of milk from infected udders and the casein content also exhibited this relationship, the correlation being still less marked and the curd tension values being lower than for normal milk. The chief reason for lower curd tension in samples from infected udders was apparently the low casein content. The fact that a certain milk was low in curd tension was not evidence that it came from a diseased udder.

A. H. Johnson

**Inversion of sucrose in the manufacture of sweetened condensed milk.** Carl E. Haradine. *Natl. Butter Cheese J.* 24, No. 19, 7, 41; No. 20, 7, 16; No. 21, 16–20 (1933).—The development of the brown color of sweetened condensed milk was attributed to the formation of humin due to reactions between protein or amino acids and sugars. The preheating temp. used in the manuf. of sweetened condensed milk had little effect upon the brown coloration while temp. of storage had marked effects on the rate of its development. High storage temp. (e. g.,  $100^\circ \text{F}$ .) allowed rapid development of the brown color while at storage temp. below  $68^\circ$  the brown color formed slowly. Use of invert sugar sirup as a substitute for cane sugar in sweetened condensed milk caused a brown discoloration. It is suggested that the inversion of sucrose is responsible for the brown discoloration, this not being evident to the eye until 25% of the sucrose has been inverted. The crit. temp. at which the brown coloration develops is  $80\text{--}90^\circ \text{F}$ . The presence of Fe salts was found to facilitate the development of the brown color.

A. H. Johnson

**A comparative physiological evaluation of milk powder.** E. S. London, A. I. Kolotilov, R. M. Kutok, A. C. Gagina and N. I. Shokhor. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 121–40 (1933).—Parallel feeding tests (dogs) were made with cow milk and milk powder contg. protein 25.1, fat 26, carbohydrates 36.6, water 4.8 and ash 4.8%. Digestion expts. showed a slower rate for milk powder, evidently due to the different phys. condition; but food value and digestibility of the powder compare favorably with fresh milk. The protein was 94.6% assimilated in milk powder, 96% in fresh milk; but the digestion was slower in the powder than in fresh milk.

Julian F. Smith

**Freezing point of milk.** Hortvet method. Ernest V. Jones. *Analyst* 59, 29 (1934).—In the *Methods of Analysis of the A. O. A. C.*, no mention is made of the necessity of removing the freezing starter from the app. before tapping the thermometer. With the starter in place, it is often difficult to get a const. zero reading, possibly because the thermometer strikes the starter.

W. T. H.

**Higher aging temperatures in the manufacture of ice cream.** W. S. Mueller. *Mass. Agr. Expt. Sta., Bull.* 302, 2–16 (1933); C. A. 27, 3538.—In an ice cream mix contg. gelatin, the efficiency of the gelatin was increased by aging 4 hrs. at  $20^\circ$  whether this was followed by aging at a lower temp. or not. This increased gelatin efficiency was evidenced by improvement in body and texture, increase in melting resistance and a slight retardation in rate of whipping. Only  $\frac{1}{4}$  the usual amt. of gelatin was necessary when the aging was for 4 hrs. at  $20^\circ$ . No measurable effect occurred on bacteria,  $\text{pH}$ , or titratable

acidity of the mix. An ice cream mix contg. gelatin showed a slight decrease in viscosity when aged for 4 hrs. at 20° but a marked increase when this initial aging period was followed by 20 hrs. at 3°. The effects of high-temp. aging could not be correlated directly with basic viscosity values. High-temp. aging had no significant effect on the consistency and whipping ability of the mix or on the melting resistance, body and texture of the finished product when the ice cream mix contained no gelatin or other stabilizer. Unless the gelatin content of the mix was reduced by 25%, excessive retardation in melting and a curdled appearance resulted, if aging occurred at 20° for 4 hrs.

C. R. Fellers

Effect of lipins and of sulfonation of unsaturated fats on certain modified Babcock tests of fat in buttermilk. Emerson W. Bird. Ia. Agr. Expt. Sta., *Rept.* 1932, 49-50; cf. *C. A.* 26, 4386.—A comparison of values for the percentage of fat in the same samples of buttermilk by the Mojonniier, the Babcock, the Am. Assocn. and the Minn. tests yielded: 0.7191, 0.232, 0.652 and 0.513, resp. Analysis of the fatty substances from these tests show good agreement in I value, 44-8, a value which negatives the possibility of sulfonation of unsatd. fats in the Babcock test.

C. R. Fellers

An aid to the reading of Gerber milk-fat tubes. E. B. Grayson. *Analyst* 59, 29(1934).—From a light-tight box, which is a little taller than the Gerber tube and not over 3 in. wide, remove one face and replace with glass, of which the inner side is covered with grease-proof paper. Place an ordinary elec. light bulb in the box. Hang the box on the wall at a convenient height, forming a translucent window. Hold the Gerber tube about 1 in. from the glass.

W. T. H.

Amyl alcohol as a source of error in the Gerber test. B. L. Herrington. *J. Dairy Sci.* 16, 557-8(1933).—Fat values obtained by the Gerber test may average 0.6-1.5% higher than by the Babcock test, depending upon the particular isomeric AmOH used. Fusel oil AmOH, b. 128-32°, is recommended. H. K. Salzberg

The automatic acidity tester of the "Fermiers Reunis." Jean Pien. *Lait* 13, 1222-9(1933).—The acidity of milk is used as a criterion as to whether or not the milk can be accepted for pasteurization. The present methods of detg. milk acidity are so slow that they cannot be used commercially. Hence milks are accepted or rejected by their odor. As such a method is subject to so much personal error, an app. has been devised by which the experienced tester can det. the acidity of milk at the rate of 300 samples per hr. The app. consists of a small pump and piston by which measured dosages of standard alkali can be ejected into measured quantities of milk. If the dosage of standard alkali turns the phenolphthalein pink or red, the milk is accepted. If the milk contg. phenolphthalein remains white, the milk is rejected. A. H. J.

The workmanship of butter. R. M. Washburn. *Natl. Butter and Cheese J.* 24, No. 20, 8, 24-6(1933).—The workmanship of butter is discussed in relation to the constituent fats, the color and the manner in which the moisture is held.

A. H. Johnson

The microscopy of food products. II. Butter and margarine. Chas. H. Butcher. *Food* 3, 99-101(1933); cf. *C. A.* 28, 2178.—A brief description of the examn. of butter under the microscope, explaining more particularly the characteristics which may reveal the presence of foreign fat or which may distinguish between fresh and renovated butter.

A. Papineau-Couture

Autoxidation of fats and oils to be used for the manufacture of margarine. C. Wolf and Germaine Martin. *Lait* 13, 1201-14(1933).—Fats which have been subjected to oxidation undergo an increase in acidity, a decrease in I no. but no change in m. p. The induction periods of the different vegetable and animal fats are variable. The animal fats, peanut oil and cottonseed oil have short induction periods. Coconut fat and hydrogenated oils have very long induction periods. The addn. of water to a fat appears to prolong the induction period.

A. H. Johnson

A new method of determining glycerol in egg yolk.

Kai Ho and Tzu-Hui Cheng. *J. Chinese Chem. Soc.* 1, 199-207(1933).—Dry 5 g. egg yolk at 55° under 25-in. vacuum for H<sub>2</sub>O detn., and ext. the dried residue with acetone. After evapn. of the acetone, ext. the oil and fat in the residue with petroleum ether, and obtain the percentage of glycerol by difference.

Wm. H. Adolph

Guide for laboratories in meat-curing establishments. I. A. Oberhard. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchevoi Vkusovoi Prom.*, Separate, 1931, 36-41.—Brief instructions are given for detn. of sp. gr., nitrites, nitrates, color and  $p_H$ , and for detection of Al. Needed items of app., reagents and materials are listed.

Julian F. Smith

Experimental study of the problem of salt pork production. L. M. Horovitz-Vlasova. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchevoi Vkusovoi Prom.*, Separate, 1931, 6-35.—Red staining of salted meat occurs only when nitrates in the brine are reduced by denitrifying bacteria. "Ripening" of brines is merely accumulation of nitrites and org. matter due to bacterial growth. Reddening can occur at nitrate concns. as low as 0.2%; com. brines use about 2% KNO<sub>3</sub>, which is injurious to muscle fiber. Addn. of 1% of a neutral phosphate helps to retard the transfer of phosphates and protein products from the meat to the brine. Most of the NaCl penetration occurs in the first week; nitrites and nitrates have little effect on the penetration process. Addn. of 0.1% NaNO<sub>2</sub> to the brine, instead of KNO<sub>3</sub>, eliminates the tedious "ripening" process and is harmless. Gas formation in brines is due to *B. halobius n. sp.*, an obligative halophile organism which reduces nitrates to nitrites, then to N<sub>2</sub>. A method is described for clarifying and decolorizing spent brines with AlCl<sub>3</sub>. Much improvement in meat curing can be accomplished by application of these findings under strict lab. control.

Julian F. Smith

Experimental study of the so-called sliminess of salt pork. L. M. Horovitz-Vlasova and M. I. Livshitz. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchevoi Vkusovoi Prom.*, Separate, 1931, 42-6.—The organism causing sliminess in cured pork was found to be a lipolytic coccus and was named *Micrococcus lipolyticus*. Prevention is best accomplished by strict antiseptic control in slaughtering, prepg., curing and storing the meat.

Water for brines should be boiled. Storage should be at 5° or lower, with not over 70% relative humidity. Cf. following abstr.

Julian F. Smith

Problem of lipolytic bacteria. L. M. Horovitz-Vlasova and M. I. Livshitz. *Izvestiya Tsentral. Nauch.-Issledovatel. Inst. Pishchevoi Vkusovoi Prom.*, Separate, 1931, 56-66.—The organism causing sliminess in cured pork, *M. lipolyticus*, resembles *M. albus* and *flavus liquefaciens*, occurring in air and in river water but never tested for lipolytic action. A statement of lipolytic action or its absence would be helpful in descriptions of bacteria. The Kreis test is pos. in any liquid contg. a trace of nitrite and is not reliable for the usual bacteriol. tests. Cf. preceding abstr.

Julian F. Smith

Signs of incipient meat spoilage. B. I. Guterman. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 53-84(1933).—For the chem. detection of incipient spoilage in beef the Eber test, performed with suitable precautions, is the most rapid and convenient; a pos. test agrees quite accurately with the accumulation of 0.016-0.02% NH<sub>3</sub> (detd. by the Folin method). The litmus test is about as accurate, but less convenient. The MgO test is too sensitive, often being pos. even in fresh-killed meat. Titrating the amino acids with formol gives a measure of the extent of decay, but the accuracy is low. Viscometry of aq. exts. is sufficiently accurate; viscosities higher than 1.01 (water = 1) indicate incipient spoilage. The urea test has more theoretical than practical significance, because of its relations to the problem of chem. structure of proteins. Tests for other meats than beef (e. g., mutton, pork, fish) are needed. No method involving water extn. is suited to rapid or routine testing.

Julian F. Smith

The Voges-Proscauer reaction in spent brines. L. M. Horovitz-Vlasova and I. A. Oberhard. *Izvestiya Tsentral.*

*Nauch.-Issledovatel. Inst. Pishchevoi Vkusovoi Prom., Separate, 1931, 47-9.*—Spent meat-curing brines give a pos. Voges-Proscauer reaction because of the presence of AcMeCHOH (identified by qual. tests and by the m. p. of its osazone), formed by the action of *B. mesentericus vulgaris*, *B. corrugatus* and other organisms commonly occurring in the brines. Julian F. Smith

**Determination of fish fats in oil sardines.** Gulbrand Lunde and Erling Mathiesen. *Z. Untersuch. Lebensm.* 66, 435-44(1933).—Methods for the detn. are fully given and the general subject discussed, with literature references. Methods for the estn. of olive oil in the presence of fish fats are also given. F. L. Dunlap

**Influence of carbon dioxide on the keeping quality of fruits.** V. S. Zagoryanskii. *Schriften zentr. biochem. Forschungsinst. Nahr.-Genussmittelind.* (U. S. S. R.) 3, 141-93(1933).—Expts. were made with various concns. of CO<sub>2</sub> surrounding apples, pears, oranges and grapes as a means of inhibiting mold growths. Good results were obtained a little above ordinary atm. concns., but high CO<sub>2</sub> concns. were harmful. Paper wrappings serve to accumulate CO<sub>2</sub> from the respiration of the fruit, and also to prevent transfer of moisture from one fruit to another. At temps. near 0° the respiration of the fruit is still sufficient to build up mold-inhibiting concns. of CO<sub>2</sub>, in presence of which the natural aging processes are also retarded. Some molds are more sensitive than others to CO<sub>2</sub>. As practical expedients for long keeping of fruits in storage, removal of accumulated CO<sub>2</sub> by ventilation should be avoided, and the fruit should be wrapped or packed to minimize the escape of the CO<sub>2</sub> given off in respiration. Julian F. Smith

**Influence of gassing with hydrocyanic acid on fruit.** Ferdinand Beran. *Z. Untersuch. Lebensm.* 66, 317-21(1933).—Various types of apples and pears were gassed with Zyklon-B and pure HCN. The HCN content of the gassed fruit was detd. and the influence observed of various lengths of gassing, for cyanide retention. F. L. Dunlap

**Cold storage of apples.** W. J. Williams. *Ice and Cold Storage* 36, 177-8(1933).—Biochem. and biophys. considerations involved in the storage of apples are discussed. A. H. Johnson

**The identification of whortleberry juice.** W. Diemair and G. Lix. *Z. Untersuch. Lebensm.* 66, 540-4(1933).—The Plahl blue coloration of whortleberry juice and of red wine adulterated with it depends in part on the presence of substances which are formed during the course of the reaction. Phloroglucinol, furfural and protocatechuic acid have been identified with certainty. Fe and metallic ions are responsible for the pos. result of the color reaction. F. L. Dunlap

**Analytical study of pure concentrated grape juice of Algerian origin.** J. H. Fabre and E. Bremond. *Ann. fals.* 26, 531-43(1933).—Addn. of small amts. of SO<sub>2</sub> reduces the possibility of premature fermentation, but can easily impair the flavor. Liability to crystn. of glucose can be reduced by careful filtration before and after concn. Crystn. of K bitartrate during concn. is inevitable and apparently facilitates crystn. of glucose. There seems to be no definite sugar concn. that absolutely ensures against incipient fermentation; a juice contg. 495 g. total sugars per l. contained 4.75% EtOH by vol., and one contg. 804 g. sugar contained 0.4% EtOH. Crystn. of considerable amts. of glucose was observed with a concentrate contg. only 623 g. total sugars per l. In the natural musts, the sugars consist of 50-52% levulose and 48-50% glucose; in the concentrates they consist of 51-56% levulose and 44-49% glucose. Fraudulent addn. of glucose is readily detected; the juice or concentrate contains sufficient acidity to invert rapidly any sucrose that might be added, and the levulose-glucose ratio would be practically unchanged. The acidity does not increase proportionally to the degree of concn., because of pptn. of K bitartrate. In a 3- to 5-fold concn. of a juice that was originally sulfited, 80-95% of the total SO<sub>2</sub> and 95-98% of the free SO<sub>2</sub> are eliminated. The Fe content of the original juice remains integrally in the concentrate, and may be in-

creased by soln. of Fe from the equipment, particularly in sulfited or very acid juices; Fe contents of 0.015-0.201 g. per l. (av. 0.121) were found in 17 com. samples. The following standard is suggested: alc. not over 0.5% by vol., total SO<sub>2</sub> not over 0.5 g. per l., total Fe not over 0.080 g. per l.; prohibition of adding any saccharine product; total reducing sugars and total acid (as H<sub>2</sub>SO<sub>4</sub>) should be stated on the labels and invoices. A. Papineau-Couture

**The detection of unheated fruit juice.** J. F. Reith. *Pharm. Weekblad* 70, 1358 61(1933).—The benzidine reaction for peroxidase is recommended for detg. whether fruit juice beverages have been heated. The max. blue color is obtained in 30-60 min. at pH 5.0 (Na acid phthalate buffer) with 0.01% H<sub>2</sub>O<sub>2</sub> and 0.1% benzidine. A. W. Dox

**The physicochemical properties of pectin.** Preliminary report. Paul B. Myers and G. L. Baker. *Del. Agr. Expt. Sta., Bull.* 179 (Annual Rept. for Year Ending June 30th, 1932), 28-9(1932); cf. *C. A.* 23, 5716.—A series of pectins was extd. from citrus albedo at 40°, 60°, 80° and 100° and subjected to phys. and complete chem. examn. Galacturonic acid made up 87.2-95.18%, AcOH 2.19-5.3 and MeOH 7.83-12.75% of the purified pectin. The more severe the hydrolysis (by heat) the more the pectin mol. breaks down, except that galacturonic acid remains approx. const. It is thus possible to have a pectin of low jellying power with a high percentage of pectic acid. The ratio of CO<sub>2</sub> to furfural was 0.982-1.11 which is taken as an indication that the pectin mol. contains arabinose. Insufficient data are at hand accurately to det. the arabinose. C. R. Fellers

**Philippine rice-mill products with particular reference to the nutritive value and preservation of rice bran.** Augustus P. West and Aurelio O. Cruz. *Philippine J. Sci.* 52, 1-76(1933).—A general résumé with many references to the literature. The topics covered are: rice cultivation; rice straw; Philippine process of milling rice; rice starch; rice hulls; polished and unpolished rice; nutritious parts of the rice grain; rice bran; rice-bran oil (rice oil); vitamins in rice bran; proteins and mineral constituents; nutritive value of rice bran; deterioration of rice bran; preservation of rice bran. F. L. Dunlap

**Effect of inoculation on the quality, chemical composition and bacterial flora of sauerkraut.** Carl S. Pederson. *N. Y. Agr. Expt. Sta., Tech. Bull.* 216, 3-21(1933); cf. *C. A.* 27, 349.—The addn. of a starter to shredded cabbage when packed for fermentation is of doubtful value. The best inoculum consisted of either *Streptococcus lactis* Löhnis or *Leuconostoc mesenteroides* Van Tiegham, but neither improved kraut quality over that obtained by natural fermentation. Definitely detrimental changes were brought about when either *Lactobacillus cucumeris* Bergey or *Lactobacillus pentoceticus* Fred predominated in a fermentation. If the juice has an acidity (lactic acid) of .3% or more, the kraut is usually of poor quality. If the acidity is .25% or less, the kraut produced is normal, but no better than when no inoculation is used. C. R. Fellers

**Investigation of California honeys.** W. Bartels and A. Fauth. *Z. Untersuch. Lebensm.* 66, 396-407(1933).—A considerable no. of North American, especially California honeys, were shown to have low diastase values, without evidence of heating or sugar feeding. Based on an investigation of the pollen, no relationship was found between the plant source of the honey and its diastase content. Just as little did the diastase value depend on the no. of pollen grains. It is not excluded that the high temp. to be found in certain portions of California and from which these honeys may have come, may be responsible for the low enzyme content. This hypothesis agrees in several cases with the results of the pollen investigation. F. L. Dunlap

**An investigation of honey cakes.** K. Braunsdorf. *Z. Untersuch. Lebensm.* 66, 524-39(1933).—The compn. is given of sweetening substances used in the mfg. of German honey cakes, of cakes prepared by B. and of honey and similar cakes of commerce. F. L. Dunlap

**Colloidal constituents of honey. Influence on properties and commercial value.** H. S. Paine, S. I. Gertler and R. E. Lothrop. *Ind. Eng. Chem.* 26, 73-81 (1934).—Honey can be freed from colloids by ultrafiltering a 20% aq. soln. through collodion films prepd. under standard conditions and of const. permeability. The colloids so obtained, constituting 0.07-0.80% of the honey, contained more than 50% protein, some waxes and 2.7-10% of ash. The colloid-free honey had a 22% higher surface tension, but a slightly lower viscosity, than the original. Its N content, apparently due to amino acids, was still more than half that of the original honey, and its dextrin content was the same. The clarification and increase of surface tension resulting from removal of colloids would be of com. value if a suitable flocculant could be devised.

K. V. Thimann

**Arrowroot.** P. H. Jones. *Food* 3, 87-8 (1933).—An outline of its distinctive characteristics and properties.

A. Papineau-Couture

**Composition and caloric value of English cider.** D. W. Stewart. *Analyst* 59, 27-28 (1934).—Complete analytical data are given for 8 samples of English cider. The caloric values varied from 465 to 218. In the last case the alc. content was low and saccharin was present. The caloric values were computed from the percentage ext. and percentage alc. present.

W. T. H.

**The caffeine content of maté.** F. Kraus, E. Kleucker and A. Kollath. *Z. Untersuch. Lebensm.* 66, 348-54 (1933).—Maté contains 0.3-1.5% of caffeine. It is not admissible to speak of "matein" or of caffeine-poor or caffeine-free maté. The method of Lendrich-Grossfeld is recommended for detg. caffeine in coffee and tea.

F. L. Dunlap

**The iodine content of the iodized table salt of commerce.** G. Prange. *Z. Untersuch. Lebensm.* 66, 369-74 (1933).—In 12 samples examd., the KI varied from 20.3 to 0.4 mg. per kg. Long storage does not seem to lessen materially the I content. A few of the samples gave, after storage for 10-12 months, differences of 4-22% of the original I content. Because of the uneven quality of these iodized table salts, regulation of their prepn. and marketing is needed. P. proposes that the I content of such salts be placed at 5 mg. KI per kg., with a permissible limit of error of 10%. He also would require that the date of prepn. be declared.

F. L. Dunlap

**Identification and estimation of iodine in bicarbonate-containing table salt, mineral waters and mineral water salts.** G. Prange. *Z. Untersuch. Lebensm.* 66, 556-64 (1933).—The identification of I may be carried out in 3 ways: (1) Up to a content of 6% of bicarbonate in table salt, the v. Fellenberg nitrite-starch reagent can be used, by increasing the concn. of the  $H_2SO_4$ . (2) If it is necessary to use a soln. of the salt mixt., v. Fellenberg's reagent in its original form may be employed after neutralization of the salt. (3) The I in the form of KI may, for the most part be extd. from salt mixed with bicarbonate and carbonate by means of alc. and detected colorimetrically by the v. Fellenberg method. The I microdetn. according to Winkler can be used if the salts are slowly and carefully neutralized prior to the oxidation of the I. The presence of Fe and Mn salts does not interfere seriously with the Winkler method, although the results obtained are a little higher when they are present.

F. L. D.

**Types and varieties of corn for silage. Yield of nutrients; composition; feeding value for milk production.** W. B. Nevins. Ill. Agr. Expt. Sta., *Bull.* 391, 67-124 (1933).—The most satisfactory stage of development (both palatability and keeping quality are considered) at which to ensile corn, was when it contained 30% dry matter. This detn. may be roughly made by drying representative stalks cut in short lengths, in a range oven at 105-120°. Reid Yellow Dent variety yielded highest digestibility, with Virginia Horsetooth, second, and Cocke Prolific, third. The varieties ranked in this same order in percentage of dry matter. Metabolizable energy was nearly proportional to the dry matter content of the silage as fed. All the silages were palatable to cows. The acidity is highest in fresh silage when made from immature corn.

1 There is a direct relationship between the water content of the corn at the time of ensiling and the percentage of acidity in the silage. The digestibility of silage made from sweet corn cannery refuse compared favorably with ordinary good silage. A thorough review of the literature as contained in 121 references is given. C. R. Fellers

**Range grasses in Hawaii.** J. C. Ripperton, R. A. Goff, D. W. Edwards and W. C. Davis. *Hawaii Agr. Expt. Sta., Bull.* 65, 58 pp. (1933).—Over 150 species of grasses are described, and the chem. compns. of 53 are given. Crude protein,  $Et_2O$  ext., crude fiber, ash, Ca and P were detd. The analysis of a grass is of little value unless the stage of maturity at which it was cut is considered. Protein is highest in immature plants; crude fiber is higher in the mature ones.

C. R. Fellers

**Feeding value of artificially dried young grass.** II. O. M. Camburn. Vt. Agr. Expt. Sta., *Bull.* 359, 3-14 (1933); cf. C. A. 27, 1059.—Artificially dried young grass contg. 20.4% protein, 40.24% N-free ext. and 3.4% fat ( $Et_2O$  ext.) was fed to 2 groups of young milking cows, together with  $\frac{1}{2}$  the usual allowance of timothy hay and corn silage, in comparison with grain and the usual allowance of hay and silage. The productions of milk, fat and solids-not-fat were practically identical on the 2 rations.

C. R. Fellers

**Feeding of mineral supplements to livestock.** II. H. Mitchell. Ill. Agr. Expt. Sta., *Circ.* 411, 3-8 (1933).—Minerals should be used in feeding livestock only as supplements to rations that have been properly balanced in other respects, particularly as to protein. A mixt. of 2 parts of ground limestone and 1 part of salt will supplement Ca deficiencies. A mixt. composed of 2 parts of steamed bone meal and 1 part of NaCl will supply both Ca and P in a favorable ratio and in readily available form. A mixt. composed of equal parts of finely ground limestone, steamed bone meal and NaCl will supply much more Ca than P, and for rations deficient in both Ca and P, it is an inexpensive and effective supplement. The use of ground rock phosphate is not recommended because of the harmful F content. The feeding of I-rich rations to cows results in a variable increase in the I content of the milk. Natural milk rarely contains over 50 parts per billion of I.

C. R. Fellers

**Comparison of cottonseed hulls and grass hays for milk production.** R. H. Lush, C. H. Staples, J. L. Fletcher, and S. Stewart. La. Agr. Expt. Sta., *Bull.* 238, 1-8 (1933).—Cottonseed hulls, supplemented with Ca, green feed and protein, are superior to hill land carpet and Bermuda grass hay, almost equal to high-grade Bermuda, and inferior to mixed clover for milk production.

C. R. Fellers

**Irradiated yeast as a feeding stuff to increase milk production.** H. Poelt. *Z. Vitaminforschung* 1, No. 4 (1932); *Deut. Landw. Presse*, 60, 16.—Three forms of protein were fed cows from Nov. to Feb.: (1) irradiated dry yeast contg. 50% protein, (2) soy beans contg. 46% protein and peanut meal contg. 48% protein, both vitamin poor and (3) vitamin-free casein contg. 78% protein. The yeast gave a max. increase of  $2\frac{1}{2}$  l. of milk, and the daily yield never dropped below  $\frac{1}{2}$  l. more than the initial quantity. Casein and the meal feeds caused a temporary increase of 1-1 $\frac{1}{2}$  l. which rapidly fell off to a yield of 4 l. less than that at the beginning of the expt.

K. C. Person

**Effects of feeding cottonseed on composition and quality of butter.** E. W. Neasham and A. J. Gelpi. *Natl. Butter Cheese J.* 25, No. 1, 12-13 (1934).—Whole cottonseed or cottonseed meal was used in comparative feeding expts. in quantities sufficient to supply the bulk of the protein required in the ration of dairy cows. The sapon. no. of the butter fat from these cows varied from 4 to 8 points lower for the cottonseed meal ration than for the whole cottonseed ration; the I no. was 0.7 to 2 points lower when cottonseed meal was fed; the Polenske no. varied from 0.18 to 0.50 points lower when whole cottonseed was fed; the Reichert-Meissl no. was 1.3 to 1.6 lower when cottonseed meal was fed and the m. ps. of the cottonseed lots ranged from 8 to 9 degrees higher than

those of the cottonseed meal lots. The butter obtained when whole cottonseed was fed was whitish, heavy-bodied and of a tallowy consistency with a sweetish, sickening flavor. Green pastures and corn silage counterbalanced somewhat the effects of cottonseed on the quality of the butter. Thus when cottonseed meal constituted 20% of the concn. in the dairy ration, a butter of fairly normal compn. and consistency could be produced, while when cottonseed meal constituted 40% of the concentrate, the butter might be abnormally hard. The effects of whole cottonseed meal were more pronounced than those of cottonseed meal even when green succulent feeds were supplied.

A. H. Johnson

The feeding value of tung-seed meal. W. Godden. *Bull. Imp. Inst.* 31, 352-8 (1930).—Tung-oil cake and exhd. meal are fairly rich in protein and carbohydrates. The meal contains some substance which makes it unpalatable and some irritant material which has a harmful effect on the mucous membranes of the intestine.

A. Papineau-Couture

The transformation of wood and wood products into feedstuffs rich in carbohydrate and containing protein. F. Honcamp. *Deut. med. Wochschr.* 59, 1437-9 (1933).—A review with analytical data. Arthur Grollman

Inhibiting development of rancidity in cereal foods. Edwin Cox (to Phosphate Products Corp.). U. S. 1,938,999, Dec. 12. Materials such as cereal flours, etc., are mixed with a phosphate such as mono-Ca phosphate and with a reducing salt such as a phosphite which is eventually oxidized into a phosphate in the reaction which it undergoes.

Bread, etc. August Röttinger and Siegfried Plaschkes. Austrian 135,335, Nov. 10, 1933 (Cl. 2c.). Bread and other bakery products free from starch are prepd. from a mixt. of soy-bean meal with gluten. The gluten is prepd. for use by treating the dry com. product with a dil. weak acid, e. g., aq. lactic acid. Bran, vegetables, spices, etc., may be added to the mixt.

Medicinal bread. Johann Schwaiger. Ger. 589,184, Dec. 4, 1933 (Cl. 2c. 1.03). Dough prepd. with water ontg. I or an iodide is baked slowly in sealed containers lined with asbestos.

Estimating the fatty content of milk by its transparency to light. Walter Strauss. Ger. 589,762, Oct. 26, 1933 (Cl. 491.5.02).

1 Substantially pure milk fat. Milton E. Parker and Sidney Quam (to Research Laboratories of National Dairy Products Corp.). U. S. 1,941,415, Dec. 26. Milk or a milk product is heated to about 75-80° and then cooled and the temp. is adjusted (suitably to about 45-55°) as is also the pH (suitably to about 7.0-8.5) for enzymic digestion of the protein phase; an enzymic material such as trypsin or papain is added; digestion is effected; the digested material is heated to destroy the enzyme; and the milk fat is sep'd., as by centrifuging.

Improving the whipping properties of cream and milk. Grover D. Turnbow. U. S. 1,939,326, Dec. 12. The material is heated with addn. of about 0.3% of Na citrate.

"Synthetic" milk product rich in fat. Ragnvald Hellerud. U. S. 1,941,261, Dec. 26. Milk and a vegetable fat such as hardened earthnut oil are mixed with an emulsifying agent comprising proteins of egg yolk sol. in water, and the material is homogenized at a temp. of 70-90°.

"Artificial cream." Arne Bergsvik and Ragnvald Hellerud. U. S. 1,941,243, Dec. 26. Water-sol. proteins derived from egg yolk are added to milk; earthnut oil hardened to a m. p. of about 32° is injected into the material through an orifice of not more than 0.4 mm. diam. and at a pressure of not less than 130 atm., and the product is then heated to at least 70° to obtain a whippable "synthetic" cream.

Beverage containing modified milk and pectin. Clarence P. Wilson and James A. Finley (to Calif. Fruit Growers Exchange). U. S. 1,940,036, Dec. 19. Modified milk products are prepd. with a sufficient content of pectin to prevent agglomeration of solids present, and the material is dried to produce a beverage base in finely divided form.

Ice cream. Clarence W. Vogt (to Vogt Instant Freezers Inc.). U. S. 1,940,109, Dec. 19. In ice cream manuf., a layer of aerated mix is agitated in contact with a heat-transfer surface through which heat is withdrawn at such a rate that over 30% of the water content of the mix is frozen in less than one min., the volume and size of the ice crystals thus formed being such that their intercrystal spaces are of a magnitude that does not permit the forming of detectable crystals from the solids in soln. in the intercrystal spaces during hardening and storage of the product.

Treating sour cream for butter making, etc. Milton E. Parker (to Research Laboratories of National Dairy Products Corp.). U. S. 1,941,414, Dec. 26. An enzymic material such as pepsin or papain is added to sour cream and the curd is softened and dissolved by enzymic digestion without disturbing the acidity while the mixt. is maintained at substantially optimum conditions for the enzymic digestion, and the cream is sep'd.

Cheese treatment. Joel Taub. U. S. 1,940,031, Dec. 19. During the processing of cheese, there is added to it about 1-4% of an approx. neutral salt such as Na or NH<sub>4</sub> mucate, lactate or malate which serves as an emulsifier.

Nutrient fats. Hanseatische Mühlenwerke A.-G. Ger. 585,972, Oct. 13, 1933. The fats are improved by addn. of a small amt. of partly halogenated phosphatide.

Apparatus for ripening fruits with ethylene, etc. Frank A. L. Bloom. U. S. 1,938,880, Dec. 12. Various structural and operative details are described.

Coating fresh fruits. Ernest M. Brogden and Miles L. Trowbridge (to Brogden Co.). U. S. 1,940,530, Dec. 19. The surface of fruits such as oranges or grapefruit is subjected to an alk. treatment, as with borax or NaOH soln. and then is provided by heat and friction, with a thin coating comprising paraffin with a smaller proportion of carnauba wax. Numerous details and modifications of treatment are described.

Preserving fruit juices such as cider. Paul C. Petersen. U. S. 1,940,013, Dec. 19. Steam is passed through cider in a closed vessel to heat the cider to about 118°, and the cider is subjected to the heating for about 90 min.; evolved gases are allowed to escape and vapors are condensed so as to maintain a const. pressure on the cider, H<sub>2</sub>OAc being driven off and malic acid retained. App. is described.

**Liquefying frozen products such as frozen fruit juices.** Joe C. Jenkins. U. S. 1,940,353, Dec. 19. The frozen material is simultaneously comminuted and subjected to the action of heat to assist liquefaction and then immediately removed from the heat zone. App. is described.

**Apparatus (employing glycerol as a refrigerant) for quick freezing of food products such as fruits and fruit juices.** Clarence M. Davidson (to Pan American Frozen Products, Inc.). U. S. 1,939,109, Dec. 12. Various structural, mech. and operative details are described.

**Jellies, etc.** California Fruit Growers Exchange. Brit. 397,714, Aug. 31, 1933. Presetting is prevented in making jams and jellies from (the juice of) cranberries, blueberries, tart plums, etc., by first wholly or partially destroying or rendering innocuous, e. g., by enzymic action, the quick-setting pectin. Pectinase may be used or an enzyme prepn. from *Penicillium glaucum*, used in soln. or pptd. by alc., etc., and used solid, the fruit material being kept at optimum temp., e. g., 25–50°, during the treatment (about 12 hrs.).

**Fruit jellies.** Consortium für elektrochem. Ind. G. m. b. H. (Wolfram Haehnel and Willy O. Herrmann, inventors). Ger. 589,201, Dec. 4, 1933 (Cl. 53k. 1.01). Polyvinyl alc. and its water-sol. derivs. are used as gelatinizing agents in the manuf. of fruit jellies.

**Grained confections.** John M. Krno and Adolf Schildberger (to International Patents Development Co.). U. S. 1,939,990, Dec. 19. Fondants are prepd. by crystn., with agitation, an aq. soln. of dextrose and, after crystn. has advanced toward completion, mixing with the massculite a soln. of a sugar having a higher soly. than dextrose such as a soln. contg. dextrin, dextrose and levulose.

**Amylaceous products suitable for use in puddings, etc.** Wm. E. Stokes (to Royal Baking Powder Co.). U. S.

1,939,230, Dec. 12. A material such as corn starch or arrow-root starch or a cereal product such as oatmeal is heated with water to a temp. and for a time sufficient to disrupt the starch granules without substantial dextrinization of the starch, and the product is subsequently frozen and thawed which serves to facilitate sepn. of excess water and form a product which may be toasted for use in puddings or as a precooked breakfast food or for other purposes.

**Coffee.** Eduard Orno-Ornfeldt and Makoto Ottmar Loew. Ger. 566,264, Nov. 29, 1933 (Cl. 53d. 2.02). Coffee is improved by treatment with an aldehyde before roasting. Treatment for 10 hrs. with 50% of a 1% AclI soln. is suitable.

**Decaffeinizng and dethenizing coffee and tea extracts.** Cornelius Massatsch. Brit. 397,323, Aug. 24, 1933. See Fr. 743,900 (C. A. 27, 3996). Alternatively, solvents of lower sp. gr. may be fed through the exts.

**Preserving fodder.** I. G. Farbenind. A.-G. (Friedrich A. Henglein and Friedrich W. Stauf, inventors). Ger. 589,362, Dec. 6, 1933 (Cl. 53g. 5.01). Green fodder is preserved by addn. of lactates and acid compds. capable of liberating lactic acid therefrom. The lactates and acid compds. may be mixed together before they are added to the fodder.

**Stock food from molasses.** John P. Bartz (to Ralston Purina Co.). U. S. 1,940,837, Dec. 26. For changing a body of molasses from a liquid to a jelly-like state, the molasses is heated, then mixed with a soln. of a jellyfying material such as agar agar or gelatin in water, the mixt. (or the molasses) is dehydrated sufficiently that the mixt. has no greater water content than the untreated molasses, and the mixt. is allowed to cool. The product thus prepd is suitable for mixing with various other stock feed ingredients.

**Some chemical discoveries which have influenced the development of South Africa.** Jas. Gray. *S. African J. Sci.* 30, 28–45(1933). E. H.

**Purification of the noble gases.** K. K. D'yakov. *J. Tech. Phys.* (U. S. S. R.) 1, 488–97(1931).—Metallic Na followed by high-frequency discharge was used to remove O<sub>2</sub>, N<sub>2</sub>, Cl<sub>2</sub>, CO<sub>2</sub>, CO, H<sub>2</sub>, NH<sub>3</sub>, H<sub>2</sub>S, HCl, C<sub>2</sub>H<sub>2</sub>, CH<sub>4</sub>, H<sub>2</sub>O, etc. F. H. Rathmann

**Third-component method in fractional distillation.** E. C. Craven. *Ind. Chemist* 9, 414–17(1933).—The subject is considered with the third component as a gas, liquid or solid, the liquid being the more important, and given most consideration. Detns. on 4 mixts., MeOH with EtOH, acetone with MeOH, acetone with EtOH, EtOH with benzene, gave  $\alpha_0$  1.54, 0.90, 1.33, 0.90 and  $\alpha_1$  0.70 2.80, 2.00, nil, resp., where  $\alpha_0$  represents the relative volatilities in the absence of H<sub>2</sub>O and  $\alpha_1$  represents the relative volatilities at high diln. with H<sub>2</sub>O. Detns. are made on alc./ketone/water combination. In the case of solids, NaCl with HOAc and H<sub>2</sub>O are discussed. It was found that a point will be reached where the soly. of the salt falls to such an extent that further enrichment ceases. Halsey E. Silliman

**Inverted fractional-distillation analysis.** R. A. J. Bosschart. *Ind. Eng. Chem., Anal. Ed.* 6, 29–33(1934).—A detailed description of app. and method of fractionating mixts. of liquids or gases, commencing with components of highest b. p. J. H. Moore

**Theory of artificial drying. Calculation of operating**

**characteristics. Heat balance and control of an artificial drier.** G. Barberot. *Rev. matériaux construction trav. publics* 1933, 101–4B, 144–7B, 181–0B, 222–8B.—A discussion and math. treatment of the theory of drying, with sample calcs. of operating constants and illustrations of graphical solns. Various types of driers are treated. Karl Kammermeyer

**A study of the drying of solids. I–II.** Saburo Kamei and Tamotsu Sedohara. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 645–54(1933).—The mechanisms of the drying of different kinds of solids under varying conditions were studied and the authors concluded that in practice all drying processes for solids fall in the following 3 groups. (1) surface evapn. is the controlling resistance; and (2) internal diffusion resistance is controlling (both (1) and (2) are for the case where evapn. takes place at the surface of the solid); and (3) evapn. takes place in the interior of the solid with the internal diffusion resistance as the controlling factor. The app. and the expl. procedure are described. Karl Kammermeyer

**Problems of commercial hydrogenation processes** Carl Bosch. *Chem. Fabrik* 1934, 1–10.—An address on the hydrogenation of N to NH<sub>3</sub>, CO to alcs. and coal, petroleum and tar to benzene, as developed during recent years by the I. G. F., with 11 cuts and 3 tables (cf. C. A. 27, 2226). J. H. Moore

**Plastics as engineering materials.** Herbert W. Rowell. *Chemistry and Industry* 1934, 29–32. E. H.

**The danger of carbon monoxide poisoning in motor-driven vehicles.** I. Fisher and A. Hasse. *Arbeitsphysiol.* 6, 249–70(1933).—The CO content of the air of closed motor vehicles was detd. with PdCl<sub>2</sub>. After 1/2–1 hr. travel the air contained 150–240 cc. per cu. m. The blood of 10 conductors and drivers of motor busses contained before the beginning of the trips 10.17% carboxyhemoglobin as against 3.72% in 4 control subjects. At the end

of 9-hr. service with long pauses at the ends of the routes there was no essential rise in carboxyhemoglobin but with trips with the shortest pauses the highest values ranged from 14.7 to 18.0%. "Limousine sickness" may be due to a light CO poisoning and some of the otherwise unexplained accidents on the part of drivers may be due to the same cause.

Drying. I. G. Farbenind. A.-G. (Siegfried Kiesskalt, inventor). Ger. 589,439, Dec. 13, 1933 (Cl. 82a. 1.01). See Fr. 744,831 (C. A. 27, 4324).

Separating gaseous mixtures. Société de recherches et d'exploitations pétrolières. Brit. 398,010, Sept. 7, 1933. See Ger. 576,772 (C. A. 27, 5124).

Separating gases by liquefaction. American Smelting & Refining Co. Fr. 755,226, Nov. 21, 1933. See Brit. 395,641 (C. A. 28, 6169).

Separating mixed gases such as oxygen and nitrogen from air by liquefaction and rectification. Niels C. Christensen. U. S. 1,939,104, Dec. 12. Numerous details of app. and operation are described.

Recovering oxygen from air by liquefaction. Mathias Fränkl. Austrian 135,454, Nov. 25, 1933 (Cl. 12d.). A method of procedure is described.

Liquefaction of gases such as those of air. Christian W. P. Heylandt (to Flüga A.-G.). U. S. reissue 19,031, Dec. 19. A reissue of original pat. No. 1,777,040 (C. A. 24, 5899).

Apparatus for supplying liquid oxygen for breathing apparatus, etc. Ewart G. Hickling (to Linde Air Products Co.). U. S. 1,939,592, Dec. 12. Various structural and operative details are described.

Apparatus for storage and dispensing of liquid carbon dioxide. Henry H. Purvis. U. S. 1,939,611, Dec. 12. Structural and mech. features.

Compressing, condensing and partial liquefaction system for recovery of sulfur dioxide from furnace gases. Rudolph L. Hasche (to American Smelting and Refining Co.). U. S. 1,939,693, Dec. 19. Various details of app. and operation are described. U. S. 1,939,694-5-6 also relate to app. and details of operation for the same or similar purposes.

Separating liquids. N. V. de Bataafsche Petroleum Maatschappij. Fr. 755,291, Nov. 22, 1933. A liquid mixt. is sep'd. into its constituents or groups of constituents A and B by treating the mixt. with a selective extg. agent

which dissolves A more easily than B and washing the soln. of the ext. by a liquid composed entirely or principally of A, this liquid being a portion of the soln. of ext. obtained before or after the washing and freed completely, or for the greater part, of extn. agent. Cf. C. A. 27, 4604.

Differential sedimentation process for separating solids from liquids. The Dorr Co., Inc. Ger. 587,293, Nov. 1, 1933. The process may be used to effect the sep. removal of  $\text{CaSO}_4$  and org. matter from the reaction product of crude  $\text{Ca}_3(\text{PO}_4)_2$  and  $\text{H}_2\text{SO}_4$ .

Gravity separation of emulsified oil and water. Francis D. Mahone (to Petroleum Rectifying Co. of Calif.). U. S. 1,940,762, Dec. 26. Various details of app. and operation are described.

Crystallizing. Metallges. A.-G. Fr. 754,432, Nov. 7, 1933. To feed crystals in a vacuum cooling app., the difference between the entry and exit temp. in the various stages of cooling of the soln. is increased beyond the scale of temp. of the metastable satn. zone to a max. of about double, while evapg. slowly and maintaining the crystals in suspension in the soln. by an agitator. An app. is described.

Thickening liquid suspensions. Henry Howard. U. S. 1,940,753, Dec. 26. Various details of operation are described, of a process in which settled solids are continuously removed, settling being accelerated by supplying steam solely to the free upper surface of the liquid to heat it.

Solvents and emulsifying agents. Mendel Burak. U. S. 1,938,804, Dec. 12. Olein and a combination of soap and cyclohexanol in specified proportions are used for producing aq. solns. or emulsions of water-insol. org. liquid compds. such as mineral oils, fatty acids,  $\text{CS}_2$ , turpentine or chlorinated hydrocarbon derivs.

Treating solids or liquids with gases or vapors. I. G. Farbenind. A.-G. (Georg Pfeiderer and Ernst Koch, inventors). Ger. 585,318, Oct. 2, 1933. The solid or liquid passes through a container divided into a no. of zones, the gas or vapor being absorbed by the solid or liquid in the first zone and driven off in a later zone. The process is particularly useful in the saccharification of wood and other vegetable materials with HF. App. is described.

Heating solids, liquids or gases. Wilhelm Schwarzenauer. Ger. 588,213, Nov. 14, 1933 (Cl. 12a. 2). Fuel under pressure is burnt beneath the surface of a heat-carrier which surrounds or is surrounded by the solid, liquid or gas to be heated. The material to be heated may be in direct or indirect contact with the heat carrier or may be mixed with the heat carrier, which may be a fused metal or salt or an oil. Various forms of app. are described. Applications of the invention include the distn. of oils, the evapn. of salt solns., the gasification of powd. coal, the manuf. of H and CO from Fe, C and steam and the manuf. of CO from  $\text{CO}_2$  and C.

Mixing pasty materials. Paul Hirschfelder. Ger. 589,430, Dec. 7, 1933 (Cl. 12e. 4.01). The materials are arranged in superposed layers in order of granule size, with the finest material underneath. Compressed gas is then forced into the bottom layer.

Sintering hydrated materials. Metallgesellschaft A.-G. Ger. 585,767, Oct. 9, 1933. In sintering decrepitating materials contg. hydrate water, such as garnierite, the material is reduced to a granular state not exceeding 5 mm. and preferably below 3 mm. before being admitted to the sintering furnace. About 8-10% C is admixed.

Granulating fusible materials. I. G. Farbenind. A.-G. (Walter Strathmeyer, inventor). Ger. 588,157, Nov. 13, 1933 (Cl. 12g. 1.01). Materials such as  $\text{C}_{10}\text{H}_8$ ,  $\text{C}_{14}\text{H}_{10}$  and S are fused and sprayed into a vessel contg. a mist of a nonsolvent for the material. Pearl-like granules are obtained.

Treating comminuted solids in suspension as in treating cacao waste with solvents. Max Luthy (to Monsanto Chemical Co.). U. S. 1,939,178, Dec. 12. In the continuous sepn. of liquid from solids as in treating cacao waste to ext. cacao butter and alkaloids, a suspension is caused to flow continuously through a duct in which the solids are permitted to settle so that most of the solids are

withdrawn while maintaining the flow of the suspension of material. App. is described.

Rendering  $\beta,\beta'$ -dichlorodiethyl sulfide innocuous. Chem. Fab. von Heyden A.-G. (Curt Philipp and Hans Mirau, inventors). Ger. 588,181, Nov. 13, 1933 (Cl. 78d. 1.02). Addn. to 557,081 (C. A. 27, 355). The dichloroamides used in the method of Ger. 557,081 are replaced by *N*-monochloro-amides or -imides, e. g., *N*-chloro-acetamide or -phthalimide.

Heat-transfer system for gas such as in preheating air by fine gases. Ward S. Patterson and Fay H. Rosenkrants (to International Combustion Engineering Corp.). U. S. 1,941,365, Dec. 26. Various app. and operative details are described.

Salt solutions for transferring heat or cold. Stratmann & Werner (chemische Fabrik. Ger. 585,737, Oct. 7, 1933. The aq. solns. contain one or more metal salts and an addn. of C to regulate the  $p_H$  value. The C is present as a finely divided powder.

Brine for transmission of heat "and cold." Fritz Werner. U. S. 1,939,937, Dec. 19. Brines such as those contg. corrosive substances and used in refrigerating systems, etc., contain also water-insol. adsorbents such as carbons in fine and uniform dispersion, which serve to minimize corrosion.

Freezing mixture. James J. Cronin. Australia 11,371/-33, Oct. 19, 1933. A refrigerant for cold cabinets, etc., is made up of solns. of  $\text{CaCl}_2$ ,  $\text{KNO}_3$ ,  $\text{NaCl}$  and  $\text{Na}_2\text{CO}_3$ .

Impregnating or coating porous materials. Bakelite Ges. m. b. H. (Ernst Elbel and Fritz Seebach, inventors). Ger. 589,071, Dec. 1, 1933 (Cl. 8l. 2). The materials are treated successively in either order with a finely divided synthetic resin and a drying oil. Thus, paper stuff may be mixed with a synthetic resin and the web treated with a drying oil on the paper-making machine. Various other methods of procedure are indicated.

Insulating compositions. Frank J. Groten (to The British Thomson-Houston Co. Ltd.). Brit. 397,405, Aug. 24, 1933. A cold molding compn. comprises a filler and a binder composed of an alkyd resin, a varnish base contg. an oil, a gum and an asphalt. The filler is coated with the binder, the compn. shaped in the cold and the formed article then heated to cure the binder. In an example the binder comprises equal parts of an alkyd resin and a mixt. of oil, e. g., linseed, chinawood, etc., gum, e. g., copal, kauri, and an asphalt, e. g., gilsonite; 14 parts thereof is mixed with 80 parts filler, e. g., asbestos. A suitable alkyd resin comprises phthalic anhydride 35.1, glycerol 19.1, linseed oil fatty acids 30.9, rosin 10 and castor oil 5 parts.

Insulating materials. Soc. pour l'ind. chim. à Bâle.

Fr. 755,269, Nov. 23, 1933. Cellulose esters insol. in org. solvents, prepd. from natural or regenerated cellulose by esterification to a degree beyond the diacyl deriv., while preserving the structure of the initial product, are used as heat and elec. insulators.

Electric insulating material. Emil C. Loetscher. U. S. 1,938,917, Dec. 12. A laminated product comprises a plurality of interior layers of kraft paper impregnated with a phenol condensation product, outer layers of thinner surface paper, and intermediate layers of a mixt. of equal parts of wood flour and resin, all consolidated together by heat and pressure.

Electric insulating material. Siemens & Halske A.-G. (Reinhold Reichmann, inventor). Ger. 589,341, Dec. 6, 1933 (Cl. 21c. 2.03). Highly sintered practically pure  $\text{BeO}$  is used as insulating material against high-frequency current.

Steel sheets with electrical insulation coatings. Vere B. Browne. U. S. 1,940,707, Dec. 26. A baked gelatinous coating is used contg. silicate of Ca or of Mg.

Heat- and sound-insulating material. Frédéric Merckling. Fr. 754,901, Nov. 16, 1933. Protein substances, e. g., yeast, albumin, casein or glue, are added to milk of lime used for mineralizing fibrous materials. The treated fibers are mixed with plaster, cement, etc., for making insulating materials.

Waterproof insulation suitable for use in sheets, blocks or slabs. George D. Shaver (to The Therminul Corp. of America). U. S. 1,940,974, Dec. 26. A heat-insulating material is prepd. by mixing mineral wool fiber with a relatively large quantity of a liquid emulsion of a water-repellent substance such as asphalt suitable for a size and binder for the mineral wool, agitating a batch of the mixt. to individualize and disperse uniformly the fibers throughout the liquid, pptg. the binder (as by use of alum) upon the individualized fibers to coat them thinly, and subsequently assembling the coated fibers and heating them to render the coating material plastic and coherent. U. S. 1,940,975 relates to app. for producing sheet heat-insulating material from mineral wool in combination with app. for forming the mineral wool from melted mineral matter.

Spark plugs. Hans Navratil. Brit. 396,567, Aug. 10, 1933. Substantially the whole igniter surface exposed to the fuel mixt. is composed of a material having catalytic properties for oxidation of C, an oxide of Cu, Ce, U or Th being used for the insulator while the metallic surface consists of Cu, Pt, Ag, Au or Sn or of Pt with an alkali oxide coating or of W with an earth-alkali coating. The action of metallic oxides on the insulator may be resisted by coating the same with an oxide of Be, Mg, Ca, Ba or Sr.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

St. Paul's successful water works. Anon. *Public Works* 64, No. 7, 25(1933).—This plant during 1932 furnished an average of 83.9 gal. per capita per day at a cost of 95 cents per month for each domestic consumer. Av. analysis for the year indicate turbidity 0, color 12.1, iron 0.04, permanent hardness 25, temporary hardness 140 and bacteria ( $37^\circ$ ) in plant effluent 9 per cc., in city taps 347. Over 99.3% of the population are connected to the city plant and the no. of metered services is 99.5%.

C. C. Ruchhoft

Operation of Columbus, O., water-purification plant. Anon. *Public Works* 64, No. 7, 27(1933).—A daily av. of 29.6 million gal. was softened and filtered in 1932 with a reduction of hardness from 202 to 85 p. p. m. Cost of lime, soda ash, alum, chlorine and coke was \$10.24 per million gal. Special equipment was installed to handle soda ash in carload lots. Hoppers which feed the dissolvers are fitted with weigh levers capable of feeding the material at any rate up to 2800 lbs. per hr. C. C. Ruchhoft

Water-purification studies. H. W. Streeter. *Public Works* 64, No. 6, 12-14(1933).—Data from an exptl.

water-purification plant operated at Cincinnati have provided the following facts: When using the  $37^\circ$  total count as an index the efficiency of filtration is higher in winter than in summer, while the reverse is true regarding the efficiency of chlorination. When using the same index the data show over-all efficiency of removal directly affected by variations in raw water turbidity. Variations in temp. or in turbidity showed little effect upon *Es. coli* removal. Data from 10 Ohio River plants indicated a general relationship between the yearly mean and the frequency with which bacterial counts equaled or exceeded various amts. Thus as increase in the mean river pollution results in an increase in the frequency of lapses below a given count. Excess lime treatment is not as advantageous as prechlorination. Prolonged storage when possible effects a desirable improvement in the bacterial and phys. qualities of highly polluted sources. Purification efficiency is definitely limited according to the law of diminishing returns as the degree of raw water pollution increases. C. C. Ruchhoft

Seelke water purifiers. J. M. Halv6. *Rev. ind. Aug.*

1932; *Génie civil* 102, 50(1933); *U. S. Pub. Health Eng. Abstracts* 13, W, 108(Dec. 9, 1933).—The Zerhyd water-softening filter, the Douso-Lux app., the Buron softener for domestic use, the semi-industrial Puro softener, and Permo softeners of industrial and portable types, are discussed (cf. *C. A.* 26, 2536). C. R. Fellers

The service of the laboratory to the water purification plant. Harry E. Jordan. *J. Penna. Water Works Operators Assoc.* 5, 47-52(1933).—The importance of regularly conducted plant control tests is stressed, and the unreliability of the *o*-tolidine tests under some conditions is mentioned. A modified procedure for the detn. of phenols is included. G. L. Kelso

Water purification and control. Frank R. Filz. *Paper Trade J.* 97, No. 16, 29-33(1933).—The "bottle test" and  $p_H$  methods of control are compared. The optimum alum requirement is a linear function of the total solids of the raw water and a power function of the alk. of the raw water. A. Papineau-Couture

Analysis of water. Anon. *Paper Trade J.* 97, No. 18, 36 9(1933).—A description of the tentative standard methods of the Tech. Assoc. of the Pulp and Paper Ind. A. Papineau-Couture

The influence of colloid chemistry on treatment of water and waste liquors. A. M. Buswell. *Water Works Eng.* 86, 1289-91(1933).—A review, with bibliography, including methods of detg. particle size; mechanism of pptn. as applied to the use of alum floc, activated sludge, etc.; the isoelec. point and coagulation; adsorption and its importance in filter beds, zeolite softeners, dehydration of sludge, etc.; and the treatment of emulsions in waste liquors. M. G. Moore

The evaluation of activated carbon. John R. Baylis. *Water Works and Sewerage* 80, 220-4(1933).—The adsorption of phenol by C is in accord with the theory of adsorption and the advantage that phenol can be detd. in extremely small amts. makes it a desirable test compd. for the evaluation of activated C. Com. carbons evaluated in this manner have shown an increase of 20% in adsorptive capacity over those first offered for sale in 1931. Different carbons can be compared in their adsorptive by detg. the amt. of each necessary to reduce the phenol content in water from 0.10 to 0.01 p. p. m. After detg. phenol values the carbons can be compared with respect to their power for removing tastes and odors from water supplies. Amts. of the carbons are added to the water being tested according to their phenol value and the cold and hot threshold no. is detd. for each as described in previous articles. Carbons must be compared on the basis of the amt. of C required to give equal reduction of a definite compd. and not on the percentage reduction obtained with definite amts. of C. C. C. R.

Copper sulfate treatment improved by adding chemical in mixing chambers at plant. J. K. Marquis. *Water Works Eng.* 86, 1284-5(1933).—Since only about  $1/10$  of the water drawn from the storage reservoir at Spartanburg, S. C., is used for the city supply, it is not economical to treat the water in the reservoir. The  $\text{CuSO}_4$  is added continuously to the water as it enters the mixing chambers. 0.2-1.6 p. p. m. of  $\text{CuSO}_4$  is fed, the 6-hr. retention period in mixing and filtration being sufficient to eliminate the algae. The water treated here does not contain algae in amts. sufficient to impart pronounced tastes and odors. The effectiveness of the method in such cases cannot be predicted. M. G. Moore

Removal of fluorides from drinking waters. C. S. Boruff. *Ind. Eng. Chem.* 26, 69-71(1934).—A report of lab. tests on tap water contg. 5 p. p. m. F. Single (stirring 30 min., letting stand 18-24 hrs., and filtering) with 170 p. p. m.  $\text{Al}_2(\text{SO}_4)_3$  or double coagulation with 85 and 50 p. p. m. reduced the F from 5 to 1.0 p. p. m. or less, the amt. removed increasing with the dosage. Optimum  $p_H$  is 6.7. Fresh, synthetic zeolites remove F, but the capacity is small. Satisfactory removal was secured by filtering through activated alumina, or agitating with this reagent and decanting. Only slight removal was obtained with  $\text{Na}_2\text{Al}_2\text{O}_4$ , com. bauxite, silica gel, Na sil-

cate and ferric salts. Softening, with addn. of excess lime, causes copptn. of considerable F. M. G. Moore

Colorimetric determination of fluorine. O. M. Smith and Harris A. Dutcher. *Ind. Eng. Chem., Anal. Ed.* 6, 61-2(1934).—To det. F in waters, first ppt. sulfate by adding 5 ml. of 2%  $\text{BaCl}_2$  soln. to 100 cc. of sample. Allow the ppt. to settle and take 50 ml. of the clear soln., add 3 ml. of 6 N HCl and 5 ml. of  $\text{Zr}(\text{NO}_3)_4$ -quinizarin reagent (mix equal parts of 0.14% soln. of 1,2,5,8-tetrahydroxyanthraquinone and an 0.87% soln. of  $\text{Zr}(\text{NO}_3)_4$ . Dil. the mixt. with 40 times as much water). After 20 min. compare with standards. The best range of concn. for the test is 0-0.1 mg. of F per 50 ml. W. T. H.

Simple chlorination equipment for small water supplies. F. E. Daniels. *Pub. Works* 64, Oct., 1933; *U. S. Pub. Health Eng. Abstracts* 14, W, 1(Jan. 6, 1934).—A small inexpensive, home-made hypochlorite plant is described. C. R. Fellers

Coagulation. Marsden C. Smith. *J. Penna. Water Works Operators Assoc.* 5, 56-62(1933); cf. *C. A.* 27, 2229.—Prechlorination can sometimes be used as an aid to coagulation, and the saving in coagulant may be more than the cost of the Cl. Reduction of industrial waste in raw water, installation of flocculators, and a check on coagulant dosages with a lab. stirring machine resulted in the following savings: coagulant 50, wash water 83, C 75-100%. No const. optimum  $p_H$  was found. The best taste and odor control were obtained by adding the entire dose to the top of a filter at the beginning of a run. G. L. Kelso

Water coagulation with ferric chloride. Robert N. Clark. *Public Works* 80, No. 7, 22(1933).—Comparative tests on  $\text{FeCl}_3$  and alum indicate a decided advantage for the former. Results indicate that a similar reduction in turbidity can be obtained by using an av. of 55% less of  $\text{FeCl}_3$  than of alum. The time of floc formation is shortened by use of the former and thus the use of smaller sedimentation basins is made possible. Coagulation is effective at any  $p_H$  above 5.0 in comparison with the limited  $p_H$  range of alum pptn. Overdosing does not affect filter efficiency and in the case of soft, colored waters,  $\text{FeCl}_3$  removes the color below the range of alum coagulation. C. C. Ruchhoft

Hydrogen sulfide and oxygen in natural waters. W. Stroede. *Z. Fischerei* 31, 345-51(1933); *Wasser u. Abwasser* 31, 224(1933).— $\text{H}_2\text{S}$  can be formed by purely biol. or purely chem. means. Bacteria produce  $\text{H}_2\text{S}$  by the decompn. of proteins, the reduction of sulfates, sulfites and thiosulfates. Sulfate-reducing bacteria, *Thiospira desulphuricans* and *T. aestuarii*, are present in water. In certain S springs,  $\text{H}_2\text{S}$  is formed by purely chem. means by the reduction of sulfates by carbonaceous layers. The min. lethal amt. of  $\text{H}_2\text{S}$  in waters inhabited by trout is 1 mg. per l.; for carp 8-12 mg. per l. *Chara* grows only in clean water but the roots may be embedded in slime contg. decomp. org. matter and  $\text{H}_2\text{S}$ . In general, the  $\text{H}_2\text{S}$  content of water increases with the depth.  $\text{H}_2\text{S}$ - $\text{O}_2$  relationships in water are discussed. C. R. F.

The construction and protection of drilled wells. A. G. Giedler. *J. Penna. Water Works Operators Assoc.* 5, 72-80(1933).—The "cable-tool percussion" and "hydraulic rotary" methods of well drilling are discussed. Methods for the protection of drilled wells from contamination and protection of the casing are given. A completed well may be chlorinated under pressure or by introducing strong chloride of lime solns. with a dump bailer. G. L. Kelso

Ice made from water treated with Caporit. N. van der Walle. *Geneeskund. Tijdschr. Nederland.-Indië* 72, 1759-69(1932); *U. S. Pub. Health Eng. Abstracts* 13, W, 109(Dec. 9, 1933).—Ice made from water contg. 2 mg. of Caporit per l. was practically free from bacteria. To make river water bacteria-free, 5 mg. per l. of Caporit was required. Only traces of Cl could be detected in the ice after 24 hrs. by the *o*-tolidine test. C. R. F.

Calculation of the  $p_H$  value of water from the free and combined carbon dioxide content. G. Naskitgall. *Gas u.*

**Wasserfach 76**, 833-4(1933); cf. Mayer, C. A. 27, 3270.—The  $p_H$  value of a water can be calcd. by the formula  $p_H = 6.517 + \log(2g/f)$ ; where  $f$  is the content of free  $CO_2$  in mg. per l. and  $g$  the content of combined  $CO_2$  in mg. per l. Tables are given for values of  $6.517 - \log f$  and for  $\log 2g$ , and a nomogram for obtaining  $p_H$  values directly from those for  $f$  and  $g$ . R. W. Ryan

**Deacidification of water.** H. Haupt. *Gas u. Wasser-fach 76*, 856-9(1933).—Water contg. aggressive  $CO_2$  has a very destructive action on Fe pipes and some deacidifying plants do not completely remove this aggressive  $CO_2$ . Mech. deacidifying plants leave 5-7 mg. of free  $CO_2$  per l., so that soft waters are still aggressive. Some waters are not sufficiently deacidified on passing through marble filters. Hydrated lime is satisfactory for large plants, but the saturator must be carefully designed and operated to secure soln. and proper supply to the Venturi tubes or other proportioning devices. Samples of treated water should be allowed to stand before titration or values for  $CO_2$  may be erroneous. Very small plants should use marble filters of adequate size and aeration. The Tillmans-Lürmann process for deacidifying water with calcined magnesite completely removes aggressive  $CO_2$ , but some industries find Mg much more troublesome than Ca. R. W. Ryan

**Road oils and tars and their effect on water supplies.** Martin E. Flentje. *J. Penna. Water Works Operators Assoc.* 5, 41-2(1933).—In one instance chlorinated water in a distribution reservoir developed a taste after an adjacent highway had been freshly surfaced. Potential tastes and odors may come from either phenol or petroleum products used in surfacing material. G. L. Kelso

**Effects of road oils and tars on public water supplies.** Lewis V. Carpenter and Earl W. Klinger. *J. Penna. Water Works Operators Assoc.* 5, 43-6(1933).—Small test sections of road were prepd. according to the specifications of the W. Va. State Road Commission. The test sections were washed with distd. water equal to one inch of rainfall. Washings were collected and tested for taste and odor. Half-liter samples of the washings were distd. and 300 ml. of distillate collected. The distillate was dild. to 500 ml. and dilns. of 1:20, 1:200, 1:200,000 prepared. The dilns. were chlorinated to a residual of 0.3 p. p. m., free chlorine was removed and the warm odor and cold taste detns. were made according to the Standard Methods of Water Analysis 1933. Results indicated that when roads were surfaced with a "primer" coat there was distinct danger of chlorophenol tastes in water supplies if heavy rains occurred within two hrs. after application. The danger is not as pronounced when "retread" material is used. G. L. Kelso

**(Water)sterilization by the use of chlorine and chlorine compounds resembles a simple oxidation effect.** Ed. Imbeaux. *Rev. hyg. méd. prévent.* 55, 696-9(1933).—After discarding other theories, I. concludes that sterilizing power varies with the oxidation potential, and the same factors influence both. Bacterial reduction parallels oxidation potential (in volts) with  $Cl_2$ , chloramine and azochloramide. Similarly, the addn. of  $NH_3$  reduces both the oxidation potential and the sterilizing power of  $Cl_2$ . Between  $0^\circ$  and  $25^\circ$  there is a gradual increase in sterilizing action and oxidation potential. There is a decrease with increasing turbidity. C. R. Fellers

**Connection between water supply, soil pollution and intestinal disease.** C. P. Mom. Separate. Albrecht & Co., Batavia, Java, 1931, 26 pp.; *U. S. Pub. Health Eng. Abstracts* 13, W, 51(May 13, 1933).—For Java conditions, a colontiter in excess of 100 cc. is necessary to give a fair pollution index. No epidemics of typhoid have been caused by a water supply with a colontiter above 100 cc. The usual ratio of *B. typhi* to *B. coli* is between 1:1000 and 1:100,000 so that a water supply contg. a few colon bacteria is unlikely to be dangerous. The death rate from intestinal diseases in the Dutch East Indies is 65 times that of The Netherlands. C. R. Fellers

**The bacterial efficiency of the excess-lime method of water purification.** H. W. Streeter. *Public Works* 64,

No. 8, 17-19(1933).—Addn. of lime to raw water produced a marked bactericidal effect, which varied directly with the intensity of the treatment. Excess lime diminished the bacterial efficiency of post-chlorination. Considered as a method of disinfection, the excess-lime treatment is more difficult to control and less consistent than ordinary chlorination. C. C. Ruchhoft

**Changes in un-iced bacterial samples during shipment.** Gilbert L. Kelso. *J. Penna. Water Works Operators Assoc.* 5, 27-9(1933).—Water samples for bacterial analysis were exchanged by 3 labs. Samples were shipped by parcel post un-iced. Under these conditions plate counts were rendered unreliable. *Es. coli* tests were reliable 50% of the time while treated samples checked 90% of the time. Max. shipping time was 48 hrs. G. L. Kelso

**Lactose broth fermenters.** Chas. R. Keatley. *J. Penna. Water Works Operators Assoc.* 5, 26-7(1933).—Prechlorination and pretreatment and posttreatment with chloramines did not eliminate organisms fermenting lactose after 24 hrs. incubation. Brilliant green bile medium has eliminated these false presumptive tests. G. L. K.

**Problems involved in providing safe and adequate water supplies for oil-refinery uses.** Sheppard T. Powell. *Water Works and Sewerage* 80, 211-15(1933).—The uses of water in this type of plant may be classified as follows: cooling water for condenser, boiler-feed water, fire protection and sanitary supply. The first 2 classifications require a noncorrosive source which is usually secured by one of the several softening methods. The control of corrosion, scale formation and embrittlement is accomplished by maintaining a  $p_H$  of 9.0 or higher, complete deaeration and the correct ratio of sulfates to the amt. of Na carbonate or NaOH present in the supply. In using a contaminated source for fire protection great care should be exercised to prevent cross connections with the sanitary supply. C. C. Ruchhoft

**Physical chemistry of carbonate separation in water and practical applications.** R. Stumper. *Wärme* 56, 315-18, 340-51(1933); *Wasser u. Abwasser* 31, 265-6(1933).—The article deals principally with the sepn. of  $CaCO_3$  through bicarbonate decompn. as incrustations or silts. The influence of temp. and other phys. factors is described. The clinging capacity of the pptd.  $CaCO_3$  is doubled in the presence of 0.1% NaCl and increased 7-fold by 0.1%  $Na_2SO_4$ . C. R. Fellers

**Iron-removal and zeolite-softening plant at Lancaster, Ohio.** Charles P. Hoover. *Public Works* 64, No. 6, 9-11(1933).—This plant has a present capacity of 2,000,000 gal. daily which can be increased to 3,000,000 gal. daily by equipping the extra filter and zeolite units. The source of supply is two 8-in. wells which discharge into the inlet of an Aero-Mix unit. This is followed by a 30 min. detention period in the reaction basin with the resultant removal of 50% of the  $CO_2$  and the oxidation and pptn. of the 2.4 to 3.4 p. p. m. of Fe present in the raw water. After filtration through sand beds of conventional size and compn. the water is pumped up through beds of Crystalite. Provision is made for the automatic proportioning of hard and soft water. Zeolite runs have averaged 8.4 hrs. with a removal capacity of 12,000 grains per cu. ft. Salt consumption has been  $1\frac{1}{2}$  pound per 1000 grains of hardness removed, while water required for regeneration has averaged 3.9% of the total pumpage. The salt cost for reducing the hardness from 359 to 76 p. p. m. has averaged 2.25 cents per 1000 gals. C. C. R.

**The Budenheim process of water softening with trisodium phosphate.** P. Köppel. *Papier-Fabr.* 31, Tech.-wiss. Teil 109-11(1933).—A correction of the abstract in *C. A.* 27, 4861. Feed water is preheated, mixed with alk. water drawn from the boiler and the phosphate added. Heating removes gases and 30% of the  $Ca(HCO_3)_2$ ; NaOH from the alk. water drawn from the boiler removes the remaining bicarbonate, the resulting  $Na_2CO_3$  and the  $Na_2CO_3$  of the boiler-water removes most of the  $CaSO_4$ ; and the phosphate removes all the substances still present in the water after the pretreatment with the boiler-water, "especially the sol. parts of  $CaCO_3$ . One hr. is required,

when 15 g. phosphate per cu. m. per degree hardness is used. With water harder than 30°, a preliminary soda-lime treatment is recommended." E. J. C.

Role of neutral salts in the treatment of feed waters with trisodium phosphate according to the Budenheim method. P. Köppel and Steinbrunn. *Wärme* 56, 380-2 (1933); *Wasser u. Abwasser* 31, 272 (1933); cf. C. A. 27, 4861, and preceding abstr.—Neutral salts are not coned. in the boiler water but are largely thrown out in the phosphate sludge and removed. C. R. Fellers

The colloidal method of boiler-feed water conditioning. J. S. Merry. *Proc. S. Wales Inst. Engrs.* 49, 367 (1933); cf. C. A. 27, 5127.—Discussion. Alden H. Emery

Boiler scale, its origin and removal. H. Kalb. *Molkerei-Ztg.* 1933, 667-8; *Wasser u. Abwasser* 31, 272 (1933).—The boiling of scaled tanks or boilers with waste starch residues or a mixt. of skim milk and graphite removes scale. If the feedwater is high in Fe or otherwise requires special treatment, coin. prepn. should be used. C. R. Fellers

Filter operating experiences. L. B. Wickersham. *J. Penna. Water Works Operators Assoc.* 5, 64-70 (1933).—Problems arising in the supervision of purification in different plants are reported. G. L. Kelso

When and how to wash a filter. August V. Graf. *Water Works Eng.* 85, 1516-17, 1540 (1932); *U. S. Pub. Health Eng. Abstracts* 13, W, 19 (Feb. 11, 1933). C. R. F.

Obstacles encountered in the flow of water through filter beds. John R. Baylis. *Water Works and Sewerage* 80, 335-6 (1933).—Filter performance is largely influenced by the following factors: size of openings in the filtering material, amt. and characteristics of the suspended material and the extension of the filtering surface by cracks and pulling away from the side walls. The first factor may be expressed mathematically, but as yet this cannot be done with the second factor. The third may be alleviated by some method of surface washing. These suggestions indicate the difficulties encountered in attempting to express filter performance by means of a math. formula. C. C. Ruchhoft

Clay used as artificial turbidity to eliminate short filter runs. Carl Leipold. *Water Works and Sewerage* 80, 304-5 (1933).—Clay secured by crushing "green" bricks was applied to the mixing basin in rates varying from 1.1 to 7.1 grains per gal. It was found that for satisfactory operation with artificial turbidity the mixing period must exceed 15 min. and the coagulation period must be greater than 2 hrs. Periods less than these caused mud balls and cracking of the filters. Too rapid settling of the clay caused difficulties in cleaning the mixing basin. C. C. Ruchhoft

Bleaching clays. John R. Baylis. *Water Works and Sewerage* 80, 287-8 (1933).—Lab. expts. with 2 brands of bleaching clay indicate that this substance had no appreciable power for removing tastes and odors from the samples of water used. When used in connection with Al sulfate the clay aided in the formation of a rapidly settling floe. The odor-removal value of bleaching clay as indicated by this expt. is less than 2% that of activated C. C. C. Ruchhoft

Overhauling filters at the Chain of Rocks plant, St. Louis, Mo. August G. Nolte and Warren A. Kramer. *Southwest Water Works J.* 15, No. 2, 7-9 (1933).—Mud-ball troubles were eliminated by increasing the rate of wash from 12 to 24 in. vertical rise per min. The strainers were clogged by a ZnO coating, obtained from the corrosion of Tobin bronze plates; this increased the water pressure in washing and much trouble resulted from breaking of bolts and strainer plates. Increasing the size of the strainer opening from  $\frac{1}{16}$  to  $\frac{3}{32}$  inches increased the rate of washing from 24 to 36.5 in. vertical rise per min. and eliminated mud balls and broken plates. O. M. Smith

Overhauling rapid sand filters. August G. Nolte and Warren A. Kramer. *Southwest Water Works J.* 15, No. 1, 9-12 (1933).—Unexpected overhauling of filters has been necessary due to blocking of passages by foreign matter, careless handling of cement, improper placement of gravel,

1 nonalignment, faulty design and incrustation on sand grains and strainers. There are discussed method of inspection, cleaning sand bed, partial and complete overhauling and the screening and replacing of gravel and sand. O. M. Smith

Removal of bacteria from a sand filter. F. Meyer. *Gas- u. Wasserfach* 75, 29 (1932); *U. S. Pub. Health Eng. Abstracts* 13, W, 37 (Apr. 1, 1933); cf. C. A. 27, 1425.—At Chemnitz, the water supply from impounding reservoirs is treated by prefiltration and slow sand filtration with chlorination of the raw water or the primary filtrate. *B. coli* appeared in the final effluent of 1 of the filters after chlorination. The Cl disturbed the action of the slow sand filters and it was only by const. backwashing and the addn. of 35 g. of Cl per cu. m. of water that *B. coli* could be eliminated. C. R. Fellers

Bacterial changes in chlorinated filter effluents. H. W. Streeter. *Public Works* 80, No. 7, 19-21 (1933).—Samples of unchlorinated effluent were placed in sterile containers at an av. temp. of 40°F. and various doses of Cl added. Samples were secured after storage up to 9 days. Results showed no secondary increase of bacteria as indicated by the total count and the coli-aerogenes index. The same expt. performed with the av. temp. at 75°F. gave a secondary rise in all cases when the Cl residual was less than 0.10 p. p. m. The data indicate that the rate of bacterial destruction is a function of the time varying with the temp. and that it conforms in general to the laws of disinfection. C. C. Ruchhoft

Pressure pipes of nonmetallic materials. Eugen Weber. *Z. Gesundheitstech. Städtehyg.* 25, 7-18 (1933).—A discussion of the suitability of reinforced-concrete, centrifugally cast concrete or asphalt concrete, and asbestos-cement pipes in piping water from reservoirs. B. C. B.

Metallic materials in water-pipe construction. L. W. Haase and E. Naumann. *Z. Gesundheitstech. Städtehyg.* 25, 18-24 (1933).—A review of the advantages and disadvantages attached to pipes of Fe, Cu, Pb, Sn, Zn, Al, Ni and Cr for water. B. C. Brunstetter

Copper and health. W. M. G. Schneider. *Cuivre et Laiton* 6, 519-26 (1933).—According to recent research Cu and brass are absolutely safe for pipes of drinking water; the admissible amount of Cu in drinking water is 5 mg. per l. A greater content makes the taste disagreeable. Sewer pipes of Cu are safe even for acidic sewer waters if the  $pH$  is about 6.5 and the Cu content about 0.5 mg. per l. The use of copper sulfate in order to prevent development of microorganisms in water reservoirs is not harmful to health. Fifteen references. M. Hartenheim

Algae. Geo. R. Taylor. *J. Penna. Water Works Operators Assoc.* 5, 34-40 (1933).—A thorough, detailed and elementary discussion of examn., enumeration and significance of algae in water supplies. A list of equipment needed and its cost is included. G. L. Kelso

The chemical aspects of the purification of water and sewage. H. B. Taylor. *Chem. Eng. Mining Rev.* 26, 139-42 (1933). W. H. Boynton

New water and sewage-disposal systems of Williams Bay. Ethel L. Gray. *Municipality* 27, 195, 202 (1932); *U. S. Pub. Health Eng. Abstracts* 13, S, 9 (Feb. 4, 1933).—Water is obtained from an 18-in., 278-ft. well with a 42-in. casing outside of the 18-in. casing to a depth of 170 ft., imbedded in a 30-ft. clay stratum. Sewage disposal is effected at an activated-sludge plant including screen chambers, preliminary tank, 3 aeration tanks, a final settling tank and digester tank. There are 4 levels in the collection system. C. R. Fellers

Research in sewage chemistry and sewage treatment. Critical review of the literature of 1932. J. W. Bugbee. *et al. Sewage Works J.* 5, 567-64 (1933); *U. S. Pub. Health Eng. Abstracts* 13, S, 74 (Dec. 9, 1933).—A very comprehensive critical review covering 97 articles. C. R. Fellers

Modern (sewage) purification involving the latest technical and hygienic developments. A. Horn. *Pumpen- u. Brunnenbau, Bohrtech.* 29, 439 (1933); *Wasser u. Abwasser* 31, 275 (1933).—The Horn digestion tank is modeled after the well-known Imhoff tank. The results

are said to be very satisfactory for disposal of fresh domestic sewage.

C. R. Fellers  
Operation of a small sewage-treatment plant. Floyd G. Browne. *Public Works* 64, No. 7, 39-40(1933).—This 600,000 gal. per day plant includes a hand-raked bar screen, clarifier, covered digester, covered sludge beds and chlorinating equipment. The entire plant is operated by one man who is on duty during the day only, but all operations are under tech. supervision. During the first year the clarifier has removed 98% of the settleable solids and reduced the biochem. O demand of 59%. No trouble has been experienced with the digester which gives a sludge having 39% volatile matter and 84% moisture. Gas production has been 1840 cu. ft. per day from a contributing population of 3000.

C. C. Ruchhoft  
Mechanical equipment in sewage-treatment works. A. Prescott Folwell. *Public Works* 64, No. 6, 21-2(1933); cf. C. A. 27, 5852.—Addenda to previous chapters.

C. C. Ruchhoft  
Sewage at Spartanburg, S. C. Geo. W. White. *Water Works and Sewerage* 80, 327-9(1933).—This plant designed for 3,000,000 gal. daily is equipped with a bar screen, primary sedimentation tanks, covered heated digesters, a sprinkling filter, secondary sedimentation and chlorination facilities. Operating results indicate a reduction of suspended solids from 200 to 20 p. p. m., a reduction of biochem. O demand from 235 to 31 p. p. m. and the production of ripe sludge having a moisture content of 90%. Gas production has averaged 17,500 cu. ft. per day. Chlorinators are located at the screen house, dosing tanks and the final effluent line. Provision is made for by-passing at any stage of treatment.

C. C. Ruchhoft  
The sewage-treatment works of Souderton, Penn. Chas. F. Mebus. *Water Works and Sewerage* 80, 265-6(1933).—This plant designed for a population of 5000 includes a bar screen, detritor, Imhoff tank, sprinkling filter, secondary settling tanks, covered sludge bed and chlorination equipment. The filter which is 110 ft. in diam. contains crushed trap rock to a depth of 6.5 ft. Filter effluent is chlorinated before entering the final settling tanks. The plant handles a dry-weather flow of 220,000 and a storm flow of 500,000 gal. per day.

C. C. Ruchhoft  
Vacuum filtration of sewage at Rockville Center, N. Y. Wm. Gavin Taylor. *Water Works and Sewerage* 80, 283-6(1933).—Originally this activated sludge plant discharged the final effluent on native sand seepage beds. Finely divided suspended solids varying from 5 to 10 p. p. m. were carried over and caused considerable difficulty. Three Wright vacuum filters of 3,000,000 gal. daily capacity each were installed to eliminate the trouble. Two of these are used to filter the final effluent and this reduces the suspended solids to 1.0 p. p. m. The third filter may be used for filtering settled raw sewage or for dewatering waste filter cake before incineration. When filtering settled sewage paper pulp is added to secure greater efficiency of clarification. For ordinary filtering sufficient vacuum is developed by the filter, but in dehydrating a vacuum pump must be used. Plant capacity has been increased and digestion tanks and sludge drying beds have been eliminated.

C. C. Ruchhoft  
Cost analysis of the Ensley sewage treatment plant, Birmingham, Alabama. H. H. Hendon and M. E. Borriss. *Water Works and Sewerage* 80, 275-9(1933).—This is designed to treat 15 million gal. daily and consists of the following units: bar screen, detritor, settling tanks, covered digesters, open drying beds, screenings and scum incinerator and gas holder. About 30% of the 100,000 cu. ft. daily gas production is utilized in the lab. and for heating digesters and buildings. The balance is piped to a waste gas burner. Dried sludge is handled by industrial cars.

C. C. Ruchhoft  
A study of ferric chloride treatment of sewage at Grand Rapids, Mich. E. F. Eldridge and N. G. Damoose. *Water Works and Sewerage* 80, 207-10(1933).—Stream conditions at Grand Rapids demand an addnl. removal of 20-25% suspended solids and biochem. O demand

during an annual crit. period. Plant-scale expts. involving 5 doses of  $\text{FeCl}_3$  (3, 5, 7, 10 p. p. m.) were applied to the influent of the final settling tank. Over a period of 8 days the increase in dry solids removal averaged 17.8%. Increase in biochem. O demand varied considerably and gas production was not materially affected. Effects are more pronounced with sewage of high solids content. The use of  $\text{FeCl}_3$  during short periods is justified if the receiving stream approaches the crit. stage.

C. C. Ruchhoft  
Notes on the ferric chloride coagulation of sewage. E. F. Eldridge. *Water Works and Sewerage* 80, 335-6(1933).—Exptl. plant data have indicated the necessity of a 10-min. mixing and flocculation period when  $\text{FeCl}_3$  is used as a coagulant. Doses of this chemical varying from 10 to 30 p. p. m. gave good flocculation with the max. effect at 20 p. p. m. When using sewage high in colloids the addn. of 5 to 7 p. p. m. of  $\text{KMnO}_4$  assured max. flocculation. In using this form of treatment it is essential to regulate the dose to the varying quality of the sewage and to maintain the optimum  $\text{pH}$ .

Helpful hints on sewage-works operation. F. M. Veatch. *Public Works* 64, No. 6, 23-4(1933).

C. C. Ruchhoft  
Pre-aeration of sewage by air diffusion. Frank C. Roe. *Public Works* 64, No. 7, 15-16(1933).—The most effective means of removing grease and oil is a small pre-aeration unit. Besides completely removing grease the treatment eliminates odors and results in improved sedimentation. Pre-aeration periods vary from 10 to 30 min. and air quantities from 0.10 to 0.05 cu. ft. per gal. With the ridge-and-furrow type tank a diffuser area of 20 to 30 sq. ft. per m. g. is required. Provision should be made for the effective removal of the liberated grease.

C. C. Ruchhoft  
Biochemical changes and loss of nitrogen during prolonged aeration of sewage. H. Heukelekian and N. S. Chamberlin. N. J. Agr. Expt. Sta., *Bull.* 529, 20-31(1932).—Lab. expts. on aeration of sewage show that the original  $\text{NH}_3$  content of the sewage is not nitrified but undergoes a stabilization stage. The development of a nitrifying flora is a minor factor in this lag. Nitrification proceeds in 2 definite stages, (1) accumulation of nitrites, and (2) oxidation of nitrites to nitrates. Sulfate production is similar to nitrate production. Aeration drives off the  $\text{H}_2\text{S}$  and accelerates sulfate formation from org. S. Aeration also causes a loss of N due largely to the blowing off of  $\text{NH}_3$ . Bases other than  $\text{NH}_3$  are also given off during aeration. Loss of  $\text{NH}_3$  is greatest during the first few days. Loss of N cannot be attributed to interaction of amino acids and  $\text{HNO}_3$ .

Investigations in the field of sewage colloids. R. Manschke. *Städtereinigung* 25, 155-6(1933); *Wasser u. Abwasser* 31, 279(1933).—Largely a discussion of Harold Wilson's researches (cf. C. A. 27, 2510).

C. R. Fellers  
The regulation of chlorine application in sewage-odor-control work. A. E. Griffin. *Water Works and Sewerage* 80, 218(1933).—Odors in trunk sewers and plants are controlled by the addn. of sufficient Cl to neutralize the  $\text{H}_2\text{S}$  and to kill the sulfate-splitting bacteria. The amt. of this dose can best be detd. by the methylene blue stability test which is as follows: Five-tenths cc. of a 0.10% methylene blue soln. is added to 250 cc. of sewage in a glass-stoppered bottle and incubated at 20°. The time required for the complete disappearance of the color is an indication of the time the sewage will be free from odor, providing that no reseedling has occurred. By this means over-chlorination can be prevented and the max. efficiency and economy secured in the prevention of odors.

C. C. Ruchhoft  
Chlorination at Downers Grove, Ill., helps solve sewage-works odor and stream pollution problems. Harry F. Ferguson and W. Homer Wisely. *Water Works and Sewerage* 80, 200-2(1933).—The old treatment plant consisting of an Imhoff tank, sprinkling filter and secondary settling tank was augmented by the construction of an Imhoff tank equipped for gas collection, sludge beds and a combination screenings incinerator and waste-gas burner. Provision was made for the addn. of 10 p. p. m.

Cl at the screen chamber of the old plant. This dosage provided a tank effluent residual of 0.01–0.2 p. p. m. and permitted heavier loading of the filter. Sewage entering the new plant received 15 p. p. m. Cl at the diversion manhole and 9 p. p. m. after sedimentation. The latter dose was successful in delaying putrefaction until addnl. disin. was made available. Chlorination was practiced only during the crit. months between March and October.

C. C. Ruchhoft

**Sewage disposal.** J. H. Gärner. *Surveyor* 82, 467–9 (1932); *U. S. Pub. Health Eng. Abstracts* 13, S, 12 (Feb. 4, 1933).—The more common shortcomings of English sewage-treatment plants are noted. Emphasis is placed on proper sludge digestion in lagoons for large plants, or in tanks for smaller ones. Gas recovery is practicable only where the sludge is of sufficient quantity to justify the expense and where there is a use on the works for the gas produced. Sludge tank capacity where digestion is practiced should be about 1½ cu. ft. per person; optimum temp. is 30°; reduction of volatile matter is approx. 50%; the gas yield per capita is 0.827 cu. ft. with a calorific value of 660 B. t. u. per cu. ft.

C. R. F.

**Protozoan fauna of sewage disposal.** I. Comparison of plants. James B. Lackey. N. J. Agr. Expt. Sta., *Bull.* 529, 49–50 (1932).—In general, the types and nos. of organisms in the aeration tanks increased or decreased in relation to the stability of the effluent. Dissolved O<sub>2</sub> present determines the types of protozoa to a large extent. Detailed data are given.

C. R. Fellers

**The utilization of the by-products of sewage disposal.** James R. Rumsey. *Water Works and Sewerage* 80, 241–5 (1933).—Experiences at Grand Rapids, Mich., with the following: sludge and scum as fuel, sludge fertilizer, gas and power, agricultural and horticultural projects and intangible by-products.

C. C. Ruchhoft

**Removal of phenols from sewage by means of compressed air.** A. Schulze-Förster and L. W. Haase. *Gesundh.-Ing.* 56, 608–10 (1933).—From 70 to 80% of the phenols present in normal sewage can be removed by vigorous aeration with compressed air (1–2 hrs.) followed by filtration. Both polymerization to difficultly sol. compds. and oxidation take place, the former being especially favored by higher temps. The higher polymers form a crust on the sides of the aeration basin, but a subsequent retention period of ½ hr. with gentle circulation, followed by filtration is necessary to remove the lower polymers. The best filter material is coke 1–3 cm. in diam. or wood wool. Best results are obtained with a  $pH$  of 8–10. At a  $pH$  as low as 2, the phenols are appreciably removed by aeration, but through volatilization rather than polymerization, thus giving rise to objectionable odors. The presence of suspended matter, especially lime, favors the removal of phenols.

M. G. Moore

**Preliminary results on experimental sprinkling filters.** Willem Rudolfs, H. Heukelekian and N. S. Chamberlin. N. J. Agr. Expt. Sta., *Bull.* 521, 6–32 (1931).—Numerous data on crushed stone, slag, gravel and ½ in. wire-mesh exptl. sprinkling filters are presented. In the building-up process of the filter, the nitrification zone moved downward. Considerable NH<sub>3</sub> was lost into the air. The greatest suspended solids removal occurred in the roughest media, whereas the greatest ease of unloading was exhibited by the smoothest material. Considerable direct, non-biol. oxidation occurred. The reduction in biochem. O<sub>2</sub> demand on the wire-mesh filter was 25%, mainly direct oxidation. The greatest *Es. coli* reduction took place in the gravel, followed by the slag and crushed stone. The upper layers of the filters were most effective as strainers for suspended solids and *Es. coli*. The percentage biochem. O<sub>2</sub> demand removal increased with increased loads (cf. C. A. 25, 1610).

C. R. Fellers

**Performance of experimental trickling filters during winter and summer.** Willem Rudolfs, Noel S. Chamberlin and H. Heukelekian. N. J. Agr. Expt. Sta., *Bull.* 529, 4–16 (1932); cf. C. A. 25, 1610.—Decrease of NH<sub>3</sub>, production of nitrite and nitrate, and decrease in biochem. O<sub>2</sub> demand were in all cases greater in summer than in winter. Slag, crushed-stone and gravel filters gave equal

overall performances. The percentage decrease in NH<sub>3</sub> was greatest at the top levels and more pronounced in the stone filter, followed by the slag, and finally by the gravel. Nitrification proceeded at increased rates with downward movement of the sewage. Most of the decrease in biochem. O<sub>2</sub> demand took place in the upper 1.5-ft. levels. The upper half of the filters removed most of the suspended solids and effected most of the decrease in NH<sub>3</sub> and biochem. O<sub>2</sub> demand, whereas the lower half produced more nitrates. The upper part of the filters removed 90% of the *B. coli* of the influent. The zone of greatest activity in the filters was somewhat deeper in winter than in summer.

C. R. Fellers

**Experiments with Trenton sewage sludge.** Willem Rudolfs and I. O. Lacy. N. J. Agr. Expt. Sta., *Bull.* 521, 38–41 (1931).—Samples of sewage solids from the Trenton sewage plant, contg. large quantities of trade wastes, were limed, and other samples were seeded with ripe sludge. The limed samples yielded higher gas production than the control, but less solids reduction. Adding more lime reduced gas production. The seeded material digested very rapidly but the gas was less in total amt. than is normally formed from domestic sewage. Fe compds. in the sewage are believed to be responsible for the decreased gas production. Although large quantities of sulfates were present, H<sub>2</sub>S production was low. The Fe flocks out the finely suspended solids and thus assists in settling. The digested sludge dries rapidly. About 25 million cu. ft. of gas could be collected yearly.

C. R. Fellers

**Loss of heat in activated sludge aeration channels.** Darwin W. Townsend. *Proc. Am. Soc. Civil Engrs.* 60, 63–71 (1934).

E. H.

**Disposal of activated sludge.** Arnold Kershaw. *Surveyor* 82, 427–8 (1932); *U. S. Pub. Health Eng. Abstracts* 13, S, 11 (Feb. 4, 1933).—Various schemes were tried at Epsom, England, for disposing of large aunts. of excess activated sludge. Such schemes as ridging, harrowing and trenching were unsatisfactory. Best results were secured by plowing land and planting to coarse water grass. When sludge was discharged on such grassy land, the solids were retained while the inoffensive liquid passed on to the contact beds. Neither flies nor offensive odors were troublesome. The use of sludge-drying beds during fair weather in conjunction with grass lands is practiced and about 1.5% of wet sludge on the beds after decanting the top water was found to be the most practicable dose.

C. R. Fellers

**Sludge disposal by incineration.** M. J. Blew. *Public Works* 64, No. 8, 39–40 (1933).—Sludges vary in heat value from 6000 B. t. u. per lb. for combined sludge to 9500 B. t. u. for domestic sludge. Drying and leaching reduces the heat value, but moisture should be reduced to 75%. Incineration temps. must be above 1400°F. to prevent odors, but not above 2000°F. if much grit is present. Sludge should be stored for a min. time before dewatering and predrying. Forced draft with preheated air is desirable.

C. C. Ruchhoft

**Reaction adjustment of acid sludge.** Willem Rudolfs. N. J. Agr. Expt. Sta., *Bull.* 521, 32–4 (1931); cf. C. A. 22, 2423.— $pH$  detns. on sludge liquor may be made after centrifuging, after filtration through paper or glass wool or after dilg. greatly if the liquid is highly colored. Either milk of lime or dry Ca(OH)<sub>2</sub> is the best neutralizing agent for the treatment of acid sludges. Graphs are given showing the proper aunts. of lime required per cu. ft. of fresh solids at  $pH$  ranges 5.1–6.1. It is best to add the lime to highly acid sludges over a period of several days because of the stimulating action of lime on acid-producing microorganisms.

C. R. Fellers

**Heating top sludge.** II. Henry W. Taylor. *Public Works* 64, No. 2, 7, 10–12 (1933); cf. C. A. 27, 5853.—Expt. at 2 plants in northern New York showed the possibility of controlling gas production by regulating the air temp. above the digesting sludge. This was accomplished by installing a blower so as to force air into the Imhoff tank cover attic at a rate varying from 90 to 120

cu. ft. per min. During winter months the air was heated by passing it through a coil located in an exhaust burner. When top sludge temps. were maintained above 82°F., max. gas production was assured. During summer months cool night air was sufficient to cause a marked reduction in the gas yield. The method suggests an effective means of securing a const. yield of gas regardless of outdoor temps. C. C. Ruchhoft

**Effect of narrowing the carbon-nitrogen ratio on sludge digestion.** Willem Rudolfs and L. R. Setter. *N. J. Agr. Expt. Sta. Bull.* 529, 31-7(1932); cf. *C. A.* 27, 5853.—While the addn. of org. N substances to sewage increased the rate of digestion, the mechanism of decomposition is influenced by many other factors.

C. R. Fellers

**Notes on supernatant liquid and (sludge) digestion.** Willem Rudolfs. *N. J. Agr. Expt. Sta. Bull.* 521, 36-8 (1931).—At solids concns. up to 15%, the digestion of ripe sludge-fresh solids mixts. from which the supernatant liquid is removed is as rapid as that in mixts. from which the supernatant liquid is not removed. The withdrawal of supernatant liquid in digestion tanks has a slightly depressing effect on solids digestion. Fourteen days were required for the supernatant liquid withdrawn immediately after collection of the fresh solids to reach a  $pH$  of 7.8. Material which stood for 1-3 weeks required 20-30 days longer. That is, supernatant liquid after standing in contact with the solids contains substances which are difficult to decompose. C. R. Fellers

**Distribution of solids in a digestion tank.** Willem Rudolfs and C. N. Henderson. *N. J. Agr. Expt. Sta. Bull.* 529, 48-9(1932); cf. *C. A.* 25, 5230.—Stratification became more pronounced in digestion tanks held at 21° or below than at higher temps. Two tanks with scum layers of 1 and 7 ft., resp., were compared. The d. of the sludge near the bottom of the 2 tanks was practically the same. Sepn. of water was more pronounced in the tank with the least scum. The ash contents of the scums were nearly the same, but the ash content of the sludge was considerably higher in the tank without the thick layer of scum. Simultaneously with the increase in solids concn. in the sludge, the ash content increased. The grease content of the scum (deeper layer) was 57% of the total dry solids, decreasing rapidly to 48% at the underside of the scum blanket. The grease content decreased further gradually to about 20% in the liquid layer and remained const. in the sludge. Based on ash content, the sludge with the thick, greasy scum was considerably inferior to the material from the other tank.

C. R. Fellers

**Digestion of activated sludge mixed with fine screenings.** Willem Rudolfs. *N. J. Agr. Expt. Sta. Bull.* 529, 45-8 (1932).—Lab. expts. on properly seeded activated sludge with addns. of 10-20% of fine screenings showed that such sludges could be fully digested. The addn. of 10% of fine screenings did not appreciably retard but the presence of as much as 20% of fine screenings definitely delayed digestion and resulted in poorer quality of digested material. Gas production was higher from sludge to which had been added fine screenings (cf. *C. A.* 24, 1449).

C. R. Fellers

**Effect of trade wastes on thermophilic sludge digestion.** I. Comparison of the digestion of Trenton (containing pickling liquor wastes) and Plainfield solids (domestic). H. Heukelekian. *N. J. Agr. Expt. Sta. Bull.* 529, 37-41 (1932); cf. *C. A.* 25, 5231.—The comparison of the digestion of Trenton solids, which are high in Fe content, with the Plainfield solids shows that the presence of Fe affects the digestion in the same way at 50° as at 28°. At both temps. the digestion of solids with the higher Fe content proceeds at a somewhat faster rate (2-3 days) and produces less gas than the domestic solids.

C. R. Fellers

**Diurnal and seasonal variations in the small ion content of outdoor and indoor air.** C. P. Yaglon and L. Claribel Benjamin. *Heating, Piping, Ventilating* 6, 25-32(1934); cf. *C. A.* 26, 3593.—The variations in the ionization

1 condition of outdoor air are considered, together with the corresponding changes which take place in lightly occupied rooms, heated and ventilated by the usual methods. Drawings and addnl. specifications of the exptl. app. used are included. Evidence supports the belief that the sun is not the direct cause of atm. ionization. For temps. under 21° a rise in temp. appears to be assocd. with an increase in the ion numbers, but this does not hold for higher temps. There is, however, a definite inverse relationship between humidity and ionization. Much more important than either temp. or humidity are the changes in these conditions; a rise in the interdiurnal temp. or humidity is as a rule preceded or accompanied by a falling ion content, but if the temp. continues to rise for 3 days or more the ionization begins to increase. Other influences of less importance are cloudiness, high humidity and light or moderate pptn. of any kind, which have a detrimental effect on the small ion content; it is found that a considerable increase in the small neg. ions is produced by pptn. of a heavy character, while both pos. and neg. ions are increased by pptn. when this is accompanied by thunder and lightning. In winter the concn. of small ions is observed to be much lower in indoor air than in outdoor air; in summer the reverse holds true. A. W. Furbank

**Some causes and effects of stream pollution.** J. K. Hoskins. *Public Works* 64, No. 8, 11-12(1933).—Substances polluting streams may be classified as chem., inert and org. The former are directly detrimental and the latter reduce available O and carry pathogenic bacteria. Inert materials create objectionable conditions. Chemicals produce tastes and odors, damage structures and interfere with treatment. Their removal is best accomplished before being discharged into the stream. Org. pollution is reduced by aerobic and anaerobic decomposition by bacteria whose growth is stimulated by plankton. Natural purification may be encouraged by artificial means such as extensive surface exposure, agitation, addn. of O-bearing chemicals and by delaying biochem. oxidation with the use of a disinfectant. C. C. Ruchhoft

**The problem of waste-water disposal.** L. Aublanc. *Rev. hyg. mbd. prevent.* 55, 684-9(1933).—General.

C. R. Fellers

**Purification of waste water.** H. A. J. Pieters and H. Koopmans. *Chem. Weekblad* 30, 779-80(1933); cf. *C. A.* 25, 4639.—Clay can be sepd. from a suspension with an elec. current by means of Cu electrodes. The purification is due to electrolytic Cu. More economical is the use of Fe electrodes. E. Schotte

**Wastes and pollution vs. recovery for profit.** C. M. Baker. *Water Works and Sewerage* 80, 296-8(1933).—Suggestions are made for the utilization of materials ordinarily wasted. Slight changes in the mfg. process often bring new profits and eliminate pollution. Treatment of trade wastes is recommended only after every effort has been made to salvage the polluting material.

C. C. Ruchhoft

**Spent sulfite liquor, its toxic effect and disposal.** Vogel. *Reichsarbeitsblatt* 1933, III, 265-9; *Gesundh.-Ing.* 56, 180; *Wasser u. Abwasser* 31, 210(1933); cf. *C. A.* 27, 5452.—Because of its toxicity for fish and water plants and animals, spent sulfite liquors should not be returned to rivers. They may be concd. by evapn. and, by the addn. of a cementing substance, may be briquetted. The concd. liquor may also be used to sprinkle streets to lay the dust. It is likewise useful as a tanning material.

C. R. Fellers

**Treatment of butter factory drainage.** R. E. Harris and A. Gordon Gutteridge. *State of Victoria (Australia) Dept. Pub. Health, Bull.* 33 and 34, 1020-3(Jan.-June, 1933); *U. S. Pub. Health Eng. Abstracts* 13, S, 75(Dec. 23, 1933).—The wastes from a butter factory in Gippsland contg. washings from cream cans, buttermilk, churn washings, cleansing and sterilizing solns., floor washings and yard drainage, amounting to 14,000 gal., have been successfully treated for a 12-month period in a plant consisting of grease traps, an equalizing tank and 2 trickling

filters for biol. oxidation under aerobic conditions. A preliminary grease trap of 2 parallel basins with a 1/4-hr. detention period at the max. flow removes 6-8 cu. ft. of grease daily. From the equalizing tank, to which clear water is at times added, the waste water passes through another grease trap to 2 circular trickling filters and finally through a 3rd grease trap to prepd. soil beds. The addn. of garden earthworms to the filter helps to loosen the accumulations of solid matter from the filter material. C. R. Fellers

Disposal of shaft-furnace wastes. W. Steffens. Z. *Kommunalwirtschaft* 23, 409-12(1933); *Wasser u. Abwasser* 31, 209-10(1933).—Wastes may be impounded in sedimentation tanks for the settling out of solids and the effluent used on arable land. Where offensive odors result, further purification by coagulation with lime and  $\text{FeSO}_4$  followed by chlorination is recommended.
